EXECUTIVE SUMMARY

The overall site for the Macquarie Point Development Project (MPDP), is located to the east of the Hobart CBD and is approximately 9.3 ha in area. The MPDP includes a large area of reclaimed land and has historically been used for rail yard and industrial purposes. The overall site is being used for a range of interim activities such as initial landscaping, car parking and workers compounds to support a range of infrastructure projects in the Hobart area, with a number of the existing buildings and open areas being used for public events.

To allow progressive redevelopment, the overall site has been divided into sub-areas referred to as Audit Area 1 (AA1) through to Audit Area 7 (AA7). David Lam, of Tetra Tech Coffey (Coffey), has been engaged to undertake contaminated land audits for the overall site. The subject of this Contaminated Land Audit is a part of Audit Area 2 (AA2), part of Audit Area 4 (AA4), part of Audit Area 5 (AA5) and all of Audit Area 7 (AA7). The site is described as Lot B (also referred to as 'Precinct North'). The reason that this area is not one of the originally defined Audit Areas is to do with envisaged development sequencing and use patterns. This is the fourth part of the overall site to be audited, following Audit Area 1, Audit Area 4 West, and Lot E and Underground Carpark.

This Contaminated Land Audit is a legislative requirement for redevelopment under Clause 39F of the *Macquarie Point Development Corporation Act 2012* (consolidated to include amendments including those under the *Macquarie Point Development Corporation Amendment Act 2015*).

The proposed use of the site subject to this audit is for Arts and Institutional area, with commercial and cultural uses, with no basement or residential occupancy planned.

The site has been subject to significant soil remediation, which has resulted in the removal and disposal off-site of significant volumes of contaminated soil. Some imported virgin excavated natural materials has been used to backfill excavations along with material excavated from the site and re-used following assessment.

Environmental assessment of soil at the site prior to and post remediation indicates some residual variable contamination by metals, PAHs, TRHs/TPHs, and aesthetic impacts that would preclude some beneficial uses / protected environmental values, in the absence of appropriate management measures. These precluded beneficial uses / protected environmental values of soil are: Maintenance of Ecosystems; Human Health (residential use, low and medium/high density); Human Health (commercial use); Recreation / Open space; and Aesthetics.

An assessment of Clean Up to Extent Practicable (CUTEP) has been made with respect to Victorian guidance. The Auditor has considered EPA Victoria (2016) (EPA Publication 840.2 "*The Cleanup and Management of Polluted Groundwater*"), which has been adopted as relevant guidance in the CUTEP assessment. Based on an assessment of the groundwater condition and the absence of practicable remediation options, the Auditor has assessed that there is no practicable remediation which would provide any net environmental benefit, and so concludes that Clean Up to The Extent Practicable (CUTEP) has been achieved.

Environmental assessment of groundwater at and adjacent to the site indicates impact by a range of contaminants, meaning the groundwater would not be suitable for possible (albeit highly unlikely) uses as follows: Drinking Water (Human Health); Drinking Water (Aesthetics); Recreational (Primary Contact and Secondary Contact), Stock Watering, Irrigation and Industrial use. An assessment of possible off-site ecological impacts identified that risks to receiving environments (Derwent River and Sullivans Cove) are unlikely.

While remediation of both soil and groundwater has occurred, and the site is considered suitable for development (risks for the proposed development plan would be manageable regardless of further remediation), the actual development works and any maintenance may encounter contaminated media, which will require controls for works including disposal of surplus material in accordance with Environment Protection Authority Tasmania requirements. Although no basements are planned, it is likely that foundations and services for any new building may encounter contaminated media.

Risks associated with the soils and groundwater following remediation are able to be managed subject to conditions which are outlined in the Site Suitability Statement. A Site Environment Management Plan (SEMP) has been prepared to outline appropriate measures to be applied to mitigate risks presented by the site conditions. A copy of the SEMP is attached to the Site Suitability Statement in Appendix A.

Based on the considerations covered in this Contaminated Land Audit Report, the site is considered suitable for use subject to conditions outlined in the Site Suitability Statement which is included in Appendix A

1. INTRODUCTION

1.1 BACKGROUND

The overall site for the Macquarie Point Development Project (MPDP), is located to the east of the Hobart CBD and is approximately 9.3 ha in area, as shown in Figure F1[1]. MPDP includes a large area of reclaimed land and has historically been used for rail yards and a range of industrial purposes. The overall site is currently being used for a range of interim activities such as initial landscaping solutions, car parking and workers compounds to support a range of infrastructure projects in the Hobart area, with a number of the existing buildings and open areas being used at times for public events.

To allow progressive redevelopment, the overall site has been divided into sub-areas referred to as Audit Area 1 (AA1) through to Audit Area 7 (AA7). The Audit Areas are shown in Figure F2. Although it was initially envisaged that each of the nominated Audit Areas would be the subject of successive audits (one audit for each audit area), this approach has not been adhered to, because of development sequencing and development pattern imperatives. The subject of this Contaminated Land Audit is called 'Lot B' (also described as 'Precinct North'). With respect to the overall site, Lot B is located on the central eastern boundary. The area is made up of the entirety of AA7; the southern portion of AA4 East; a very small portion of the south east corner of AA4 West; a small part of the eastern portion of AA2 and part of the eastern portion of AA5. Lot B is the fourth Contaminated Land Audit parcel within the overall site to be audited, following audit reports (and associated Site Suitability Statements) being issued for AA1 (June 2019), AA4 West (September 2020) and Lot E and Underground Car Park (July 2021).

David Lam, of Tetra Tech Coffey (formerly Coffey Environments Australia Pty Ltd) (Coffey), has been engaged to undertake contaminated land audits for the overall site. A notification of the commencement of the audit was provided to Environment Protection Authority Tasmania (EPA Tas) in a letter dated 1 March 2016 (a copy of which is provided in Appendix C).

Although Tasmania does not have a formal auditing system, a process has been developed to allow contaminated land auditing by an Auditor accredited under legislation for other Australian states. A contaminated land audit in Tasmania may be undertaken voluntarily (to satisfy a planning authority or for due diligence) or it may be required by legislation (such as an Act or Notice).

This Contaminated Land Audit is a legislative requirement for redevelopment under Clause 39F of the *Macquarie Point Development Corporation Act 2012* (consolidated to include amendments including those under the *Macquarie Point Development Corporation Amendment Act 2015*) (Tasmanian Government (2012) and Tasmanian Government (2015) respectively). Clause 39F notes that:

> *Redevelopment of a part of the site may not occur until an accredited environmental auditor has certified that the remediation of the part of the site has occurred to a standard that is satisfactory for the purposes of the proposed redevelopment.*

In some circumstances, active remediation may not be required, either because contamination does not affect beneficial uses of the site, or because the risks are manageable by reasonable control measures such as limiting access to soils or groundwater affected by contamination.

A copy of the Auditor's Registration on the EPA Tasmania Register of Interstate Auditors, which enables the Auditor to conduct auditing at the Macquarie Point site, is provided in Appendix F.

[1] Note that Figure F1 and all other figures are reproduced in this report directly from the Lot B - Clean Up to the Extent Practicable Report AECOM (2021h), a copy of which is provided in Appendix D.5 of this audit report.

1.2 PURPOSE OF ENVIRONMENTAL AUDIT

The purpose of this Contaminated Land Audit Report is to determine whether remediation of Lot B has occurred to a standard such that the site is satisfactory for the purposes of the proposed uses. The audit objective is to produce a "Site Suitability Statement" confirming the suitability of the land for the proposed use/s, subject to conditions which may apply for the suitable use of the site.

This Contaminated Land Audit Report provides a formal evaluation of the environmental condition of the site in terms of risks to human health and/or the environment associated with the presence of soil or groundwater contamination. This Contaminated Land Audit Report also describes management conditions that must be applied to ensure ongoing suitability for certain site uses, and any uses for which the site is unsuitable.

It is important to note that while remediation may occur to a point at which the site is satisfactory for the proposed development, there may still be contamination on the site, and for some development scenarios, some of the affected soils and groundwater may be encountered. Where the contaminated media are encountered, they will require management and, in some cases, off-site disposal.

1.3 STAKEHOLDERS

The parties involved in the environmental audit and the members of the audit team are listed in the following Table 1-1 and Table 1-2.

Table 1-1: Parties involved in the Environmental Audit

Role	Organisation
Regulator	Environment Protection Authority Tasmania (EPA Tas)
Site owner / Developer	Macquarie Point Development Corporation (MPDC)
Project manager for developer	Greg Cooper
Project Remediation Consultant (environmental site assessor)	AECOM Australia Pty Ltd (AECOM)
Project director / manager for assessor	Paul Carstairs / Rob Crowe
Primary laboratory	ALS Laboratories (ALS) for soil and groundwater, and SGS Leeder Consulting (SGS) for soil vapour.
Secondary laboratory	Eurofins for soil and groundwater, and National Measurement Institute (NMI) for soil vapour.
Sub-consultant assessor	Geo-Environmental Solutions (GES)
Remediation contractor	Synergy

Table 1-2: Audit Team

Name	Role
David Lam	Site Environmental Auditor (Auditor)
Adi Thomas	Project Manager and assistance with Audit Report preparation

2. AUDIT FRAMEWORK AND METHODOLOGY

2.1 CONTAMINATED LAND AUDITS – TASMANIA

Tasmania does not have a formal system of environmental auditing of contaminated land, as exists in other Australian states. While the *Environmental Management and Pollution Control Act 1994* (EMPCA) outlines a broad definition of a contaminated land audit, it does not include a formal system for the appointment or accreditation of persons able to conduct audits nor does it include guidance on how audits must be conducted. The lack of an existing formal auditing system was considered by MPDC to pose risks in relation to the level of certainty which could be provided to site developers and users of the Macquarie Point site.

MPDC therefore wished to institute a formal auditing system in order to obtain voluntarily-triggered audits. No audit requirement has been made by EPA Tas. In order to provide a formal auditing system for the site, MPDC proposed a system under which Interstate Contaminated Land Auditors could conduct audits on the Macquarie Point site.

Accordingly, the *Macquarie Point Development Corporation Amendment Act 2015* (Tasmanian Government (2015)) was passed in late 2015, and now forms part of the consolidated *Macquarie Point Development Corporation Act 2012* (Tasmanian Government (2012)). This 2015 Act requires certification of the site as suitable for the proposed redevelopment, as described in Section 1.1 above.

In order to facilitate this requirement, the Act also included provision for the Director (within the meaning of the EMPCA) to accredit a person as an environmental auditor for the purposes of the remediation of the site.

In February 2016, EPA Tas produced a Fact Sheet '*Register of Interstate Contaminated Land Auditors*' (EPA Tas (2016), a copy is provided in Appendix B), which outlined the following.

- The Auditor Registration process. (Refer to Appendix F for a copy of the Auditor's registration.)
- A description of a contaminated land audit and a Contaminated Land Audit Report.
- The process of Audit commencement, and Auditor engagement, and audit fees (nil).
- Insurance requirements for Auditors.
- Compliance with guidelines for auditing, which effectively require the Auditor to comply with obligations outlined in legislation, mandatory guidelines and Codes of Practice that apply in the home state/s of accreditation.

The Fact Sheet further requires that Auditors must comply with the standards expressed in the National Environment Protection (Assessment of Site Contamination) Measure 1999 (NEPM (2013)), which is a State Policy in Tasmania. The Fact Sheet goes on to note that for any areas of ambiguity a determination from the Director, EPA may be requested, and the Auditor must comply with Director's determination.

This audit is being conducted under the consolidated *Macquarie Point Development Corporation Act 2012* (Tasmanian Government (2012)) and in accordance with EPA Tas (2016). This Contaminated Land Audit Report needs to be provided to EPA Tas as it is the result of a regulatory instrument (Tasmanian Government (2012)) per the Fact Sheet.

2.2 AUDIT METHODOLOGY

As mentioned in Section 2.2.2 of this audit report below, this site is being audited under the guidelines issued for S53X audits in the Victorian EPA system under the Environment Protection Act 1970 rather than the Environment Protection Act 2017 which commenced 1 July 2021. EPA Victoria has stated that any audit commenced before the Environment Protection Act 2017 commencement date, under the previous guidelines, may be completed under those same guidelines.

In conducting this contaminated land audit, the Auditor and/or his representative has:

- notified EPA Tas of the audit as part of the expression of interest for placement on Tasmania's Register of Interstate Contaminated Land Auditors (see Appendix C);
- reviewed the history of the site and the surrounding area, including other relevant background information;
- reviewed and provided comment on reports and documents prepared by the environmental site assessor (including work plans, assessment reports, and derivation of Remediation Criteria);
- conducted site visits and attended meetings;
- assessed the environmental condition of soil, groundwater and soil vapour at the site, using all available information;
- assessed the potential risks to human health and the environment relevant to the potential land use/s;
- consulted with MPDC and their consultant, AECOM, to discuss planning intentions;
- consulted with EPA Tas with respect to the audit process and the determination of 'clean up of groundwater to the extent practicable' (CUTEP) using EPA Victoria guidance (see Section 2.2.2); and
- prepared this Contaminated Land Audit Report.

The documentation relevant to the site is listed in Section 2.2.3 below, whilst Section 2.2.1 describes site visits undertaken by the Auditor.

2.2.1 Site visits

The Auditor has undertaken multiple visits to the overall site since 2014, including to AA2, AA4, AA5 and AA7, within the areas of which lies the Lot B area, as listed in Table 2-1 below.

Table 2-1: Site visits conducted by the Auditor and/or his representative

Date	Who Attended
19 August 2014	Auditor
24 October 2014	Auditor
23 December 2014	Auditor Representative
24 February 2015	Auditor
18 March 2015	Auditor
30 April 2015	Auditor
18 Sept 2015	Auditor
15 February 2017	Auditor

The site visits have provided the Auditor with site familiarisation and a spatial appreciation of the activities relevant to the site and the general site setting. The Auditor has also relied upon site observations made by the assessor during field investigations, and extensive photography provided in reporting – particularly with respect to remediation excavations.

The Remediation Validation Report - Audit Areas 2 and 7 and Pipeline Removal (AECOM 2020e) presents several photographs of the site, presented in a number of in-text Plates throughout the document.

The ability to visit the site in recent times has been compromised by interstate travel restrictions associated with the COVID-19 pandemic, however the Auditor considers that by a combination of previous site visits, and photographic and other records from the site, the conditions of Lot B area are adequately understood for the purposes of the audit report.

2.2.2 Technical guidance and legislation

As outlined in the Fact Sheet (Appendix B), Auditors undertaking Contaminated Land Audits must comply with the technical auditing standards in their accrediting State legislation.

The following guidance documents have been utilised in assessing site conditions, and conducting auditing, for the purposes of this audit report, as follows. It is noted that as the audit has been undertaken with reference to the guidelines for conducting a S53X audit, the Victorian Environment Protection Act 2017 and subordinate documents have not been referenced.

- NEPM (2013) - National Environment Protection Council [NEPC] - *National Environment Protection (Assessment of Site Contamination) Measure* (1999, as amended 2013).
- State Government of Victoria (1970), Environment Protection Act No. 8056/1970 (and amendments), State of Victoria, 1970.
- State Government of Victoria (2002), State Environment Protection Policy (Prevention and Management of Contamination of Land), No: S95, State of Victoria, Environment Protection Act, 4 June 2002.
- State Government of Victoria (2018), State Environment Protection Policy (Waters), State of Victoria, Environment Protection Act, October 2018.
- SAI Global (1999). "Guide to the Sampling and Investigation of Potentially Contaminated Soil. Part 2: Volatile Substances AS 4482.2-1999".
- SAI Global (2005). "Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soil, Part 1: Non-Volatile and Semi-Volatile Compounds AS 4482.1-2005".
- SAI Global (2009). "Piling – Design and Installation AS 2159-2009".
- ANZG (2018). Australian and New Zealand guidelines for fresh and marine water quality (2018) [Water Quality Australia website, under the auspices of the National Water Quality Management Strategy (NWQMS), an Australian Government initiative in partnership with state and territory governments]
- NHMRC (2011). "Australian Drinking Water Guidelines" National Health and Medical Research Council, January 2011 (revised 2015).
- NHMRC (2008). "Guidelines for Managing Risks in Recreational Water". National Health and Medical Research Council, February 2008.
- EPA Victoria (2015). EPA Publication 759.3 "Environmental auditor (Contaminated Land): Guidelines for Issue of Certificates and Statements of Environmental Audit" 21 December 2015.
- EPA Victoria (2016). EPA Publication 840.2 "The Cleanup and Management of Polluted Groundwater" 20 April 2016.
- EPA Victoria (2009). IWRG702 "Soil Sampling" 30 June 2009.
- EPA Victoria (2000). EPA Publication 669 "Groundwater Sampling Guidelines" 17 April 2000.
- EPA Victoria (2006). EPA Publication 668 "Hydrogeological Assessment (Groundwater Quality) Guidelines", 8 September 2006.
- EPA Victoria (2009). IWRG701 "Sampling and Analysis of Waters, Wastewaters, Soils and Wastes" 30 June 2009.
- CRC CARE (2011a). Friebel, E & Nadebaum, "Health screening levels for petroleum hydrocarbons in soil and groundwater. Part 1: Technical Development Document, CRC CARE Technical Report no. 10"
- CRC CARE (2011b). Friebel, E & Nadebaum, "Health screening levels for petroleum hydrocarbons in soil and groundwater. Part 2: Application Document, CRC CARE Technical Report no. 10".
- CRC CARE (2013). J Wright 2013, "Petroleum hydrocarbon vapour intrusion assessment, CRC CARE Technical Report no. 23"

- CCME (2008). Canadian Council of Ministers of the Environment, "Canada-Wide Standards for Petroleum Hydrocarbons (PHC) in Soil", Endorsed by CCME Council of Ministers, April 30-May 1, 2001, Winnipeg. Table 1 Revised January 2008.
- HEPA (2020) - Heads of EPAs Australia and New Zealand 'PFAS National Environmental Management Plan Version 2.0' – January 2020

The following legislation and state-based associated documents have been used:

- Tasmanian Government (2012) - Macquarie Point Development Corporation Act 2012.
- Tasmanian Government (1997) - State Policy on Water Quality Management 1997.
- EPA Tas (2012) - Bulletin 105 Classification and Management of Contaminated Soil for Disposal

The Auditor notes that this site (as for all stages of the MPDC site) is being audited under the guidelines issued for S53X audits in the Victorian EPA system under the Environment Protection Act 1970. As of 1 July 2021, the Environment Protection Act 2017 came into force in Victoria and is associated with a range of new subordinate legislation and guidelines, including for the environmental audit system. The changes relate to the basis on which audits are conducted, and include reference to 'Clean Up So Far As Reasonably Practicable' (CUSFARP) for groundwater. The Auditor notes, however, that EPA Victoria has stated that any audit commenced before the Environment Protection Act 2017 commencement date, under the previous guidelines, may be completed under those same guidelines.

It is proposed, based on the allowance to do so under the transition arrangements adopted by EPA Victoria, to continue to conduct environmental audits for the MPDC site using the 'old' guidelines, including reference to 'CUTEP' for groundwater rather than the new 'CUSFARP' for groundwater.

2.2.3 Assessment reports

The following key reports were provided to the Auditor for review and to support the findings of the contaminated land audit. Appendicised reports are noted in the below list.

- AECOM (2016c) Derivation of Remediation Criteria, Macquarie Point Development Project, 22 August 2016
- AECOM (2020d) - Audit Area 2 – Detailed Site Investigation Macquarie Point Development Project, 17 December 2020 **(Appendix D.1)**
- AECOM (2021b) Audit Area 4 – Detailed Site Investigation Macquarie Point Development Project, 10 July 2020 **(Appendix D.2)**
- AECOM (2021b) Audit Area 5 – Detailed Site Investigation Macquarie Point Development Project, 16 March 2021 **(Appendix D.3)**
- AECOM (2020i) Audit Area 7 – Detailed Site Investigation Macquarie Point Development Project, 18 December 2020 **(Appendix D.4)**
- AECOM (2021h) Lot B - Clean Up to the Extent Practicable Report, 17 November 2021 **(Appendix D.5)**
- AECOM (2020b) - Assessment of Potential Off-Site Ecological Impacts, 10 July 2020 **(Appendix D.6)**
- AECOM (2021e) - Remediation Validation Report - Audit Areas 2 and 7 and Pipeline Removal, 27 April 2021 **(Appendix D.7)**
- AECOM (2021d) Site Environment Management Plan, 17 November 2021 (Appendix A with the Site Suitability Statement)
- AECOM (2017b) Macquarie Point Development Project – Site Remediation Strategy Update, 22 June 2017
- AECOM (2017d) Macquarie Point Development Project – Preferential Pathway Assessment, 22 August 2017

- AECOM (2017a) Macquarie Point Development Project - LNAPL Remediation Action Plan, May 2017
- AECOM (2020a) Macquarie Point Development Project – Groundwater Well Installation and Monitoring 2019, March 2020 **(Appendix D.10)**
- +AECOM (2020c) Macquarie Point Development Project – Underground Carpark Soil Categorisation and Waste Management Plan, 4 November 2020
- AECOM (2021f) Macquarie Point Development Project – Soil Vapour and Indoor Air Investigations 27 April 2021 **(Appendix D.9)`**
- AECOM (2021g) Macquarie Point Development Project – Assessment of LNAPL Remediation End-Points, 27 April 2021 **(Appendix D.8)**

Summaries of the scope of work and findings for each of the key documents is provided in Section 7 of this audit report. The SEMP is discussed further in Section 9.3 of this audit report and is attached to the Site Suitability Statement (in Appendix A).

Other key documents considered by the Auditor include:

- Certificate of Title (CT 114462/1) (see Appendix E of this audit report)
- Sullivans Cove Planning Scheme
- Macquarie Point Development Corporation Site Development Plan

2.2.4 Management Plan

The following Site Environment Management Plan (SEMP) has been prepared for the site and reviewed by the Auditor, and as noted above is attached to the Site Suitability Statement presented in **Appendix A**:

- AECOM (2021d) Site Environment Management Plan, 18 November 2021

The purpose of the SEMP is to provide controls and measures for the environmental management of the site following the issue of the Site Suitability Statement. The SEMP is to be implemented during the redevelopment/construction period and during future occupation (which may include maintenance activities). The SEMP may be updated/revised as required.

3. SITE INFORMATION AND ENVIRONMENTAL SETTING

3.1 SITE DESCRIPTION

Site identification details are provided in Table 3-1 below.

Table 3-1: Site identification summary

Site Detail	Description
Address	41 Evans Street, Hobart (the overall site, of which the Lot B area forms a part)
Location	The overall site is located to the east of the Hobart CBD, approximately 160 m east of the Tasman Highway (Davey Street). The Lot B area is located in the central-eastern portion of the overall site.
Certificate of Title	CT 114462/1 (part of)
Owner/s	Macquarie Point Development Corporation
Site Area	Approximately 1.04 ha (within an overall Macquarie Point Development Corporation Site Area of 9.3 ha).
Survey Drawing	Not available, although coordinates are presented which define the area (Table 3-2 below).
Municipality	Hobart City Council
Zoning	Macquarie Point Mixed Use Zone under the Sullivans Cove Planning Scheme 1997.

The Lot B boundary is described by the boundary as presented on Figure F2. As the figure shows, the Lot B area occupies AA7 and surrounding portions of AA2, AA4,and AA5, as follows:

- Eastern edge of AA2;
- The southern edge of AA4 East;
- The extreme southeast corner of AA4 West; and
- An irregular shape in the east-northeast corner of AA5.

The coordinates of the site are presented in Table 3-2 below. Certificate of Title information is provided in Appendix E.

Table 3-2: Coordinates of Lot B site boundary

Coordinate point	Easting	Northing
1	527654.987	5252446.831
2	527638.635	5252455.775
3	527629.026	5252438.234
4	527590.441	5252459.370
5	527600.047	5252476.912
6	527554.729	5252501.739
7	527601.549	5252587.213
8	527669.843	5252594.393
9	527638.959	5252488.502
10	527658.539	5252480.722
11	527659.577	5252467.092

Coordinate point	Easting	Northing
12	527692.380	5252467.410

Environmental assessment of Lot B was based upon investigation locations within the area described by the coordinates in Table 3-2 above, but also utilised analytical results in a 20 m 'buffer zone' beyond that area, as shown on Figure F2 (and other figures). The 20 m buffer zone extended into the following adjacent areas.

- To the north of Lot B further into AA4 (mainly AA4 East, but also a small part of AA4 West).
- To the west of Lot B further into AA2.
- To the south of Lot B further into AA5.
- To the east in Tasports.

Some of these buffer zone areas consist of small areas which have been subject to audit already, in AA4 West to the north west, and Lot E and Underground Carpark to the east.

The Auditor agrees with the consideration of conditions on and adjacent to each audit area as an acceptable approach given the significant number of data which are available, and given the similar geological / hydrogeological conditions present across adjacent audit areas. The Auditor has referred to the land within the site boundary combined with the land within the adjacent 'buffer' area, although the main focus is on data from within the immediate audit boundary. AECOM reporting (including figures and tables reproduced from AECOM (2021h)) refers to these areas as 'CUTEP boundary' (the audit site) and 'surrounding area' (the buffer zone) respectively.

3.2 SITE SETTING AND SURROUNDING LAND USES

The site boundaries and site features are shown on Figure F2 and Figure F6. The vertices co-ordinates shown on Figure F2 are tabulated at Table 3-2 above.

The site is in the central-eastern part of the overall Macquarie Point Development Corporation site, generally east of AA2, and borders on TasPorts land which lies to the east and fronts on to the Derwent River. The land to the north in AA4 (West and East) rises up to the Hobart Cenotaph area. The Lot B area is separated from the immediate waterfront – with AA6, Evans Street and waterfront land occupying some 230 m between Lot B and Sullivans Cove to the south; and AA7 and the remainder of AA5, and TasPorts land occupying some 230 m of land between Lot B and the Derwent River to the east.

The surrounding site uses are presented in Table 4 of the CUTEP Report (AECOM 2021h) as reproduced in Table 3-3 below.

Table 3-3: Surrounding Site Uses

Direction	Adjacent land use	Anticipated Future Change in Use
North	The Lot B Area is bound to the north by Audit Area 4 West, which is currently occupied by the Northern Vehicular Access roadway.	• Audit Area West: Residential (medium to high density), Commercial (including visitor accommodation, retail), Recreation Open Space (public use areas), Transport (roads, light rail, cycleway and access way)
East	TasPorts land and port activities.	• TasPorts land and port activities (unchanged).
West	Lot B is bound to the west by Audit Area 2 and Audit Area 5. These areas are currently unoccupied, but	• Mixed (medium to high density residential, commercial, retail, open space, with an underground carpark), Access link

Direction	Adjacent land use	Anticipated Future Change in Use
	have intermittent uses including for carparking and storage of equipment.	(transport). It is planned that the Main Hobart Pipeline (Sewer) be relocated below the Access link area.
South	Lot B is bound to the south by Audit Area 5, which is occupied by a public car park immediately to the south.	• Open Space

3.3 PROPOSED USE

The Lot B area proposed use is described in the AECOM CUTEP report (AECOM, 2021h), as follows.

- Land use will include retail and commercial, comprising arts and institutional uses.
- The entire footprint of Lot B will be covered with hardstand/building footprint, with no planned basement.
- Surrounding land in the buffer zone will be used for Public Open Space (including parklands and an Access Link) and Transport/Vehicle areas which may be used by both pedestrians and vehicles.

The proposed development layout of Lot B and the larger Site is shown on Figure F3.

3.4 ENVIRONMENTAL SETTING

3.4.1 Topography

The overall MPDC Site is generally flat with three main tiers as follows.

- The upper (northern western) tier consisting of a gravel surface.
- The second (middle) tier consisting mostly of an asphalt and gravel surface.
- The third (south eastern) tier consisting of an asphalt and gravel surface and a series of sheds including the former Goods Shed, Red Shed, SeaRoad Shed and Long House.

The Lot B audit site lies within the lower tier, and is flat. Surface drainage is captured through stormwater drains which are inferred to discharge to the Derwent River (Figure F6), although field observations recorded by AECOM suggest some subsurface drainage infrastructure has been filled by gravel (AECOM, 2020d).

3.4.2 Geology and hydrogeology

3.4.2.1 Geology

Regional Geology

The regional geology is described in the four relevant DSI reports and summarised in the Lot B CUTEP Report (AECOM, 2021h). The site is underlain by a combination of reclaimed land, Quaternary aged sediments and dolerite of Jurassic age. Micaceous quartz sandstone and white felspathic sandstone and micaceous mudstone of Triassic age are located to the north and west of the overall site.

As reported in the AA4 West Contaminated Land Audit Report (Coffey, 2020), a bedrock high, known as Hunter Island, is located approximately 40 m to the south-west of the overall site and is inferred to influence groundwater flow direction. The former island and surrounds now forms part of the reclaimed land towards Sullivans Cove.

Lot B Area Local Geology

Table T1 of AECOM (2021h) provides information on the soil assessment sampling locations, along with other details such as coordinates, lithology thicknesses and a description of the location rationale.

A cross section produced by AECOM is provided in Figure F5. This section is a west-northwest to east-southeast cross section, and runs from AA2 in the west, through AA7 and into TasPorts land in the east.

This cross section is based on bore logs which are included in Appendix B of the CUTEP report (AECOM, 2021h). The reader is advised that the borelog for RN2 is a reproduced handwritten log by GHD, and so is not found by searching for the bore name.

The Auditor considers that the cross section provides a reasonable basis for presentation of local geology, although only TW02 picks up all strata, and the depicted depth of the weathered dolerite layer is shown slightly shallower than it appears in TW02, which is slightly off the transect. The fact that most bores used for the section only penetrated the into the fill layer means that there is a significant element of extrapolation in relation to the depth of fill and estuarine marine deposits. However, this is not considered to be material in the interpretation of the overall CSM for the site.

Overall, the cross section (and borelogs – presented in Appendix B of AECOM 2021h) show that across the Lot B area, there is a relatively thick layer of fill, mostly between 2.0 m and 5.0 m thick (thicker in the east towards the TasPorts land), overlying natural estuarine sediments, weathered dolerite and then unweathered dolerite. The upper surfaces of the various strata are inferred to slope generally down towards the Derwent River, which is consistent with the overall landform.

3.4.2.2 Hydrogeology

Regional hydrogeology

The regional hydrogeology is described briefly in Section 3.2 of AECOM (2020h), as well as in the DSI reports.

Groundwater flow is inferred to be in a general easterly direction toward the Derwent River and is encountered in coastal deposits, alluvial sediment, sandstone and in fractured dolerite.

Groundwater yield generally ranges from 0.77 L/s to 3.78 L/s in the varying aquifer types and salinity (Total Dissolved Solids – TDS) ranges from 70 mg/L – 8,290 mg/L.

Lot B Local hydrogeology

The local hydrogeology is detailed in Section 3.5 of AECOM (2021h) The Derwent River is approximately 170 m north and 190 m east of the Lot B boundary, and Sullivans Cove is located approximately 280 m to the south. As well, the Hobart Rivulet Diversion under the Hobart Cenotaph area runs approximately 140 m to the north.

The site is underlain by a single aquifer unit extending to greater than 25 mbgl (the maximum depth assessed). Groundwater is generally encountered in fill material, extending into the underlying natural sediments and fractured dolerite bedrock.

The Hobart Rivulet Diversion does not appear to influence local groundwater flows, and the site hydraulic profile supports an overall groundwater gradient to the south.

The features which AECOM mention which may affect groundwater flows include the Main Hobart Pipeline (Sewer), a historical former sewer, stormwater pipelines and sea walls.

As shown on the cross section (Figure F5), there appears to be a slight rise in groundwater elevation to the east towards the TasPorts land fronting the Derwent River, with groundwater slightly lower in the area of the sewer. With groundwater contours indicating some flow from both east and west, and lower groundwater elevations to the south towards Sullivan's Cover, the Auditor is comfortable with AECOM's interpretation of groundwater flow directions (generally to the south).

- The site-specific hydrogeology is based on information from the following groundwater wells / bores which are depicted on Figure F7 (August 2019) Figure F8 (November 2019) and lie either directly within the Lot B area or the surrounding buffer zone. The wells within Lot B are:AA2:
  - MW143 (just east of NAPL Plume A3)
- AA4:
  - MW171, MW168 and TW01
- AA5:
  - C1 (eastern boundary)
- AA7:
  - MW142 (just east of NAPL Plume A3)
  - MW155, RN2 and TW02 (central/east in AA7)
  - MW158 (east of NAPL Plume A1)
  - MW156, MW165, MW166 and MW167 (northeast corner of AA7)
  - TW03 (south east)

The wells within the buffer zone are:

- MW137
- MW147
- MW163
- PC15
- R4
- RN4

The purpose of each of these wells (and other nearby buffer zone wells) is described in Table T2 of AECOM (2021h), along with other details such as coordinates, screen depths, gauging dates, TOC elevation, LNAPL thicknesses, and water quality parameters.

Table 3-4 below describes the site-specific hydrogeology as assessed during the various stages of investigation, noting that in some instances 'local' refers variously to conditions within the broader MPDC site, and where noted applies to the Lot B area specifically.

Table 3-4: Summary of local hydrogeology

Depth to Groundwater	Depth gauged in Table T2 of the CUTEP report. Although the table includes mAHD reduced levels only (without depths), wells in November 2019 ranged from 2.143 m depth (TW03) to 4.278 m depth (MW171). AECOM noted an average depth of 2.8 m across the area, over the period 2014-2018.
Groundwater Elevation	The regional groundwater elevations ranged from ranged from 1.016 m AHD (MW142) to 1.526 m AHD (MW167) in November 2019. The CUTEP report notes higher elevations at PC15, but this is beyond Lot B to the east. Groundwater elevations are relatively flat across the Lot B area, and reflect a slight mound in groundwater level towards TasPorts, leading to inferred flows to the southwest towards Sullivans Cove. AECOM mentions some elements of southeast flow in the CUTEP report, but this is not evident in the referred contour plots in Figure F7 and Figure F8 for the Lot B area itself. The contours do indicate an easterly component of flow across AA6 and the western half of AA5 (in the area west of the sewer line). It is noted that the contours are at 0.2 m intervals for November 2019, and 0.5 m intervals for August 2019, which makes direct comparison difficult, and it is noted mounding in the east of Lot B is more evident in the November 2019 contours for this reason. The slight differences in the Auditor's interpretation compared to descriptions provided by AECOM are immaterial regarding overall site conditions and the potential migration of groundwater through the site – ultimately discharge towards Sullivans Cove is inferred.
Hydraulic Gradient	Hydraulic gradients are not described in AECOM (2021h), but are in the order of 0.5 m over 100 m, from northeast to southwest across the site, or approximately 0.005.
Hydraulic Conductivity	AECOM (2020d, 2020i, and 2021b) report hydraulic conductivity (K) in the southern portion of the overall site varies within the lithologies present from 5.3 x 10^{-3} m/day in the bedrock to 0.59 m/day in the alluvial/marine deposits. In the fill and the slope deposits K was estimated at 0.52 m/day and 0.26 m/day respectively. In general this indicates relatively high permeability of fill and sedimentary materials overlying relatively low permeability bedrock, which is as expected, and is consistent with the representations of groundwater elevation and flow direction.
Total Dissolved Solids (TDS)	In the Lot B area, Total Dissolved Solids (TDS) concentrations in shallow groundwater (<10.0 m bgl) during 2014 – 2019 investigations ranged from 254 mg/L (TW03) to 1,693 mg/L (MW166). Based on TDS concentrations, there is inferred to be little to no marine water intrusion beneath the Lot B area and groundwater has been classified as Category A in accordance with the Tasmanian State Policy on Water Quality Management (SPoWQM). Although AECOM does not discuss the reason for the relatively low TDS, it is somewhat surprising. The Auditor's opinion is that the effect of a buried sea wall immediately to the east of Lot B is acting to prevent significant exchange with sea water. It may also be that leakage of stormwater delivered by the piped storm drain running west to east across AA2 and AA7 may be leading to localised fresh groundwater at a slightly higher elevation in the eastern part of the site, near the sea wall.
Groundwater Flow Direction	Figure F7 (August 2019) and Figure F8 (November 2019), reproduced from AECOM (2021h), indicate the groundwater flow direction at Lot B is to the southwest towards the sewer alignment and then towards Sullivans Cove, across AA5 and along an area near the boundary between AA1 and AA6.
Nearest Down Gradient Surface Water Receptor	Sullivans Cove to the south/southwest is at a distance of approximately 280 m at its closest point. The Derwent River is approximately 190 m to the east of Lot B, but based on contours noted above, discharge is inferred to Sullivans Cove, and not to the Derwent River.

3.4.3 Registered groundwater bores

The DSI reports noted that searches of the Tasmanian Government Groundwater Information Access Portal did not identify any groundwater wells within 500 m of the boundary of the broader Site, including the area hydraulically downgradient of Lot B.

4. SITE HISTORY

Previous site uses are indicated on Figure F4 of this audit report (reproduced from AECOM 2021h). The site history as presented in AECOM (2020d, 2020i, 2021b and 2021h) was informed by the following Austral Tasmania Pty Ltd (Austral) documents:

- Austral (1998) - *Hobart Rail Yards Railway Workshop Building, Extant Recording*, unpublished report prepared for DELM, January 1998 (Austral, 1998)
- Austral (2013) - *Macquarie Point Development Project, Historical Summary* dated 15 January 2013.
- Austral (2015) - *Evans Street Historical Research Report* dated 11 June 2015.

AECOM (2021h) also presented some site history information, which drew from Austral Tasmania Pty Ltd (2014) *Built Heritage Assessment for the Macquarie Point Site* (Austral, 2014) and AECOM site observations.

4.1 HISTORY – ON-SITE

The history of the combined Lot B area includes land reclamation. It is thought that rubble, waste and some dredged material from the former Hobart Rivulet and Derwent River were used to reclaim this area.

Historical uses in Lot B that are of interest in relation to possible contamination sources include the following.

- Fuel (diesel) and oil pipelines, used to transfer petroleum products to Ocean Pier (located in the position of the current off-Site Wastewater Treatment Plant, and to other locations north of the Site. The lines were removed in 2020.
- Railyards and freight handling, including associated fuel and chemical storage, and maintenance.
- Main Hobart Pipeline (Sewer).

4.2 HISTORY – SURROUNDING AREA

A range of activities were historically conducted in the surrounding area, with the key uses associated with potential contamination at the Lot B area noted below.

- Land reclamation occurred in surrounding areas from 1828 to the 1900s.
- Railyards and freight handling to the west of Lot B.
- Goods Shed, and Goods Shed Annexe with mechanics workshop, to the south. The mechanics workshop is also associated with a truck wash bay, a triple interceptor pit and a mechanics pit (removed and remediated in early 2020).
- Port operations, including a former bulk fuel terminal, with aboveground tanks and drums used for products including light kerosene, fuel oil, motor spirit, diesel fuel, white spirit, and motor spirit, as well as caustic soda to the south east.

5. CONCEPTUAL SITE MODEL (CSM)

A conceptual site model (CSM) has been developed by AECOM to evaluate potentially complete exposure pathways between sources of contaminants and the receptors that may be exposed.

The existence of a potential receptor does not imply the existence of a complete exposure pathway. Receptors are identified with respect to onsite areas, based on PEVs considered to be applicable to the site and based on the current land use scenarios.

Section 3 of the CUTEP Report (AECOM 2021h) describes the CSM prepared by AECOM for the Lot B area. An overview of the CSM is provided in Table 5-1 below.

Table 5-1: Conceptual Site Model Overview (Summarised from AECOM (2021h))

Aspect	Considerations
Known/ Potential Sources	• Fuel and oil transfer and handling, and refuelling • LNAPL Plumes A1 and A2 immediately west of Lot B, in AA2 and AA5. • Former LNAPL Plume A3 just within the western boundary of Lot B (on the boundary of AA2 and AA7). • Land Reclamation • Railyard use and freight handling • Main Hobart Pipeline (Sewer) • Former Bulk Fuel Terminal off-site to the east • Port Operations off-site to the east • Goods Shed Annexe off-site to the south west
Potential Impacted Media	• Soil • Groundwater • Soil vapour
Potential Exposure Pathways	• Direct contact and/or ingestion of soil and groundwater • Vapour or dust inhalation • Groundwater migration to ecological receptors • Preferential pathways (to areas not previously impacted)
Potential Receptors	Human Health: • Residents • Recreation / Open Space Users • Commercial Workers • Intrusive Maintenance Workers Ecological: • Plants and Gardens • Aquatic Ecosystems (Derwent River and Sullivans Cove)

5.1 CONTAMINANTS OF POTENTIAL CONCERN (COPC)

Section 3.8 of AECOM (2021h) describes contaminants of potential concern (CoPC) presented by historical activities at the site and in the areas surrounding the site, and indicates there are no potentially contaminating activities currently being conducted. Soil, groundwater and soil vapour are listed by AECOM as media potentially impacted by the CoPC. Also, similar activities have historically been undertaken both at the site and adjacent to the site, so all CoPC are potentially present in both on and off-site areas.

The land uses, CoPC, and potentially impacted media, both at the site and the adjacent land, are listed in Table 7 of AECOM (2021h) along with potential contaminants from various past uses, as summarised in Table 5-2 below, noting that the Auditor has made some adjustments (for instance asbestos is not listed in AECOM's table for fill/reclamation areas of fuel pipelines, but asbestos is actually considered and commented upon – being absent in fill and being removed as 'cladding' with pipelines).

Table 5-2: Land uses and contaminants of potential concern (CoPC)

Activity	Contaminants of potential concern (in soil and groundwater)
Land reclamation/filling	Heavy metals, TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs, asbestos
Freight Handling, Railyards and Fuel Storage	Heavy metals, TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCP
Fuel Storage and Transfer	Lead, TRH, PAH, BTEX, asbestos
Sewer (Main Hobart Pipeline)	Heavy metals, TRH, PAH, BTEX, VOC, SVOC, nitrate, ammonia, faecal coliforms, E. Coli
Bulk Fuel Terminal	Lead, TRH, PAH, BTEX, PFAS
Port Operations	Heavy metals, TRH, PAH, BTEX, phenolic compounds, SVOC, VOC
Goods Shed Annexe (Mechanics Workshop and Truck Wash)	Heavy metals[4], TRH, PAH, BTEX, phenolic compounds

5.2 TRANSPORT MECHANISMS

The CoPC identified at the site may be transported by several primary transport mechanisms, as follows:

- leaching of contaminants in imported fill to the underlying soil, rock and groundwater due to rainwater infiltration;
- mobilisation of contaminants laterally via groundwater flow;
- spills or leaks of hydrocarbons and other chemicals associated with storage and/or handling of fuel and other dangerous goods;
- migration of volatile contaminants in the soil upward into indoor and outdoor air spaces (including into trenches and other excavations); and
- leaking and seepage from underground services and infrastructure such as sewers and pipelines in addition to former fuel infrastructure at the site, including migration via preferential pathways such as the trenches associated with those pipelines.

Secondary transport mechanisms of lesser importance include airborne dust and vertical movement through water table fluctuations in the vadose zone.

Although current activities at the site are not considered to present a risk of future contamination, sources in soil and groundwater remain and can potentially continue to contribute to exposure pathways.

5.3 EXPOSURE MECHANISMS / POTENTIAL RECEPTORS

Exposure mechanisms for human receptors include dermal contact, ingestion and inhalation as follows:

- dermal contact with contaminated soil or groundwater;
- ingestion of contaminated soil or groundwater;
- inhalation of dust or airborne particles derived from contaminated soil;
- inhalation of soil derived vapours in trenches or subsurface maintenance works; or
- inhalation of soil derived vapours in indoor or outdoor spaces.

Ecological exposure mechanisms include uptake by biota within terrestrial ecosystems and uptake by biota in aquatic ecosystems.

Potential receptors and potentially complete exposure pathways, based on the current and proposed land use and the current condition of the site, include the following:

- recreational and public open space users - direct contact or vapour inhalation;
- commercial workers - direct contact or vapour inhalation;
- construction and future maintenance workers - direct contact or vapour inhalation;
- any extractive users of groundwater – ingestion, direct contact or vapour inhalation;
- terrestrial ecosystems (including plants/gardens) – direct contact; and
- aquatic ecosystems (in receiving surface waters) – direct contact.

The risk presented by potentially complete exposure pathways at the site can be mitigated by the implementation of control measures outlined in the SEMP (AECOM, 2021d), as discussed in Section 9.3 of this audit report.

6. RELEVANT ELEMENTS OF THE ENVIRONMENT AND ASSESSMENT CRITERIA

The proposed use of the site, as described in Section 3.3 of this audit report and shown on Figure F3, are described as follows:

- Land use will include retail and commercial, comprising arts and institutional uses.
- No basements are planned, and the entire area will be covered by hardstand/building footprint.

All Protected Environmental Values (PEVs)[2] for all relevant elements associated with a range of possible site uses have been conservatively considered. Elements forming part of the site (land, groundwater and air) have been evaluated as described in the following sections. Although no surface water is present at the site, the presence of Sullivans Cove and the Derwent River has been considered with respect to conditions at the site impacting upon off-site uses.

6.1 LAND

Identified PEVs relating to land at the site have been referenced using the Victorian regulatory framework for the prevention and management of contaminated land. The *State environment protection policy (Prevention and Management of Contamination of Land)* 2002 (the Land SEPP) has been adopted.

The Land SEPP identifies and defines specific land use categories as well as a number of protected beneficial uses associated with each of the land use categories. Those beneficial uses are effectively the PEVs to be considered in the Tasmanian setting. Application of the Land SEPP intends to maintain and maximise (to the extent practicable) the quality of the land environment at the site in order to protect its existing and potential PEVs.

The Auditor considers that land (soil) is polluted where current and/or future PEVs for the relevant land use categories are precluded. The PEVs are precluded when relevant soil quality objectives set out in the Land SEPP for those PEVs have been exceeded.

Although the site is intended to be redeveloped for a mixture of uses, all PEVs have been conservatively considered in the context of assessing whether the site would also be suitable for PEVs relevant to a type of development different than that proposed.

Table 6-1 below has been adapted from Table 1 of the Land SEPP to consider the PEVs to be protected in accordance with the range of land uses.

[2] In a Victorian setting, PEVs are known as 'beneficial uses'. The term 'beneficial use' is defined in the *Environment Protection Act 1970* ("the Act") and those beneficial uses to be protected for the various elements are set out within *State Environment Protection Policies* (SEPPs) established pursuant to the Act.

Table 6-1: Protected Environmental Values of Land

PEV	Land Use						
	Parks & Reserves	Agricultural	Sensitive use		Recreation / Open Space	Commercial	Industrial
			High density	Other			
Maintenance of Ecosystems: Natural Ecosystems	✓						
Modified Ecosystems	✓	✓		✓	✓		
Highly Modified Ecosystems		✓	✓	✓	✓	✓	✓
Human Health	✓	✓	✓	✓	✓	✓	✓
Buildings & Structures	✓	✓	✓	✓	✓	✓	✓
Aesthetics	✓		✓	✓	✓	✓	
Production of Food, Flora & Fibre	✓	✓		✓			

Notes: Shading denotes beneficial uses to be protected for the site.

In summary, the PEVs for groundwater are as follows

- Maintenance of Ecosystems:
- Human Health
- Buildings & Structures
- Aesthetics
- Production of Food, Flora & Fibre

6.1.1 Tier 1 soil assessment criteria

Audit criteria were adopted based on environmental indicators and objectives listed in Table 2 of the Land SEPP. The Land SEPP refers to the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended 2013 (NEPM (2013)). It is noted that the SEPPs are superseded by a new Environment Reference Standard in Victoria from 1 July 2021 but are still able to be referenced for audits commencing before that date.

Specific audit criteria for soil adopted by AECOM for the assessment of soil at the site are presented in Section 1.1 of Appendix G of AECOM (2020d). The criteria adopted for the protection of the PEVs were as described in the following sections. The specific values for Tier 1 criteria are presented in the tables (in the tables section of this report) extracted from the AECOM CUTEP report. These tables are as follows, noting that the 'A' tables are for the Lot B audit area, while the 'B' tables are for the immediate surrounds.

- Investigation phases:
  - Table T3A and Table T3B – Tier 1 Human Health Direct Contact,
  - Table T4A and Table T4B – Tier 1 Ecosystems and Buildings and Structures, and
  - Table T5A and Table T5B – Tier 1 Human Health Vapour Intrusion
- Remediation Validation Phase:

- Table T13 - Tier 1 Human Health Direct Contact, Ecosystems, Buildings and Structures, and
- Table T14 – Tier 1 Human Health Vapour Intrusion

6.1.1.1 Maintenance of Ecosystems

The Land SEPP states that *'contamination must not adversely affect the maintenance of ecosystems'.* Although the site is located on reclaimed land and is considered highly modified, the maintenance of ecosystems PEV has been considered on a conservative basis. Terrestrial ecology is largely absent at the site due to pavements and the proposed use will also include site coverage by hardstand/building footprint.

The protection of the beneficial use "*Maintenance of Ecosystems*" is assessed with reference to the Ecological Investigation Levels (EILs) for metals and Ecological Screening Levels (ESLs) for petroleum hydrocarbons provided in Schedule B1 of NEPM (2013).

- NEPM (2013) EIL, Urban residential and public open space
- NEPM (2013) EIL, Commercial and Industrial
- NEPM (2013) ESL, Urban residential and public open space
- NEPM (2013) ESL, Commercial and Industrial

6.1.1.2 Human Health

The Land SEPP states that *'contamination must not cause an adverse effect on human health'.* The protection of the beneficial use "*Human Health*" is assessed with reference to the NEPM Health Investigation Levels (HILs), interim soil vapour health investigation levels (interim HILs) and health screening levels (HSLs) provided in Schedule B1 of NEPM (2013). Other guidance used includes CRC CARE and US EPA RSLs.

- ASC NEPM (1999) HILs:
  - HIL A, for low density residential
  - HIL B, for medium / high density residential
  - HIL C, for recreation and open space
  - HIL D, for commercial and industrial
  - Interim HIL for soil vapours
- CRC CARE (2011) Vapour Intrusion HSLs
  - HSL A, for low density residential
  - HSL B, for medium / high density residential
  - HSL C, for recreation and open space
  - HSL D, for commercial and industrial
- CRC CARE (2011) Vapour Intrusion Shallow Trench Worker
- CRC CARE (2011) Direct Contact HSLs
  - Direct Contact HSL A, for low density residential
  - Direct Contact HSL B, for medium / high density residential
  - Direct Contact HSL C, for recreation and open space
  - Direct Contact HSL D, for commercial and industrial
- US EPA RSL (2017)

6.1.1.3 Buildings and Structures

The Land SEPP states that "*contamination must not cause the land to be corrosive to or adversely affect the integrity of structures or building materials*". AECOM have utilised pH as an indication of the risk of corrosion / durability based on AS 2159-2009 *Piling – Design and Installation* (Australian Standard, 2009), which the Auditor considers appropriate.

6.1.1.4 Aesthetics

The Land SEPP PMCL states that *"contamination must not cause the land to be offensive to the senses of human beings"*. Currently there are no concentration-based aesthetic criteria for soil. While aesthetic observations are subjective, it is considered that if there is discolouration, noticeable odour from the soil on the site or if there are obvious components of waste, such as rubble, slag, bagged waste or similar, then there is a potential for detriment to the PEV of 'aesthetics', which the Auditor considers appropriate.

6.1.1.5 Production of food, fibre and flora

The Land SEPP states that *"contamination must not (a) adversely affect produce quality or yield; and (b) affect the level of any indicator in food, flora and fibre produced at the site such that the level of that indicator is greater than that specified by the Australia New Zealand Food Authority Food Standards Code"*. The NEPM does not provide specific criteria for the assessment of production of food, fibre and flora; AECOM have adopted the NEPM EILs to screen this PEV, which the Auditor considers appropriate.

6.1.2 Management Limits

In addition to appropriate consideration and application of the HSLs and ESLs, NEPM (2013) provides "management limits" for petroleum hydrocarbons, which reflect the nature and properties of petroleum hydrocarbons:

- Formation of observable light non aqueous phase liquids (LNAPL);
- Fire and explosive hazards; and
- Effects on buried infrastructure e.g. penetration of, or damage to, in-ground services by hydrocarbons.

Where management limits are exceeded, further site-specific assessment and management may enable risks to be addressed.

6.1.3 Site Derived Remediation Criteria – soil

Site Derived Remediation Criteria (RC) have been developed by AECOM as reported in the following:

- AECOM (2016c) - *Derivation of Remediation Criteria*, dated 13 May 2016.

The Remediation Criteria have been developed for both soil and groundwater for the protection of human health. As Tier 2 criteria they apply to specific land use scenarios on the basis of generic assumptions (as detailed in Section 5.4 of the DSI Reports).

The generic assumptions relate to the presence of an engineered barrier and the implementation of the Site Environment Management Plan (SEMP), AECOM (2021d). A copy of the SEMP prepared for this site is presented in Appendix A attached to the Site Suitability Statement. The engineered barrier prevents access to soil by occupiers/users of the site, with the exception of maintenance workers (who may be required to penetrate the barrier).

The Remediation Criteria are also considered to be protective of receptors adjacent to the site.

The specific land use scenarios include residential; commercial; recreational; public open space; and maintenance workers (those undertaking excavation to depths up to 1.0 mbgl). With respect to residential and commercial use scenarios, the Remediation Criteria have been developed on the assumption that buildings will be slab-on-grade or will include basement car parks.

Figure F13A and Figure F13B show the exceedences of the Remediation Criteria for soil. The relevant tables are as follows, again noting that the 'A' tables are for the Lot B audit area, while the 'B' tables are for the immediate surrounds.

- Investigation phases:
  - Table T6A and Table 6B – all Remediation Criteria
- Remediation Validation Phase
  - Table T15 – all Remediation Criteria

6.2 GROUNDWATER

In the Lot B area, total dissolved solids (TDS) concentrations in shallow groundwater (<10.0 m bgl) during 2015 – 2019 ranged from 254 mg/L (TW03) to 1,693 mg/L (MW166), with an average TDS of 819 mg/L.

Based on the average TDS concentrations, shallow groundwater is placed within Category A of Tasmanian Government (1997) (the 'State Policy on Water Quality Management (1997)' as outlined in Table 6-2 below (Category A shown shaded).

Table 6-2: Protected Environmental Values of groundwater

Protected Environmental Values	Groundwater TDS Category (mg/L)			
	A < 1,000	B 1,000 – 3,500	C 3,500 – 13,000	D >13,000
Drinking Water	✓			
Irrigation	✓	✓		
Industry	✓	✓	✓	
Stock	✓	✓	✓	
Ecosystem Protection	✓	✓	✓	✓

Based on salinity, all PEVs are protected for groundwater in Lot B. The PEV for Industry is excluded given the industry-specific nature of the required water.

Beyond the uses listed in the State Policy on Water Quality Management, Recreational Contact (Primary and Secondary) was considered a relevant PEV, and a PEV for Buildings and Structures was considered relevant, given the potential for building foundations etc to intersect the groundwater beneath the site. Aesthetics were included as PEVs given the potential for groundwater to discharge to surface waters. The protection of human health was also considered with respect to vapour intrusion from groundwater beneath the site.

In summary, the PEVs for groundwater are as follows:

- Drinking Water;
- Irrigation;
- Stock;
- Ecosystem Protection;

- Recreational Contact (Primary and Secondary);
- Buildings and Structures;
- Aesthetics; and
- Human Health (Vapour Intrusion).

6.2.1 Adopted Tier 1 criteria – groundwater

Table 16 of AECOM (2021h) outlines a summary of the relevant guideline sources from which the groundwater criteria were adopted. Specific audit criteria for groundwater adopted by AECOM are presented in Section 1.1 of Appendix G of AECOM (2020d), with values adopted presented in the attached tables of analytical results. As water quality requirements are industry-specific, no criteria have been adopted for the PEV 'Industry'.

While the AA2 DSI Report Appendix G (AECOM 2020d) and the AA5 DSI Report Appendix I (AECOM 2020i and 2021b) cite ANZECC 2000 as its source for assessment criteria for ecosystem protection, the Off-Site Ecological Impacts Report and the CUTEP Report update this by referencing the 2018 ANZG guidelines. ANZG has replaced the ANZECC guidelines as an appropriate reference, with the web-based ANZG guidelines being subject to periodic change. Guideline values are generally consistent between the two references.

The criteria adopted for the protection of the PEVs were taken from the following:

Drinking water/Aesthetics

- NHMRC (2011) Australian Drinking Water Guidelines (amended 2013) Aesthetic
- NHMRC (2011) Australian Drinking Water Guidelines (amended 2013) Human Health
- WHO (2011) Drinking Water Guidelines
- US EPA (2017a) Tap Water Quality
- Health Canada (2014)
- NZMH Drinking Water (2008)

Irrigation

- ANZECC (2000) Short-term Trigger Values for Irrigation Water (STV)

Stock

- ANZECC (2000) Livestock Drinking Water Quality

Ecosystem Protection

- ANZG (2018) 90% level of ecosystem protection (marine water)
- US EPA (2013) Ambient Water Quality Criteria (chronic – marine)
- US EPA (2006) Region 3 Mid-Atlantic Biological Technical Assistance Group (BTAG) Screening Benchmarks.
- RIVM (2001) Dutch Intervention Values (DIV) for TPH.
- VROM (2009) Netherlands Ministry of Housing – DIV (2000) for Mineral Oil.

Recreational Contact (Primary and Secondary)

- ANZECC (2000) Primary Contact Recreation
- NHMRC (2008) Guidelines for Managing Risks in Recreational Water

Buildings and structures

- SAI Global (2009) - Australian Standard AS 2159 (2009) Piling – Design and installation - 2009

Human health (vapour intrusion)

- CRC CARE (2011) - Health Screening Levels (HSL) for Petroleum Hydrocarbons in Soil and Groundwater

The specific Tier 1 criteria are shown in the attached analytical results tables as follows, noting that 'A' tables are for the direct Lot B audit area, while 'B' tables are for the immediate surrounds.

- Table T7A and Table T7B - Human Health Drinking Water and Recreation
- Table T8A and Table T8B - Ecosystem, Irrigation, Stock watering, Buildings and Structures
- Table T9A and Table T9B for Tier 1 Human Health Vapour Intrusion

6.2.2 Site Derived Remediation Criteria – groundwater

As described in Section 6.1.3 above, Site Derived Remediation Criteria (RC) have been developed by AECOM for the protection of human health for both soil and groundwater.

The specific values for groundwater criteria are presented in the following tables which have been extracted from the AECOM CUTEP report, and are included in the tables section of this audit report, noting the 'A' table includes data for the direct Lot B audit area, while the 'B' table is for the immediate surrounds.

- Table T10A and Table T10B – all Remediation Criteria

6.3 AIR – VAPOUR

Criteria adopted in the DSI reports for the protection of human health via vapour inhalation were taken from the following:

- CRC CARE (2011) - Cooperative Research Council for Assessment and Remediation of the Environment (2011) Technical Report No. 10, *Health Screening Levels for petroleum hydrocarbons in soil and groundwater*.
  - HSL A for low density residential (sand)
  - HSL B for medium and high density residential (sand)
  - HSL C for recreation and open space (sand)
  - HSL D for commercial and industrial workers (has also been adopted for intrusive maintenance workers) (sand)
- NEPM (2013) - National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended 2013.

The specific values for soil criteria are presented in the following analytical results tables which have been extracted from the AECOM 2021h, and are included in the tables section of this report, noting the 'A' table includes data for the direct Lot B audit area, while the 'B' table is for the immediate surrounds.

- Investigation phases:
  - Table T5A and Table 5B
- Remediation Validation Phase
  - Table T14

7. ENVIRONMENTAL ASSESSMENT WORKS

A series of field investigation, including investigations associated with remediation, have been undertaken at the Lot B site to provide data to support the environmental audit. In addition, desktop assessments were completed. Section 2.2.3 of this audit report lists the key documents reviewed by the Auditor, copies of most of which are presented in Appendix D. The scope and findings of each are summarised below. Note that it is not the purpose of the environmental audit to recount all details of the very extensive investigations, but rather to summarise the approach taken, the findings made, and the considered acceptability of the final characterisation, as a basis for determining the suitability of the site and any conditions which may apply in regard to that suitability.

Because the various assessments were undertaken across different areas and different times relative to (excavation) remediation works which removed some earlier data points, care needs to be taken in any review of DSI data. A large proportion of data from the AA2, AA4 and AA5 DSIs, are from outside the Lot B area (or the immediate surrounds). As well, the Remediation Validation Report (AECOM 2021e) includes a significant proportion of data produced in validating remediation outside of the Lot B area and immediate surrounds.

For this reason, while tabulated soil and groundwater analytical results for all appended reports can be found in those reports, the reader is directed to the analytical tables in the tables section, which have been extracted from the CUTEP report (AECOM 2021h), because these tables isolate the data which remain current at the time of writing of this audit report (i.e. excluding removed samples), and isolate and identify which sample locations are within the Lot B area – these are the 'A' tables. The data are for the surrounding buffer zone are the 'B' tables. Also, for this reason, the Auditor describes below the overall extent of the DSI reports and the extent to which data relates to the Lot B area, but does not describe in detail the findings of the various DSI reports, as they only partly relate to Lot B (except for AA7, which is entirely within Lot B). The results of investigations are described in summarising the CUTEP report for Lot B, where all relevant investigation results are consolidated.

The purpose of the various tables is described in the criteria section, in relation to where a reader will find specific criteria and associated data. The list of tables is also provided in the Table of Contents, and so the list is not repeated here.

The DSI Reports present a compilation of the soil and groundwater assessment undertaken relevant to the site various 'AA' areas (and the surrounding 'buffer' areas), including previous works by GHD and various assessment phases by AECOM over the period 2014 to 2020, with the earliest works considered in the DSI being GHD soil investigations in 2014 and the latest being soil vapour and off-site ecological impact investigations in 2020. It should be understood that the DSI Reports were originally written prior to remediation works being conducted and while updated to reflect that status, the detailed results of remediation validation are not included in the DSI reports. Instead, these results are reported in a separate Remediation Validation Report (AECOM 2021e). The DSI reports also describe the remediation of LNAPL within AA2, AA5 and AA7 under the *LNAPL Remediation Action Plan* (AECOM, 2017a). The objective of the DSI Reports included assessment of remediation and/or management requirements measures to allow the proposed use, in the context that the remediation works undertaken in AA2 were being separately reported. The review of historical activities and the development of the CSMs in each case allowed assessment of the site conditions against the adopted criteria considered protective of human health and the environment.

The various DSI reports also show the locations of groundwater wells relevant to this audit report, which are listed in Table 7-2 in Section 7,10.1.6 of this audit report. Of these, MW158, MW165, MW166, MW167 MW168 and MW171 are shown in figures of the various DSI reports, but results of analysis are found in the Groundwater Well Installation and Monitoring 2019 report (AECOM 2020a), and are not reported in the DSI reports.

7.1 AA2 DETAILED SITE INVESTIGATION

The Detailed Site Investigation (DSI) for AA2 (AECOM (2020d)) included both the large proportion of AA2 included in the Lot E and Underground Carpark area, as well as the small southeastern edge of the AA2 area which is within the Lot B (refer Figure F3).

7.1.1 AA2 Soil Sampling

Boreholes located in the AA2 DSIs study area are shown in Figure F7 of AECOM (2020d) and are also shown in Figure F9 in this audit report, which includes AA2, AA5 and the surrounds. Section 6.1.3 of AECOM (2020d) outlines the soil assessment methodology employed by AECOM. Non-destructive techniques were generally used in AA2 where possible to a depth of 1.5 mbgl with soil samples recovered via hand auger or geoprobe/sonic drilling below that depth.

Soil samples were also generally recovered during drilling for installation of groundwater monitoring wells using air hammer. Table T1 of the DSI Report lists soil sampling locations within the AA2 study area along with a description and the purpose of each location.

There are only two locations in AA2 that are within Lot B, as shown in the AA2 DSI report (validation sampling details in the AA2 area in later remediation works are not covered by the AA2 DSI). The locations are MW143 (NDD and hollow stem) and BH156 (pushtube).

Because this is a thin strip of land, and is augmented in terms of sampling for characterisation by later validation sampling, as well as nearby samples in AA7 and the balance of AA2, the investigations in the part of AA2 that lies within Lot B are considered adequate to support the environmental audit.

Appendix I of the DSI Report (Appendix D.1 of this report) presents borehole logs for soil bores (and groundwater monitoring wells), and includes the locations within Lot B. Details of the samples recovered and the lithology at each location are presented on the borehole logs. Table 27 of AECOM (2020d) describes field observations of potential contamination from the field works.

In summary, there were various observations of fill inclusions such as coal/slag, glass and ceramics at a range of depths through the site, consistent with the filling and reclamation of the area. As well, hydrocarbon odours (in some cases specifically described as ‘diesel’ odour) were noted at MW143, which is expected as this is at former LNAPL Plume A3.

7.1.2 AA2 Groundwater Investigations

Groundwater investigations in AECOM (2020d) were undertaken from nine groundwater monitoring wells in AA2 overall, of which only MW143 was within the Lot B area.

The groundwater assessment locations, as described in Table 28 of the AA2 DSI report, are clustered around the known areas of hydrocarbons sources, which correspond to the known LNAPL plume areas.

MW143 was installed using NDD and hollow stem auger.

Groundwater sampling was undertaken in accordance with EPA Victoria Publication 669 with water quality parameter stabilisation.

MW143 was gauged on 6 occasions from 2016-2018, but was not sampled, as it was used primarily for LNAPL recovery/remediation, having contained 0.010 m thickness of LNAPL prior to total fluids extraction (TFE) remediation, and having then been gauged to confirm an absence of measurable LNAPL in 2018. Analytical results to characterise groundwater conditions across Lot B have been obtained from the other wells across Lot B (MW155, MW156, MW158, MW166, MW167, MW171, TW02, TW03), and in nearby wells (MW163, NR2, RN4), although none of these wells are in the AA2 part of Lot B.

Given that there is an expectation of residual LNAPL in the AA3 area at MW143, which can be accounted for in assessing risks for site development, and the spread of other wells across Lot B, the lack of wells within this part of AA2 is not considered material to the outcome of the audit.

LNAPL remediation end points for the various plumes across the broader site (including LNAPL Plume A1 and LNAPL Plume A3 in AA2, and LNAPL Plume A2 in AA5 on the southern boundary of AA2) are described in the report 'Assessment of LNAPL Remediation End-Points' (AECOM 2021g), and are discussed later in this audit report.

7.2 AA4 DETAILED SITE INVESTIGATION

The northern part of the Lot B area covers a very small part of the AA4 area, in the extreme southeast corner of AA4 West, and the southern strip of AA4 (Figure F3).

7.2.1 AA4 Soil Sampling

Boreholes located in the Study Area are shown in Figure F7 of AECOM (2020j). Section 6.1.3 of the DSI Report outlines the soil assessment methodology employed by AECOM, which was effectively the same as for the AA2 DSI described above.

Table T1 of the DSI Report lists soil sampling locations within the Study Area along with a description and the purpose of each location.

There are only three directly relevant borehole locations within Lot B shown the AA4 DSI report, although a further eight borehole locations are within the 'buffer zone' of Lot B (the nearby areas), within AA4.

The relevant bore locations are MW168, MW171 (for which no soil results are reported), and TW01. Soil analytical results and field observations from drilling MW171 are presented in the Groundwater Well Installation and Monitoring Report (AECOM, 2020a).

Although the borehole based sampling is relatively sparse in this small part of AA4, this is mitigated by significant shallow soil sampling undertaken during remediation validation sampling reported separately in the Remediation Validation Report (AECOM 2021e), which covers the area near MW171 and encompasses the area to the east towards TasPorts. As well, sampling in the nearby buffer zone area immediately north and west of the Lot B area provides additional context to support the overall characterisation of the site.

Table 26 of AECOM (2021h) describes the field observations from sampling in AA4. In TW01, glass and brick fragments were recorded between 0.7 m depth and 5.5 m depth.

7.2.2 AA4 Groundwater Investigations

Groundwater investigations for the AA4 DSI were said by AECOM to have been undertaken from nine wells, of which only TW01 was within the Lot B area. However, while groundwater elevation information was obtained for TW01, no groundwater analytical results are reported for this well, which is reported to have been installed as part of geotechnical investigation undertaken by TasWater, in 2016 (although soil results are available for this well). Although TW01 was intended to be sampled during the Groundwater Well Installation and Monitoring 2019 investigations, that report noted that the well was unable to be sampled as the PVC standpipe within the well was broken. This means that TW01 has been used for soil sampling and gauging but not for groundwater sample analysis (as reported by AECOM for the purpose of this audit). This lack of analysis at TW01 is not considered critical, because nearby wells NR2, MW156 and MW171 provide information on groundwater conditions.

7.3 AA5 DETAILED SITE INVESTIGATION

The southern part of the Lot B area includes a small part of the AA5 area, in the east-northeast corner of AA5 (Figure F3).

7.3.1 AA5 Soil Sampling

Boreholes located in the Study Area are shown in Figure F7 of AECOM (2021b). Section 6.1.3 of the AA5 DSI Report outlines the soil assessment methodology employed by AECOM.

Table T1 of the AA5 DSI Report lists soil sampling locations within the Study Area along with a description and the purpose of each location.

There are some eight locations reported in the AA5 DSI which are within Lot B, with a number of locations also present in the buffer zone. The AA5 locations within Lot B were: BH57, BH58, BH60, C1, C2, C3, DP01, and RN6. (It is noted that while C1 is listed here as within the AA5 and Lot B area, it is virtually on the boundary just in the buffer zone of AA5.)

The overall spread of sampling locations is considered adequate to support the environmental audit. Although there are no sample locations in the western part of the part of Lot B within AA5, there are a number of locations in the nearby buffer zone (BH54, RN4, MW146, and BH32), as well as validation sampling from remediation excavations which provide an insight into conditions in these areas.

Borelogs supported the field observations noted in Table 28 of the AECOM report. Details of the samples recovered and the lithology at each location are presented on the borehole logs. Table 28 of AECOM (2021b) describes field observations of potential contamination from the field works.

In summary, there were various observations of fill inclusions such as timber, brick, charcoal and ceramics/glass, at a range of depths through the site, consistent with the filling and reclamation of the area. As well, hydrocarbon odours were noted.

7.3.2 AA5 Groundwater Investigations

Groundwater investigations for the AA5 DSI were undertaken from 22 wells within the AA5 area. None of these wells were located in the Lot B area, although wells C1, TW03, MW163, RN4, MW146, R4 and MW137 were in the buffer zone surrounding this southern part of Lot B (or within AA7, for TW03).

7.4 AA7 DETAILED SITE INVESTIGATION

All of AA7 lies within Lot B – it is the central part of the area subject to this environmental audit.

7.4.1 AA7 Soil Sampling

Boreholes located in the Study Area are shown in Figure F5 of AECOM (2020i). Section 6.1.3 of the AA7 DSI Report outlines the soil assessment methodology employed by AECOM.

Table T1 of the DSI Report lists soil sampling locations within the Study Area along with a description and the purpose of each location.

There are 24 locations reported in the AA7 DSI, and as AA7 is entirely within the Lot B area, all are directly relevant to this environmental audit report. The AA7 locations were: BH53, BH66, BH80, DP04, MW142, RN1, RN2, RN3, RN7, RN8, TW02, TW03, BH122, BH123, BH124, BH125, BH126/MW156, BH127, BH128, BH129, BH130/MW155, BH131, BH132, and BH133.

It is noted that bore logs are not available for bore holes RN1 and RN3.

The overall spread of sampling locations is adequate to support the environmental audit. Although the number of locations (24) exceeds that indicated by AECOM's grid based requirement for 15 locations, there is some unevenness in the spread of sampling locations, but not enough to indicate that the 24 locations are inadequate. Table 26 of the AA7 DSI report shows that a number of samples were taken down to over 4 m depth (as well as at shallower intervals), so that the vertical range of sampling is considered appropriate to support the audit.

Borelogs supported the field observations noted in Table 27 of the AECOM report. Details of the samples recovered and the lithology at each location are presented on the borehole logs. Table 27 of AECOM (2020i) describes field observations of potential contamination from the field works.

In summary, there were various observations of fill inclusions such as timber, brick, rubble, wood, and ceramics/glass, cloth, traces of coal/coke, metal fragments, and charcoal at a range of depths through the site, consistent with the filling and reclamation of the area. As well, hydrocarbon (and slight tar) odours were noted, mainly around 3 m depth and deeper, consistent with the approximate depth of the water table.

7.4.2 AA7 Groundwater Investigations

Groundwater investigations for the AA7 DSI were undertaken from six wells within the AA7 area. These wells were MW142, MW155, MW156, RN2, TW02 and TW03.

The tabulated data and resulting figures exclude analytical results for TW02, although this was later sampled as part of the Groundwater Well Installation and Monitoring 2019 investigation.

The nearby wells in the 'buffer zone' of the AA7 area are all wells which lie within the adjacent audit areas and are discussed in relation to AA2, AA4 and AA5. An exception is well PC15 in TasPorts, as is indicated in the figures for the AA7 DSI, but no data is available for this well.

7.5 REMNANT PIPELINE AND IMPACTED SOIL REMEDIATION

Soil remediation associated with the removal of pipelines and associated impacted soil was conducted by Synergy and Geo-Environmental Solutions (GES) in the period December 2019 to November 2020 and reported by AECOM in their Remediation Validation Report - Audit Areas 2 and 7 and Pipeline Removal (AECOM, 2021e).

7.5.1 Remediation Extent

The work included removal of two sections of unused pipeline infrastructure (a diesel pipe and an oil pipe) and the surrounding impacted soil. The initial 'estimated remediation area' was expected to be within AA2 and AA7 (as depicted in Figure F4 of the Remediation Validation Report).
This work was undertaken in general accordance with:

- Audit Area 2 and Audit Area 7 – Remediation Work Plan (AECOM, 2020e).
- Pipeline Remediation – Remediation Work Plan (AECOM, 2020f).

The soil remediation works targeted identified soil impacts and remnant infrastructure, and included the following areas relevant to Lot B.

- EX 4, which is the western end of a continuous excavated area EX2/3/4, in the northwest of Lot B.
- FL-EX, extending north-east from EX 4, in the northwest corner of Lot B.
- EX 6, in the west-southwest corner of Lot B.
- EX 7, in the southeast corner of Lot B (which merges with OL-EX and DL-EX).
- EX8, in the northeast part of Lot B.

- OL-EX (oil line), running along the eastern boundary of Lot B.
- DL-EX, in the southeast corner of Lot B.

The works included removal of 50 m of fuel line in the Lot B and immediate buffer area, with soil remediation excavations extending some 2,800 m^2 in the Lot B area (AECOM 2021h). Excavations were sloped at site boundaries to prevent collapse.

7.5.2 Validation of Excavation

The remediation validation was undertaken in order to address (to the extent practicable) exceedances of Remediation Criteria identified by AECOM. The remediation was undertaken in accordance with technical specifications and sampling, analysis and quality plan documents which had been prepared for the works and reviewed by the Auditor.

The remediation was associated with the removal of lead impacted soil and the removal of the disused Fuel, Diesel and Oil Lines.

The excavation and removal of soils around these areas resulted in approximately 2,800 m^2 of the Lot B area and 1,200 m^2 in the surrounding buffer zone. The maximum depth of excavation recorded was 2.5 m bgl (EX4-51), but excavation was generally to a depth of ~2 m bgl, as can be seen by the noted depths of the validation samples in figures throughout the Remediation Validation report.

Soil remediation extent was validated by sampling at the edges and base of excavations at typically 5 lineal m intervals along excavation walls, and roughly a 5 m x 5 m grid on excavation bases, as noted in the Remediation Report, and reiterated in the CUTEP Report. Figures F19A to F19E which are reproduced from the CUTEP Report (AECOM 2021h) show the validation sampling locations in the Lot B areas relevant to the remediation works.

The Auditor notes that while the some of the sampling intervals are uneven (perimeter gaps exceeding 5 m in some locations) and there is some degree of unevenly distributed base grid sampling, these exceptions do not affect the validity of the AECOM statement regarding overall sampling density. In this regard, the sampling associated with the remediation validation is considered appropriate for the characterization of the site.

While the Remediation Report contains all soil validation data relevant to the soil remediation works, it does not distinguish results within the Lot B area (and buffer zone) from those in other areas of the site, and so the overall remediation results are not discussed in detail in this audit report, except as follows.

- The remediation works removed a range of former underground fuel lines and left them sealed off at the points where pipelines extending beyond the excavation areas were cut.
- A significant quantity of contaminated soil (total of approximately 8,500 m^3) was removed, disposed in accordance with Tasmanian requirements, and the excavations partially backfilled with approved materials.
- A number of exceedances of Tier 1 criteria remain in situ, with a smaller number of exceedances for site-derived Remediation Criteria.

Soil validation data directly relevant to the Lot B area, including residual exceedances, are presented in tables and figures in the CUTEP report.

7.5.3 Backfilling of Excavations

Areas of excavated soil and infrastructure were backfilled with a mixture of imported Virgin Excavated Natural Material (VENM) and reused material from Audit Area 4, as reviewed and accepted as appropriate by the Auditor during the works.

Backfill locations are shown in Figure F20 and tabulated results are presented in:

- Table T16 Soil Analytical Results – Tier 1 Criteria—Backfill Material
- Table T17 Soil Analytical Results – Tier 1 Vapour Intrusion - Backfill Material
- Table T18 Soil Analytical Results – Remediation Criteria - Backfill Material

All VENM, including quarried crushed rock, was assessed to be below criteria which were more conservative than the Tier 1 and RC values adopted for the site (AECOM 2021h).

Soils reused on site from remediation excavations were from tested stockpiles as detailed in Table 15 of AECOM 2021h (and as shown on Figure F20). Although some exceedances of remediation criteria were found in several samples taken from stockpiles that were re-used in the Lot B area (for TRH C10-C16 (minus naphthalene) and naphthalene), these exceedances were in respect of non-proposed residential remediation criteria, and no exceedances were present which would compromise the proposed use of the site (for Arts and Institutional use).

7.6 CUTEP REPORT – SOIL IMPACT SUMMARY

Although a CUTEP report is ordinarily a report addressing groundwater conditions on a site subject to environmental auditing, and specifically to determine whether further remediation remains practicable and therefore required, in this instance (as with the audit report previously completed for Lot E and Underground Carpark) the CUTEP report (AECOM 2021h) is the primary document where relevant soil data are collated, in respect of the Lot B area.

This is because the DSI reports for AA2, AA4 and AA5 (AECOM (2020d, 2020j and 2021b)), and the Remediation Validation Report (AECOM, 2021e) which extends across parts of AA2 and AA5, but covers other audit areas as well) do not distinguish the soil conditions on the Lot B area from soil conditions outside of the Lot B area. (The AA7 DSI report is excluded from this list as AA7 area lies entirely within Lot B). The separation of soil data which apply only to the Lot B area is provided only in the CUTEP report (except for AA7).

7.6.1 Tier 1 Soil Impact Assessment

Table 21 of the CUTEP report summarises soil locations exceeding Tier 1 Screening Criteria, which are relevant for all possible uses which could apply to the site (i.e., not limited to the proposed use scenario). The table excludes some DSI sampling results which represented soils removed during remediation works (and so are no longer present on the site). The table includes many exceedances of the Tier 1 criteria in residual soils in the Lot B area (and buffer zone). Exceedances for the Lot B area (excluding those which only occurred in the buffer zone, except where noted) were for the following.

- Modified and Highly Modified Ecosystems, for:
  - hydrocarbon fractions >C16, benzo(a)pyrene, metals (arsenic, copper, lead, nickel and zinc). Noting that for Highly modified ecosystems, lead exceedances were only present in the buffer zone.
- Human Health Direct Contact – Low Density Residential, for:
  - hydrocarbon fractions >C16 , a range of PAHs, metals (arsenic and lead).
- Human Health Direct Contact – Medium/High Density Residential, for
  - hydrocarbon fractions >C16, a range of PAHs, metals (lead).
- Human Health Direct Contact – Recreational/ Open Space, for:
  - hydrocarbon fractions >C16, a range of PAHs, metals (lead).
- Human Health Direct Contact – Commercial, for:
  - hydrocarbons fractions >C10 (including F2), a range of PAHs, and lead.

- Human Health Vapour Intrusion – Residential, for:
  - >C10-C12 and > C12-C16 aromatic and aliphatic hydrocarbons, F1 and F2 hydrocarbons, and naphthalene. Benzene exceeded the criterion only in the buffer zone.
- Human Health Vapour Intrusion – Commercial
  - >C10-C12 aliphatic hydrocarbons, and > C12-C16 aromatic hydrocarbons, F1 and F2 hydrocarbon fractions (naphthalene exceeded only in the buffer zone).
- Aesthetics, for:
  - General anthropogenic materials, including brick, glass, ceramic, tiles, timber and concrete fragments, gasworks-type materials such as coke/slag traces, and hydrocarbon odours.

These exceedances are shown in the following figures:

- For the Lot B area: Figure F10A (soil direct contact), Figure F11A (vapour intrusion), and Figure F12A (ecosystems).
- For the surrounding area: Figure F10B (soil direct contact), Figure F11B (vapour intrusion), and Figure F12B (ecosystems).

The results indicate significant residual contamination which would compromise the unrestricted use of the site in the absence of management measures to control exposure of sensitive receptors, noting that such unrestricted use of the site is not planned.

7.6.2 Remediation Criteria Screening Assessment

Section 5.4 of the CUTEP Report (AECOM 2021h) details the exceedances of Remediation Criteria for the future land uses for the Lot B area and the surrounding buffer zone: Arts and Institutional (a commercial use setting) and Recreational Open Space, Access Link and Transport / Vehicle.

A range of applicable Remediation Criteria are attributed to the future land uses in Table 28 of the CUTEP Report. The layout of future land uses is shown on Figure F3 of the CUTEP Report reproduced in the figures section of this audit report. This shows that the entire Lot B area will be Arts and institutional use, with the other uses in the adjacent areas (and so not directly relevant to the audit of the Lot B area, as follows:

- Recreational Open Space (to the north in AA4 and south in AA5).
- Access Link (to the west in AA2 and AA5).
- Transport / Vehicle in a small adjacent area to the northeast of Lot B, in AA4.

Remediation Criteria exceedances for soils for the noted future land uses are described in Section 5.4.1.1 of the CUTEP report for Lot B, while the buffer zone exceedances are described in 5.4.1.2 of that report. Lead exceedances (and the statistical approach to assessing shallow lead impacts) are discussed in 5.4.1.3 of the CUTEP report. In summary, for lead analyses exceeding the criterion, an evaluation of the mean concentration, the 95% UCL of the true mean, and the standard deviation (per guidance in the NEPM) was undertaken. The evaluation was done for data sets for the 0-1 m depth range (most likely maintenance worker exposure) and for 0-2 m depth to consider unlikely but possible exposure across all depths to 2 m). The results showed that the individual exceedances did not collectively pose a risk when considering average exposure based on the statistical approach. The exceedances are depicted on Figure F19A to Figure F19E. These results are summarised as follows (Lot B only, given the adjacent buffer areas are not within the audit boundary).

For the Lot B area, exceedances were identified as follows.

- 71 soil samples from soil above the water table reported exceedances of Residential RC for TRH C6-C10 (minus BTEX) or TRH C10-C16 (minus naphthalene) concentrations (or for speciated TPH results within those ranges), or for naphthalene.

  - While these results are relevant to know in terms of residual contamination and the need to consider unrestricted use for the site (per Victorian EPA auditing guidelines in Publication 759.3), there is no residential use proposed for the Lot B site.
- 18 soil samples from above the water table reported exceedances of Commercial RC for TRH C6-C10 (minus BTEX) or TRH C10-C16 (minus naphthalene) concentrations (or for speciated TPH results within those ranges).
  - These results are mitigated by further considerations as explained by AECOM:
    - Five of the samples were collected at or below the depth of nearby direct soil vapour monitoring points, which did not identify vapour risks.
    - Eleven samples had aromatic/aliphatic split analysis, and the criteria applicable for the more speciated results indicates no unacceptable risk.
    - Two of the samples were at the site boundary with TasPorts land (OL-EX-59, in the extreme north of the eastern boundary, and OL-EX-288, in the southeast corner), and given their perimeter location they are more representative of soils extending off-site than of soils remaining on site, and are therefore not considered to pose a material vapour risk to the site use as proposed.
- 11 soil samples from a range of depths from 3.15 m bgl to 5.75 m bgl contained exceedances of RC for TRH C6-C10 (minus BTEX) or TRH C10-C16 (minus naphthalene) concentrations (or for speciated TPH results within those ranges) or for naphthalene. However as these samples were all taken from the depth of the water table or deeper, AECOM considered that the groundwater conditions could reasonably be used to assess vapour risks, and this is considered reasonable by the Auditor as the dry weight concentrations of submerged soils will have less influence on partitioning to vapour than will groundwater concentrations which would better represent conditions at the water table. Based on the groundwater concentrations, the exceedances noted do not pose an unacceptable risk.
- Some 46 samples reported exceedances of the Potential Future Maintenance Worker RC for lead or benzo(a)pyrene.
  - Some 33 of the 46 were from 2 m deep or deeper, considered deeper than the normal range of maintenance works.
  - One backfill sample and two samples from 1-2 m depth exceeded for lead, but do not pose a risk based on a statistical assessment of lead (in which the mean concentration is acceptable, without extreme outlier concentrations to invalidate the statistical analysis).
  - Six samples were close to the Main Hobart Pipeline sewer and were unable to be excavated as the sewer owner applied an exclusion zone – these areas are subject to site management by notation of affected areas in the SEMP for the site (which is now a 'Sitewide SEMP', AECOM 2021d). The Auditor can confirm that elevated lead impacts requiring caution for maintenance workers is noted clearly in the SEMP.
  - Five soil samples (all from the OL-EX excavation) were close to the eastern boundary of the site and considered not to represent significant volumes of material within the Lot B site boundary. Given the practicality of excavation at site boundaries, the Auditor considers this to be reasonable.

7.7 SOIL VAPOUR INVESTIGATIONS

The Soil Vapour and Indoor Air Report (AECOM 2021f) covered investigations undertaken in 2019 to assess remediation needs prior to the conduct of remediation works. The Soil Vapour and Indoor Air Report included indoor air investigations at the SeaRoad Shed, which are not relevant to this environmental audit.

It also included soil vapour investigations in areas nearby but not directly relevant to Lot B, including at LNAPL Plume A1 to the west in AA2, and LNAPL Plume A2, to the southwest on AA5.

The investigation locations (soil vapour bores) relevant to the Lot B area were as follows.

- SV13, at the historic LNAPL Plume A3
- SV15, just west of Lot B between LNAPL Plume A2 and historic LNAPL Plume A3
- SV 14, SV16, SV17, SV18, SV19, and SV26, which are spread generally across Lot B and provide good coverage to assess vapour risks.

Sampling locations for soil vapour are shown on Figure F18 of this audit report. Installation of soil vapour bores was conducted in July 2019, with vapour sampling in August 2019 and November 2019. In addition, some test pitting was undertaken to assess shallow soil impacts which may affect vapour risks.

The assessment approach identified the relevant chemicals to assess, which included BTEX, naphthalene and TPH, based on previous assessment at the site. Chlorinated hydrocarbons were excluded from the vapour assessment, based on being absent from previous soil and groundwater sampling across the area. The Auditor agrees with the adopted assessment approach.

The assessment adopted criteria were taken from CRC CARE HSLs (Report 10, 2011) for most parameters. For methane, the adopted criteria were taken from CRC CARE (Report 23, 2013) (for guidance regarding methane risks), and EPA NSW guidance (Assessment and management of hazardous ground gases, May 2020).

Table T12A and Table T12B present the analytical results for soil vapour samples and show exceedences of the Tier 1 HSLs for the Lot B area and for the surrounding area respectively.

Table 33 of the CUTEP report summarises the exceedances of adopted criteria from the Soil Vapour and Indoor Air Report that are relevant to the Lot B area. These exceedances included:

- Methane at soil vapour bores SV14, SV16, SV17, SV18, SV19, and SV26.
- Naphthalene at SV26 (Residential HSL A/B)

It is noted that the methane concentrations were considered by AECOM in some cases not to present a current risk because the methane concentrations are too high and oxygen levels too low to represent explosive conditions. AECOM did however consider the risk of methane accumulating in buildings. Methane concentrations above 10% (v/v) were recorded in SV17, SV18, SV19 and SV26, with a maximum of 50% methane at SV26.

AECOM recognised the methane risk and noted that, based on the *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020), a minimum gas protection guidance value of 3 should be incorporated into the future development (Arts/Institutional). (Table 8 of the NSW guidelines adopts a minimum gas protection guidance value of 3 for 'Public Buildings', for a CS3 scenario.)

The Auditor agrees with this approach to the management of methane risk.

In summary, the only concentrations of concern from the Soil Vapour and Indoor Air Report were those indicating methane, noting that this affected a large proportion of Lot B such that controls should be incorporated into all buildings constructed on the site.

It is noted that no underground car parking is proposed on Lot B, but should this ever occur, consideration for ventilation of the car park would need to consider measures to mitigate the methane risk which has been identified in the area.

7.8 ASSESSMENT OF POTENTIAL OFF-SITE ECOLOGICAL IMPACTS

The potential for impact to off-site ecological receptors is critical for determining the reasonable basis for considering Clean Up to The Extent Practicable (CUTEP) to have been achieved.

The potential for off-site ecological risks to occur from areas of the MPDC site, including the Lot B area, is in respect of discharge of contaminated groundwater to the nearby receiving waters – the Derwent River to the east and Sullivans Cove to the south.

In order to address this potential risk, AECOM undertook an investigation and prepared a report titled Assessment of Potential Off-Site Ecological Impacts, which was based on the following scope.

- Installation of groundwater wells addressing data gaps.
- Completion of two GMEs.
- Review of groundwater data from 2015 through to 2018.
- Evaluation and description of adjacent aquatic habitats.

Groundwater analytical results from monitoring associated with this investigation identified groundwater concentrations within the Lot B area exceeding marine ecosystem criteria (90% of species protection values) as follows.

- TRH C10-C36 fraction: MW142, MW155, MW156, MW158, MW166, MW167
- TRH >C10-C40 fraction: MW142, MW155, MW156, MW158, MW166, MW167, MW171
- Anthracene: MW142, MW155, MW156, MW158, MW171, RN2
- Phenanthrene: MW142, MW155, MW156, MW158, MW166, MW171, RN2, TW02
- Fluoranthene: MW142, MW155, MW156, MW158, MW166, MW171, RN2, TW02
- Benzo(a)pyrene: MW142, MW155, MW156, MW166, RN2, TW02
- 2,4-Dimethylphenol: MW155
- Lead (Filtered): MW156, RN2
- Manganese (Filtered): MW142, MW155, MW158, MW166, MW167, RN2, TW02, TW03
- Zinc (Filtered): MW155, MW167, RN2, TW03
- Ammonia (as N): MW142, MW155, RN2, TW02, TW03

While the Assessment of Potential Off-Site Ecological Impacts Report does not recount the specific groundwater conditions which exist across the Lot B site, these are summarised in Table 22 of the CUTEP report.

The Assessment of Potential Off-Site Ecological Impacts Report concluded that while groundwater wells across the broader site contained contaminants associated with petroleum hydrocarbons, including BTEX and PAH species, these did not persist towards the inferred points of discharge. The CoPC that exceeded Tier 1 screening criteria for ecosystem protection towards inferred discharge areas included manganese, copper and vanadium towards the north east of the overall site (in wells MW159, MW160 and MW161) near the Derwent River, and manganese, copper and ammonia towards Sullivans Cove (MW151, MW152 and MW153).

The report also considered the effects of LNAPL plumes and the LNAPL remediation activities. For the Lot B Area, the Auditor notes that the groundwater contours indicate groundwater migration from the areas of known impact around former LNAPL Plume A3 generally towards the south towards Sullivans Cove, rather than what might be expected – migration towards the Derwent River to the east. In fact, groundwater elevations are generally higher along the eastern edge of the overall MPDC site, with a small groundwater mound apparently present just east of Lot B in the edge of the TasPorts land.

While the overriding concern on initial review of the Lot B area would reasonably be the potential for hydrocarbons associated with the former NAPL Plume A3 (and dispersed hydrocarbon impact as detailed above) it appears that there is limited migration of hydrocarbons associated with the NAPL zones towards

points of discharge. This is evident in the low concentrations of hydrocarbons at MW162 and MW122 in particular (as well as other wells towards Sullivans Cove).

CoPC concentrations which persisted towards the receiving waters were considered either to be natural background (manganese and copper) or likely subject to further attenuation prior to discharge and at the points of discharge into Sullivans Cove and the Derwent River. Elevated salinity within the zone of reclaimed land indicates significant mixing/dilution of groundwater prior to emergence into the receiving waters, which is to be expected given the reclaimed nature of the land, and the flushing effects of tidal movement, which will effectively lead to a 'mixing' zone within groundwater under the site.

Investigations of the zones of discharge through concrete walls under the wharf areas (to both Sullivans Cove and the Derwent River) indicated that discharge is through cracks and protrusions in the seawalls. This means that at the point of emergence, the substrate is effectively a crack in the concrete wall, with significant further mixing occurring immediately beyond this point of emergence within the water column. Observations of the adjacent aquatic habitats are that they are generally artificial, of low ecological value and considered to be 'highly disturbed' environments.

Based on the report, AECOM considered that groundwater emanating from the boundary of the overall site was unlikely to pose an unacceptable risk to off-site aquatic ecological receptors at Sullivans Cove and the Derwent River. As this can be considered to apply to the Lot B area, the Auditor considers that the Lot B area site does not pose an unacceptable risk to those ecosystems.

This means that the Auditor considers that the report demonstrated a lack of impact to ecological receptors associated with the Lot B area, despite there having been a former LNAPL plume (LNAPL Plume A3) subject to remediation within the area, and there being persistent hydrocarbon impacts in monitoring wells generally.

7.9 LNAPL REMEDIATION

AECOM's report Assessment of LNAPL Remediation End-Points (AECOM, 2021g) recounts the history of in-situ LNAPL remediation efforts across the broader MPDC site. AECOM oversaw remediation of LNAPL plumes under their LNAPL Remediation Action Plan (AECOM, 2017a). The Remediation Action Plan describes the remediation of plumes of which LNAPL Plume A3 was within the Lot B area, and LNAPL Plume A1 and LNAPL Plume A2 to the west and south west respectively. LNAPL Plume B was distant at the SeaRoad Shed in AA3. Accordingly, the most relevant LNAPL remediation in the Lot B area was that of LNAPL Plume A3.

LNAPL Plume A3 was reported (AECOM, 2021g) as being understood to have comprised of predominantly diesel fuel, as well as fuel oils associated with diesel engine operation (e.g. lubricants, engine oils etc.) and is likely to be associated with isolated spills in the general area of the roundhouse refuelling area.

Although some LNAPL remediation at other plumes (A1, A2 and B) was undertaken in 2000-2001, no remediation occurred at LNAPL Plume A3 at that time.

7.9.1 LNAPL Remediation Trial November 2015 to February 2016

LNAPL remediation options for remaining LNAPL at LNAPL Plume A3 (along with other plumes) were considered in the preparation of the LNAPL Remediation Action Plan (AECOM 2017a).

Options included

- Skimming
- Total Fluids Extraction (TFE)
- Excavation
- In-Situ Chemical Oxidation (ISCO)

Total Fluids Extraction was chosen as the preferred technology, and the Auditor agreed with this as an appropriate technology. In many instances of NAPL remediation, a technology based on multiple phases of contamination including vapours is preferred, but the nature of the NAPL (relatively low volatility) did not favour such an approach.

Initial trials were conducted in 2015 and 2016. Although some remediation trialling was undertaken at LNAPL Plume A3 using periodic TFE in the period 2015 to 2016, LNAPL was not observed at this plume, and so there was no LNAPL recovery to be recorded. Because of this, full scale operation of the TFE system, which was applied at LNAPL Plume A1 and at LNAPL Plume A2 (west of Lot B) was not undertaken at LNAPL Plume A3, as there was no longer any observable LNAPL to recover.

The practicability of further remediation of LNAPL Plume A1 and LNAPL Plume A2 has been considered exhaustively in the audit report for Lot E and Underground Carpark and so is not repeated here.

7.9.2 Consideration of Practicability of Alternative Approaches

The TFE option applied for LNAPL remediation (which was applied only as a trial at LNAPL Plume A3 in Lot B) had been selected from a short-list of technologies considered in AECOM's LNAPL Remediation Action Plan (AECOM 2017a). The three other options short-listed (as described in Section 7.9.2 above) were skimming, excavation and ISCO.

AECOM's review of the remaining options that could be applied indicated that none of them were practicable to implement to restore environmental values. It is noted that the options considered covered both removal of LNAPL (skimming, excavation through the water table) and dissolved groundwater contamination (excavation and ISCO).[3]

- Skimming was considered less aggressive than TFE and so unlikely to remove greater volumes of LNAPL.
- Excavation was considered impracticable to implement fully through the LNAPL impacted zones. AECOM noted that the main reasons for this were the depth (to and beyond the water table), and the fact that other contaminants in the groundwater were anyway precluding environmental values at the location. AECOM did note that some further excavation of impacted material may (incidentally) occur with any basement construction (not specifically within Lot B).
- ISCO was considered not to be suitable to remove a significant quantity of hydrocarbon contamination given the ongoing presence of residual LNAPL. While AECOM simply note inapplicability of the technology to LNAPL, the Auditor notes that where ISCO has been applied to plumes with residual NAPL (even where measurable NAPL is limited or absent), the technology routinely consumes large quantities of additives, while rarely making a material difference to the contamination. While ISCO works very well in some circumstances where NAPL is absent, the Auditor agrees with AECOM's position in this instance.

The Auditor notes that it is important to distinguish what is meant in the discussion of the possibility (or likelihood) of future additional removal of contamination.

As with the extent of soil remediation, it must be understood that the further removal of a degree of contamination is not depended upon for the site to be considered to have been cleaned up to the extent practicable (for groundwater) or to have been rendered suitable (for soil impact exposures).

The further removal is in effect incidental to that consideration – that is, clean up to extent practicable for groundwater must be considered to have been achieved whether there was a possibility of further removal or not.

[3] The Auditor notes that the subsequent CUTEP Report, AECOM (2021h) considered a wider range of technologies.

In consideration of the options available for alternative technologies to have been applied, the Auditor agrees with the AECOM position that alternative technologies would not be practicable for application at the site to clean up groundwater.

The Auditor notes that impracticability of further remediation must be considered along with the degree of impact to environmental values. Where environmental values are being materially threatened, then further remediation that might seem difficult or costly (or otherwise impracticable) may need to be reconsidered. In order to address this, AECOM's LNAPL Remediation End-Points Report considered risks to receptors, as has been discussed above in relation to the assessment of off-site ecological impacts. The Auditor agrees with the finding that groundwater emanating from the site boundary is unlikely to pose an unacceptable risk to off-site aquatic ecological receptors at Sullivans Cove and the Derwent River, based on AECOM (2020b).

The other risk issue that could cause a reconsideration of practicability of further remediation is vapour risk. As noted above, in relation to soil vapour investigations, while some vapour risks (from methane) are present, these can be managed by appropriate building measures. No other unmanageable vapour risks exist for the development as proposed.

In summary, in relation to whether or not the active remediation of LNAPL had reached an extent practicable, the following was concluded.

- LNAPL recovery had occurred briefly at LNAPL Plume A3 and no LNAPL was since observed.
- There were no unacceptable risks to current or future receptors based on the proposed future land uses. This is noted to be on the basis of some requirements for buildings, to manage methane risk.

7.10 CUTEP STATUS

The AECOM (2021h) Clean Up To the Extent Practicable Report (the CUTEP Report) was produced for the dual purpose of capturing arguments regarding the extent of active remediation efforts, as well as consolidating and isolating the relevant data for the Lot B area audit (both for soil and groundwater). In this regard, the CUTEP Report addresses more than is usual in a CUTEP submission produced under Victorian EPA's guidelines. However, the CUTEP Report does address the Victorian EPA guidance relating to CUTEP, and included (in Table 1 of the report) a 'CUTEP Checklist', which is a list of required information as outlined in EPA Victoria (2016) (Publication 840.2), to ensure that the minimum information is provided for the evaluation of CUTEP for any site.

The contents of the CUTEP Checklist is reproduced in Table 7-2 below, with references to where the information is addressed being relevant to the AECOM CUTEP Report.

Table 7-1: CUTEP Checklist

Information included	Section of AECOM CUTEP Report	Please tick off
Title details	Section 2.1	✓
Land area	Section 2.1	✓
Past use	Section 2.3	✓
Surrounding land use (North, South, East and West)	Section 2.5	✓
Proposed future use	Section 2.4	✓
Geology	Section 3.2 and 3.4	✓
Groundwater depth (m)	Section 3.5.1	✓
Groundwater flow direction	Section 3.5.2	✓
Nearest surface water receptor (distance & direction)	Section 3.5	✓

Information included		Section of AECOM CUTEP Report	Please tick off
Bore search (2 km radius)		Section 3.6.1	✓
Groundwater segment (note – most conservative segment should be used)		Section 5.1.2	✓
Protected Environmental Values of groundwater identified		Section 5.1.2	✓
Summary table of precluded beneficial uses, with associated contaminants, as per Attachment C of Publication 840.2		Section 5.3	✓
Remediation options table	Discussion of specific options	Section 5.5	✓
	Cost	Section 5.5	✓
	Technical feasibility	Section 5.5	✓
	Logistical feasibility	Section 5.5	✓
Vapour risk considered		Section 5.6	✓

	Cost – establishment and annual	Not applicable	×
	Duration	Not applicable	×
Water quality summary table showing results from all rounds of monitoring (µg/L)		Table T7 A/B to Table T10 A/B	✓
Separate table showing latest water quality results that are above guidelines.		Table T11	✓
An opinion on the source of all contaminants over criteria in the groundwater (e.g. on-site source, off-site source, co-source)		Section 5.3.2.1	✓
Groundwater and soil contamination maps		Figure F7 to Figure F8	✓
Hydrogeological cross-section(s) of site showing (as a minimum) geology, groundwater levels, groundwater bores and any relevant features (e.g. USTs, excavations, utility services, building structures, etc).		Figure F5	✓
Discussion of proposed GQRUZ (if applicable). This should include sufficient information to identify it and an associated figure. N.B. A meeting should be held with EPA to discuss the GQRUZ. The GQRUZ itself should cover the known/modelled extent of all known precluded extractive beneficial uses.		A GQRUZ is a Victoria specific requirement without a direct equivalent in Tasmania. Discussion regarding proposed groundwater use restrictions is provided in **Section 5.5.3** of the CUTEP report	✓
Details and records of communications with off-site property owners associated with the GQRUZ (if applicable).		Not Applicable	×
A clear and concise executive summary providing all of the above information		Executive Summary	✓

Most of the above information has been discussed above in earlier sections of this audit report. The key issues are summarised in the following sub-sections.

7.10.1 Summary of CUTEP Considerations

7.10.1.1 Past Use

The site history has been considered in respect of likely/known contamination. For the Lot B area, the key issues are the land reclamation, railyards and freight handling, fuel and oil transfer, and the Main Hobart Pipeline (Sewer). One LNAPL Plume (LNAPL Plume A3) was within the Lot B area, with two others (LNAPL Plume A1 and LNAPL Plume A2) to the west.

7.10.1.2 Site and Surrounding Use

The site locality is considered in respect of the location of known contamination from past uses on and around the site, and future use receptors.

The Lot B area future use is arts/institutional, with no underground parking proposed.

- To the north the Lot B area sits hydrogeologically downgradient of the adjacent AA4. AA4 contained some groundwater contamination, with NR2 located north of Lot B being impacted by organic and inorganic contaminants, with hydrocarbons likely associated with the northern refuelling area (or fuel/oil transfer lines). AA4 will have mixed uses.
- To the west are parts of AA2 and AA5 which lie outside the Lot B area, including LNAPL Plume A1 and LNAPL Plume A2.
- To the south lies a southern strip of AA5 which is outside the Lot B area, beyond which lies AA1, which contains the Goods Shed, and AA3. These areas will include a range of mixed uses (retail, commercial, arts/institutional and visitor accommodation) and open space use.
- While AA6 to the southwest includes part of the former gasworks, this area is broadly downgradient of the site (although groundwater is unlikely to migrate from Lot B as far west as AA6, as it migrates generally southward with a small westerly component).

7.10.1.3 Geology and hydrogeology

The geology and hydrogeology has been discussed in detail earlier in this audit report. The key CUTEP issues are that groundwater is typically at around 2.8 m depth, with good quality (relatively fresh) groundwater lying in fill, and inferred to flow generally to the south (with a small westerly component). Ultimate groundwater discharge is inferred towards Sullivans Cove.

7.10.1.4 Groundwater segment and bore search

The groundwater is of good quality in terms of natural salinity, not being subject to significant saline intrusion.

The groundwater classifies as Segment A, and so based on salinity alone would be suitable for use for drinking, irrigation, industrial use, stock watering (ecosystem protection is also relevant).

However, there is no groundwater use, and future groundwater use can be controlled on the site, with no inferred potential use in any downgradient areas.

7.10.1.5 Protected Environmental Values

For land, the protected environmental values (PEVs) are:

- Maintenance of Modified ecosystems
- Maintenance of Highly modified ecosystems
- Human Health

- Buildings and Structures
- Aesthetics.

The PEVs for groundwater (as listed in Tasmanian Government State Policy on Water Quality Management (1997) (SPoWQM), based on the Segment A quality groundwater are:

- Drinking Water
- Irrigation
- Industry
- Stock
- Ecosystem Protection

In addition to the PEVs listed in the SPoWQM, recreation (primary and secondary contact), aesthetics, buildings and structures, and human health were considered by AECOM.

Of these uses, only ecosystem protection is likely to be relevant given the site setting, ability to control uses on site, and lack of surrounding bores (or plausibility of use).

7.10.1.6 Groundwater Conditions

While the groundwater conditions have been described in relation to the DSI reports (for AA2, AA4, AA5 and AA7 respectively (AECOM (2020d, 2020j and 2021b and 2020i)) and in general in relation to the LNAPL Remediation End-Points Report, they are summarised for the overall Lot B audit area here.

Groundwater monitoring has occurred for wells within the Lot B area and immediate surrounds over a number of monitoring rounds from 2015 to 2019, as described in the following Table 7-2 (reproduced from Table 12 in the AECOM CUTEP Report).

Table 7-2: Lot B Area Groundwater Monitoring Events (January 2015 to November 2019)

Sampling Event	Sampled Wells	
	Within Lot B Area	Immediate surrounds
January 2015	RN2	NR2, RN4
February 2016	MW142	NR2, RN4
July 2016	MW142, RN2, TW03	MW146, MW147, NR2, RN4
July 2017	MW142, RN2, TW03	MW146, MW147, NR2, RN4
February 2018	MW142, RN2, TW03	MW146, NR2, RN4
August 2018	MW142, MW155, MW156	MW146
August 2019	MW155, MW156, MW158, MW166, MW167, MW171, RN2, TW03	MW163, RN4
November 2019	MW155, MW156, MW158, MW166, MW167, MW171, TW02, TW03	MW163, NR2, RN4

Groundwater conditions across all rounds of monitoring are shown in Table T7 to Table T10 ('A' tables for the Lot B area and 'B' tables for the immediate surrounds), with Table T11 showing the latest (most recent) results including criteria exceedances.

The results are shown relative to Tier 1 criteria in Figure F14A through to Figure F16B, and against Remediation Criteria in Figure F17. The tables and figures show that impacts are well characterised (both with respect to Tier 1 criteria and Remediation Criteria) through the assessment area.

On the basis of the above, the Auditor considers that the representation of groundwater conditions as described by the referenced figures and tables is a reliable basis for a consideration of CUTEP and specifying conditions on the Site Suitability Statement which will adequately manage residual risks.

The tables and figures show exceedances for hydrocarbons against Remediation Criteria, although these are given perspective, based on the Soil Vapour and Indoor Air Assessment Report, which concluded an absence of risks from hydrocarbons, for the proposed use.

Also shown are exceedances for a range of PEVs, although as noted the ecological exceedances do not apply within the site boundary as there is no discharge to surface water, and eventual discharge to surface water is not considered to preclude the PEVs. Effectively, groundwater across much of the site is precluded for at least one of drinking water (health or aesthetics), recreation (primary or secondary contact), or irrigation.

PFAS was identified as a contaminant of concern associated with bulk terminals. Although AECOM did not discuss PFAS directly in the CUTEP report in any detail, the Auditor has considered PFAS based on data presented in the report. There was some soil sampling which indicated only a minor risk to groundwater, with PFAS absent at BH66 and BH80, and present at a trace concentration of 0.0002 mg/kg at TW02. Groundwater analyses detected no PFAS at TW03 in 2016 and 2017, minor detectable 8:2 Fluorotelomer sulfonic acid (0.13 µg/L – with no relevant criteria for this individual species) in RN2 in July 2016, but no detectable PFAS July 2017, including no detection of 8:2 Fluorotelomer sulfonic acid at that later time. The Auditor notes that AECOM omitted from the assessment tables a relevant drinking water criterion of 0.07 µg/L for the sum of PFOS and PFHxS (per the PFAS NEMP 2.0, January 2020), but that this was not exceeded in any samples. None of the PFAS analyses in Lot B indicated PFAS posing an ecosystem risk for the 90% of species protection relevant to discharge to the urban port waters of the Derwent River.

7.10.1.7 Precluded Environmental Values

While AECOM provided a table of precluded environmental values (PEVs) in respect of land, and this is useful for defining what contaminants preclude unrestricted use of the site (as well assisting with required control measures to be implemented), the EPA Victoria CUTEP checklist requires a tabulation of environmental values (beneficial uses) specifically for groundwater.

A summary of precluded PEVs is presented in Table 22 of the CUTEP Report, which is summarised in the following Table 7-3. It is noted that the Auditor has removed ecosystem protection from Table 7-3.

AECOM understandably included this in their Table 22, however the preclusion of this environmental value is considered to apply at the point of discharge, and the Assessment of Potential Off-Site Ecological Impacts Report demonstrated that the contaminants present in the Lot B area (and the site generally) do not extend such that they significantly affect the ecosystem at the inferred area of discharge, which is Sullivans Cove.

Table 7-3: Precluded Groundwater Protected Environmental Values

Precluded PEVs	Contaminants
Drinking Water (Health/Aesthetics)	Benzene, Naphthalene, Benz(a)anthracene, Benzo(a)pyrene, Benzo(k)fluoranthene, Pyrene, Chrysene, Dibenz(a,h)anthracene, Indeno(1,2,3-cd)pyrene, Lead, Manganese, Iron, Total Cyanide, E Coli
Recreation (contact)	Naphthalene, Benz(a)anthracene, Benzo(k)fluoranthene, Benzo(a)pyrene, Dibenz(a,h)anthracene, Indeno(1,2,3-cd)pyrene, E Coli
Irrigation	Boron, Iron
Human health - Vapour Intrusion (from groundwater)	C_{10}-C_{16} fraction (sum minus naphthalene)

As well, of the PEVs noted in Section 6 of this audit report, aesthetics would be precluded if contaminated groundwater was extracted for any use (aesthetics is noted in the above table, but only in respect of aesthetic criteria for drinking).

The vapour intrusion risk is addressed by the Soil Vapour Investigation Report, and risks would not apply for the proposed development, except in relation to methane risk. Methane exists in potentially hazardous concentrations in the subsurface of the site, requiring management in respect of building design.

No current risk exists due to low subsurface oxygen concentrations, but the methane risk requires management for construction and post construction.

Of the contaminants listed in the above table, AECOM considered that all of them except iron were co-sourced (that is, at least partly due to onsite contamination), with iron considered to be 'background'. The Auditor agrees with this evaluation of sources.

7.10.1.8 Remediation Options

Although the LNAPL Remediation End-Points Report considered only the short list of technologies selected in the LNAPL Remediation Action Plan (TFE, skimming, ISCO and excavation), Table 31 of the CUTEP Report covers a wider range of technologies, in order to provide an appropriately broad range of technologies for consideration, in presenting an argument that no further remediation was practicable.

Table 31 of the CUTEP Report considered the necessary factors in assessing practicability for implementation, including technical, logistical, environmental, financial and timing factors.

The total list of remediation options covered was as follows:

- Air Sparging
- ISCO
- Skimming
- Monitored Natural Attenuation
- Barrier Systems
- Pump and Treat (TFE)
- Excavation

Although this aspect was not discussed in any detail by AECOM, the Auditor notes that some of the technologies would have the potential to remediate non LNAPL related contamination, directly or indirectly, as follows.

- Metals would be removed by pump-and-treat. Metals, including (arsenic, lead, manganese and boron) would also be less soluble in the absence of hydrocarbons, which produce redox conditions favouring dissolution of many metals. Air sparging would provide this effect directly, while any technology removing hydrocarbons would eventually reduce metals in groundwater.

In regard to the above, while AECOM did not directly discuss this, the range of selected technologies would have the potential (if practicable) to reduce all groundwater contaminants precluding environmental values.

A summary of AECOM's considerations is that none of the technologies were practicable to continue or initiate to remediate groundwater, in the context of likely benefit versus cost of implementation (including environmental cost). The Auditor notes that excavation has been extensively applied, removing a large proportion of the soil impact, and some limited TFE has occurred in the Lot B area, where LNAPL is no longer present. While application of any of the technologies would further reduce the contaminant mass, the question is one of balance, in the context of the degree of impact to environmental values, and whether residual impacts are manageable.

All of the precluded PEVs are able to be protected by management (either restricting the use or including a management measure). Therefore, the Auditor considers that a decision regarding the need or otherwise for additional remediation effort prior to finalising an environmental audit can reasonably be based on the consideration of AECOM's Table 31 in their CUTEP Report.

The Auditor therefore agrees that further effort to remediate groundwater would not be practicable.

7.10.1.9 Ongoing Management of Polluted Groundwater

The CUTEP Report (AECOM 2020h) concluded that ongoing monitoring of groundwater conditions was not proposed, subject to a SEMP being in place to manage residual groundwater risks. The Auditor considers this reasonable, as monitoring to continue to confirm the limited risks from groundwater, where such risks were readily managed, could be considered wasteful of resources.

It is noted that groundwater monitoring may be required for broader parts of the site, in particular for area AA6 which is subject to future remediation and assessment in relation to deeper tar impacts and will therefore be the subject of some groundwater monitoring.

AECOM identified (in the Site Environmental Management Plan (SEMP)) the following management requirements for impacted groundwater.

- Actions to be taken in the event that groundwater is encountered during subsurface works.
- Directive that groundwater is not to be extracted for any use other than for environmental monitoring or remediation purposes.
- To the extent that methane risks that arise could be associated with methane generated in/around the water table, it is appropriate to note that the Lot B ('Precinct North') area is noted to require methane mitigation for a minimum gas protection guidance value of 3 in any building design, to cope with CS3 - Moderate Risk.

7.10.2 Determination of CUTEP

Reference has been made to Victorian guidance in the absence of Tasmania legislation or guidance relating to groundwater clean up. Specifically, the Auditor has considered EPA Publication 840.2 "The Cleanup and Management of Polluted Groundwater" (EPA Victoria (2016)), which has been adopted as relevant guidance in AECOM's CUTEP Report.

In accordance with the EPA Tas Fact Sheet: Register of Interstate Contaminated Land Auditors February 2016 (EPA Tas (2016)) the determination of CUTEP has been made by the Auditor, rather than any Tasmania regulator, and the supporting information and considerations are presented in this Section 7.10of this audit report.

The Auditor considers that for the Lot B area:

- CUTEP is determined to have been achieved.
- Ongoing groundwater monitoring is not required.
- Conditions attached to the Site Suitability Statement need to ensure that through the SEMP:
    - stakeholders proposing to undertake subsurface works (including construction) take precautions associated with the identified residual contamination (including waste classification and appropriate disposal of any contaminated soil);
    - groundwater not to be extracted except for monitoring or remediation; and
    - buildings in Lot B be designed and installed in such a way as to mitigate for CS3 – Moderate Risk, as defined by Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases (EPA NSW, 2020). (Table 8 of the NSW guidelines adopts a minimum gas protection guidance value of 3 for 'Public Buildings', for a CS3 scenario.)

8. QUALITY AND COMPLETENESS OF DATA

This environmental audit report relies upon site assessment works conducted by AECOM as the assessment consultant (with a component of soil remediation and validation undertaken by Geo-Environmental Solutions (GES) in support of remediation works undertaken by Synergy). The following appraisal of the site assessor's investigation addresses the following:

Appropriateness and completeness of the assessment with respect to the potential for contamination on the site; Validity of the investigation data with respect to data quality; and Appropriate and correct interpretation of the data and justification for the assessment conclusions.

These factors are considered in the following three sections.

8.1 CONFORMANCE WITH EPA VICTORIA REQUIREMENTS

As part of the environmental audit, the work completed by AECOM (and GES) has been reviewed by the Auditor in the context of its completeness in accordance with Appendix 2 of the EPA Victoria (2015) Publication 759.3 *"Guidelines for Issue of Certificates and Statements of Environmental Audit"*, as summarised in Table 8-1 to Table 8-4 below.

Table 8-1: Contents of Site Assessment Reports

History of the site and adjacent land uses	The history of the site has been described in detail in each of the DSI reports (AECOM (2020d, 2020i, 2020j and 2021b) and the CUTEP report (AECOM 2021h). The contaminants associated with the uses have been adequately identified.
Visual Inspections	The Auditor has visited the site on multiple occasions. In addition, numerous visual inspections have been completed by AECOM during the course of the assessment works. Records of site observations are documented throughout the available AECOM reports.
Geology and hydrogeology	Broad descriptions of the regional geology and hydrogeology were provided, along with detailed information obtained by numerous rounds of intrusive soil and groundwater investigations and is documented in borelogs and field sampling sheets. It is noted that most of the assessment locations did not penetrate through all fill layers, however some locations were installed into deeper bedrock, and numerous locations penetrated to the depth of the water table, such that environmental conditions which may affect beneficial uses can be adequately characterised by a combination of direct soil data and groundwater vapour data, as well as the characterisation of overall geology/hydrogeology provided by some deeper drilling.
Condition of site structures and water courses	The DSI reports (and Remediation Validation report) describe various existing, past and buried structures across the site. There are no water courses on-site, although the rivulet diversion lies to the north of the site. The removal of pipelines is well documented, as is the presence of the Main Hobart Pipeline (Sewer). The Off-Site Ecological Impact report provides information regarding downgradient surface water receptors.
Analytical detection limits	Soil and groundwater analyses were completed by NATA accredited laboratories. • Laboratory detection limits for soil were below the adopted criteria with the exception of F2 hydrocarbons (25 mg/kg for 0-1 m in sand, versus a detection limit of 50 mg/kg), as well as a range of PAHs and halogenated compounds. • Laboratory detection limits for groundwater were below the adopted criteria with the exception of PAHs and several halogenated compounds including 1,4 dichlorobenzene, 2 chlorophenol, 2,4 dichlorophenol, 1,4 dichlorobenzene, 1,2 trichloroethane, 1,2 dichloropropane and allyl chloride. These above criteria laboratory detection limits for soil would not be considered to compromise the data set / CSM, given the F2 hydrocarbon exceedance is covered by the direct assessment of soil vapour impacts (which included NAPL impacted areas to the west of Lot B and found no risks),

	and the other contaminants are not considered to represent a concern given they were either less volatile PAHs (which will be managed by break layers), or were not expected COPCs. The above criteria laboratory detection limits for groundwater were not considered to compromise the dataset/ CSM. PAHs may exceed criteria in the Lot B area, but this does not pose a risk to the wider ecosystem at the point of discharge to Sullivans Cove. The halogenated compounds exceed groundwater criteria for the PEV of drinking water, which is an implausible use on the site and will be controlled by restriction of groundwater extraction. Detection limits for soil vapour samples were below adopted criteria

Table 8-2: Scope of Site Investigation to support an Environmental Audit

Sampling and analysis program	The methodologies provided in the AECOM assessment reports were reviewed by the Auditor and were considered to comply with the following guidance documents: • National Environment Protection Measure (Assessment of Site Contamination); • AS 4482.1-Australian Standard, Guide to the sampling and investigation of potentially contaminated soil, Part 1: Non-volatile and semi-volatile compounds; • AS 4482.2-Australian Standard, Guide to the sampling and investigation of potentially contaminated soil, Part 2: Volatile substances; In many cases the Auditor was provided with an opportunity to review Sampling and Analytical Quality Plans or Remediation Work Plans prior to field works commencing. In general, the Auditor was satisfied that the sampling and analysis program was sufficient and in accordance with the site history information and CSM.
Compliance with approved methods/protocols	In general, the AECOM reports confirm that appropriate field investigation and sampling methods were adopted by both AECOM and GES. The scope of work for each stage of investigation was discussed with the Auditor in advance of execution and so potential for non-compliance was generally eliminated.
Laboratory accreditation	The Auditor has reviewed the laboratories used and confirms that all laboratories used were NATA-accredited for the analyses performed as part of the recent assessments (ALS and Eurofins for soil and groundwater, and SGS and NMI for soil vapour samples.)
Site plans and bore logs	Site plans showing the site locality, locations of sampling points, historical uses, development areas, groundwater contours and analytical results exceeding criteria are provided in the various reports, and summarised for the Lot B area in the CUTEP report (from which figures have been extracted for this audit report). Borelogs are presented in the DSI reports and included in Appendix B of the CUTEP report. Some borelogs are hand written (GHD logs for C1-C4, NR2, R4, R11, RN2, RN4, RN7, RN8 and RN9), while some logs were not available (RN1, RN3). Some of the reports were prepared without regard to the Lot B area boundaries (effectively all referenced reports other than the CUTEP report, although the AA7 DSI report was written for an area wholly within Lot B), so in many instances it is difficult when reviewing the reports to distinguish data that are within or without the audit area boundary. However, the area boundaries are shown and tabulated results are isolated for the Lot B area (and 20 m buffer zone showing proximal conditions) in the CUTEP report, including the figures which are reproduced in this audit report.
Quality assurance	AECOM (and GES) implemented a QA/QC program throughout the assessment process. The data validation criteria, quality assurance and quality control results are presented in Section 4.5 of the CUTEP report, which summarises the locations of data quality investigations (data quality objectives, calibration certificates, borelogs, sampling sheets, well development details, analytical results, data validation) for the following reports: • Groundwater Well Installation and Monitoring 2019 • AA2 DSI • AA4 DSI • AA5 DSI • AA7 DSI • Remediation Validation Report – Audit Areas 2 and 7 and Pipeline Removal

	• Soil Vapour and Indoor Air Investigations 2019 • Roundhouse Test Pit and Trench Investigation 2020 (although the Auditor notes that this has limited relevance to Lot B). Appendix F of the CUTEP report consolidated the assessment of Data Quality from all the reports. The Auditor undertook a review of the QA/QC program undertaken by AECOM (and GES) and found that generally the works undertaken met the requirements of AS4482, the NEPM (2013) and EPA Victoria Publication 668 (2006). Some deficiencies / non-conformances were identified in the program and these are discussed in Section 8.2.
Background samples	Groundwater well BG1, located to the northwest of the site, is considered to be representative of background groundwater conditions, with noted exceedances of Tier 1 criteria inferred to represent background conditions as follows: Ecosystem Protection: copper, vanadium and zinc Drinking Water (Aesthetics): TDS Drinking Water (Health): vanadium. Although background soil samples were not specifically collected, the soil sampling conducted from natural soils (where not impacted by mobile contaminants such as hydrocarbons) on surrounding areas of the overall site are considered to be representative of background soil conditions.
Soil screens/targets contaminants	The earlier soil and groundwater analytical program included a broad suite of analytes to ensure other contaminants were not present. Subsequent sampling programs focussed on the identified potential contaminants of concern. The range of contaminants assessed is considered to have been appropriate and provides a robust assessment of the site conditions. Although not discussed in detail, the sampling included PFAS, which the Auditor has discussed above and found to pose no risks at Lot B. The soil vapour sampling conducted included an appropriate range of contaminants, noting an absence of chlorinated hydrocarbons in widespread soil and groundwater testing as a reason to exclude them from vapour sampling.
Other environmental hazards	Nil.

Table 8-3: Information required for contaminants of concern

Chemical properties	AECOM has identified the chemicals of potential concern in the soil, groundwater and soil vapour at the site based on the site history and historical assessment works.
Form / species	A conceptual site model (CSM) in Section 3 of the AECOM CUTEP report presents the potential exposure pathways, transport mechanisms and sensitive receptors. The CSM is also described in Section 5 of this audit report.
Physical characteristics	The CUTEP report includes a comparison with the adopted groundwater guideline concentrations and a discussion on the potential impacts to PEVs of groundwater (Section 5). The AECOM DSI reports and the CUTEP report (also Section 5) includes a comparison of the final soil condition with adopted soil guideline concentrations, and a discussion on the potential impacts to PEVs of land.
Potential harm	As noted, AECOM did not discuss groundwater PFAS analyses in any detail, but the Auditor has considered the data against relevant criteria and determined there to be no significant risk based on the available data.
Detriment to beneficial uses	The AECOM Soil Vapour and Indoor Air Assessment includes an assessment of vapour intrusion risks, relevant to human health, including the explosive risk from methane.
Potential off-site effects	Overall, the information provided regarding chemicals of concern considers the form of the species present, including physical characteristics, exposure pathways, harm and detriment to PEVs, including those off-site, and is considered sufficient for the purposes of this environmental audit.

Table 8-4: Assessing the significance of site investigation results

Reference to SEPPs	The significance of soil assessment results in terms of potential impacts to PEVs of the site, were assessed against the SEPP (Prevention and Management of Contamination of Land) (2002). The significance of groundwater assessment results in terms of potential impacts references the Tasmanian Government State Policy on Water Quality Management (1997) [SPoWQM].
Evaluation of Risk in compliance with NEPM	An evaluation of risk was undertaken by comparison of soil, groundwater and soil vapour analytical results with established criteria provided in the NEPM, ANZG and other relevant guidelines.
Use of other guidelines	In cases where NEPM or ANZECC criteria were not available, other published guideline criteria were used to evaluate risk. AECOM omitted guidelines for drinking water for PFAS (available from the PFAS NEMP 2.0, January 2020). The ecosystem protection criterion adopted for PFOS of 2 µg/L (the 90% of species protection value from the NEMP) should have been adjusted to 0.13 µg/L (the 95% of species protection value), to account for bioaccumulation, but no results in Lot B exceeded any NEMP 2.0 criteria in any case.
Consideration of impact to all beneficial uses	Beneficial uses / protected environmental values associated with on-site receptors (site occupants and ecosystem receptors) were considered. Environmental values of groundwater both on and off site were considered.
Waste classification	Waste classification for off-site disposal of excavated soil was completed in accordance with the EPA Tas Information Bulletin No. 105: Classification and Management of Contaminated Soil for Disposal (IB105) (EPA, 2018), including EPA approvals.

8.2 QUALITY OF ASSESSMENT DATA

Section 7 of this audit report reviews the content and quality, in general terms, of the assessment reports. This section of report focuses on the fieldwork and analysis undertaken as part of the site investigations and quality control undertaken by AECOM (and GES) and the laboratories selected to analyse samples.

As part of the assessment works, AECOM (and GES) implemented a quality assurance program to ensure the reliability and traceability of samples collected. It is noted that key features were:

- Preservation and storage of samples upon collection and during transport to the laboratory in order to maintain sample integrity in accordance with AS4482.
- Vapour sampling was conducted in accordance with Technical Report no. 10, 2011, Health screening levels for petroleum hydrocarbons in soil and groundwater. Part 1: technical development document (CRC CARE, 2011)
- Sample holding times to maintain sample integrity in accordance with AS4482 and USEPA SW846 (1998) and Victorian EPA Publications IWRG701;
- Use of appropriate analytical procedures in accordance with NATA Technical Note No. 23;
- Required limits of reporting to be below applied guideline concentrations;
- Frequency of conducting quality control measurements as defined in AS4482, NEPM (2013) and IWRG701;
- Checking of laboratory blank results to assess the potential for incidental or accidental contamination or analytical interference within the laboratory;
- Checking of field blanks such as rinsate and trip blanks to assess the potential for incidental or accidental sample contamination;
- Matrix spike recovery results in order to assess the effects of the sample matrix on the precision and accuracy of the analyses (the desired matrix spike recovery range is between 70% - 130%);

- Laboratory control sample (LCS) recovery results in order to assess analytical method precision and accuracy independent of sample matrix;
- Surrogate spike results in order to assess the accuracy of organic analyses that involve chromatographic techniques (the desired surrogate recovery range is between 70% - 130%, except where the laboratory has specific recovery ranges);
- Comparison of field and inter-laboratory duplicate results with parent / primary sample results to ensure that the relative percent difference is within acceptable ranges; and
- Investigation of the occurrence of apparently unusual or anomalous results.

The following non-conformances were noted with regards to the assessor's procedures and quality control objectives:

- A number of samples exceeded the recommended temperature range (0-6 degrees C) when received at the laboratory as noted in laboratory certificates, for both soil and groundwater. The Auditor note it was necessary to transport samples to Melbourne / Sydney for analysis. Evidence of chilling was generally recorded, and the temperature variations are not considered to significantly affect the data integrity (maximum temperatures were below 10 degrees C).
- A number of duplicate soil pair results (both inter and intra lab duplicates) were outside the recommended RPD ranges, particularly in respect of TRH, PAH and metal concentrations. While AECOM noted only the over 90% compliance with recommended ranges as acceptable, the Auditor notes that RPD variation is routinely noted in heterogeneous soil sampling, such as in the fill materials present on the site – which constitutes a large proportion of the non-compliant results. A similar but slightly lower rate of RPD exceedances (4.5%) was noted in backfill soil sampling. The Auditor accepts AECOM's conclusion that the RPD exceedances across the overall program do not compromise the useability of the data set used to characterise final site conditions.
- Some 15% of soil vapour analyses were outside the recommended RPD ranges, with exceptions mainly for TRH and BTEXN.
- Groundwater inter and intra laboratory duplicate pairs were highly compliant, with approximately 3% of pairs outside the recommended RPD range, those being for TPHs and PAHs.
- A range of rinsate blank samples from DSI field works detected variously low concentrations of metals (mostly copper and manganese, but including barium, nickel, zinc, and cadmium) and toluene.
- AECOM reported false positive readings for a meter used for leak testing at SV25 and SV26 during soil vapour testing.
- The Auditor notes that for remediation validation sampling for AA4, ALS in Sydney was used for interlaboratory check sampling where the primary samples were analysed at ALS in Melbourne. While there is a degree of independence, a totally separate laboratory should have been used. For other assessments, ALS (primary) and Eurofins (secondary) were used to ensure independence.
- Holding times were mostly complied with for soil and groundwater samples, although AECOM excluded some samples from the dataset where it was considered the holding time non-compliance could affect sample integrity. For groundwaters, where holding times were exceeded for groundwater samples, field values for groundwater quality parameters were preferred over laboratory analysed results. As holding times were mostly complied with, and the exceptions represent a relative minority of samples, the general adherence to holding time requirements is considered to support the acceptance of the overall dataset.
- As noted in Table 8-1 above, a number of analyte LORs exceeded criteria, but these were not considered to affect the overall characterisation of the site.

While there were some irregularities in the QC results presented, these were not considered to materially compromise the dataset, and analytical data was found to be directly usable in this audit report.

8.3 AUDITOR OPINION ON ADEQUACY OF DATA

From an overall perspective it is concluded that the dataset obtained from the reports prepared by AECOM provides a reliable understanding of potential site contamination and is of sufficient quality to support the audit requirements.

9. ASSESSMENT OF RESIDUAL CONTAMINATION AND RISK

9.1 SOIL

9.1.1 Nature and extent of residual contamination

The final condition of soils at the site is described in Section 5 of AECOM (2020h), as was discussed in Section 7.6 of this audit report. The data used assess both the excavation validation results and the relevant DSI investigation results across the broader areas of the site.

9.1.2 Soil Tier 1 Exceedances

As described in Section 7.6, concentrations of various PAHs, TRHs [TRH >C10-C16, TRH >C16-C34, TRH >C34-C40, aliphatic TRH >C10-C12, aromatic TRH >C10-C12, aliphatic TRH >C12-C16, aromatic TRH >C12-C16, TRH C6-C10 (minus BTEX) (F1), TRH >C10-C16 (minus Naphthalene) (F2)], benzene and metals (arsenic, copper, lead, nickel, zinc) in soil remained above Tier 1 Criteria at numerous locations for the following.

- Modified and Highly Modified Ecosystems
- Human Health Direct Contact – Low Density Residential
- Human Health Direct Contact – Medium/High Density Residential
- Human Health Direct Contact – Recreational/Open Space
- Human Health Direct Contact – Commercial
- Human Health Vapour Intrusion – Residential
- Human Health Vapour Intrusion – Commercial/Industrial

The exceedances are summarised in Table 9-1 below from investigation sampling results for soils still in situ, from remediation validation sampling and (in a small number of cases) from backfill soils, where these exceeded Tier 1 Criteria (but were within site specific Remediation Criteria). It should be noted that the Tier 1 exceedance risks are obviated by the proposed nature of the development, inapplicability (vapour screening levels based on aromatic/aliphatic splits) or further assessment (such as vapour risk assessment), as well as management measures proposed in the SEMP. Therefore, while these exceedances assist in describing residual contamination present within the site, they do not indicate that the site is unsuitable for the proposed use, with controls. The number of exceedances is summarised here to provide an indication of the scale of the exceedances, but details of sample identifiers are listed in Table 21 of the CUTEP report for Lot B.

It is noted that in the figures reproduced from the AECOM CUTEP report, the exceedances of Tier 1 Criteria which are shown in Figures 10A/B, 11 A/B, and 12A/B are those detected in the borehole based sampling during DSI investigations, prior to excavation validations being undertaken. Similarly, the Remediation Criteria exceedances shown in Figures 13A/B are also based on DSI borehole based sampling, prior to excavations and associated validation. So while these figures provide a good understanding of conditions present across the site at the DSI stage, they do not depict all Tier 1 exceedances identified during later validation sampling (which are included in Table 21 of AECOM (2021h), and are summarised in Table 9-1 below). This is considered reasonable, as the sheer quantity of information which would be graphically presented on the figures would render the figures almost unreadable. In any case, exceedances of Remediation Criteria, which are more relevant to residual risks that need management at the site are shown on Figures 19A-E.

Table 9-1: Summary of Tier 1 Screening Criteria Exceedances

Environmental Value	Land Use Scenario	Contaminant	Number of Exceedances
Human Health	Direct Contact (Low Density Residential)	TRH >C16-C34	41
		TRH >C34-C40	3
		Benz(a)anthracene	215
		Benzo(b)fluoranthene	2
		Benzo(k)fluoranthene	32
		7,12-Dimethylbenz(a)anthracene	1
		Benzo(a)pyrene	348
		Chrysene	3
		Dibenz(a,h)anthracene	291
		Indeno(1,2,3-cd)pyrene	273
		Sum of PAHs	29
		Arsenic	2
		Lead	142
	Human Health Direct Contact – Medium/High Density Residential	TRH >C16-C34	37
		TRH >C34-C40	2
		Benz(a)anthracene	305
		Benzo(b)fluoranthene	2
		Benzo(k)fluoranthene	18
		7,12-Dimethylbenz(a)anthracene	1
		Benzo(a)pyrene	339
		Dibenz(a,h)anthracene	238
		Chrysene	3
		Indeno(1,2,3-cd)pyrene	271
		Sum of PAHs	22
		Lead	18
	Human Health Direct Contact – Recreational/ Open Space	TRH >C16-C34	42
		TRH >C34-C40	2
		Benz(a)anthracene	306
		Benzo(b)fluoranthene	2
		Benzo(k)fluoranthene	32
		7,12-Dimethylbenz(a)anthracene	1
		Benzo(a)pyrene	339
		Chrysene	3

Environmental Value	Land Use Scenario	Contaminant	Number of Exceedances
		Dibenz(a,h)anthracene	239
		Indeno(1,2,3-cd)pyrene	271
		Sum of PAHs	29
		Lead	49
	Human Health Direct Contact – Commercial	TRH >C16-C34	4
		Benz(a)anthracene	36
		Benzo(b)fluoranthene	1
		7,12-Dimethylbenz(a)anthracene	1
		Benzo(a)pyrene	275
		Dibenz(a,h)anthracene	128
		Indeno(1,2,3-cd)pyrene	18
		Lead	15
	Human Health Vapour Intrusion - Residential	C6-C10 fraction (minus BTEX) (F1)	6
		>C10-C16 (minus Naphthalene) (F2)	103
		>C10-C12 Aliphatic	6
		>C12-C16 Aromatic	8
		>C12-C16 Aliphatic	4
		>C10-C12 Aromatic	7
		>C12-C16 Aromatic	6
		Naphthalene	12
		Benzene	1
	Human Health Vapour Intrusion – Commercial	C6-C10 fraction (minus BTEX) (F1)	1
		>C10-C16 (minus Naphthalene) (F2)	28
		>C10-C12 Aliphatic	2
		>C12-C16 Aromatic	1
Maintenance of Ecosystems	Modified Ecosystems	TRH >C10-C16	5
		TRH >C16-C34	244
		TRH >C34-C40	2
		Benzo(a)pyrene	329
		Arsenic	1
		Copper	14
		Lead	21
		Nickel	10
		Zinc	35

Environmental Value	Land Use Scenario	Contaminant	Number of Exceedances
	Highly Modified Ecosystems	TRH >C10-C16	4
		TRH >C16-C34	35
		TRH >C34-C40	1
		Benzo(a)pyrene	329
		Arsenic	1
		Copper	5
		Nickel	7
		Zinc	32

As well, aesthetics is precluded for various anthropogenic inclusions, as well as for staining and odour associated with hydrocarbon impacts.

9.1.3 Soil Remediation Criteria Exceedences

Remediation Criteria were exceeded, as summarised in Table 9-2 below, however, as presented by AECOM, none of the Remediation Criteria exceedances are applicable except for intrusive maintenance worker exposures. This is because the exceedances are obviated by one or more of the following reasons.

- Inapplicable criteria exceedance to the planned use (e.g., residential exceedance but commercial (arts/institutional use proposed), such that the exceedance is irrelevant to the proposed use of the site).
- Criteria being inapplicable, on the basis of diesel fuel origin (criteria for aliphatic/aromatic splits not exceeded).
- Results superseded by actual measurements of vapour in the area of the sampling.
- Results from below the water table, where groundwater monitoring results are more relevant to vapour risk.
- Maintenance worker exceedances at depth of > 2 m, below the reasonable expectation of maintenance works (noting that any sub-surface maintenance work would in any case be subject to SEMP controls).
- Lead exceedances being acceptable using statistical analysis to assess mean concentrations.
- Samples from soils unable to be removed owing to site constraints (but where these areas may be subject to explicit (to the area) SEMP controls).

Table 9-2: Summary of Residual Remediation Criteria Exceedances

Remediation Criteria Exceeded	Contaminant	Number of Exceedances
Future Resident (not proposed)	TRH C_6-C_{10} (minus BTEX), TRH C_{10}-C_{16} (minus naphthalene) concentrations (or for speciated TPH results within those ranges), or naphthalene	71 soil samples 3 backfill samples
Commercial/Light Industrial worker	TRH C_6-C_{10} minus BTEX (F1), TRH C_{10}-C_{16} minus naphthalene (F2) (or for speciated TPH results within those ranges), or naphthalene	29 (11 from below the water table)
Intrusive Maintenance Worker	Benzo(a)pyrene or lead	46

9.1.4 Asbestos

While asbestos ‘cladding’ was noted in the removed Diesel Pipeline, no observations of asbestos nor detections of asbestos in soil samples (17 samples from within Lot B) were identified.

9.1.5 Summary

Overall, while significant contamination remains across parts of the Lot B area, the residual contamination is able to be managed without posing an unacceptable risk to the proposed development use of the site (noting that some contaminated soil is likely to be incidentally removed during proposed construction excavation).

9.2 GROUNDWATER

9.2.1 Nature and extent of residual contamination

AECOM discusses groundwater assessment results against adopted criteria in Section 5 of the CUTEP report, AECOM 2020h (in Appendix D of this report). Full tabulated analytical results and screening assessment for all GME data are provided as Table T7 to Table T11 in AECOM (2021h), which are reproduced in the tables section of this audit report. The dataset that represents the latest (most recent) condition of groundwater against Tier 1 criteria is presented in Table T11.

A summary of key guideline exceedances is presented in Table 9-3 below based on the most recent data presented in Table T11.

Table 9-3: Groundwater analytical results above investigation levels (latest round of sampling 2015-2019)

COMPOUND	DATA RANGE (µg/L)*				ADOPTED criteria (µg/L)*					
	Up-gradient#1	Cross-gradient#2	Plume Centreline#3	Down-gradient#4	ANZECC 2000 Freshwater 90% & Dutch Intervention	ANZECC 2000 Irrigation Ltv	ANZECC 2000 Livestock Watering (Sheep)	Drinking USEPA Tap water / ADWG	Recreation Primary/Secondary Contact	CRC CARE HSL A&B (sand)
Analytes considered by AECOM to be co-sourced from the site										
Naphthalene	<1	<1	<1-**4.5**	<1	90		**1**	**0.17**	**1.7**	
Benz(a)anthracene	<1	<1	<1-**2.1**	<1				**0.03**	3

Analytes considered by AECOM to be natural and hence not pollution										
Iron	NA	NA	**15,500**	NA		**10,000**		**300**		

Notes

**units µg/L unless specified otherwise*

NA= Not Analysed

*Analyte in **Bold** exceeds an adopted GWQO.*

#1 Upgradient Well BG1 (data from AA4West CUTEP Report)

#2 Cross-gradient Well:MW121 (west of Lot B)

#3 Plume Centreline Wells MW155, MW158, MW166, MW167 MW171 and MW142 – selection of impacted wells

#4 Downgradient Wells: MW122, 149 (in AA6 and AA1 – data from Assessment of Potential Off-Site Ecological Impacts and AA1 CUTEP Report)

9.2.1.1 LNAPL

LNAPL was briefly present at measurable thickness in NAPL Plume A3 in the western part of Lot B, but since the remediation trials using intermittent TFE, LNAPL has not been observed at this location. No other LNAPL is known to exist within Lot B.

9.2.2 Impacts to protected environmental values of groundwater

A summary of impacts to groundwater protected environmental values is presented in Table 7-3 in Section 7.10 of this audit report.

Based on that table:

- Drinking water (health/aesthetics) is precluded by Benzene, Naphthalene, Benz(a)anthracene, Benzo(a)pyrene, Benzo(k)fluoranthene, Pyrene, Chrysene, Dibenz(a,h)anthracene, Indeno(1,2,3-cd)pyrene, Lead, Manganese, Iron, Total Cyanide, E Coli.
- Primary/secondary contact (recreation) is precluded by Naphthalene, Benz(a)anthracene, Benzo(k)fluoranthene, Benzo(a)pyrene, Dibenz(a,h)anthracene, Indeno(1,2,3-cd)pyrene, E Coli.
- Irrigation is precluded by Boron and Iron.
- Human health - Vapour Intrusion (from groundwater) is precluded by C10-C16 fraction (sum minus naphthalene).

9.2.3 Likelihood of environmental values of groundwater being realised

AECOM assessed the likelihood of groundwater PEVs being realised, both on-site and off-site, as detailed in Section 5.3.3.2 of AECOM (2021h). The Auditor has also completed an appraisal which is summarised below in Table 9-4.

Table 9-4: Likelihood of Environmental Values being realised

Protected Environmental Value	Comment	Likelihood of PEV being realised
Drinking Water	No known extraction wells on or near the site.	AECOM considered this use to be UNLIKELY. The Auditor agrees, as extractive use in this setting would be implausible. While the groundwater on the Lot B area is generally of low salinity, it is in a reclaimed area, so that it is unlikely any person would consider groundwater extraction. As well, the use can readily be controlled by conditions of the Site Suitability Statement.
Irrigation	Given the proposed use, such an extractive use would be plausible. No such use is current.	AECOM considered this use UNLIKELY. While watering of plants would be possible, this is unlikely and can readily be controlled by conditions of the Site Suitability Statement.
Stock	There is no known use for this purpose in the area.	AECOM considered this use UNLIKELY. The Auditor agrees – given the proposed use setting there is no plausible stock watering use at the site.
Industry	No known nearby use, and site not planned to be used for such a purpose.	This use would not be plausible given the proposed development scenario.
Primary Contact Recreation	This would apply for swimming in water extracted on site or in Sullivans Cove (point of discharge).	AECOM rated this UNLIKELY, and the Auditor agrees, on the basis that there is no plausible extraction for pools or spas on the site, and swimming in the Sullivans Covet area is unlikely.
Secondary Contact Recreation	This would occur where a person had incidental contact with water while carrying out non immersive recreation activities (in Sullivans Cove).	This was assessed as POTENTIAL by AECOM on the basis that boating/paddling and fishing may occur (in nearby Sullivans Cove). The Auditor agrees with this, although notes that the locations where secondary contact recreation would be plausible (out in the Sullivans Cove) would not be proximal to the actual points of groundwater discharge, which appear to be well under the wharf structures at the waterline.
Aesthetics	Presence of objectionable odours, colours, taints, visible floating material, foam, oil or grease or 'dirty' water.	AECOM considered this as POTENTIAL, given that there is potential for secondary contact recreation at the point of discharge. AECOM note that no adverse aesthetic impacts have been observed.
Buildings and structures	Contamination should not affect building integrity through aggressive (e.g. acidic) groundwater conditions.	AECOM listed this PEV as POTENTIAL given that building elements may contact groundwater.

While there is potential for some groundwater PEVs to be realised, these are unlikely to be adversely effected given the low likelihood and manageability of extractive uses. For secondary contact recreation and aesthetics, risks are mitigated by the findings of a lack of observable off-site ecological impact from groundwater emerging from the site, and the location of discharge zones beneath wharf structures (see Section 7.8 of this audit report).

9.3 METHANE IN GROUND GAS

The soil vapour assessment, as noted earlier in this audit report identified a minor methane risk which will be managed for buildings by design taking into account a minimum gas protection guidance value of 3, 'Public Buildings', for the assessed CS3– (Moderate Risk) value, as defined by Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases (EPA NSW, 2020).

9.4 SITE ENVIRONMENT MANAGEMENT PLAN

AECOM prepared a (sitewide) Site Environmental Management Plan (SEMP) for implementation at the site (AECOM (2021d)). This plan describes the area subject to this audit (Lot B) as 'Precinct North'. The SEMP describes assessments and the environmental audit process and advises those implementing the SEMP of residual risks at the site and the requirement to manage those risks.

The residual risks, and associated management measures, include:

- Soil exceedances by a wide range of contaminants potentially affecting human health, ecosystems and aesthetics if not managed, including vapours.
  - Notable impacts at Lot B/Precinct North include lead impacts at the Main Hobart Pipeline (Sewer) alignment (where excavation was not possible) and along the eastern boundary.
  - Hydrocarbon impacts, particularly along the eastern boundary, with previous LNAPL noted as having been present at NAPL Plume A3 in the west of Lot B/Precinct North.
- All subsurface works are to be undertaken in accordance with a site-specific work health and safety plan which recognises the possible presence of
  - Heavy metals
  - PAHs
  - TRHs
  - Benzene
  - ACM.
- Based on the residual contamination, residential uses are not allowable on the ground floor in Lot B/Precinct North, but would be acceptable on higher floors (above the ground floor).
- Groundwater impacts affecting extractive uses, and possibly human health through vapours.
- Methane calculated as CS3 – Moderate Risk, as defined by *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020), requiring appropriate mitigation measures (a minimum gas protection guidance value of 3 for 'Public Buildings') in future building design in Lot B/Precinct North.
- The site surface will be covered with either hardstand and/or an engineered break layer, as specified in Section 4.6 of the SEMP, to provide a framework for ongoing maintenance and management of the Site during future use. (It is noted that this is a general requirement for the overall site; in Lot B the entire area is to be occupied by building footprint.) In the event that the existing hardstand is partly or wholly removed, and/or changes to the configuration and/or penetrations are made, the following would be required:
  - Further assessment to evaluate potential impact to future users.
  - Reinstatement of hardstand, or placement of an earthen cap.
  - The following minimum design barrier shall be installed, unless otherwise agreed by a suitably qualified Site Environmental Auditor, noting that consideration will need to be given to the intended use of the hardstand area during the design process to ensure the hardstand is suitable for the anticipated loads (e.g. light or heavy vehicles):
    - Layer 1: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert site users / maintenance workers.
    - Layer 2: Sub-grade / base material (minimum 0.2 m thickness) certified as 'Fill Material' in accordance with EPA Tas EPA Bulletin 105 and being geotechnically suitable.

    - Layer 3: Surface covering such as concrete or asphalt at a thickness suitable for the intended use (e.g. light or heavy vehicles). Asphalt shall be a minimum 30 mm thickness to allow for longevity of the barrier.
  - Landscaped areas and gardens should be established in above ground planter boxes on hardstand and not directly over exposed soil. In the event that gardens are proposed in-ground, the following barrier system shall be installed:
    - Layer 1: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert the site users / maintenance workers.
    - Layer 2: Earthen cover (minimum 0.5 m thickness) certified as 'Fill Material' in accordance with EPA Bulletin 105.
    - Layer 3: Surface coverage (comprising shallow-rooted vegetation).

Allowance may be made for the establishment of deep-rooted vegetation; however, the barrier thickness may need to be increased, or the design modified. In-ground garden designs should be confirmed with a suitably qualified Site Environmental Auditor.

- Groundwater from beneath Lot B should not be extracted for any purpose other than environmental monitoring, or remediation.
- The SEMP requires any person conducting underground works to prepare a site specific work health and safety plan.
- The SEMP requires controlled stockpiling of any excavated soils and (where excess to site needs) off-site disposal or re-use per EPA Tas *Information Bulletin No. 105 - Classification and Management of Contaminated Soil for Disposal* (IB105). If excavated soils are required to be re-used there are specific requirements for reinstatement, including reinstatement of physical barriers and the sequence of reinstatement into excavations which prevents deeper soils (which may be more contaminated) being left in a shallower location).
- The SEMP includes requirements for importation of Fill Material, to ensure such importation does not pose additional risks.
- There are requirements to manage any groundwater produced by excavation works, in order to deal with potential groundwater contamination.

The Auditor considers that the SEMP is appropriate in dealing with residual risks, outlining not only conditions for the final future development, but also for maintenance works, including a requirement for services to be installed in protective shrouds or in trenches/corridors of clean fill, to avoid risks from direct contact with contaminated soil.

10. CONCLUSIONS

This audit report presents the Auditor's opinion as to the environmental condition of the Lot B site at Macquarie Point, and potential risks that the site may present to the future use or re-development of the site. In preparing this report, the Auditor has assessed any harm, detriment, or risk for all beneficial uses / protected environmental values.

The Auditor's appraisal of the site condition has been based largely on a series of soil, groundwater and vapour assessments undertaken at the site by AECOM. The Auditor is satisfied that the investigations undertaken followed a logical sequence that included a detailed consideration of the site history and surrounding areas. This was followed by a process of intrusive soil and groundwater investigations (undertaken prior to, during and post remediation) that took account of the preliminary information and which were designed and executed according to industry standards.

The Auditor and/or his representative visited the site on several occasions as part of the overall assessment and auditing of the site including the Lot B area. The Auditor is satisfied that the works performed by AECOM provide a reliable set of data on which to make an assessment of the environmental conditions of the site and risks which it may present to human health or the environment.

10.1 SITE CONDITION AND SUITABILITY FOR USE

The site is currently covered with a combination of asphalt and gravel surfacing, having had significant remediation excavations and backfilling, as part of soil remediation works.

Although fuel/oil pipelines have been removed, a stormwater sump is present and remains in use, in the central part of the site.

Soil remediation works have occurred in parts of the site as shown on Figure F19A to Figure F19E. This has targeted soil impacts and pipeline contaminant source infrastructure. Remediation areas have been backfilled.

Although remediation was undertaken to target soils exceeding Remediation Criteria, excavations which were extended to a practicable extent did not fully remove all soils exceeding the adopted criteria. There remains on site soil contamination – in particular by hydrocarbons, PAHs and metals (lead). The hydrocarbons are mostly associated with LNAPL sources. AECOM does not consider that gasworks waste was the source of PAHs (Table 23 of the CUTEP report), but the Auditor considers that it is possible that some filling has included gasworks waste from the former gasworks.

Some of the soils exceeding Remediation Criteria are not considered to represent a risk to the future landuse, based on more specialised speciation analysis, or because they were from soils below the water table (which will not control vapour risk), or because statistical analysis renders the average exposure acceptable.

Some of the soils remaining above Remediation Criteria are in respect of future maintenance workers, and while these are generally at depths which would not be likely to be accessed by maintenance workers, would be managed in any case by SEMP controls requiring management of subsurface works, including consideration of contamination and a work health and safety plan. Such controls would also manage risks during building construction.

There is significant methane present across the Lot B/Precinct North area, and this requires management by appropriate mitigation measures in future building design, and would also need consideration in any work health and safety plan for subsurface works under the SEMP.

Groundwater remains contaminated in parts of the site. The groundwater below the site is not considered to pose any risks to off-site ecosystems, and risks to site users may be managed by prevention of extraction for use, management of any pooled water in excavations (such as during construction or maintenance) and adoption of the development as planned.

Overall, the site is considered suitable for the proposed Arts and Institutional area, with commercial and cultural uses, noting that:

- The entire footprint of Lot B will be covered with hardstand.
- No basements are planned as part of the development.
- Land use will include retail and commercial, comprising arts and institutional uses.
    - Residential use, while not planned could occur in levels above the ground floor, but not on the ground floor, based on exceedances of Remediation Criteria for residential occupancy.

Contaminated soils which may be surplus spoil from construction or maintenance works will require management, as outlined in the SEMP.

10.2 SUITABILITY FOR USE AND SITE SUITABILITY STATEMENT

Based on the considerations covered in this Contaminated Land Audit Report, the site is considered suitable for use subject to conditions outlined in the Site Suitability Statement which is included in Appendix A.

11. STATEMENT OF UNCERTAINTIES

This report represents a review of data and information (together, “Information”) relating to the property which is the subject of this report. The Information was obtained not by the Auditor and Coffey but from other sources and contacts, some of whom may be noted in the report. The Auditor has conducted reasonable checks as to the adequacy of the information provided and is satisfied that it is suitable for the purpose of conducting an environment audit. However, the Auditor notes that, inherent in any environmental assessment approach (and audits that rely on such assessments), is the fact that information is based on a number of “spot” tests and that conditions may vary between those locations.

The analyses, evaluations, opinions and conclusions presented in this report are based on the information provided, and they could change if the information is, in fact, found to be unrepresentative of conditions between sampling and analysis locations.

The Environmental Auditor and Coffey will not update the report and has not taken into account events occurring after the time its review was conducted.

TABLES

Table T1 - Soil Assessment Location Summary

AECOM

Audit Area	Bore ID	Major Soil Interface (m bgl)				Easting	Northing	Comments
		Fill	Natural - Estuarine/ Marine Deposits	Natural - Weathered Dolerite	Natural -Dolerite Bedrock			
Lot B	BH122	0-6.9+	-	-	-	527598.55	5252507.59	Located in the southern portion of Lot B. Grid based sampling.
	BH123	0-5.7+	-	-	-	527609.09	5252524.57	Located near centre of Lot B. Grid based sampling
	BH124	0-5.4+	-	-	-	527615.95	5252540.23	Located near centre of Lot B. Grid based sampling
	BH125	0-6.0	6-7.5+	-	-	527631.41	5252563.87	Located in the central northern portion of Lot B. Grid based sampling.
	BH126/MW156	0-3.1	3.1-4.0+	-	-	527650.05	5252566.76	Groundwater well located in the north eastern portion of Lot B. Grid based sampling.
	BH127	0-5.4+	-	-	-	527636.69	5252554.06	Located in the central northern portion of Lot B. Grid based sampling.
	BH128	0-3.4+	-	-	-	527648.97	5252544.26	Located in the north-western portion of Lot B near the Oil Pipeline. Grid based sampling.
	BH129	0-5.9+	-	-	-	527633.09	5252532.62	Located in the central eastern portion of Lot B near the Oil Pipeline. Grid based sampling.
	BH130/MW155	0-4.6+	-	-	-	527624.58	5252516.69	Groundwater well located in the central eastern portion of Lot B near the Oil Pipeline. Grid based sampling.
	BH131	0-8.2+	-	-	-	527634.27	5252511.62	Located in the south-western portion of Lot B. Grid based sampling.
	BH132	0-5.7+	-	-	-	527601.33	5252546.18	Located near central western boundary of Lot B. Grid based sampling
	BH133	0-4.3	4.3-7.3+	-	-	527595.56	5252528.26	Located near central western boundary of Lot B. Grid based sampling
	BH156	0-2.2+	2.2 - 3.2+	-	-	527582.92	5252552.59	Located in the western boundary of Lot B
	BH53	0-2.9	-	2.9-3.8	3.8+	527579.52	5252510.79	Located in the south-western portion of Lot B. Grid based sampling.
	BH57	0-4.0+	-	-	-	527616.59	5252481.14	Located in the central south area of Lot B in the oil and diesel pipeline area. Grid based sampling.
	BH58	0-4.0+	-	-	-	527609.18	5252460.01	Located in the south area of Lot B. Grid based sampling.
	BH60	0-4.0+	-	-	-	527621.41	5252450.37	Located in the south area of Lot B. Grid based sampling.
	BH66	0-5.8+	-	-	-	527609.18	5252496.02	Located in the southern portion of Lot B. Grid based sampling.
	BH80	0-4.0+	-	-	-	527633.28	5252489.21	Located in the south-eastern portion of Lot B. Grid based sampling.
	C1	0-4.5+	-	-	-	527657.50	5252456.17	Located on the eastern boundary of Lot B
	C2	0-5.8+	-	-	-	527648.03	5252469.83	Located on the eastern boundary of Lot B
	C3	0-5.65+	5.65-5.80+	-	-	527643.65	5252456.76	Located on the eastern boundary of Lot B
	DP01	0-6.0	-	6.0-9.0	9.0-12.5+	527644.98	5252461.59	Geotechnical borehole located in the south-eastern corner of Lot B
	DP04	0-5.2	5.2-6.0	6.0-8.9	8.9-12.0+	527593.44	5252501.27	Located in the south-western portion of Lot B. Grid based sampling.
	MW142	0-5.5+	-	-	-	527581.38	5252528.23	Groundwater well located near central western boundary of Lot B. LNAPL delineation location
	MW143	0-5.50+	-	-	-	527577.06	5252532.82	Groundwater well located within historical LNAPL Plume A3 in central western area of Lot B
	MW166	0-5.5+	-	-	-	527641.99	5252570.73	Located in the north eastern corner of Lot B to assess groundwater quality and potential vapour risks associated with previously identified TRH impacts in soil at BH126/MW156 near the water table.
	MW167	0-5	-	-	-	527658.87	5252563.91	Located in the north eastern corner of Lot B to assess groundwater quality and potential vapour risks associated with previously identified TRH impacts in soil at BH126/MW156 near the water table.
	MW168	0-5.5+	-	-	-	527654.34	5252575.68	Located in the north east area of Lot B to assess groundwater quality and potential vapour risks associated with previously identified TRH impacts in soil at BH126/MW156 near the water table.
	RN1	Unknown				527607.05	5252569.80	Located in the north-western portion of Lot B near the Diesel Pipeline. Grid based sampling.
	RN2	0-6.0+	-	-	-	527645.79	5252526.64	Located in the central western portion of Lot B near the Oil Pipeline. Grid based sampling.
	RN3	Unknown				527617.24	5252501.04	Located in the southern portion of Lot B. Grid based sampling.
	RN6	Unknown				527624.62	5252467.08	Located in the central south portion of Lot B
	RN7	0-4.4+	-	-	-	527595.18	5252526.58	Located near central western boundary of Lot B. Grid based sampling
	RN8	0-7.0	7.0-8.7+	-	-	527656.64	5252559.63	Located in the north-eastern portion of Lot B near the Oil Pipeline.
	SV26	0-1.9	-	-	-	527600.81	5252455.71	Soil vapour bore to assess vapour risk from soil impacts
	TW01	0-6.8	-	-	6.8-9.0+	527662.71	5252592.41	Groundwater well located near the north eastern boundary of Lot B and adjacent of the Oil Pipeline.
	TW02	0-7.6	-	7.6-8.5	8.5-13.6+	527643.66	5252532.49	Groundwater well located in the central eastern portion of Lot B near the Oil Pipeline.
	TW03	0-6.4	-	-	6.4-8.0+	527648.43	5252476.92	Located in the south eastern portion of Lot B.
Buffer Zone	BH115	0-3.2	3.2-6.0+	-	-	527568.02	5252483.65	Located south of Lot B. Grid based sampling.
	BH134	0-4.0+	-	-	-	527558.72	5252519.64	Located west of Lot B.
	BH140	0-3.0+	-	-	-	527589.11	5252571.95	Located west of Lot B.
	BH141	0-2.4	2.4-4.4+	-	-	527548.75	5252523.28	Located west of Lot B.
	BH142	0-4.9	4.9-6.3+	-	-	527571.39	5252543.85	Located west of Lot B, up hydraulic graidient of former LNAPL plume A3.
	BH147	0-3.0	3.0-3.5	-	3.5+	527609.40	5252591.64	Located north west of Lot B. Grid based sampling.
	BH149	0-2.8	2.8-4.2+	-	-	527642.10	5252609.65	Located north of Lot B. Grid based sampling.
	BH170	0-5.5	-	5.5-6.0+	-	527666.99	5252472.45	Located south of Lot B. Grid based sampling.
	BH178	0-2.0+	-	-	-	527575.14	5252559.96	Located west of Lot B.
	BH179	0-2.0+	-	-	-	527550.28	5252533.75	Located west of Lot B.
	BH180	0-2.0+	-	-	-	527558.75	5252540.39	Located west of Lot B.
	BH181	0-0.7+	-	-	-	527560.61	5252528.73	Located west of Lot B.

Notes:

Y - Yes

N- No

1. Measured from well top of casing

2. Groundwater SWL was corrected for the presence of LNAPL (corrected SWL = measured SWL - density of product (assumed to be 0.85 kg/m^3) x product thickness (m))

3. Redox values corrected for the reference electrode (standard hydrogen)

DNAPL - Dense Non-Aqueous Phase Liquid
LNAPL - Light Non-Aqueous Phase Liquid
EC - Electrical Conductivity
TDS - Total Dissolved Solids
ORP - Oxygen Reduction Potential
SWL - Standing Water Level
GME - Groundwater Monitoring Event
TRH - Total recoverable Hydrocarbons
PAHs - Polycyclic Aromatic Hydrocarbons
BTEX - Benzene, Toluene, Ethylbenzene and Xylenes
SVOC - Semi-Volatile Organic Compounds
VOC - Volatile Organic Compounds
MNA - Monitored Natural Attenuation

APPENDIX A – SITE SUITABILITY STATEMENT

SITE SUITABILITY STATEMENT

This Statement provides a summary of the findings of a Contaminated Land Environmental Audit of the Macquarie Point Development Project – **Lot B (also known as Precinct North)**, Evans Street, Hobart, in accordance with the following

- Placement of the Auditor on the Register of Interstate Contaminated Land Auditors by the Director, Environment Protection Authority (Tasmania)
- EPA Tasmania 'Register of Interstate Contaminated Land Auditors'
- Macquarie Point Development Corporation Act 2012 (consolidated 2015)

I, David Lam of Tetra Tech Coffey, a person appointed by the Victorian Environment Protection Authority ('EPAV') under the *Environment Protection Act 1970* ('the Act') as an environmental auditor for the purposes of the Act, and also a person placed on the *Register of Interstate Contaminated Land Auditors* by the Director, Tasmania Environment Protection Authority (Tas EPA), having

1. been requested by Mr Greg Cooper on behalf of Macquarie Point Development Corporation (MPDC) to issue a Site Suitability Statement in relation to Lot B located at Evans Street, Hobart (as shown in Figure F2 in the attached document: *Site Environment Management Plan*) ('the site') owned by MPDC. Survey details of coordinates defining the land parcel are provided in the body of the audit report.

2. had regard to, among other things,
   (i) guidelines issued by EPAV for the purposes of conducting Environmental Audits (contaminated land) and guidelines issued by Tas EPA for conduct of a contaminated land audit, noting that EPAV is allowing ongoing reference to pre-existing guidance documents in Environmental Audits commenced prior to 1 July 2021, regardless of changes to legislation from that date:
   (ii) the beneficial uses and protected environmental values that may be made of the site
   (iii) relevant (Victorian) State environment protection policies/industrial waste management policies, namely
   SEPP Waters
   SEPP Ambient Air Quality and Air Quality Management
   IWMP Prescribed Industrial Waste
   SEPP Prevention and Management of Contamination of Land
   (iv) relevant (Tasmanian) State Policy on Water Quality Management

   in making a total assessment of the nature and extent of any harm or detriment caused to, or the risk of any possible harm or detriment, which may be caused to any beneficial use/protected environmental values associated with use of the site, by any industrial processes or activity, waste or substance (including any chemical substance), and

3. completed a contaminated land environmental audit report in accordance with Clause 39F of the Macquarie Point Development Corporation Act 2012, a copy of which has been sent to Tas EPA.

HEREBY STATE that I am of the opinion that

The site is suitable for the proposed site use of 'Arts and Institutional Area', which is considered to be a 'Commercial' use setting, involving commercial and cultural uses, including retail, (the site would also be suitable for high density residential uses above – but not on - the ground floor, and other less sensitive uses such as industrial use),

subject to the following conditions:

1. Nature of development: the site shall be developed in accordance with the layout provided in Figure F2 of the attached Site Environment Management Plan (SEMP), with reference to the following details.

   a. Methane is present at significant concentrations across Lot B and must be designed to account for CS3 – Moderate Risk, as defined by *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020).
   b. The entire site is to be covered by building footprint/hardstand in its final developed state.

2. Implementation of SEMP: from the date of issue of this Site Suitability Statement, the owner/occupier of the site must implement and maintain the SEMP attached to this Site Suitability Statement (or as modified from time to time), including requiring any parties conducting works or otherwise at risk of exposure to residual contamination at the site to conform to the SEMP. The key features of the SEMP include but are not limited to the following.
   a. The Site area must be maintained with a hardstand or earthen cap seal or other engineered break layer to prevent direct human access to soil. Where the hardstand or earthen cap or other break layer is breached, such as for construction or maintenance works, it must be reinstated to achieve the same or better prevention of access to soil. Further details of layers or physical barriers must be adopted per Section 4 of the SEMP.
   b. Garden plantings are to be in above ground planter boxes and not into the soil directly, noting that this is a general requirement, and that the coverage of the Lot B area by building footprint means that this requirement is likely redundant. Any proposal to plant into site soils must be confirmed as suitable by a Site Environmental Auditor.
   c. Specified requirements must be followed for managing excavated soil and for importation of Fill Material.
   d. Any subsurface works including for construction of the development or later maintenance must include a site specific work health and safety plan as detailed in Section 4 of the SEMP and allow for potential contaminant exposures.
3. Any (substantive) changes to the SEMP referred to in Conditions 1 and 2 must be prepared for the site by a suitably qualified professional and verified as acceptable by a Site Environmental Auditor.
4. Groundwater at the site is polluted and must not be used for extractive uses other than environmental monitoring or remediation. Where groundwater is encountered during construction or maintenance works, it must be managed in accordance with the SEMP.

The condition of the site is detrimental or potentially detrimental to some possible beneficial uses/protected environmental values associated with the site, and so requires ongoing management. The site conditions which would need to be addressed so that no management would be necessary in any use scenario include the following.

- Material containing contaminant concentrations above human health-based criteria considered protective of sensitive land uses and above ecologically-based criteria considered protective of ecosystems would need to be removed or remediated.
- Aesthetically impacted materials would need to be removed.
- Groundwater would need to be cleaned up to the extent that all relevant beneficial uses and protected environmental values associated with all extractive uses are protected.

Other related information

1. This Site Suitability Statement has been adapted from the EPAV Statement of Environmental Audit. The EPAV guidelines for Issue of Certificates and Statements of Environmental Audit (Publication 759.3, December 2015) have been followed so far as reasonably practicable. This Statement varies from the Victorian document in order to suit the site requirements and Tas EPA's Fact Sheet Register of Interstate Contaminated Land Auditors (February 2016).
2. Although new legislation took effect in Victoria on July 1 2021, audits commenced prior to that date continue to be able to be executed with reference to the previous system (and associated guidance), and this principle has been followed in this audit report. Specifically, reference has not been made to the Victorian Environment Protection Act 2017 or associated documents, and has instead continued to reference guidance for audits which continue under the Environment Protection Act 1970.
3. The Auditor has determined that groundwater does not have practicable remediation options and therefore is assessed to have been cleaned up to the extent practicable.
4. Groundwater at the site is polluted with respect to use for Drinking Water, Irrigation, Stock Watering , Industrial use, and Primary Contact Recreation. Groundwater is not considered to preclude Ecosystem Protection at a point of discharge to a surface water, nor Buildings and Structures.
5. Groundwater monitoring wells present on and adjacent to the site may be retained, where necessary, to assist in groundwater characterisation of the balance of the Macquarie Point Redevelopment Project. Within 12 months of cessation of use, the groundwater monitoring wells are to be decommissioned in accordance with the requirements of "Minimum Construction Requirements for Water Bores in Australia", published by the Land and Water Biodiversity Committee [Third Edition, February 2012].
6. While no fragments of asbestos have been noted on the Lot B area (nor has any asbestos been identified in analysis of soil samples), asbestos may be encountered wherever fill soils are present. The SEMP outlines requirements in the event that potential ACM is encountered in soil during subsurface works.
7. Soil impacts are present in excess of the Future Maintenance Worker remediation criteria in the locations listed below, which will be managed by adherence to the SEMP for any future construction or maintenance works.
    a. An exclusion zone surrounding the original Main Hobart Pipeline (Sewer).
    b. Areas on the site boundary where further soil excavation could not be conducted.
    c. Areas where impacted soil supported surrounding infrastructure.

8. Not all land uses for which the land is considered suitable by this audit may be allowed under the existing zoning of the Sullivans Cove Planning Scheme 1997.

This Site Suitability Statement forms part of contaminated land audit report (Tetra Tech Coffey, Contaminated Land Audit Report, Macquarie Point Development Project – Lot B, ref. 754-MELEN225720-R04). Further details regarding the condition of the site may be found in the contaminated land audit report.

1.0 Introduction

1.1 Purpose

This Site Environment Management Plan (SEMP) has been developed by AECOM Australia Pty Ltd (AECOM) on behalf of the Macquarie Point Development Corporation (the Corporation) for implementation at the Macquarie Point site in Hobart, Tasmania (the Site).

The purpose of this SEMP is to identify known areas of contamination on the Site and to provide an overview of appropriate management measures to address potential human health and environmental risks associated with subsurface contamination, and to maintain compliance with relevant environmental management requirements, and related safety management requirements.

The SEMP:

- Documents:
  - The current contamination status of the Site.
  - Environmental management measures (including contaminant management associated with intrusive works such as excavation/disposal of soil, dust and odour control, stormwater and sediment management, noise control and groundwater management).
  - Responsibilities for implementation of the SEMP and for managing identified environmental issues in accordance with the SEMP.
- Defines:
  - Preventative exposure measures for intrusive works (e.g. subsurface excavation) undertaken at the Site.
  - Roles and responsibilities for owner/managers and occupiers/contractors at the Site, or subsections thereof, when undertaking intrusive works.
- Provides a framework for the implementation of measures so that human health and environmental risks to Site users are low and acceptable where the existing preventative exposure barriers and controls remain in place.

All subsurface work and any work that may change the risk profile to receptors on the Site while this SEMP is in place should follow the guidance provided in this SEMP. Maintenance of the SEMP has been identified as a condition of Audit (discussed in **Section 1.6**) for management of human health and environmental risks at the Site.

1.2 Applicability

This SEMP applies to the management of contaminated soil, groundwater and soil vapour on the Site. The following parties should be provided with a copy of the SEMP, prior to undertaking any activities which may interact with soil, groundwater or soil vapour:

- Owners or Managers (and delegates) of the Site or subsections of the Site.
- Workers who undertake subsurface work at the Site during which they may be exposed and/or come into contact with contaminated soil and/or groundwater.

It is noted that this SEMP is an active document, which is to be updated as conditions at the Site change (e.g. development changes, changes to the known contamination status, etc.). If activities to be undertaken at the Site are not covered in this SEMP, the Site Owner or Manager, or owner of smaller areas of the Site, should update the SEMP to include those activities. Alternatively, should the requirement for a more specific application be determined, a Construction Environment Management Plan (CEMP) may be required which specifically addresses the proposed tasks and a framework to mitigate potential environmental impacts posed by the activities to be undertaken.

If a sale or division of areas at the Site occurs in the future, owners of subdivisions at the Site should communicate changes to owners of other Site subdivisions or develop their own SEMP specific to the subdivision in question.

Any significant amendment to this SEMP, or future SEMPs developed for divisions of the Site, should be reviewed by a suitably qualified and experienced Contamination Land Auditor prior to implementation.

1.3 Training and Induction

The appropriate Site representative (i.e. the Owner, Manager or delegates) is to ensure the health, safety and environment (HSE) requirements outlined in this SEMP are met during works.

All persons conducting subsurface work on the Site, including but not limited to Site occupiers, tenants and maintenance workers, will be required to be trained and inducted to this SEMP. All workers must sign the induction form (provided in **Appendix B**) to acknowledge an understanding of the content of this SEMP and completion of the induction.

This training/ induction recommendation is limited to those personnel and contractors who are undertaking subsurface works at the Site. It is not the intention that this document be applied to passive users of the Site such as those using it for the purposes of short-term commercial activities (e.g. market holders), car parking, pedestrian thoroughfare or visitors engaging in public uses of the area.

Training should be structured to ensure that relevant workers understand their obligation to exercise due diligence in relation to environmental matters. The following items should be presented in the induction:

- General overview of the work to be conducted
- Overview of Site contamination issues
- Familiarisation with environmental controls
- Chemicals of Potential Concern (CoPC), and associated exposure risks and potential symptoms of exposure
- Hazard identification and prevention
- Personal Protective Equipment (PPE).

Records of all training should be maintained and include:

- Name of the individual receiving training
- When the individual was trained
- Name of trainer
- A general description of the training content.

It should be noted that this SEMP does not preclude the need for a Safe Work Method Statement (SWMS) for each task, but rather should be included as part of the general training for working on the Site.

1.4 Responsibilities

The distribution and implementation of this SEMP will be the responsibility of the Owner/Manager of the Site, or of future sub-divisions at the Site. The Site Owner/Manager may at times delegate responsibility for individual items or tasks to maintenance contractors and other persons. However, the Site Owner/Manager retains the overall responsibility for the implementation of this SEMP during any subsurface works and ongoing use of the Site or future subdivisions which they hold responsibilities for.

All contractors, including workers engaged in any subsurface works where groundwater or soil vapour infiltration may occur (such as accessing service conduits or trenches) or works which may come into contact with Site soil or groundwater will be responsible for adhering to the management measures described herein.

Table 1 below provides a summary of the key roles and responsibilities associated with the implementation of this SEMP.

Table 1 Roles and Responsibilities

Role	Key Responsibilities
Site Owner/ Manager (or delegate)	• Provide a full copy of the SEMP to Site occupiers/ contractors undertaking subsurface works and discuss as part of the Site induction process. • Manage and/or enforce the SEMP for Site occupiers/ contractors undertaking subsurface works. • Implement and complete corrective actions as required. • Complete and keep up to date all necessary registers and records as required in the SEMP. • Undertake reviews and revision of the SEMP every three years (or more frequently, as deemed appropriate based on-Site activities or changes). • Review evidence of compliance to this SEMP every three years (or more frequently, as deemed appropriate). • Undertake visual inspections of existing controls, such as hardstand areas every three years. • Review and revise the SEMP to reflect changes that occur at the Site.
Site Occupiers/ Contractors undertaking subsurface works or works which may come into contact with Site soil or groundwater.	• Implement the requirements of the SEMP. • Complete all necessary registers and records as required in the SEMP. • Complete all activities at the Site in a safe and environmentally responsible manner. • Implement a Work Health and Safety Plan (WHSP) and ensure that suitable PPE is worn, and monitoring is undertaken, where required, for tasks that involve subsurface works. • Ensure all contractors comply with the requirements of the SEMP.

1.5 Site Environment Management Plan Revision

This SEMP will remain in place indefinitely, and will require revision:

- In the event that areas of the Site undergoes remediation or land use changes.
- Following changes to the conditions at the Site which may change the risk of exposure to contamination on the Site.
- In response to additional data to inform the understanding of the contamination status of the Site.

Regardless of the above-listed considerations, this SEMP should be reviewed (and updated if required) every three years. It is recommended that a suitably qualified environmental practitioner be engaged to review evidence of compliance to this SEMP, including records of works on the Site and compliance with the conditions of implementation contained within **Section 5.5** of this SEMP. A visual inspection of the Site should be conducted as part of this review, as described in **Section 5.1**.

1.5.1 Previous SEMPs

This SEMP combines and supersedes the following SEMPs which have been previously issued for some or all of the Site:

- *Site Environmental Management Plan, Macquarie Point Development Project* (AECOM, 2018)
- *Site Environmental Management Plan, Macquarie Point – Audit Area 1* (AECOM, 2019)
- *Audit Area 4 – Site Environmental Management Plan, Macquarie Point Development Project* (AECOM, 2020a)

- *Lot E and Underground Carpark – Site Environmental Management Plan, Macquarie Point Development Project* (AECOM, 2021a)

The information and management procedures within the previous documents have been combined in this SEMP.

1.6 Environmental Audit

In conjunction with the amendment of the *Macquarie Point Development Corporation Act 2012*, the Corporation has engaged a Contaminated Land Auditor, David Lam of Coffey Environments (the Auditor). David is included on the Director of the Tasmanian Environment Protection Authority (EPA) Register of Interstate Contaminated Land Auditors and is considered suitably qualified by EPA to undertake an Environmental Audit to review the progress of environmental assessment, remedial planning and execution works at the Site.

The role of the Auditor is to ensure that the works are carried out in compliance with local Tasmanian legislation and guidelines with consideration given to the requirements of the Victorian EPA Environmental Audit framework in the absence of an Audit scheme in Tasmania. It is noted that Victoria legislation which defines the Audit process was updated and superseded by the *Environment Protection Act 2017* (the EP Act), which came into effect on 1 July 2021, and contains significant changes to Audit methodology and terminology under the Victorian framework. Under Section 478 of the EP Act, existing Audits where an Auditor has been engaged prior to 1 July 2021, and the Audit has not been completed by 1 July 2021, can be conducted under either the EP Act or the previous framework. To maintain continuity with the portions of the Audit already completed, the Site Audit will continue under the previous framework and terminology.

The overarching outcome required for the Environmental Audit is a Contaminated Land Audit Report (i.e. sign off) prepared by the Environmental Auditor confirming that Clean Up to the Extent Practicable (CUTEP) has been achieved and that the Site is suitable for the intended future uses.

As part of the Environmental Audit, implementation of a SEMP is required to manage potential human health and environmental risks associated with subsurface contamination associated with historic Site activities.

Contaminated Land Audit Reports have been received for the areas of Site (described in **Section 2.2**) as listed on **Table 2** below.

Table 2 Status of Environmental Audit by Area

#	Area	Contaminated Land Audit Report	
		Status	Report
1	The Goods Shed and Yard	Issued	*Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1* (Coffey, 2019)
2	The Escarpment (Audit Area 4 West)	Issued	*Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West* (Coffey, 2020)
3	The Promenade and Underground Carpark	Issued	*Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark* (Coffey, 2021)
4	The Precinct North	Pending[1]	
5	The Precinct South	Pending	
6	The Gateway	Pending	
7	Audit Area 4 East	Pending	

Notes: [1]CUTEP assessment submitted to Auditor

2.0 Site Details and Background

2.1 Site Identification and Layout

The Site details are provided in **Table 3** below:

Table 3 Site Details

Item	Description
Site Identification	• Macquarie Point
Site Address	• 10 Evans Street, Hobart, Tasmania (refer to the Site Location plan provided as **Figure F1** in the **Figures** section)
Site Area	• Approximately 9.3 ha
Current Site Owner	• State of Tasmania (Crown Land)
Current Zoning (1)	• Mixed Use Area – Sullivans Cove Planning Scheme 1997
Current Uses	The following is noted with regard to Site use and features: • The Site is generally flat with three main tiers as follows: - The upper (northern western) tier consisting of a gravel surface with former rail tracks. - The second (middle) tier consisting mostly of an asphalt and gravel surface. - The third (south eastern) tier consisting of an asphalt and gravel surface and a series of sheds including the Goods Shed, Red Shed and SeaRoads Shed. • The majority of the Site is currently vacant and is covered with a combination of asphalt, concrete and gravel surfacing, as well as backfill and clean fill material from previous soil remediation works. • A series of sheds are located along the southern boundary of the Site: - the Goods Shed; occupied by the Corporation and subject to intermittent uses including public events. - the Red Shed; occupied by Hobart Brewing Company. - the Long House; occupied by commercial and cultural tenants. - the SeaRoads Shed; currently used for storage. • A public carpark is present in the south eastern portion of the Site. • Public events including markets and concerts have intermittently occurred at the Site. • An access road (the Northern Vehicular Access) is located in the north and northwest sections of the Site. • Access stairs to the adjacent Hobart Cenotaph are being constructed in the northwest corner of the Site.
Closest Surface Water Body	• Sullivans Cove to the southwest (170 m) • River Derwent to the southeast (280 m) and to the northeast (25 m).
Site Layout	• **Figure F2** in the Figures Section

2.1.1 Surrounding Land Uses

The surrounding land use comprises a number of aspects including public access and cultural significance; commercial and professional services; retailing; health care; port facilities; light industry; marine industry; fishing industry; and education. The immediate local setting is summarised in **Table 4**.

Table 4 Surrounding Land Uses

Direction from Site	Land Use
North	• The Site is bound to the north by the Hobart Cenotaph and associated public open space. • A Wastewater Treatment Plant and River Derwent are located in a general northeast direction from the Site.
South	• The Site is bound to the south by Evans Street, with residential apartments and commercial properties beyond, which extend towards Hunter Street and Sullivans Cove.
East	• The Site is bound to the east by the Tasports' port operations and further east by the River Derwent. • The Wastewater Treatment Plan is located in a general northeast direction from the Site.
West	• The Site is bound to the west by a public bike path and Davey Street, with commercial properties beyond.

2.2 Areas of Site

For the purpose of assessment and completion of the Environmental Audit, the Site has been divided into seven sub-areas for assessment based on the nature of identified contamination, historic activity, and the intended future uses of each area. Each area may have specific development controls or work requirements, which are discussed in **Section 4.0**. The sub-areas of the Site are shown on **Figure 1** below.

Figure 1 Site Areas

It is noted that the Site was previously divided into Audit Areas (named Audit Area 1 to Audit Area 7) for assessment. Due to changes in the remediation approach and planned development of the Site, these have been replaced with the sub-areas above. However, the locations of the former Audit Areas are shown on **Figure F3** for reference to earlier documents.

2.3 Future Land Use

As part of the Environmental Audit, CUTEP documentation has or will be prepared for all areas and submitted to the Environmental Auditor for review and issue of a Contaminated Land Audit Report. As a condition of Audit, restrictions on land use or development type have been specified in the Contaminated Land Audit Report for each area, based on the based on the *Master Development Plan* (MPDC, 2015). Any person planning development of an area should consult the Contaminated Land Audit Report specific to the area of works and ensure that planned works conform with Audit requirements and restrictions. This controls are summarised below.

Under the *Master Development* Plan, the Site is intended to be developed for a mix of uses comprising:

- Residential, including medium to high density
- Commercial, including visitor accommodation, retail, arts and institutional
- Open space, including parks and recreations areas

- Transport, including roads, light rail, cycleway, and pedestrian access
- An Underground Carpark will be constructed in the Promenade and Underground Carpark Area.

The proposed development layout of the Site is shown on **Figure F2** in the **Figures** section.

2.4 Subsurface Features

Table 5 below provides a summary of currently known subsurface features that may present contaminant source risks or influence subsurface hydrogeology/contaminant transport mechanisms. A plan showing the current known location of subsurface infrastructure is presented in **Figure F5**.

It should be noted that during Site investigations, the Corporation has encountered redundant pipe works and other abandoned services which are not on any records and the origin and purpose of which remains unknown. The potential for unidentified pipe networks or other features to be present below the Site should be considered during future excavation works.

Table 5 Subsurface Feature Summary

Feature	Comment
Gasworks Infrastructure	• Historical gasworks infrastructure is located beneath the Gateway area and former gasworks subsurface infrastructure has been backfilled as part of previous Site development.
Roundhouse	• A former Roundhouse was located in the western portion of the Site on the boundary of the Gateway and the Promenade and Underground Carpark areas, and subsurface infrastructure associated with the Roundhouse was been backfilled as part of previous Site development. Parts of remaining Roundhouse infrastructure (the central turntable) were excavated and remain exposed by works in 2021.
Underground Storage Tanks (USTs)	• USTs have been formerly located at the Site. • The following is noted: - Two USTs and associated infrastructure were previously located in the central southern portion of the Precinct South and have been removed. A backfilled former UST pit, associated hydrocarbon odour and residual impact were identified during the target investigation undertaken in this area in 2014. - A UST and associated infrastructure were present in the south east corner of the Gateway and were removed in 2019. - A review of historical information indicates that potentially two USTs and associated infrastructure were planned for installation in the north western portion of the Escarpment. It is not known if this infrastructure was installed, however no evidence of these USTs was identified, and it is not considered likely that they were constructed. • There is the potential that more USTs are present at the Site that have not yet been identified.
Fuel Transfer Lines	• Disused fuel transfer lines are currently present in the Precinct South and in Audit Area 4 East. Removal of these line is planned prior to completion of the Environmental Audit of these areas. • Portions of these fuel lines were present in the Precinct North and in the eastern section of the Promenade and Underground Carpark area but were excavated and removed in 2020.

Feature	Comment
Sewer (Main Hobart Pipeline)	• The Sewer (Main Hobart Pipeline) currently traverses the central portion of the Site from southwest to northeast. Lead impacts are known to be present in soil around this sewer in the Precinct North area. • A realignment of this sewer is planned to occur in 2022. • A sewer line also runs from the Main Workshop area connecting to the Sewer (Main Hobart Pipeline) in the general central portion of the Site.
Stormwater	• Stormwater infrastructure is located in the general central portion of the Site traversing the Site in a north-south and east–west direction.
Seawalls/ Engineers Jetty	• Seawalls: Historically established for land reclamation purposes. • Engineers Jetty: Constructed on the historical outer edge of the former slaughter yard. • GHD, 2014 identified the likely location of the Engineers Jetty in the general central portion of the Site and a seawall on the eastern Site boundary.
Former Building Footings	• Remnant infrastructure associated with former buildings (such as footings) located across the Site. • It is noted that select structures may have archaeological significance.
Telecommunications services	• Telecommunications enter the Site in the north western portion of the Escarpment. An exclusion zone of 2 m applies around this telecommunications cable, and works should not be completed within this radius without consultation with the asset owner (Telstra Tasmania). • Soil with lead impacts is known to be present within the exclusion zone. • The depths of these services are typically between 0.6 m – 1.2 m below ground level (bgl).
Other Services	• Water, electricity, gas and communications services are located across the Site.

2.5 Geology

2.5.1 Fill Material

The Site has been subject to significant filling (controlled or otherwise) since the early 1800's with up to 600 m of land reclaimed in stages from the original 1800's shoreline (Department of the Environment, *Australian Heritage Database*, 2007). Fill material has been encountered across the Site to depths of up to approximately 12.0 m bgl.

Fill material has been described as generally containing a combination of clays, sands, gravels, cobbles and bricks. Virgin Excavated Natural Material (VENM) consisting of crushed dolerite, or reused inert construction materials (crushed concrete and bitumen), has been used as backfill in areas in the Escarpment, the Precinct North, and the Promenade and Underground Carpark Area. The thickness of fill is variable across the Site (0.2 – 12.0 m bgl) and generally increases from north to south across the Site consistent with historical land reclamation activities.

Deeper fill material generally consists of silty sands, similar to the underlying natural marine deposits, indicating that the deeper fill material may be associated with reworked natural material or dredged material.

Staining and odours consistent with gasworks and fuel storage has also been encountered in fill material at select locations.

2.5.2 Natural Soil

Two main natural soil types have been encountered at the Site including marine deposits (silty sands) and slope deposits (weathered Dolerite including clays, gravels and cobbles).

Marine deposits have generally been encountered in the south east portion of the Site, ranging in depth from 3.7 to 15.0 m bgl. Slope deposits generally underlay the marine deposits (with the exception of the northern portion of the Site where the marine deposits are absent). The slope deposits are generally encountered at near surface to 1.4 m bgl in the northern portion of the Site and 11.2 to 19.0 m bgl in the south eastern portion of the Site.

Dolerite bedrock underlies the fill and natural soils at the Site. Dolerite has generally been encountered at near surface in the northern portion of the Site and slopes down in the southerly and south easterly direction and has been encountered at depths up to 25.0 m bgl (GHD, 2014). GHD, 2014 also notes that there are potentially three bedrock highs (i.e. 'reefs') in the general central portion of the Site. The dolerite has been described as of high strength and slightly to highly fractured.

In the following instances, the interface between various natural soil types has been difficult to distinguish:

- Between fill material and natural marine sediments given the similar material type.
- Between the changes from slope deposits to the underlying Dolerite bedrock given the weathering of the slope deposits, which consist of fine to coarse cobbles and boulders similar to the Dolerite.

Due to the relatively shallow depth to bedrock in the northern portion of the Site, natural soils are likely to be encountered during shallow intrusive works (i.e. < 2.0 m bgl) in the general northern and north western portion of the Site, such as the Escarpment, Audit Area 4 East, and northern portions of the Promenade and Underground Carpark area.

It is noted that due to the increasing depth of fill material across the Site from north to south, it is unlikely that natural soils will be encountered during shallow subsurface works (i.e. < 2.0 m bgl) in the general southern portion of the Site.

2.5.3 Hydrogeology

The River Derwent is located approximately 280 m southeast of the Site boundary and Sullivans Cove is located approximately 170 m south west of the Site boundary.

Based on investigations completed to date, the Site is underlain by a single aquifer unit extending to greater than 25.0 m bgl (the maximum depth assessed). Groundwater has generally been encountered in fill material in the central, southern and eastern portions of the Site, extending into the underlying natural material including marine deposits, slope deposits and fractured Dolerite.

Observations from intrusive investigations have not identified any consistent confining layers between the fill material, natural sediments or the fractured Dolerite to indicate that the lithology's are hydraulically separated. This is supported by similar standing water levels (SWLs) reported for nested groundwater wells screened within different portions of the aquifer, which may indicate that the shallow and deeper portions are likely to be hydraulically connected.

SWLs across the Site at the time of the AECOM groundwater investigation undertaken in February 2018 ranged from approximately 1.3 m bgl and 5.9 m bgl.

Groundwater is inferred to have southeast and southerly components of flow. This indicates that groundwater flows toward the River Derwent and Sullivans Cove, respectively.

Other subsurface structures such as sewer mains (understood to be at a depth of approximately 4.0 m bgl), stormwater pipes, former fuel transfer lines and former sea walls are likely to cause localised variations in groundwater flow direction.

3.0 On-Site Contamination

3.1 Chemicals of Potential Concern

Based on the known Site history, **Table 6** below presents a summary of the Chemicals of Potential Concern (CoPC) that may be present based on known historical activities or uncovered during investigation of the Site.

Table 6 Chemicals of Potential Concern Summary

Area	Historical Land Uses	Chemicals of Potential Concern
Goods Shed and Yard	• Freight storage and handling. • Vehicle Maintenance. • Fuel Storage and Handling.	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Chlorinated solvents associated with vehicle maintenance activities.
The Escarpment	• Locomotive refuelling comprising fuel storage and transfer facilities. • Railway maintenance workshop. • Rail corridor and fuel transfer infrastructure historically located within the area. • Concrete batching plant.	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Chlorinated solvents associated with locomotive maintenance activities and the storage of hazardous materials. • Heavy metals, chlorinated solvents and hydrocarbons associated with workshop and maintenance areas. • Phosphorus and sulphur associated with locomotive washing. • ACM sourced from historical structures (i.e. cladding). • Hydrocarbons associated with the truck wash. • Heavy metals, chlorinated solvents and hydrocarbons sourced from the historical incineration of paint/ solvents
The Promenade and Underground Carpark	• Locomotive refuelling comprising fuel storage and transfer facilities. • Locomotive maintenance. • Freight storage and handling.	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel (diesel) storage and transfer activities. • Chlorinated solvents associated with locomotive maintenance activities. • Heavy metals, asbestos and PAHs sourced from materials used to backfill Roundhouse structures.
The Precinct North	• Freight storage and handling.	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel (diesel) storage and transfer activities. • Chlorinated solvents associated with locomotive maintenance activities.
The Precinct South	• Freight storage and handling.	• TPHs, BTEXN, PAHs, phenolic compounds, and lead associated with historical fuel storage and transfer

Area	Historical Land Uses	Chemicals of Potential Concern
		activities undertaken adjacent to the Site's eastern boundary.
The Gateway	• Former Hobart Gasworks. • Locomotive refuelling comprising fuel storage and transfer facilities. • Railway maintenance workshop.	• TPHs, PAHs, BTEXN and phenols sourced from coal tar and tar oils, or from historical fuel storage and transfer activities. • Heavy metals, chlorinated solvents and hydrocarbons associated with workshop and maintenance areas. • Phosphorus and sulphur associated with locomotive washing. • ACM sourced from historical structures (i.e. cladding). • Chlorinated solvents associated with locomotive maintenance activities and the storage of hazardous materials. • Complex cyanides, free cyanides and metals sourced from spent oxides. • TPHs, PAHs and metals sourced from coke, coke breeze, ash and clinker residues. • TPHs and BTEX associated with light and drip oils. • Phenols, nitrates, sulphates, sulphides, ammonia and PAHs sourced from ammoniacal recovery wastes.
Audit Area 4 East	• Rail corridor and fuel transfer infrastructure historically located within the area.	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities.

Notes: TPHs – total petroleum hydrocarbons; PAHs – polycyclic aromatic hydrocarbons; BTEXN – benzene, toluene, ethylbenzene, xylene, naphthalene; ACM – asbestos containing material; VOC – volatile organic compounds; SVOC – semi VOC.

Appendix C contains areas specific fact sheets which provide more detailed information on CoPC in each area of the Site which has had a CUTEP submission to the Environmental Auditor. The following areas have fact sheets prepared:

- The Goods Shed and Yard
- The Escarpment (Audit Area 4 West)
- The Promenade and Underground Carpark
- The Precinct North.

The remaining areas of the Site (the Gateway, the Precinct South, and Audit Area 4 East) will have factsheets prepared and added to this SEMP as investigation and remediation of these areas are completed.

3.2 Identified Soil Impacts

3.2.1 Fill Material

Shallow soil across the majority of the Site consists of fill material used for land reclamation or construction during the Site's history.

Soil samples collected during the investigation of the Site have been assessed against adopted Tier 1 Criteria for the following uses:

- Maintenance of Modified/Highly Modified Ecosystems
- Human Health
  - Low and Medium/High Density Residential
  - Recreation/Open Space
  - Commercial Industrial
  - Shallow Trench Worker
- Buildings and Structures
- Aesthetics

The following CoPC have been detected in excess of one or more of the adopted Tier 1 criteria in soil samples collected from the Site:

- TRH)– C_6–C_{16}, C_{10}-C_{40}
- Benzene, naphthalene
- PAHs – benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, Indeno(1,2,3-cd)pyrene, Sum of PAHs
- Metals – arsenic, cadmium, chromium, copper, lead, nickel, zinc

Further information on exceedances of the adopted Tier 1 Criteria for areas of the Site where a CUTEP submission has been made can be found in **Appendix C**. Although exceedances of the Tier 1 criteria are present in these areas, they may be managed by implementation of the safety and environmental control measures in this SEMP.

Tasmanian EPA Information Bulletin No. 105, *Classification and Management of Contaminated Soil for Disposal* (IB105) (EPA, 2018) provides guidance with regard to the classification of contaminated soil for disposal purposes. Total contaminant concentrations of the following compounds were reported in excess of the maximum total concentration for soils to be classified as *Contaminated Soil (Level 3)* during investigation completed between 2015 and 2020:

- TPH C_{10}-C_{36} fraction.
- Total PAHs
- Benzo(a)pyrene
- Lead

Further to the above, additional compounds to those listed above have been reported in excess of the *Fill Material (Level 1)* and/or *Low Level Contaminated Soil (Level 2)* criteria within the fill material on Site.

3.2.2 Natural Soil

The AECOM soil investigations undertaken between 2015 and 2020 identified a combination of copper, lead, nickel, zinc and TRH at concentrations in excess of the adopted Tier 1 screening criteria for the assessment of risk to human health and ecological receptors in natural soils at select locations.

3.2.3 Areas of Notable Impact

As part of the Environmental Audit process for sub areas of the Site, the following areas of notable impact to soil have been identified:

Table 7 Soil Impacts - Areas of Notable Impact

Area	CoPC	Description
The Promenade and Underground Carpark	Lead	Areas of lead-impacted soil which may present a risk to future Intrusive Maintenance Workers (i.e. workers installing or maintained subsurface conduits) are present in the Promenade and Underground Carpark Area, generally at a depth of >2 m bgl.
	Asbestos	Isolated fragments of Asbestos Containing Material (ACM) have been uncovered in fill in this area. Anecdotal evidence indicated that trenches and service pits associated with the former Roundhouse which was present in this area may have been backfilled with building rubble including ACM, although investigation to date has not uncovered any.
The Escarpment	Lead	Lead-impacted soil which may present a risk to future Intrusive Maintenance Workers (i.e. workers installing or maintained subsurface conduits) is present in the exclusion zone surrounding a telecommunications cable in this area.
The Precinct North	Lead	Lead impacted soil which may present a risk to future Intrusive Maintenance Workers is present: • On the eastern site boundary • In the soil surrounding the Main Hobart Sewer line
	Petroleum Hydrocarbons	Hydrocarbon impacted soil which may present a risk to future Intrusive Commercial Workers is present on the eastern site boundary.
The Precinct South	Lead	Lead-impacted soil which may present a risk to future Intrusive Maintenance Workers (i.e. workers installing or maintained subsurface conduits) is present on the boundary with the Precinct North. Impacts do not extend into the Precinct North at depths <2 m bgl, following remediation in 2020.
The Gateway	Coal Tar	Coal tar, associated with the historic Hobart Gasworks, has been detected in soil in the south and southwest sections of the of the Gateway area
Audit Area 4 East	Asbestos	Fragments of corrugated roofing materials between 5 and 300 mm in size were detected within an embankment within Audit Area 4 East, adjacent to the boundary with the Escarpment.

These areas are shown on **Figure F5**. Further detail on the location and extent of these impacts, and management controls required for safe future works in the vicinity of these impacts, can be found in the area fact sheets in **Appendix C**, and should be consulted for prior to subsurface works in these areas.

3.3 Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) were routinely conducted for monitoring groundwater wells located on-Site between January 2015 and November 2019.

Groundwater sample analytical results have been assessed against adopted Tier 1 Criteria for the following uses:

- Drinking water

- Irrigation
- Industry
- Stock watering
- Ecosystem protection
- Recreation - Primary and Secondary Contact
- Aesthetics
- Buildings and Structures
- Vapour Intrusion – Residential and Commercial/Industrial.

The following CoPC have been detected in excess of one or more of the adopted Tier 1 criteria in soil samples collected from the Site:

- Total Dissolved Solids (TDS)
- TPH - C_{10}-C_{36},
- TRH - C_{10}-C_{40}
- Benzene, naphthalene
- PAHs – anthracene, benz(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, chrysene, pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, dibenzofuran, phenanthrene, fluoranthene, 2.4-dimethylphenol
- Metals – aluminium, arsenic, boron, cobalt, copper, iron, lead, manganese, vanadium, zinc
- Ammonia (as N), chloride, sodium, phosphorus, sulphate
- Cyanide
- E. Coli
- pH.

Further information on exceedances of the adopted Tier 1 Criteria for areas of the Site where a CUTEP submission has been made can be found in **Appendix C**. Although exceedances of the Tier 1 criteria are present in these areas, they may be managed by implementation of the safety and environmental control measures in this SEMP.

3.4 Non-Aqueous Phase Liquids

3.4.1 LNAPL

Measurable Light Non-Aqueous Phase Liquid (LNAPL) has been noted in the central and south-eastern portions of the Site, associated with LNAPL Plume A1, Plume A2 and Plume B. It is noted that LNAPL was previously detected at Plume A3 in the Precinct North area but has not been detected since 2017.

A detailed assessment of LNAPL impacts and remediation conducted at Site has been reported in the *Assessment of LNAPL Remediation End-Points* (AECOM, 2020e). This report concluded that:

- Further recovery of LNAPL is considered to be impracticable.
- The LNAPL plumes are sufficiently stable.
- Based on the current development plan for the Site, no unacceptable risks to current or future human or ecological receptors from LNAPL appears to be present, assuming that a SEMP or similar is implemented in order to minimise and manage potential risks for any interactions between groundwater, LNAPL and future Site users.

On this basis, further LNAPL remediation is not practicable or required. However, restoration of groundwater Protected Environmental Values (PEVs) is not practicable, and groundwater management will be required as discussed in **Section 4.10**.

3.4.2 DNAPL

Coal tar and gross tar impacts (dense NAPL [DNAPL]) have been identified within, and in proximity to, the former Hobart Gasworks footprint in the Gateway area.

The location of known NAPL impacts is shown on **Figure F3**.

3.5 Soil Vapour

Soil vapour monitoring events have been conducted across the Site between 2015 and 2019 at locations where concentrations of VOCs and SVOCs in soil or groundwater were in excess of the Tier 1 vapour intrusion criteria selected (as noted in **Section 3.2** and **3.3**), or in the vicinity of the LNAPL plumes (**Section 3.4**) to enable assessment of potential risks posed by soil vapour to potential future users of this area.

Assessment of potential vapour intrusion risks associated with the LNAPL plumes undertaken in *Soil Vapour and Indoor Air Investigations 2019* (AECOM, 2021b) surmised that soil vapour impacts associated with the LNAPL plumes do not present an unacceptable risk to the planned future uses of the Site.

Soil vapour investigations identified methane exists in potentially hazardous concentrations in the subsurface within the Precinct North and the Promenade and Underground Carpark Area. The risk from soil methane in the area assessed has been calculated as CS3 – Moderate Risk, as defined by *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020), and appropriate mitigation measures should be included in future building design in this area or when conducting works in potentially enclosed spaces, such as pits, trenches or conduits, in these areas.

3.6 Asbestos

Asbestos or ACM fragments have previously been observed in the following locations at the Site:

- Isolated small ACM fragments have been observed at the surface and encountered in fill material in the Promenade and Underground Carpark, and the Escarpment areas and have been collected and removed by the Corporation or a licensed asbestos subcontractor.
- Larger ACM fragments (5 to 300 mm in size) have been encountered in the side of an embankment in Audit Area 4 East.
- Asbestos fibres were detected in piping cladding in a former fuel line which was present beneath the Precinct North and Precinct South areas. This pipeline has been removed within the Precinct North but is still present beneath the Precinct South and will require removal or further management prior to development of this area of the Site.
- Asbestos has been observed within the Goods Shed building.

An Asbestos Register has been prepared for the Site, and this register should be referred to prior to undertaking works on the Site.

In the event that potential ACM is encountered in soil during subsurface works, all activities are to cease immediately in the immediate work area. A suitably experienced environmental practitioner should be consulted to provide advice regarding the removal and management of ACM in soils prior to works re-commencing.

4.0 Management of Environmental Risks

4.1 Overview

The following sections provide details of measures to be implemented to manage potential human health risks.

This SEMP provides a framework for soil and groundwater management measures associated with subsurface works such as the excavation and/ or disposal of soil and importation of fill material, as well as the requirements and maintenance of barriers designed to mitigate direct and indirect contact with contaminated soils.

As previously noted, should any activities need to occur at the Site that are not currently covered in the SEMP, then the Site Owner/ Manager should update the SEMP to include these activities, where relevant. Alternatively, should the requirement for a more specific environmental management application be determined, a Construction Environment Management Plan (CEMP) may be required which addresses the proposed tasks and how the works shall comply with the general requirements of the SEMP. It is likely that a CEMP will be required during any future significant construction or development programs which occur on the Site.

The following is a list of appropriate legislative and regulatory guidelines that have been considered in the production of this SEMP:

- National Environment Protection Council, *National Environment Protection (Assessment of Site Contamination) Measure 1999* (as amended in May 2013) [ASC NEPM]
- Tasmanian Government *Environmental Management and Pollution Control (Waste Management) Regulations 2010*
- Tasmania EPA (2018) Information Bulletin No. 105, *Classification and Management of Contaminated Soil for Disposal* (IB105).

4.2 Preventative Exposure Measures

Preventative exposure measures provided in this SEMP can be categorised as follows:

- **Physical Barriers**: Placement/maintenance of a permanent barrier (i.e. concrete, asphalt, clean soil etc.) to mitigate unrestricted access/exposure to the underlying contamination (as described in **Section 4.6**).
- **Administrative Measures** such as:
  - Management plans/documents (such as this SEMP or a WHSP) that provide control of the activities and/or use of the areas of the Site as described in **Section 4.3**.
  - Planning controls as described in **Section 2.3** and **Section 4.4**.
  - Site inductions.
- **Personal Protective Equipment (PPE)** as described in **Section 4.5** to mitigate exposure to potentially harmful chemicals in soil and groundwater during subsurface works.

In some cases, it may be necessary to employ multiple preventative exposure measures, beyond the SEMP, that act as a contingency (or 'fail-safe'). For example, two physical barriers (e.g. concrete and plastic marker layer), or a physical barrier (concrete) combined with an administrative barrier (management plan).

4.3 Work Health and Safety Plan

It is recognised that as part of current and proposed future uses of the Site, it may be necessary to undertake intrusive works. Such activities increase the exposure to potentially impacted materials and therefore protective measures are to be adopted prior to work commencing.

Any works conducted on the Site should be undertaken in accordance with a WHSP. This WHSP should provide guidance with respect to the minimum PPE requirements where workers are likely to come into contact with potentially contaminated materials. Specific Safe Work Method Statements (SWMS) for each task to be performed should also be included in the WHSP.

ANY COMPANY/CONTRACTOR ENGAGED TO CONDUCT SUBSURFACE WORKS AND/OR EARTHWORKS ON THE SITE MUST PREPARE A SITE-SPECIFIC WHSP COVERING THEIR WORKERS AND PLANNED ACTIVITIES.

The following is an overview of WHS considerations for any works that may be undertaken, at a minimum, at the Site:

- Identification of WHS roles and responsibilities
- Evaluation of the Site hazards and the risks associated with these hazards
- Risk assessment methods and the risk control measures
- Details on work practices and restrictions, assessment of anticipated protection levels (including PPE), controls on access to the Site and decontamination
- Methodology for handing and management of soil and groundwater in accordance with **Section 4.9** and **Section 4.10** (if required)
- Detail regarding appropriate ventilation of the work area
- First aid and emergency procedures
- The notification of accidents and other matters
- Environmental monitoring protocols.

Appropriate WHS measures should be established by the contractors for personnel involved in subsurface works at the Site. The levels of protection and the procedures specified in this section are related to contamination issues only and do not represent a WHSP for the Site.

The ultimate responsibility and authority for the health and safety of the individual rests with the individual themselves and their colleagues. Each worker is responsible for exercising utmost care and good judgment in protecting his or her own health and safety and that of fellow workers. It is the responsibility of Site owners and those working on Site to bring any observed potentially unsafe condition or situations to the attention of any worker or contractor. Should workers find themselves in a potentially hazardous situation, they should immediately discontinue the hazardous procedure and take effective corrective or preventative action.

All incidents and/or near misses pertaining to works carried out on Site should be reported immediately to the owner or occupier of the area of the Site in which they occur.

4.4 Planning Controls

Development of the Site as described in **Section 2.3** is intended under the following restrictions:

- Development of an area will not proceed without an area-specific Contaminated Land Audit Report issued by an Environmental Auditor approved under Section 37 of the *Macquarie Point Development Act 2012*. Modifications in Site uses or development (i.e. planning for residential uses in an open space area) will require approval by a Contaminated Land Auditor.
- The Site surface will be covered with either hardstand and/or an engineered break layer, as specified in **Section 4.6** of this SEMP, which shall be implemented to provide a framework for ongoing maintenance and management of the Site during future use.
- Prior to commencement of building-related works within the Goods Shed, or any other structures within the Goods Shed and Yard area, a suitably qualified occupational hygienist should be consulted to confirm the nature and extent of ACM in the work area (if any), and to provide advice regarding the removal and management of ACM.

- The existing hardstand and flooring of the Goods Shed (including the slab, raised platform areas, crawl spaces and hard coverings etc.) remains *in situ*. In the event that the existing hardstand is partly or wholly removed, and/or changes to the configuration and/or penetrations are made, where the hardstand was placed directly above soils (e.g. slab on-grade), hardstand is to be reinstated to at least the minimum specification noted in **Section 4.6**.
- No ground floor residential uses will be included in developments in the Promenade and Underground Carpark, and Precinct North areas. Residential uses may be allowed on the first floor and above.
- The design of the Underground Carpark in the Promenade and Underground Carpark area should consist of the following:
  - A single level carpark excavated to a depth of 2.5 to 3.5 m bgl. The base of the carpark should be located approximately 1.5 m above groundwater.
  - The carpark roof should be located between 0.5 to 1 m above the current surface area, with an open ventilation space present surrounding the structure.
  - Any conduits or services which run beside or beneath the carpark at a depth of >2 m bgl should be installed in protective shrouds or in trenches/corridors of clean fill and no contact with soil beneath the carpark (i.e. for maintenance works) is expected as part of future carpark usage.
  - The Underground Carpark should be ventilated in accordance with ventilated in accordance with Building Code of Australia (BCA) requirements to deal with exhaust fumes.

  Final carpark design will be determined by a Site developer. Any significant changes to the proposed design should be reviewed by a qualified environmental practitioner and approved by an Contaminated Land Auditor and will require update of this SEMP.
- The potential exists for methane migration into buildings or structures in the Promenade and Unground Carpark and Precinct North areas during development. *Soil Vapour and Indoor Air Investigations 2019* (AECOM, 2021b) assessed the risk from soil methane as Characteristic Situation 3 – Moderate Risk (CS3), as defined by *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020). Based on this rating, and the proposed future development of the area (Arts/Institutional) a minimum gas protection guidance value of 3 should be incorporated into the future development. The potential for methane infiltration of confined spaces in these areas of the Site (such as pits, trenches or conduits) should be considered when planning and managing works.

It is noted that if the proposed Underground Carpark is ventilated in accordance with BCA requirements to deal with exhaust fumes, it should also provide sufficient protection from methane infiltration as per EPA NSW, 2020. If the Underground Carpark is not designed and constructed to BCA standards, methane protection measures should be advised by a qualified environmental practitioner and approved by a Contaminated Land Auditor.

4.5 Personal Protection Equipment

It is the responsibility of the contractor carrying out the works on-Site to develop SWMS for works to be undertaken, including the relevant PPE to be worn by the Site workers. This SWMS should be approved by the owner or occupier of the area of Site where works are occurring. The typical minimal level of PPE required for subsurface works includes:

- Neck to toe high visibility clothing
- Hard hat when working with plant equipment (i.e. excavator or similar)
- Protective gloves (Note: Impervious gloves are to be worn if there is potential for contact with potentially contaminated soil and/or groundwater. Gloves should be checked regularly for wear and tear and replaced when necessary).
- Steel-toed boots

- Safety glasses
- Other appropriate PPE as directed by the worker's Site Safety representative. This may include:
  - Disposable coveralls
  - Dust masks

A first-aid kit, with eye wash bottle and manual should also be available in the work area.

4.6 Physical Barriers

The following is to be considered with regard to the management of potential human health risks at the Site:

- The Site surface should be maintained with hardstand or an earthen cap to prevent direct human access to soil. In the event that the existing hardstand is partly or wholly removed, and/or changes to the configuration and/or penetrations are made, the following would be required:
  - Further assessment to evaluate potential impact to future users.
  - Reinstatement of hardstand, or placement of an earthen cap.

  It is noted that confirmation of the design of all proposed hardstand or earthen cap areas (i.e. thickness and material type) with a Contaminated Land Auditor is required prior to placement.
- In the event that the existing hardstand is partly or wholly removed, and/or changes to the configuration and/or penetrations are made, the following minimum design barrier shall be installed, unless otherwise agreed to with a Contaminated Land Auditor. Note that consideration will need to be given to the intended use of the hardstand area during the design process to ensure the hardstand is suitable for the anticipated loads (e.g. light or heavy vehicles):
  - *Layer 1*: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users/ maintenance workers.
  - *Layer 2*: Sub-grade/ base material (minimum 0.2 m) certified as 'Fill Material' in accordance with Tasmanian EPA Bulletin 105 and be geotechnically suitable.
  - *Layer 3*: Surface covering such as concrete or asphalt at a thickness suitable for the intended use (e.g. light or heavy vehicles). Asphalt shall be a minimum 30 mm thickness to allow for longevity of the barrier.
- Landscaped areas and gardens should be established in above ground planter boxes on hardstand and not directly over exposed soil. In the event that gardens are proposed in-ground, the following barrier system shall be installed:
  - *Layer 1*: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users.
  - *Layer 2*: Earthen cover (minimum 0.5 m) certified as 'Fill Material' in accordance with Tasmanian EPA Bulletin 105.
  - *Layer 3*: Surface coverage (comprising shallow rooted vegetation).

  Allowance may be made for the establishment of deep rooted vegetation; however, the barrier thickness may need to be increased, or the design modified. In-ground garden designs should be confirmed with a Contaminated Land Auditor.

Modifications of the land use and/or the configuration of the Site surface may result in a potential human health risk due to exposure to contamination in the subsurface. This includes (but is not limited to) the following:

- Construction of new buildings.
- Modification of existing buildings.
- Any subsurface excavation works.

- Modification of the existing surface profile (specifically with respect to excavation and/or levelling of soil).
- Modification of the existing surface coverings (e.g. replacing a concrete area with turf).

The Site surface is presently covered with a mixture of concrete, asphalt, and imported clean VENM in areas where remediation has occurred in.

Section 4.9 provides further guidance with respect to conducting excavation works on the Site. It is critical that in the event that the existing physical barriers are modified or removed during any future works, then they must be reinstated to a minimum of the same standard/quality that exists at that location currently.

In the event that variation from the barrier requirements within this SEMP are required, the suitability of the proposed barriers should be confirmed with a Contaminated Land Auditor prior to implementation.

4.7 Chemical Exposure

The following compounds have been identified as CoPC in soils and groundwater that may pose a potential human health risk:

- Heavy metals
- PAHs
- TRHs
- Benzene
- ACM
- Methane.

A summary of the potential symptoms of exposure is provided in **Appendix D**. Potential exposure to these CoPC should be managed through the implementation of measures provided in a Site-specific WHSP (refer **Section 4.3**).

4.8 Unexpected Finds

In the event that unexpected finds are encountered during intrusive works which have the potential to cause harm to human health or the environment, works shall cease and the area isolated. The Site owner or occupier should then immediately be informed.

An unexpected find may include (but not be limited to):

- ACM (see **Section 3.6**)
- UST
- Redundant pipework and abandoned services (as discussed in **Section 2.4**)
- Historic artifacts (Aboriginal and European) (see **Section 4.8.1**).
- Former gasworks infrastructure.

The material should be appropriately assessed by an experienced environmental or health and safety practitioner (depending on what the material is) and disposed/treated in a suitable manner with consideration to the guidance outlined in **Section 4.9**. Historic or artifact finds should be managed as described in **Section 4.8.1**

It should be noted that during previous Site investigations, redundant pipes and other abandoned services have been encountered which are not on any records and the origin and purpose of which remains unknown. There remains further potential for unidentified pipes to be discovered during subsurface works. Underground service location surveys are to be completed prior to the commencement of subsurface works and due caution taken as part of any excavation.

Further to the above, if subsurface works are to be undertaken within the Gateway area, or in proximity to the former Hobart Gasworks, reference is made to recommendations provided in Workplace Standards Tasmania *Safety Alert No. 1 September 2010* with regard to working near historical gas infrastructure.

4.8.1 Protocol for Management of Unanticipated Archaeological Discoveries

The potential exists for unexpected Aboriginal and European artifacts to exist in Site soil. Portions of the Escarpment, Gateway and Promenade and Underground Carpark areas have been identified as a Place of Archaeological Significance in the *Sullivans Cove Planning Scheme.*

The following outlines the protocol for managing Unanticipated Historic (European) Archaeological Discoveries. Separate legislative and procedural requirements exist for Aboriginal heritage and these are documented in the Unanticipated Discovery Plan (attached as **Appendix H**).

Archaeological investigations have taken place at Macquarie Point since 2008 through a series of test and controlled excavations, principally at the western end of the site. These works assist in understanding subsurface archaeological conditions and the potential of certain locations within Macquarie Point to contain archaeological features. Based on these insights, some inferred judgments have been made on:

- The potential, or likelihood for particular areas to contain subsurface archaeology; and
- The likely significance of such features or deposits.

Figure 2 shows the inferred areas archaeological sensitivity of the Site based on works completed to date.

Figure 2 Areas of Inferred Archaeological Sensitivity

However, it is highly likely that unanticipated archaeology will be encountered during excavation works because of the diversity and widespread nature of past development on the site and the limited insights available from historical research and excavations.

To account for such finds, project specifications for works must consider the potential for dealing with unanticipated discoveries. The Sullivans Cove Planning Scheme 1997 includes specific requirement as part of its requirements for Archaeological Sensitivity Reports, terming such protocols a 'watching brief'.

Features may include but not be limited to the exposure of handmade clay bricks or sandstone blocks forming walls or surfaces, or artefacts such as fragments of ceramic, bottle glass, bone, shell or other items. Where such material is found, or where doubt exists, excavations within the area should cease pending attendance on site and receipt of advice from a qualified archaeologist, at which point, depending on the findings, it may also be necessary to involve Hobart City Council in discussions.

What if any further archaeological management is required will depend on the significance of the discovery. This will largely be a question of its thematic context; its potential to provide new and important information; and its condition. Management may vary from no further action, to recording of exposed features, to further archaeological monitoring, testing or controlled excavation in accordance with Parts 4 to 8 of the Tasmanian Heritage Council's *Practice Note 2: Managing Historical Archaeological Significance in the Works Application Process.*

4.9 Soil Management Plan

The management of soils at the Site must have regards to the provision of both the *Environmental Management and Pollution Control Act 1994* and IB105.

4.9.1 Excavated Material

In the event soil needs to be excavated, excavated materials shall be stockpiled in a designated area and must be labelled as contaminated, until the material is reinstated to the excavation which it was removed from, or the contamination status is assessed by sampling and analysis of the stockpiled material for the purpose of off-Site disposal (refer to **Section 4.9.3**). Exclusion zones or barriers should be maintained around excavations to prevent access by unauthorised people who may fall into excavations or come into contact with the soil.

The stockpiling area is to be on hardstand or high-density polyethylene (HDPE) sheeting. Stockpiles should be appropriately managed to prevent the loss of suspect soils as dust (via wind erosion), or stormwater runoff.

This may involve:

- Covering, or spraying the stockpiles to keep the soil damp to mitigate wind erosion.
- Construction of silt fences and other measures to capture and prevent runoff from the area.
- Establishment of exclusion zones or barriers to prevent access and contact with soil by unauthorised people.

Stockpiling for an extended period of time should be avoided in order to mitigate potential environmental impacts such as dust and odour generation, and stormwater and sediment run off.

Soils with potentially high levels of contamination encountered during excavation work must be separated and stockpiled from other non-odorous, visibly clean soils, and assessed by a suitably experienced environmental practitioner. Soils which should be separated in this way may be identified by one or more of the following attributes:

- Containing coke, ash, coal tar, ACM fragments, or other visually evident contamination
- Highly odorous (i.e. putrescible, aromatic or hydrocarbon odours)
- Visibly stained (i.e. hydrocarbon staining or other)
- Soil which appears to have been in contact with groundwater
- Soil excavated from the areas of notable soil impacts as noted in **Section 3.2.3**.

Records of excavated soil and stockpile movements, including, but limited to, the location of materials excavated, quantities, descriptions of materials encountered, laboratory test certificates, disposal location, and tip dockets, should be maintained by the Site owner or occupier.

4.9.2 Dust Management

This section is applicable to works associated with subsurface excavation and soil movement. It is expected that normal operation of the Site, or intended future uses, will not require the implementation of dust and odour controls.

The following measures that can be undertaken to assist with mitigating issues associated with dust and odours should be considered when planning soil excavation or movement on the Site:

- Minimise movement of vehicles on exposed surface areas
- Minimise excavation and movement of soils
- Dampen down vehicle tracks with water
- Trucks transporting soil around and off-Site should have their loads covered with tarpaulins (or similar) to prevent the emission of dust and/or odour
- Dampen down exposed soil in excavations, or in stockpiles, to minimise dust generation

- Dampen down exposed soil, stockpile, or loads, with an environmentally appropriate odour suppressant solution
- Avoid excavating soil on windy days, due to the increased likelihood of dust and odour generation and transport
- Cover exposed soil (i.e. stockpiles) with netting, matting or plastic sheeting if necessary, to minimise generation of dust and odours.

4.9.3 Characterisation for On-Site Reuse/ Off-Site Disposal

Due to the heterogeneous nature of fill material at the Site, it is recommended that excavated materials be stockpiled (or stored within a skip/drums) and appropriately characterised for on-Site re-use or off-Site disposal by a suitable qualified environmental practitioner on a case by case basis.

It is noted that in accordance with IB105, on-Site remediation, treatment and/or re-use is the preferred approach to the management of contaminated soil.

A recommended approach for characterising excavated materials is provided in the following sections.

4.9.3.1 On-Site Reuse

To assess the suitability for excavated materials to be re-used on Site, it is recommended that soil data be screened against the interim Remediation Criteria (RC) developed by AECOM (refer AECOM, 2016) and listed in **Appendix G**. The interim RC considers that the Site will be mostly covered with hardstand, with opportunities for direct access to future Site users within areas of landscaping considered likely to be minimal and more likely to result in contact with imported materials rather than current Site soils. This land use scenario is also considered to be applicable for the proposed interim Retail and Commercial uses at the Site.

In addition to the consideration of contaminant concentrations in soils, material exhibiting aesthetic impacts such as discolouration (i.e. stained from spills), odours, or wastes should not be reused on-Site unless managed by placement of an impervious barrier (i.e. placement of physical hardstand).

Where existing soil data for the subject material is not available, material should be sampled at a rate of 1 sample per 25 m^3 (or three samples as a minimum) and analysed for:

- Heavy Metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, vanadium, and zinc)
- TPH
- BTEX
- PAH
- Cyanide
- Phenolic compounds.

If it is suspected that other contaminants may be present (e.g. asbestos), these should also be included in the analytical suite.

Where compounds are reported below the interim RC, soils may be reused on-Site and covered with an impervious barrier (i.e. placement of physical hardstand). In cases where compounds are reported above the interim RC, an appraisal as to whether the material is suitable for on-Site reuse (with consideration to the implementation of additional management controls) should be undertaken by an appropriately experienced environmental practitioner.

4.9.3.2 Off-Site Disposal

If off-Site disposal of excavated material is planned, stockpiles or waste in soil drums must be sampled and analysed for waste characterisation purposes prior to removal from Site in accordance with IB105.

Material should be sampled at a rate of 1 sample per 25 m^3 (or three samples as a minimum) and analysed for compounds listed on Table 2 of IB105. Alternative sampling suites and/or density may be accepted by EPA and waste disposal facilities, but any change from the sample suites and sample density should be determined by a suitably qualified environmental practitioner.

Table 8 below provides an overview of soil disposal options with reference to IB105.

Table 8 IB105 – Waste Classification Summary

EPA Classification	Disposal/ Treatment Options	Requirements
Level 4 (Contaminated Soil for Remediation)	• On-Site remediation • Off-Site remediation • Storage pending availability of treatment	• No direct disposal to landfill • EPA Environmental Approval and transport certificates must be used • Vehicles must hold EPA permit (unless exemption issued)
Level 3 (Contaminated Soil)	• On-Site remediation • Off-Site remediation • Licensed landfill	• Disposal to licensed facility • EPA Environmental Approval and transport certificate system must be used • Vehicles must hold EPA permit (unless exemption issued)
Level 2 (Low Level Contaminated Soil)	• On-Site remediation • Off-Site remediation • Licensed landfill	• Disposal to licensed landfill • EPA Environmental Approval and transport certificate system must be used • Vehicles must hold EPA permit (unless exemption issued)
Level 1 (Fill Material)	• Unrestricted	• Disposal should not adversely impact the environment or human health

A Waste Management Plan (as detailed in Section 5.2 of IB105) must be prepared and submitted to EPA for approval for disposal of any material which is classified as *Level 2 (Low Level Contaminated Soil)* or above.

Soils and excavated materials classified as *Level 4 (Contaminated Soil for Remediation)* must be remediated (either on-Site or off-Site) and are unable to be disposed directly to landfill without treatment.

4.9.4 Imported Material

Any materials imported to the Site for use as fill will be required to meet the environmental and geotechnical requirements specified for the particular end use. Material should comply with the requirements for reuse as defined in IB105 and should be assessed and below the site specific RC as defined in **Appendix G**.

Compaction of backfill should be applied such that the reinstated areas will not settle.

4.9.5 Surface Reinstatement

Where hardstand has been removed to facilitate excavation activities, it is recommended that the surface be reinstated with like materials (i.e. concrete with concrete), or with a physical barrier which fulfils the requirements described in **Section 4.6**.

4.10 Groundwater Management Plan

Groundwater from beneath the Site should not be extracted for any purpose other than environmental monitoring, assessment or remediation.

Depth to groundwater across the Site has ranged from approximately 1 to 6 m bgl. The average depth to groundwater beneath the Site is 1.5 m bgl. The potential exists for groundwater to be encountered during subsurface works that extend to 1.0 m bgl and beyond beneath the Site. Groundwater may also be encountered at shallower depths at select locations.

Groundwater which ponds in open excavations or infiltrates into subsurface infrastructure (i.e., service trenches or conduits) which needs to be removed for logistical considerations should be removed by a licensed waste contractor, or alternatively treated and disposed to sewer under a Site-specific Trade Waste Agreement (subject to regulatory approval).

4.10.1 Groundwater Monitoring Wells

Where possible, excavations should avoid damage to groundwater monitoring wells. The integrity of groundwater monitoring wells should be maintained to facilitate potential future groundwater monitoring events. The locations of groundwater monitoring wells are provided in **Figure F4a** in the **Figures** section.

4.11 Noise Control

This section is applicable to works associated with subsurface excavation and soil movement. It is expected that normal operation of the Site, or intended future uses, will not require the implementation of noise controls.

Works with heavy plant or other equipment which is has the potential to cause noise above background levels should be conducted in accordance with the *Construction Noise Management Plan* (CNMP), attached as **Appendix F**.

5.0 Implementation

The SEMP is an active document, which needs to be considered by all parties/stakeholders who may plan or undertake works which come into contact with Site soil or groundwater or access confined spaces where groundwater or soil vapour infiltration may occur. Any parties carrying out such works at the Site shall satisfy themselves that suitable safety and environmental controls have been implemented as part of their proposed works program.

Should any activities by the Site owner or occupier, or with their consent, need to occur on the Site that is not currently covered in the SEMP, then the SEMP should be updated to include these activities. Alternatively, as stated in **Section 4.1**, a CEMP may be required which specifically addresses the proposed tasks and how the works shall comply with the general requirements of the SEMP.

5.1 Site Inspection

Visual inspections of the Site should be undertaken by the Site owner or occupier (or nominated representative) annually to assess the surface condition of the Site. Where excavations have taken place, and excavations have been backfilled, the surface is to be reinstated with an impervious barrier (i.e. placement of physical hardstand).

If significant works are undertaken, or breaches or damages to surface protections are detected, inspection of the affected area should be undertaken at the time of works, and at the completion of modifications of the area, or repairs to damaged surface coverings.

Where this has not been undertaken, corrective actions will be required to reduce the risk to an acceptable level to such an extent that it no longer presents an unacceptable risk to human health or the environment.

A register of the completion of visual inspections and documentation associated with works completed subsequent to inspections identifying the need for corrective actions should be maintained by the Site owner or occupier.

The register of inspections should include (but not be limited to) the following:

- Time and date of the inspection and/or incident
- Details of any visual indications of changes to surface conditions at the Site
- Details regarding the cause (suspected or known) of the breach
- Details and documentation associated with works undertaken in the reinstatement of surface condition
- Details of any systems or procedures implemented to prevent similar breaches or deteriorations in the future.

5.2 Incident Management

All environmental incidents should be recorded, and if an incident or potential incident is likely to cause significant impacts to people or the environment, the Site owner or occupier should be immediately notified.

Environmental incidents, accidents or mishaps include:

- An accident (actual environmental impact)
- A near miss (‘near miss’ where no environmental impact occurred)
- A dangerous occurrence (event posing a risk to the environment or damage of property).

Records shall be kept by the Site owner or occupier of any environmental incidents, hazardous situations, unusual events and the corrective action taken. A representative of the Site owner or occupier should investigate the cause of any emergency so that necessary changes in work practices can be made to prevent the incident recurring.

5.3 Corrective Actions

In the event that Site conditions result in an accidental or unintentional risk to human health or the environment without implementation of appropriate exposure minimisation measures, isolation of the affected area should be undertaken and steps taken by the most suitable and effective means to prevent exposure to Site personnel.

Following this, the SEMP should undergo a review of all procedures to minimise the potential for future exposure of impacted material. Corrective actions should be completed in a manner and timing as directed by the Site owner or occupier.

Following the incident or accident, a documented review of the incident should be undertaken by the Site owner or occupier (or their nominated representative). The review should be tasked with identifying the cause of the incident and providing recommendations on alternative procedures or systems to be implemented at the Site and/or within the SEMP to prevent/minimise the likelihood of the incident reoccurring.

5.4 Document Revision

A review of the SEMP should be undertaken every three years, or earlier if significant changes in the use or conditions of the Site occur, by the Site owner or occupier (with input from specialist professionals where required), and should consider:

- Any non-compliances with the SEMP that have not been rectified
- Means of improving environmental compliance
- Legislation or guidelines that impact any part of the SEMP
- Proposed changes in the way the areas of the Site are used or any changes in the surrounding land use which may impact upon exposure pathways.

The SEMP should be updated as necessary, based on the results of reviews of the SEMP.

5.5 Record Keeping

The Site owner or occupier will be responsible for keeping documents relating to the implementation of the SEMP, including (but not limited to):

- The outcomes of additional soil assessments or modifications in the future Site uses.
- A SEMP maintenance register (including superseded versions of the SEMP, Site inspection documents, permits and correspondence between, and training records of, people who have been inducted onto the SEMP.
- Documentation of the following:
    - Materials tracking and disposal
    - Unexpected finds
    - Environmental incidents which occur on Site.

Area Specific Contamination Summaries

Goods Shed and Yard Contamination Summary

Historical activities undertaken within The Goods Shed and Yard area have resulted in the presence of residual soil and groundwater contamination. Multiple phases of soil, groundwater and soil vapour investigations have been undertaken to assess the nature and extent of contamination.

The following sections provide an overview of identified soil and groundwater impacts in this area. It is noted that no remediation of this area has been required in order to fulfil the future development plans, and this has been validated and approved by the Contaminated Land Auditor in *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1* (Coffey, 2019).

Identified Soil Impacts

Fill has been identified beneath the Goods Shed and Yard area from the surface to depths of 7 – 10 m below ground level (bgl). Field observations indicated that fill material is heterogeneous comprising silts, sands with dolerite gravels and cobbles with occasional rubble, glass, metal fragments, coal, coke and ash. A slight hydrocarbon odour was noted at two sampling locations (BH36 and MW127), and a slight hydrocarbon sheen was also noted during the drilling of the soil bore for groundwater well MW127.

The field observations and the presence of Chemicals of Potential Concern (CoPC) above the adopted soil investigation (Tier 1) criteria are likely to have occurred as a result of the placement of fill material associated with the former Hobart Gasworks, or potentially from impacted fill material imported to the site for land reclamation.

Concentrations of Polycyclic Aromatic Hydrocarbons (PAHs), Total Petroleum Hydrocarbons (TPH) / Total Recoverable Hydrocarbons (TRH) and select metals were reported in soil above the adopted Tier 1 criteria for the following Protected Environmental Values (PEVs):

- Residential, Recreation/ Open Space or Commercial/ Industrial Land Uses
- Maintenance of Modified and Highly Modified Ecosystems.

Table 1 below provides a range of concentrations of CoPC (or general CoPC groups) identified within the Goods Shed and Yard area that have been reported above the adopted Tier 1 criteria.

Table 1 Summary of Soil Analytical Results

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Lead	<5	1,640
Nickel	<2	77
Copper	<5	248
Zinc	6	2,820
TRH (C_{10}-C_{40})	<50	10,500
Benzene	<0.1	0.8
Total PAHs	<0.5	2,310

Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) have been routinely conducted for wells located within the Goods Shed and Yard area since January 2015.

Over this timeframe, groundwater samples have had concentrations reported of a combination of arsenic, cobalt, iron, manganese, zinc, ammonia, sodium, chloride, TDS and sulphate, above the adopted Tier 1 assessment criteria for groundwater PEVs.

Table 2 below provides a range of CoPC concentrations (or general CoPC groups) identified within The Goods Shed and Yard area that have been reported above the adopted Tier 1 criteria.

Table 2 Summary of Groundwater Analytical Results

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Arsenic	<0.001	0.021
Cobalt	<0.001	0.012
Iron	0.46	34
Manganese	0.004	2.48
Zinc	<0.005	0.23
Ammonia	<0.001	26
Total Dissolved Solids (TDS)	38	3,650
Sodium	<1	930
Chloride	3	4,400
Sulphate	<1	930

Asbestos

Whilst asbestos has not been identified in soil during previous environmental investigations, there is potential that Asbestos Containing Material (ACM) may be encountered during intrusive works or require management as part of building refurbishment activities within the Goods Shed and Yard area.

Asbestos has been noted within the Goods Shed building.

The Escarpment (Audit Area 4 West) and Audit Area 4 East Contamination Summary

Historical activities undertaken within the Escarpment and the Audit Area 4 East areas have resulted in residual soil and groundwater contamination. Multiple phases of soil and groundwater investigations have been undertaken to assess the nature and extent of contamination.

The following sections provide an overview of identified soil and groundwater impacts at these areas of the Site. It is noted that remediation of soil impacts in the Escarpment area was conducted in late 2019 and early 2020 as reported in *Audit Area 4 – Remediation Validation* (AECOM, 2020b).

Validation and Contaminated Land Auditor approval of this remediation has been received in *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West* (Coffey, 2020), and no further Remediation is anticipated for the proposed future development of the Escarpment. However, further remediation and Auditor approval is required for Audit Area 4 East prior to future development.

Identified Soil Impacts

In the Escarpment and Audit Area 4 East areas, fill material consists of crushed stone/ballast, silt and clayey gravels with occasional rubble, brick and wood fragments.

Concentrations of Polycyclic Aromatic Hydrocarbons (PAHs), Total Petroleum Hydrocarbons (TPH) / Total Recoverable Hydrocarbons (TRH) and select metals were reported in soil above the adopted Tier 1 criteria for the following Protected Environmental Values (PEVs):

- Residential, Recreation/ Open Space or Commercial/ Industrial Land Uses
- Maintenance of Modified and Highly Modified Ecosystems.

Error! Reference source not found. below provides the range of concentrations of Chemicals of Potential Concern (CoPC) (or general CoPC groups) identified within the Escarpment and Audit Area 4 East areas that have been reported above the adopted Tier 1 investigation criteria.

Table 1 Summary of Soil Analytical Results

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Lead	<5	1,070
Nickel	3	62
Arsenic	<5	552
Copper	12	828
Zinc	16	1,220
TPH (C_{16}-C_{34})	<100	4,170
TPH (C_{10}-C_{16})	<50	5,680
TPH (C_{10}-C_{16}) (minus Naphthalene)	<50	5,670
TPH (C_6-C_{10}) (less BTEX[1])	<10	53
Benzo(a)pyrene	<0.5	46.4
Total PAHs	<0.5	464

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Naphthalene	<0.5	17
Dibenz(a,h)anthracene	<0.5	7.1
Indeno(1,2,3-c,d)pyrene	<0.5	24.3

Note: 1. BTEX – benzene, toluene, ethylbenzene and xylenes

Lead Impacted Soil in Telecommunications Cable Exclusion Zone (the Escarpment)

During remediation works in the Escarpment, a lead concentration of 1,600 mg/kg was reported in soil validation sample CB-EX-41, collected from the boundary of the 2 m buffer zone surrounding the major telecommunications cable in the former Concrete Batching Plant area of the Escarpment. The location of the lead detection is shown on **Plate 1** below.

Plate 1 Location of lead in soil detection in telecommunication cable exclusion zone

Due to the risk of damage to the cable from excavations in this area, the asset owner (Telstra) did not give approval for excavation of soil in the exclusion zone. The impact was assessed as localised and not typical of the material in the exclusion zone in the Remediation Validation report (AECOM, 2020b), and soil present within the exclusion zone has been isolated from clean fill using a 200 µm plastic liner (shown on **Plate 2** below).

Plate 2 Liner on the Western Boundary of the Telecommunications Cable

Future works in this area should consider the potential for lead impacts to be present if this soil is to be disturbed.

Asbestos in Audit Area 4 East

On 9 July 2020, contractors (Pitt & Sherry Pty Ltd) working for the Macquarie Point Development Corporation detected fragments of Asbestos Containing Material (ACM) in the embankment within Audit Area 4 East adjacent to the boundary with the Escarpment. The following was noted with regard to these fragments:

- The ACM encountered consisted of fragments of corrugated roofing material between 5 to 300 mm in size.
- ACM was typically encountered 400 – 600 mm below the ground surface.

All encountered ACM and surrounding soil were removed when encountered and the area was assessed by an occupational hygienist to be free of visual ACM. The hygienist indicated that the number of ACM fragments present appeared to increase in the northwest of the area cleared and may be present in the adjacent embankment in that direction.

The location where ACM was detected, and the potential area to the northwest, has been added to the Site Asbestos Register, and both areas are shown on **Plate 3** below.

Plate 3 Audit Area 4 East - Area of ACM Encountered

Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) have been routinely conducted for wells located within these areas since February 2015.

Over this timeframe, groundwater samples have reported concentrations of a combination of aluminium, iron, manganese, arsenic, boron, copper, vanadium, zinc, phosphorus, ammonia, total dissolved solids (TDS), chloride, sodium, BTEXN, TRH and PAHs above the adopted Tier 1 assessment criteria for select groundwater PEVs.

Error! Reference source not found. below provides a range of CoPC concentrations (or general CoPC groups) identified within the Escarpment and Audit Area 4 East that have been reported above the adopted Tier 1 criteria.

Table 2 Summary of Groundwater Analytical Results

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Aluminium (Filtered)	1.38	1.38
Iron (Filtered)	<0.05	6.22
Manganese (Filtered)	<0.001	5.1
Arsenic (Filtered)	0.001	0.019
Copper (Filtered)	<0.001	0.03
Vanadium (Filtered)	<0.01	0.18

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Zinc (Filtered)	<0.005	0.143
Phosphorus	1.2	1.2
Ammonia as N	<0.01	3.84
Total Dissolved Solids (TDS)	460	9010
Chloride	10	8890
Sodium	30	6300
Benzene	<0.001	0.003
Naphthalene	<0.001	0.332
Dibenzofuran	<0.005	0.015
pH (pH units)	7.21	11.1
TPH C10 - C36 (Sum of total)	<0.05	1.57
TPH >C10 - C40 (Sum of total)	<0.1	1.55
TPH >C_{10}-C_{16} minus Naphthalene (F2)	<0.05	1.59
Anthracene	<0.001	0.007
Fluoranthene	<0.001	0.007
Phenanthrene	<0.001	0.035

The Promenade and Underground Carpark Contamination Summary

Historical activities undertaken within the Promenade and Underground Carpark area have resulted in the presence of residual contamination within soil and groundwater. Multiple phases of soil, groundwater, light non-aqueous phase liquid (LNAPL) and soil vapour investigations have been undertaken to assess the nature and extent of contamination. The following sections provide an overview of identified soil, groundwater, LNAPL and soil vapour impacts at the Promenade and Underground Carpark area.

Soil, groundwater and LNAPL remediation works have been undertaken in or adjacent to this area, as discussed in the *Remediation Validation Report – Audit Areas 2 and 7 and Pipeline Removal* (AECOM, 2021d) and the *Goods Shed Remediation Validation Report* (AECOM, 2021e). The *Assessment of LNAPL Remediation End-Points* (AECOM, 2021b) report contains a detailed assessment LNAPL remediation conducted.

It is noted that completion of remediation in this area for the proposed future development has been accepted by the Contaminated Land Auditor in *Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark* (Coffey, 2021).

Identified Soil Impacts

Within the Promenade and Underground Carpark area and the surrounding buffer zone, fill material typically consisted of sand and gravel with occasional anthropogenic material including coal, coke, slag, ceramics, glass, metal fragments, wire, timber/wood, bone, rubber and general building rubble including brick, concrete and pipes.

Concentrations of a combination of Chemicals of Potential Concern (CoPC) including Polycyclic Aromatic Hydrocarbons (PAHs) [naphthalene, benzo(a)pyrene, benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, sum of PAHs], Total Recoverable Hydrocarbons (TRHs) [TRH >C_{10}-C_{16}, TRH >C_{16}-C_{34}, TRH >C_{34}-C_{40}, aliphatic TRH >C_{10}-C_{12}, aromatic TRH >C_{10}-C_{12}, aliphatic TRH >C_{12}-C_{16}, aromatic TRH >C_{12}-C_{16}, TRH C_6-C_{10} (minus BTEX) (F1), TRH >C_{10}-C_{16} (minus Naphthalene) (F2)] and metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc) in soil were reported above the adopted Tier 1 criteria for the following Protected Environmental Values (PEVs) and Site Derived Remediation Criteria (RC):

- Human Health – Direct Contact – Residential (low, and medium/high density), Recreation/ Open Space, and Commercial/ Industrial land uses.
- Human Health – Vapour Intrusion – Residential and Commercial/ Industrial land uses.
- Maintenance of Modified and Highly Modified Ecosystems.
- Aesthetics.
- Remediation Criteria – Residential (slab-on-grade with unknown construction or multi-storey building, low rise slab-on-grade, and building with basement), Commercial (slab-on-grade with unknown construction or multi-storey building, and working within a basement) and Maintenance Workers.

Table 1 below provides the range of CoPC concentrations (or general CoPC groups) identified within the Promenade and Underground Carpark area that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 1 Summary of Soil Analytical Results

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Arsenic	<2	576
Cadmium	<0.4	29
Chromium	<2	314
Copper	<5	2,280
Lead	<5	20,100
Nickel	3	86
Zinc	8	55,70
TRH >C10-C16	<50	15,500
TRH >C16-C34	<100	15,500
TRH >C34-C40	<100	2,920
Aliphatic TRH >C10-C12	<10	504
Aromatic TRH >C10-C12	<10	114
Aliphatic TRH >C12-C16	<10	2,790
Aromatic TRH >C12-C16	<10	1,170
TRH C6-C10 (minus BTEX) (F1)	<10	114
TRH >C10-C16 (minus Naphthalene) (F2)	<50	15,500
Naphthalene	<0.5	39.7
Benzo(a)pyrene	<0.05	156
Benz(a)anthracene	<0.5	157
Benzo(b)fluoranthene	0.9	4.6
Benzo(k)fluoranthene	<0.5	64.7
Dibenz(a,h)anthracene	<0.5	20
Indeno(1,2,3-cd)pyrene	<0.5	66.2
Sum of PAHs	<0.5	1,810

Shallow Lead Impacted Soil

The presence of shallow lead-impacted soil has been identified at some locations within the Promenade and Underground Carpark area at depths <2.0 m below ground level (bgl), with some isolated impacts also noted at depths >2.0 m bgl. As a result, there is potential for Intrusive Maintenance workers within the Promenade and Underground Carpark area to come in contact with these soils. Two sample locations – SV12 (soil at 1.0 m bgl) and UC07 (soil at 2.0 m bgl) reported exceedances of the Maintenance Workers Site Derived RC by greater than 250%. However, based on

the overall statistical assessment of shallow lead impacts in this area conducted against the Maintenance Workers Site Derived RC, remediation of these impacts is not considered as required (AECOM, 2021b). It is further noted that these locations will be excavated and removed as part of the Underground Carpark installation.

In the event that construction of the Underground Carpark takes place, any services or conduits that will be installed within soil at a depth of >2.0 m bgl (i.e. below or in deeper soil next to the Underground Carpark) must be installed in protective shrouds or in trenches/corridors of clean fill to prevent contact with Site soil.

Maintenance Workers should use appropriate PPE (i.e. dust masks and gloves) to reduce potential exposure to lead in soil. Soil management requirements are discussed in the main body of the SEMP.

Asbestos

Anecdotal information indicates that pits and service trenches in the southern portion of the Promenade and Underground Carpark area were backfilled with building rubble including asbestos. No bulk asbestos or Asbestos Containing Material (ACM) has been encountered in investigations to date, however minor ACM has been encountered as seven isolated fragments. Under current and proposed future development, while the Site is maintained with hardstand or an engineered break, potential ACM within the soil does not have a complete source-pathway-receptor linkage to Site users. However, the potential for ACM to be present should be considered in future works which may disturb soil in this area and managed as discussed in the Site Environment Management Plan (SEMP).

Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) have been routinely conducted for monitoring groundwater wells located within the Promenade and Underground Carpark area since January 2015.

Since 2015, groundwater samples have reported concentrations of a combination of CoPC including total dissolved solids (TDS), metals (arsenic, copper, iron, lead, manganese, zinc), inorganics (ammonia, sodium, boron), TRH [TRH C_{10}-C_{36} fraction (sum), TRH >C_{10}-C_{40} fraction (sum), TRH C_{10}-C_{16} fraction (sum) (minus naphthalene)] and PAHs [naphthalene, benz(a)anthracene, benzo(a)pyrene, anthracene, phenanthrene, fluoranthene] above the following adopted Tier 1 assessment criteria for groundwater PEVs and Site Derived RC:

- Drinking water (health and aesthetics)
- Recreation (primary and secondary contact)
- Maintenance of Ecosystems (90% ecosystem protection level)
- Irrigation
- Vapour Intrusion (from groundwater)
- Remediation Criteria – Residential (unknown construction or multi-storey building)

Table 2 below provides a range of CoPC concentrations (or general CoPC groups) identified within the Promenade and Underground Carpark area that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 2 Summary of Groundwater Analytical Results

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Total Dissolved Solids	40	5,420
Arsenic	<0.001	0.032
Copper	<0.001	0.011
Iron	<0.05	6.72

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Lead	<0.001	0.017
Manganese	0.002	5.47
Zinc	<0.001	0.063
Ammonia (as N)	<0.01	8.43
Sodium	3.7	363
Boron	<0.05	0.78
TRH C10-C36 fraction (sum)	<0.050	4.05
TRH >C10-C40 fraction (sum)	<0.100	3.95
TRH C10-C16 fraction (minus naphthalene) [F2]	<0.050	2.01
Naphthalene	<0.001	0.0015
Benz(a)anthracene	<0.001	0.0014
Benzo(a)pyrene	<0.0005	0.0011
Anthracene	<0.001	0.0054
Phenanthrene	<0.001	0.016
Fluoranthene	<0.001	0.0069

Identified LNAPL Impacts

Environmental investigations completed on the Site to date have historically identified three Light Non-Aqueous Phase Liquid (LNAPL) plumes in or adjacent to the Promenade and Underground Carpark area, referred to as LNAPL Plume A1, LNAPL Plume A2 and LNAPL Plume A3.

The LNAPL in these plumes is understood to comprise predominantly diesel fuel, as well as fuel oils associated with diesel engine operation (e.g. lubricants, engine oils). The probable source of LNAPL is historic locomotive refuelling activities during operation the Roundhouse Refuelling Area.

Measurable LNAPL has been noted in the Promenade and Underground Carpark area ranging in thickness from 0.001 cm at MW138 and MW139 (located within the extent of LNAPL Plume A2) to 29.1 cm at MW137 (located within LNAPL Plume A1). Measurable LNAPL has not been identified at Plume A3, within the Precinct North to the east, since July 2017 and is not considered to be a key ongoing contaminant source at the Site.

A detailed assessment of LNAPL impacts and remediation conducted at the Site has been reported in the *Assessment of LNAPL Remediation End-Points* (AECOM, 2020e). This report concluded that:

- Further recovery of LNAPL is considered to be impractical.
- The LNAPL plumes are sufficiently stable.
- Based on the current development plan for the Site, no unacceptable risks to current or future human or ecological receptors from LNAPL appears to be present, assuming that a SEMP or similar is implemented in order to minimise and manage potential risks for any interactions between groundwater, LNAPL and future Site users.

On this basis, further LNAPL remediation is not practicable or required. However, restoration of groundwater PEVs is not practicable, and groundwater management will be required as discussed in the main body of the SEMP.

Identified Soil Vapour Impacts

Soil vapour monitoring events have been conducted across the Site between 2015 and 2019, including at soil vapour wells within and immediately adjacent to the Promenade and Underground Carpark area, at locations where concentrations of Volatile Organic Compounds (VOCs) and Semi-VOCs (SVOCs) in soil or groundwater were in excess of the Tier 1 vapour intrusion criteria selected, or in the vicinity of the LNAPL plumes to enable assessment of potential risks posed by soil vapour to potential future users of this area.

Assessment of potential vapour intrusion risks associated with the LNAPL plumes undertaken in *Soil Vapour and Indoor Air Investigations 2019* (AECOM, 2021b) surmised that soil vapour impacts associated with the LNAPL plumes do not present an unacceptable risk to the planned future uses of the Promenade and Underground Carpark area.

Soil vapour investigations identified that methane exists in potentially hazardous concentrations in the subsurface within the Promenade and Underground Carpark area (at SV12, SV27S and SV27D) as well as the surrounding area (at SV14 and SV16). The risk from soil methane in the area assessed has been calculated as CS2 – Low Risk, as defined by *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020), and appropriate mitigation measures should be included in future building design in this area or when conducting works in potentially enclosed spaces, such as pits, trenches or conduits, in these areas.

It is noted that if the Underground Carpark is ventilated in accordance with Building Code of Australia (BCA) requirements to deal with exhaust fumes, it should also provide sufficient protection from methane infiltration as per EPA NSW, 2020. If the Underground Carpark is not designed and constructed to BCA standards, methane protection measures should be advised by a qualified environmental practitioner and approved by a Contaminated Land Auditor.

The Precinct North Contamination Summary

Historical activities undertaken within the Precinct North area have resulted in the presence of residual contamination within soil and groundwater. Multiple phases of soil, groundwater, light non-aqueous phase liquid (LNAPL) and soil vapour investigations have been undertaken to assess the nature and extent of contamination. The following sections provide an overview of identified soil, groundwater, LNAPL and soil vapour impacts at the Precinct North area.

Soil, groundwater and LNAPL remediation works have been undertaken in or adjacent to this area, as discussed in the *Remediation Validation Report – Audit Areas 2 and 7 and Pipeline Removal* (AECOM, 2021d) and the *Goods Shed Remediation Validation Report* (AECOM, 2021e). The *Assessment of LNAPL Remediation End-Points* (AECOM, 2021b) report contains a detailed assessment LNAPL remediation conducted.

A submission has been made to the Contaminated Land Auditor for completion of remediation of this area for the proposed future development. Approval from the Contaminated Land Auditor is pending and this Site Environment Management Plan (SEMP) will be updated once received.

Identified Soil Impacts

Subsurface investigations have identified that the Precinct North area is underlain by fill material extending up to 8.2 m below ground level (bgl). Fill material is described as silty sand with dolerite gravels and cobbles with a range of anthropogenic materials including rubble, glass and metal fragments, coal, coke, ash, brick, rubber, timber, wires and fabric. Following remediation and soil excavation in 2020 (AECOM, 2021d), portions of the Precinct North area have been backfilled with fill material and crushed dolerite sourced from either other sections of the Site or imported Virgin Excavated Natural Material (VENM).

Underlying the fill material is natural sands, clays, gravels and dolerite bedrock.

During historic land reclamation activities undertaken across the broader Site, sea walls were constructed consisting of a combination of timber and stone. A sea wall is understood to run approximately parallel to the eastern boundary of the Precinct North area.

Concentrations of a combination of Chemicals of Potential Concern (CoPC) including Polycyclic Aromatic Hydrocarbons [PAHs] (benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, 7,12-dimethylbenz(a)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs), Total Recoverable Hydrocarbons [TRH] (aliphatic C_{10}-C_{12}, aliphatic C_{12}-C_{16}, aromatic C_{10}-C_{12}, aromatic C_{12}-C_{16}, C_6-C_{10}, C_{10}-C_{16}, C_{16}-C_{34}, C_{34}-C_{40}), naphthalene, and heavy metals (arsenic, copper, lead, nickel, zinc) in soil were reported above the adopted Tier 1 criteria for the following Protected Environmental Values (PEVs) and Site Derived Remediation Criteria (RC):

- Human Health – Direct Contact – Residential (low, and medium/high density), Recreation/ Open Space, and Commercial/ Industrial land uses.
- Human Health – Vapour Intrusion – Residential and Commercial/ Industrial land uses.
- Maintenance of Modified and Highly Modified Ecosystems.
- Aesthetics.
- Remediation Criteria – Residential (slab-on-grade with unknown construction or multi-storey building, low rise slab-on-grade, and building with basement), Commercial (slab-on-grade with unknown construction or multi-storey building, and working within a basement) and Maintenance Workers.
- Remediation Criteria - Potential Future Residential, Commercial/Light Industrial Workers or Intrusive Maintenance Workers

Table 1 below provides the range of CoPC concentrations (or general CoPC groups) identified within the Precinct North area that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 1 Summary of Soil Analytical Results

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Arsenic	<2	184
Copper	<5	1,800
Lead	<5	1,340
Nickel	3	68
Zinc	8	10,200
TRH C_6-C_{10} (minus BTEX[1])	<10	152
TRH >C_{10}-C_{16} (minus Naphthalene)	<50	17,995
TRH >C_{10}-C_{16}	<50	18,000
TRH >C_{16}-C_{34}	<100	16,000
TRH >C_{34}-C_{40}	<100	3,310
Aliphatic TRH >C_{10}-C_{12}	<50	1,420
Aromatic TRH >C_{10}-C_{12}	<50	140
Aliphatic TRH >C_{12}-C_{16}	<50	6,590
Aromatic TRH >C_{12}-C_{16}	<50	2,540
Naphthalene	<0.5	184
Benzo(a)pyrene	<0.5	141
Benz(a)anthracene	<0.5	148
Benzo(b)fluoranthene	2.1	128
Benzo(k)fluoranthene	<0.5	68.9
Chrysene	<0.5	140
Dibenz(a,h)anthracene	<0.5	18.7
7,12-dimethylbenz(a)anthracene	<0.5	3.8
Indeno(1,2,3-cd)pyrene	<0.5	59.2
Sum of PAHs	<0.5	2,330

Note: 1. BTEX – benzene, toluene, ethylbenzene and xylenes

Boundary Impacts

Soil samples collected at seven locations on the eastern boundary of the Precinct North area reported exceedances of Site Derived RC for proposed future uses:

- Two locations (OL-EX-288/1.5 and OL-EX-59/0.9) reported exceedances of the RC for Future Commercial Workers for Total Petroleum Hydrocarbons (TPH) C_{10}-C_{16} (minus Naphthalene).

- Five locations (OL-EX-75/0.5, OL-EX77/1.0, OL-EX-79/0.2, OL-EX-293/1.15, OL-EX-294/1.05) reported exceedances of the RC for Future Intrusive Maintenance Workers for lead.

These samples do not represent an unacceptable risk for future uses of the area as the impacted areas are limited and delineated by samples within 5 m from within the excavation boundary or base, and impacted soils which had the potential to extend onto the Site were excavated and removed during remediation works in 2020 (AECOM, 2021d). These areas should be considered when conducting works along the Site boundary in these areas.

Hobart Main Sewer Soils

During remediation works in 2020 (AECOM, 2021d), excavation of impacted soils was limited by the presence of the Main Hobart Pipeline, a sewer line which runs through the Precinct North area. The owner of the sewer, TasWater, required an exclusion zone for excavation which did not allow excavation to depths of greater than 1 m below ground level (bgl) within 3 m of the sewer location.

Soil was excavated to a depth of 1 m bgl in this exclusion zone. However, lead concentrations in excess of the RC for Future Intrusive Maintenance Workers for lead were detected in the soil within the exclusion zone and should be considered and appropriate controls put in place for future works in this area.

Precinct South Boundary

Lead concentrations in excess of the RC for Future Intrusive Maintenance Workers for lead were detected in the soil along the boundary between the Precinct North and Precinct South areas of the Site.

Soil was excavated to a depth of >2 m bgl on the Precinct North side of the boundary and lead in soil is not considered to present an unacceptable risk for development of the Precinct North. Further remediation or assessment of impacts in the Precinct South is required prior to development of that area of the Site.

Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) have been routinely conducted for monitoring groundwater wells located within the Precinct North area since January 2015.

Since 2015, groundwater samples have reported concentrations of a combination of CoPC including: total dissolved solids (TDS), metals (arsenic, boron, copper, iron, lead, manganese, zinc), inorganics (ammonia, chloride, cyanide, sodium), TRH (C_{10}-C_{16}, C_{10}-C_{36}, C_{10}-C_{40}), PAHs (naphthalene, benz(a)anthracene, benzo(a)pyrene, anthracene, phenanthrene, fluoranthene, 2,4-dimethylphenol, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, pyrene) and E. Coli above the following adopted Tier 1 assessment criteria for groundwater PEVs and Site Derived RC:

- Drinking water (health and aesthetics)
- Recreation (primary and secondary contact)
- Maintenance of Ecosystems (90% ecosystem protection level)
- Irrigation
- Buildings and Structures
- Vapour Intrusion (from groundwater)
- Remediation Criteria – Residential (unknown construction or multi-storey building)

Table 2 below provides a range of CoPC concentrations (or general CoPC groups) identified within the Precinct North area that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 2 Summary of Groundwater Analytical Results

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Total Dissolved Solids	240	1,690
Arsenic	<0.001	0.009
Boron	0.2	0.69
Copper	<0.001	0.011
Iron	15.5 (one sample only)	
Lead	<0.001	0.013
Manganese	0.026	2.46
Zinc	<0.005	0.134
Ammonia (as N)	<0.01	22.1
Chloride	11	664
Cyanide	<0.004	0.29
Sodium	8	547
TRH C10-C36 fraction (sum)	<0.05	12.6
TRH >C10-C40 fraction (sum)	<0.1	12.2
TRH C10-C16 fraction (minus naphthalene)	<0.1	6.19
Naphthalene	<0.005	0.232
Benz(a)anthracene	<0.001	0.095
Benzo(a)pyrene	<0.001	0.0985
Anthracene	<0.001	0.142
Phenanthrene	<0.001	0.317
Fluoranthene	<0.001	0.254
2,4-Dimethylphenol	<0.001	0.0062
Benzo(k)fluoranthene	<0.001	0.0346
Chrysene	<0.001	0.0974
Dibenz(a,h)anthracene	<0.001	0.0114
Indeno(1,2,3-cd)pyrene	<0.001	0.0434
Pyrene	<0.001	0.228

LNAPL

Environmental investigations completed on the Site to date have historically identified three LNAPL plumes in or up groundwater gradient of the Precinct North area, referred to as LNAPL Plume A1, LNAPL Plume A2 and LNAPL Plume A3.

Measurable LNAPL has been noted up groundwater gradient of the Precinct North area (in the Promenade and Underground Carpark area) ranging in thickness from 0.001 cm at MW138 and MW139 (located within the extent of LNAPL Plume A2) to 29.1 cm at MW137 (located within LNAPL Plume A1). Measurable LNAPL has not been identified at Plume A3, within the Precinct North since July 2017 and is not considered to be a key ongoing contamination source at the Site.

A detailed assessment of LNAPL impacts and remediation conducted at the Site has been reported in the *Assessment of LNAPL Remediation End-Points* (AECOM, 2020e). This report concluded that:

- Further recovery of LNAPL is considered to be impractical.
- The LNAPL plumes are sufficiently stable.
- Based on the current development plan for the Site, no unacceptable risks to current or future human or ecological receptors from LNAPL appears to be present, assuming that a Site Environment Management Plan (SEMP) or similar is implemented in order to minimise and manage potential risks for any interactions between groundwater, LNAPL and future Site users.

On this basis, further LNAPL remediation is not practicable or required. However, restoration of groundwater PEVs is not practicable, and groundwater management will be required as discussed in the main body of the SEMP.

Identified Soil Vapour Impacts

Soil vapour monitoring events have been conducted across the Site between 2015 and 2019, including at soil vapour wells within and immediately adjacent to the Precinct North area, at locations where concentrations of Volatile Organic Compounds (VOCs) and Semi-VOCs (SVOCs) in soil or groundwater were in excess of the Tier 1 vapour intrusion criteria selected, or in the vicinity of the LNAPL plumes to enable assessment of potential risks posed by soil vapour to potential future users of this area.

Assessment of potential vapour intrusion risks associated with the LNAPL plumes undertaken in *Soil Vapour and Indoor Air Investigations 2019* (AECOM, 2021b) surmised that soil vapour impacts associated with the LNAPL plumes do not present an unacceptable risk to the planned future uses of the Precinct North area.

Soil vapour investigations identified methane exists in potentially hazardous concentrations in the subsurface within the Precinct North area (at SV14, SV16, SV17 and SV18). The risk from soil methane in the area assessed has been calculated as CS2 – Low Risk, as defined by *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020), and appropriate mitigation measures should be included in future building design in this area or when conducting works in potentially enclosed spaces, such as pits, trenches or conduits, in these areas.

Appendix D

Summary of CoPC

Summary of Chemicals of Potential Concern

The following information has been compiled from the June 1997 National Institute of Occupational Health and Safety (NIOSH) *Pocket Guide to Chemical Hazards*, 1998 American Conference of Governmental Industrial Hygienists (ACGIH) *Guide to Occupational Exposure Values, Agency for Toxic Substances & Disease Registry* (ATSDR), the Australia Government *Asbestos Safety and Eradication Agency*, and representative material safety data sheets (MSDS).

Polycyclic Aromatic Hydrocarbons (PAHs)

PAHs are formed as a result of the incomplete burning of organic material. The most common health effects associated with PAHs are linked to its carcinogenic effects. The primary route of exposure to PAHs during this project is contact with contaminated soils which can lead to entry through ingestion, inhalation (dust) or open wounds. This necessitates the use of appropriate protective clothing and proper decontamination procedures.

Total Petroleum Hydrocarbons (TPH)

TPH is a term used to describe several hundred chemical compounds that originate from crude oil. The compounds in various TPH fractions can affect the body in different ways. Health effects include central nervous system depression, irritation of the throat, skin, eyes, and stomach, breathing difficulties, in addition to impacts on blood, immune system, liver, spleen, kidneys, developing foetus, and lungs. The primary route of exposure to TPH during this project will be through handling tar impacted material. Appropriate PPE must be worn at all times while handling TPH contaminated material.

Benzene, Toluene, Ethyl-benzene, and Xylenes (BTEX)

These chemicals are often found in products such as paints and coatings, and are constituents of petroleum products, particularly gasoline, jet fuels, kerosene. All of the BTEX chemicals can produce neurological impairment, and exposure to benzene can additionally cause haematological effects including aplastic anaemia and acute myelogenous leukemia. The primary route of exposure to BTEX during this project is the inhalation of vapours. This necessitates the use of appropriate protective clothing including respiratory equipment where necessary.

Chlorinated Solvents

Chlorinated solvents are a large family of chemical compounds that contain chlorine, for example, carbon tetrachloride, trichloroethylene (TCE), or methylene chloride. They are used for a wide variety of commercial and industrial purposes, including degreasers, cleaning solutions, paint thinners, pesticides, resins, glues, and a host of other mixing and thinning solutions. Exposures can lead to short-term or long-term health effects, depending on the manner by which they entered your body and the amount of exposure. Short-term side effects may include dizziness, fatigue, headaches, and/or skin rashes. Long-term side effects may include chronic skin problems, and/or damage to the nervous system, kidneys, or liver. Some chlorinated solvents are also known to cause cancer, in both humans and animals.

Workers can be exposed to chlorinated solvents through the absorption of solvents, through inhalation and skin contact.

Heavy Metals

Large amounts of heavy metals may cause acute or chronic toxicity (poisoning). Heavy metal toxicity can result in damaged or reduced mental and central nervous function, lower energy levels, and damage to blood composition, lungs, kidneys, liver, and other vital organs. Heavy metals may enter the human body through ingestion, inhalation, or absorption through the skin. Appropriate protective equipment must be worn and proper decontamination procedures must be adhered to.

Total Dissolved Solids (TDS)

TDS consist of inorganic salts and small amounts of organic matter that are dissolved in water. **TDS** comprise sodium, potassium, calcium, magnesium, chloride, sulfate, bicarbonate, carbonate, silica, organic matter, fluoride, iron, manganese, nitrate, nitrite and phosphates. No health effects have been associated specifically with or directly attributable to high TDS concentrations, although the health effects of individual components of TDS must be considered separately. Indirectly, high TDS water, being less palatable, might discourage consumers from drinking tap water, leading to use of potentially less healthy water (from alternative sources, natural or manufactured) and/or other less healthy drinks.

Sodium

Sodium is a natural component of water and essential to human life. The guideline value for sodium in drinking water is based on aesthetic considerations (taste threshold); while high sodium may be likely to give water a salty taste, it is unlikely to present a health concern. When consumed, sodium is readily absorbed by the body. It is present in all body tissues and fluids and its concentration is maintained by the kidney. High concentrations give rise to the sensation of thirst. Excessive sodium intake, usually via diet, can aggravate chronic congestive heart failure and increase blood pressure. Reduced sodium intake can reduce the blood pressure of some individuals with hypertension.

Asbestos Containing Material (ACM)

Asbestos is a naturally occurring mineral fibre which is strong, flexible, and can insulate from heat and electricity. Because of these properties, historically asbestos has been commonly used in the construction of homes and buildings and is understood to have been used in roofing material as bonded asbestos at Macquarie Point. It can be encountered as friable (generally crumbling material with potential to generate fibres) or non-friable (bonded). Asbestos is a known carcinogen and exposure to asbestos fibres can lead to a number of diseases, including pleural disease, asbestosis, lung cancers, and mesothelioma. In the event that potential asbestos containing material (ACM) is encountered in soils during intrusive works, all activities are to cease immediately in the work area. A suitably experienced occupational hygienist should be consulted to provide advice regarding the removal and management of ACM in soils prior to works re-commencing.

Methane

Methane is a colourless, odourless and highly flammable gas. It can be produced in soil from the decay under anoxic (low oxygen) conditions of carbon containing materials, including nature materials such as plant or animal matter, or from carbon impacts such as TPH.

Low levels of methane are not expected to cause adverse health effects. Higher concentrations can reduce oxygen levels in the air and lead to mood changes, slurred speech, vision problems, memory loss, nausea, vomiting, facial flushing and headaches. In severe cases, low oxygen levels can lead to changes in breathing and heart rate, balance problems, unconsciousness and, if over a long period, death.

Methane is also potentially flammable in higher concentrations. If present in soil, methane has the potential to pool in confined spaces

Table 1 Materials Tracking Register

Date	Origin[1]	Approximate Volume (m^3)	Sampled (Y/N)	Destination[2]	Notes / Comments[3]

Notes: 1. Include a description of the location where the soil was excavated and a grid location (where possible); 2. This may be off-Site disposal, placement in stockpile, re-use on the Site. Provide a description of the location where soils are to be re-used and/or stored, and a grid location (where possible); 3. Include soil type, any odours or other indicators of contamination and sampling undertaken; 4. Table provided above is an example of a soil materials tracking register for simple earthworks. Large scale earthworks may require a different tracking system; 5. The completed form should be returned to the Site Manager (or delegate) and retained on file for reference.

Appendix F

Construction Noise Management Plan

Construction Noise Management Plan (CNMP) Preparation

Purpose of this document

The Macquarie Point Development Corporation ("Corporation") requires Contractors to prepare and follow a project-specific Construction Management Plan (CMP) as part of their project set-up. A CMP addresses matters such as community liaison & communication protocols, traffic management, and management of environmental issues including dust, stormwater run-off, and noise.

The Corporation is aware of the potential for noise to trigger complaints of nuisance and the Corporation's policy is that construction activities should be carried out in such a way to prevent or minimise off site noise nuisance. The Corporation therefore requires Contractors to prepare a Construction Noise Management Plan (CNMP) as part of the CMP. The CNMP shall be in accordance with the NSW *Interim Construction Noise Guideline* (see section "Guideline to be followed") and is to be approved by the Corporation.

This document sets out the Corporation's requirements regarding key components of the CNMP.

Background

Work to develop the Macquarie Point Precinct requires construction activities to be undertaken on land owned, operated, or managed by the Corporation, either through the Corporation's own actions or through work on land parcels by third party developers. Such activities have the potential to create off-site noise nuisance.

Examples of noise generating activities include:

- operation of stationary equipment such as jackhammers, concrete saws, and power tools;
- excavation, demolition, and foundation work, including piling and drilling;
- building maintenance and repair work; and
- operation of mobile plant and equipment such as excavators, cranes, and heavy vehicles.

Nuisance caused by construction work noise can be exacerbated for any of several reasons.

i) The noise was not expected and people do not know how long it will last.

ii) The noise happens outside normal day time hours or at a noise sensitive time of day. For example, heavy vehicle activity before 7am, or when someone is participating in a zoom teleconference.

iii) The noise has intrusive characteristics such as impulsiveness, tonalities, or low frequency noise.

iv) The noise is causing nuisance and yet mitigation measures are clearly not in place or not being applied properly. For example, a concrete saw is being used but moveable acoustic barriers have not been placed to reduce its noise impact. People are more tolerant of nuisance if they can see mitigation efforts are being made.

Guideline to be followed

Tasmania's *Environmental Management and Pollution Control (Noise) Regulations 2016* specify prohibited hours of use for various common noise sources including equipment on building and demolition sites. However, these regulations are not intended to apply to comstruction activities on the scale associated with development of the Macquarie Point Precinct, which require a Construction Noise Management Plan.

Tasmanian authorities have not produced state-specific guidelines for preparing a CNMP, but the Resource Management and Planning Appeals Tribunal has identified the NSW *Interim Construction Noise Guideline* (NSW Dept. of Environment and Climate Change, July 2009) as Best Practice. The Corporation requires the CNMP to be prepared in accordance with this guideline.

In 2020, the EPA NSW released a new *Draft Construction Noise Guideline* for public consultation, but its key aspects are essentially the same as the 2009 guideline.

Support documents are:

- *AS 2436-2010 Guide to noise & vibration control on construction sites*. This provides sound levels for various civil works equipment and activities to facilitate estimation of noise levels off site, and outlines noise mitigation measures.
- *AS/NZS 2107:2016 Acoustics - Recommended design sound levels & reverberation times for building interiors*. It is sometimes necessary to establish the link between noise levels outside and inside a building and AS/NZS 2107 lists recommended internal noise levels for residences, offices, and so on.

Specialist support

The Corporation has engaged noise specialists familiar with construction noise who have helped to prepare this document. Noise levels in the vicinity of the Precinct are accurately known. The Corporation operates a permanent on-site noise monitoring station near the Longhouse and noise levels measured by this station are available in real-time through the web-based Noise Cloud service. TasPorts has made available the results of noise level surveys across the Port of Hobart, including in the vicinity of Evans Street and Hunter Street.

The CNMP should be prepared by an appropriately qualified noise specialist familiar with the NSW *Interim Construction Noise Guideline* and able to provide guidance on noise mitigation measures. The specialist should be available throughout the construction works project to address any problems that arise and to review the noise level monitoring data.

However, the Contractor has the principal day-to-day responsibility for managing noise by following the CNMP and to this end the Contractor's Project Manager and Works Supervisor will be required to be able to predict and measure noise levels from construction works activities, ensure that noise mitigation measures are properly applied, and monitor noise levels (see the worked example, below).

Communications

Communication protocols and a community liaison strategy are important components of a CNMP. The responsible people are usually the Contractor's Project Manager and Works Supervisor, under guidance and direction from the Corporation.

Developing an email distribution list is essential. It is used to advise residents and businesses of the next week's schedule of activities, flagging noisy periods so people can plan accordingly.

Stakeholders in the vicinity of the Macquarie Point Precinct include (this list is not exhaustive):

- MPDC tenants.
- The IXL complex between Evans and Hunter Streets hosts businesses, shops, and the Henry Jones Hotel.
- The Zero Davey Apartments, the Sullivans Cove Apartments and the IXL Apartments on Evans Street.
- Residents in the Glebe.
- Premises located on Hunter Street including the University's School of Creative Arts and Media, Marine and Safety Tasmania, and the MACq 01 apartments. Some premises have line of sight to the Precinct.
- Noise sensitive premises a little further away including the Woolstore and the Hotel Grand Chancellor.

Stakeholders will be provided with the contact details of the Contractor's Project Manager and Works Supervisor, so they can bring any problems to their attention instead of complaining to the Council, the EPA, or the Corporation.

Working hours

Under any contracts with construction companies, the Corporation stipulates that construction activities shall only occur between the following hours, as recommended by the NSW *Interim Construction Noise Guideline*.

- Monday to Friday: 7:00am to 6:00pm
- Saturday: 8:00am to 1:00pm
- No work on Sundays or public holidays

Work outside these hours requires strong justification and must be approved by the Corporation. Noise level management targets for any work outside the above hours will be more stringent, as per the guideline, and approval by the Corporation will likely have conditions such as requiring the Contractor to undertake negotiations with potentially affected residents and businesses.

Noise level management targets

The NSW *Interim Construction Noise Guideline* requires construction noise level management targets to be set. For residences this is based on the Rating Background Level (RBL) and the methodology to calculate the RBL for a given time of day (day/evening/night) is given in the appendix of the *NSW Industrial Noise Policy* (2000) and involves deploying a noise logger to measure L_{90} noise levels. This work has already been done by the noise specialists engaged by the Corporation.

It is expected that if construction noise levels are satisfactory at two off-site locations then noise levels elsewhere off-site should also be satisfactory. A noise level management target also applies to on-site tenants.

- The Glebe. The nearest residences in the Glebe have elevated line of sight to the Macquarie Point Precinct and are located just over 600m from the part of the Precinct that is closest to the Glebe.

  For work during the standard working hours the RBL at the residence that is nearest to the Precinct is fairly steady and approximately 50 dBA. This residence has direct line of sight to the Precinct and the reason the RBL is fairly steady is because it is significantly influenced by Brooker highway traffic noise.

  The NSW *Interim Construction Noise Guideline* specifies a noise level management target for residences of RBL + 10 dB, but the Corporation recognises that a more stringent noise level management target of 55 dBA is appropriate, using a 15 minute averaging period.

- Evans Street. Residential and visitor accommodation apartments are located on the south side of Evans Street in the first 100m from Davey Street. The Zero Davey Apartments, the Sullivans Cove Apartments and the IXL Apartments all have elevated line of sight to the Precinct.

  Between 7am to 8am the south side of Evans Street is considered to be residential in nature. Background (L_{90}) noise levels rise rapidly during this period as traffic builds on Davey Street, and are naturally higher for apartments closer to Davey Street. The RBL for this hour is estimated to be 52 dBA, using data from the Corporation's noise monitor near the Longhouse, so the noise level management target is 52 + 10 = 62 dBA (15 min).

  For the rest of the working day (8am to 6pm) the south side of Evans Street can be treated as commercial in nature since visitor accommodation premises are not particularly noise sensitive during the day. The noise level management target set by the NSW *Interim Construction Noise Guideline* for commercial premises is 70 dBA (15 min).

- On-site tenants. Tenants of the Corporation, and the Corporation's own premises, are commercial in nature so a noise level management target of 70 dBA (15 min) is appropriate.

Alert noise level

Construction noise levels above the background noise levels are audible, so marginal compliance with the noise level management target may be tolerated by the community, but it would not be surprising to receive some complaints, especially if the noise has intrusive characteristics. Therefore if construction noise levels reach an alert noise level, the works supervisor must review the situation to ensure mitigation measures are in place. An appropriate alert noise level is the noise level management target but using a five minute averaging period instead of 15 minutes.

Predicting and mitigating noise levels: a worked example

The CNMP should predict approximate noise levels associated with each project stage and set out mitigation measures and management strategies if the noise levels are above the noise level management targets.

However, noise level predictions will necessarily need to be refined as the project proceeds and details of upcoming activities come into focus. Estimating noise levels is straightforward and the project manager and works supervisor should know how to do it. The Contractor should not need to rely on a noise specialist for day-to-day noise level predictions.

In brief, noise levels at the nearest residences can be calculated from either the sound power of a noise source, or its sound pressure at a specified distance.

- The sound power level (L_W) of a noise source is measured in Watts or alternatively in decibels with a reference level of 10 pW (i.e. 10^{-12} W). It is the intrinsic strength of the noise source and it does not depend on distance.
- The sound pressure level (L_P) of a noise source is measured in Pascals or alternatively in decibels with a reference level of 20 µPa (i.e. 20 x 10^{-6} Pa). It is what we actually hear, and it depends on the distance from the noise source.
- *AS 2436-2010 Guide to noise & vibration control on construction sites* provides typical values of L_W and L_P at 10m for a various civil works activities and equipment, but it is better to use values specific to the activities and equipment being used if they are available. L_W and/or L_P values are usually provided in the equipment specifications and are inscribed on the information plate of bulldozers, excavators, generators and so on. Alternatively, the L_P values can be measured and the L_W values deduced from them.
- *AS 2436-2010* and the NSW *Interim Construction Noise Guideline* both provide worked examples of how to use this information and the distance from the noise source(s) to the nearest residences to calculate the total L_p noise levels at the nearest residences. It is usually sufficient to consider only the two or three strongest noise sources.

<u>Worked example.</u>

Two jackhammers and a concrete saw will be working in the late morning at a location 25m from the noise monitoring station, 60m from the apartments on Evans Street, and 650m from the nearest Glebe residence.

The jackhammer types are not known so the default typical noise levels given in AS2436 are used, namely a sound power level of 121 dBA re 1pw. The concrete saw's noise levels have been measured and it has a sound power level of 125 dBA re 1pW.

The total sound power is $L_W = 10 \log_{10} (10^{121/10} + 10^{121/10} + 10^{125/10}) = 127.5$ dBA re 1pW.

For sound spreading over flat hard ground, the sound power (L_W) and sound pressure (L_P) at a distance R (m) from the source are related by:

$$L_W = L_P + 10 \log_{10}(2 \pi R^2)$$

$$= L_P + 20 \log_{10}(R) + 8$$

So, the total sound pressure levels (dBA re 20 µPa) are predicted to be:

Monitoring station	$L_P = 127.5 - 20 \log_{10}(25) - 8$	≈ 92 dBA at 25m
Apartments	$L_P = 127.5 - 20 \log_{10}(60) - 8$	= 84 dBA at 60m
Glebe	$L_P = 127.5 - 20 \log_{10}(650) - 8$	= 63 dBA at 650m

Note that sound pressure levels at distances R_1 and R_2 from a noise source are related:

$$L_P \text{ at } R_2 = L_P \text{ at } R_1 - 20 \log_{10}(R_2 / R_1)$$

For example, consider the above sound pressure levels at the apartments and at the Glebe:

$$84 \text{ dBA at 60m} - 20 \log_{10}(650/60) = 84 - 21 = 63 \text{ dBA at 650m}$$

The NSW *Interim Construction Noise Guideline* lists noise sources that have intrusive noise characteristics and jackhammers and concrete saws are both on the list. The guideline requires a penalty adjustment of 5 dB to be added to the predicted noise levels, so the revised predictions are:

Monitoring station	$L_P \approx 92$ dBA at 25m
Apartments	$L_P = 84 + 5 = 89$ dBA at 60m
Glebe	$L_P = 63 + 5 = 68$ dBA at 650m

Note that the penalty does not apply to the sound pressure level predicted at the monitoring station. The predictions say that in the absence of noise mitigation measures, the two jackhammers and the concrete saw will produce noise levels (including the 5 dB penalty) of 89 dBA at the Evans Street apartments and 68 dBA at the Glebe. These predicted noise levels are 19 dB over the 70 dBA noise level target for the Evans Street apartments and 13 dB over the 55 dBA noise level target for the Glebe.

An appropriate noise mitigation and management strategy would be:

i) Consider not using all the equipment at the same time. For example, using the two jackhammers but not the concrete saw will reduce the noise levels by 3.5 dB.

ii) Place moveable acoustic barriers around the equipment (see next section). Standard barriers typically reduce noise by 12-15 dB and heavy duty barriers typically reduce noise by up to 25 dB. However, the Glebe residences and the apartments on Evans Street are elevated so the barriers need to be placed as close to the equipment as is safely possible in order to break the line of sight.

iii) Advise the community of the upcoming work and warn that even with mitigation measures in place the noise levels will be near the noise level management targets.

iv) At the start of the work, use a sound level meter to confirm that the noise levels (i.e. sound pressure levels) are acceptable, by measuring noise levels at a distance of, say, 10m from the equipment in the direction of (a) Evans Street and (b) the Glebe. Then use the above distance adjustment to predict the noise levels at the Evans Street apartments and the Glebe residences.

Mitigation measures

The above worked example shows that noise mitigation measures will be necessary for many construction activities to meet the noise level management targets.

There are several ways in which construction noise levels can be reduced or made more acceptable.

- Avoid scheduling noisy activities early in the day. Construction work usually starts at 7am, when many people are still sleeping or just getting up and the low background noise levels at this time of day mean construction work noise is more audible.

- Use quieter equipment.
  Example 1. Use a small roller instead of large roller to compact soil, with smaller lifts and a few more passes to achieve the required compaction.

  Example 2. Noise levels and issues such as tonalities vary greatly for different makes of equipment such as generators and compressors. It is important to review noise specifications before deciding on what equipment to bring on site.

- Use moveable sound absorbing barriers within the construction site to mitigate noise from equipment such as concrete saws and jack hammers. These should be placed close to the noise source.

Placing sound absorbing barriers on the site boundary will not be very effective because the residences in the Glebe and the apartments on Evans Street have elevated line of sight to the Precinct. Sound absorbing barriers placed close to noise sources will be more effective than perimeter barriers and Contractors are expected to have a sufficient number of moveable sound absorbing barriers available on site to provide satisfactory mitigation of construction activity noise. As per the worked example in the previous section, some should be heavy duty barriers able to achieve better noise reduction performance than standard barriers, especially low frequency noise.

Figure 1 Typical sound absorbing barriers mounted on a temporary fence at a project in Hobart. These barriers are each 2m high and 1.3m wide and they can achieve 12-15 dB noise reduction when placed near a noise source such as a jackhammer. A heavy duty version of the barriers is also available that can achieve much better performance, especially regarding low frequency noise. There are other similar products on the market.

The Contractor may need to apply mitigation measures other than moveable sound absorbing barriers. Here are some examples, three of them from Tasmania.

Figure 2 Top left. A 550 kVA generator inside a shipping container lined with acoustic material. Two high performance acoustic louvres provided ventilation, and on top is a custom-designed muffler.

Top right. An excavator with a rock breaker head operating behind shipping containers that reduced noise levels at a residence on the other side of the road.

Bottom right. Two compressors operating behind an acoustic barrier, with "bus-shelter" barriers over their air outlet plenums and custom-designed mufflers.

Bottom left. Using a jack hammer inside a purpose-built sound absorbing barrier.

Reversing beepers are a frequent cause of noise complaints. Mitigation options are:

i) Change to a broad-band reversing beeper instead of a beeper that produces a single tone at 1 kHz.

ii) Change to a smart beeper that only sounds if there is an object behind the reversing vehicle.

iii) Operate the reversing vehicle in a safe area in which either no-one is allowed, or someone is guiding the reversing vehicle, so the beeper can be safely switched off.

Monitoring noise levels and construction activity

The Corporation operates a real time noise monitor on site for continuous measurement of noise levels in the vicinity of Evans Street. However the Precinct is a large site and measurements of noise levels from a given activity should be made close enough to the noise source that its noise is at least 5 dB above the background noise. Noise levels in Evans Street and the Glebe can then be predicted using the distance adjustment equation given in the worked example.

Figure 3. The Corporation's noise monitoring station in the south part of the Precinct near Evans Street.

Contractors are required to have their own on-site noise measuring equipment. A sound level meter is essential, and operation of a real time noise monitoring station is recommended to help manage noise from major construction work. In addition to assisting the management of noise, a noise monitoring station allows the Contractor to independently record noise levels and investigate any complaints of noise nuisance. In addition, when people become sufficiently irritated to complain about noise nuisance they may exaggerate the extent of the nuisance, but if they know a noise monitoring station is operating then they tend to make more accurate statements.

The Corporation has a number of security cameras across site that can monitor construction activities, however the Contractor may need to install additional cameras to help in determining the source of any noise nuisance.

Appendix G

Site Specific Remediation Criteria

Site Specific Remediation Criteria

In order to assess risks and inform potential remediation works required to allow development of the Macquarie Point Site (the Site) in accordance with the Site *Masterplan* (Macquarie Point *Strategic Framework and Masterplan 2015 – 2030*), AECOM prepared *Derivation of Remediation Criteria* (AECOM, 2016) to develop Site specific Remediation Criteria (RC) for soil and groundwater which are protective of human health under the potential future land use conditions at the Site stated in the Masterplan.

The following human receptors were considered in this assessment based on the proposed future land uses:

- Residents of a High Density Development (slab-on-grade buildings and buildings with a communal basement car park)
- Recreational Open Space Users
- Users of a Multi-Storey Car Park
- Commercial/Light Industrial Workers (slab-on-grade buildings and working within a basement car park)
- Outdoor maintenance Workers (including excavation to depths of up to 1 metre below ground level).

Information about proposed Site layout, uses and building design can be used to refine the RC to be more Site-specific and reduce conservatism where appropriate based on any changes to the Masterplan or Site uses in future. Any changes to RC should be prepared by a qualified environmental professional, and if changes allow higher concentrations of Chemicals of Potential Concern (CoPC) to remain on Site, be reviewed and endorsed by a Contaminated Land Auditor.

Assumptions

The following key assumptions have been made when deriving the RC and should be noted as limitations when applying the RC:

- NAPL impacts at the Site have be remediated to the extent practicable and therefore risks associated with exposure to NAPL and volatile contaminants derived from NAPL were not considered in the derivation of the RC. NAPL is known to remain in some areas of Macquarie Point (refer to **Section 3.4** and **Section 4.10** of the main body of the SEMP). Where NAPL has been remediated to the extent practicable in areas of Macquarie Point which have received Contaminated Land Auditor endorsement (refer to **Section 1.6**), the relevant Contaminated Land Audit Report should be referred to for any specific management requirements for residual NAPL.
- An engineered break layer will be present at the ground surface to mitigate potential for future Site users (with the exception of maintenance workers) to have direct contact with soils. The engineered break layer will be required to meet ASC NEPM 2013 HIL/HSL relevant to the future land use.
- Use of any future basements is limited to car parking. If basements are constructed for other purposes, a risk assessment specific to the intended use should be conducted.
- Where basements are associated with future residential or commercial buildings, it is assumed that these will be communal areas for multiple properties, for example, as part of a strata scheme that is managed by a body corporate. Private basements will therefore not be associated with individual residences.
- Where there is access to a basement car park, it is assumed that any groundwater seepage collects in floor drains and a physical barrier is present, and therefore, it is unlikely that groundwater will be directly contacted by basement users, with the exception of maintenance workers. It is assumed that individual tenants will not be involved in the maintenance of any associated services, including drainage pumps or sumps.

- Adjacent off-Site land uses include open space, commercial/industrial and residential areas. As these potential land uses have been considered on-Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g. via groundwater migration beyond the Site boundary).
- Workers involved in Site remediation/redevelopment works are not included in this assessment. It is considered that potential exposures to these workers can effectively be mitigated through the implementation of an appropriate Construction Environment Management Plan.

Soil

Table 1 below provides a summary of Site specific RC (reported to two significant figures) for soil concentrations which are considered to be protective of human health for proposed future uses.

Table 1 Site Specific Land Use RC for Soil (mg/kg)

Appendix H

Unexpected Discovery Plan - Aboriginal Artifacts and Relics

Unanticipated Discovery Plan

Procedure for the management of unanticipated discoveries of Aboriginal relics in Tasmania

For the management of unanticipated discoveries of Aboriginal relics in accordance with the *Aboriginal Heritage Act 1975* and the *Coroners Act 1995*. The Unanticipated Discovery Plan is in two sections.

Discovery of Aboriginal Relics other than Skeletal Material

Step 1:

Any person who believes they have uncovered Aboriginal relics should notify all employees or contractors working in the immediate area that all earth disturbance works must cease immediately.

Step 2:

A temporary 'no-go' or buffer zone of at least 10m x 10m should be implemented to protect the suspected Aboriginal relics, where practicable. No unauthorised entry or works will be allowed within this 'no-go' zone until the suspected Aboriginal relics have been assessed by a consulting archaeologist, Aboriginal Heritage Officer or Aboriginal Heritage Tasmania staff member.

Step 3:

Contact Aboriginal Heritage Tasmania on **1300 487 045** as soon as possible and inform them of the discovery. Documentation of the find should be emailed to **aboriginal@heritage.tas.gov.au** as soon as possible. Aboriginal Heritage Tasmania will then provide further advice in accordance with the *Aboriginal Heritage Act 1975*.

Discovery of Skeletal Material

Step 1:

Call the Police immediately. Under no circumstances should the suspected skeletal material be touched or disturbed. The area should be managed as a crime scene. It is a criminal offence to interfere with a crime scene.

Step 2:

Any person who believes they have uncovered skeletal material should notify all employees or contractors working in the immediate area that all earth disturbance works cease immediately.

Step 3:

A temporary 'no-go' or buffer zone of at least 50m x 50m should be implemented to protect the suspected skeletal material, where practicable. No unauthorised entry or works will be allowed within this 'no-go' zone until the suspected skeletal remains have been assessed by the Police and/or Coroner.

Step 4:

If it is suspected that the skeletal material is Aboriginal, Aboriginal Heritage Tasmania should be notified.

Step 5:

Should the skeletal material be determined to be Aboriginal, the Coroner will contact the Aboriginal organisation approved by the Attorney-General, as per the *Coroners Act 1995*.

Guide to Aboriginal site types

Stone Artefact Scatters

A stone artefact is any stone or rock fractured or modified by Aboriginal people to produce cutting, scraping or grinding implements. Stone artefacts are indicative of past Aboriginal living spaces, trade and movement throughout Tasmania. Aboriginal people used hornfels, chalcedony, spongelite, quartzite, chert and silcrete depending on stone quality and availability. Stone artefacts are typically recorded as being 'isolated' (single stone artefact) or as an 'artefact scatter' (multiple stone artefacts).

Shell Middens

Middens are distinct concentrations of discarded shell that have accumulated as a result of past Aboriginal camping and food processing activities. These sites are usually found near waterways and coastal areas, and range in size from large mounds to small scatters. Tasmanian Aboriginal middens commonly contain fragments of mature edible shellfish such as abalone, oyster, mussel, warrener and limpet, however they can also contain stone tools, animal bone and charcoal.

Rockshelters

An occupied rockshelter is a cave or overhang that contains evidence of past Aboriginal use and occupation, such as stone tools, middens and hearths, and in some cases, rock markings. Rockshelters are usually found in geological formations that are naturally prone to weathering, such as limestone, dolerite and sandstone

Quarries

An Aboriginal quarry is a place where stone or ochre has been extracted from a natural source by Aboriginal people. Quarries can be recognised by evidence of human manipulation such as battering of an outcrop, stone fracturing debris or ochre pits left behind from processing the raw material. Stone and ochre quarries can vary in terms of size, quality and the frequency of use.

Rock Marking

Rock marking is the term used in Tasmania to define markings on rocks which are the result of Aboriginal practices. Rock markings come in two forms; engraving and painting. Engravings are made by removing the surface of a rock through pecking, abrading or grinding, whilst paintings are made by adding pigment or ochre to the surface of a rock.

Burials

Aboriginal burial sites are highly sensitive and may be found in a variety of places, including sand dunes, shell middens and rock shelters. Despite few records of pre-contact practices, cremation appears to have been more common than burial. Family members carried bones or ashes of recently deceased relatives. The Aboriginal community has fought long campaigns for the return of the remains of ancestral Aboriginal people.

APPENDIX B – FACT SHEET 'REGISTER OF INTERSTATE CONTAMINATED LAND AUDITORS'

EPA TASMANIA

FACT SHEET

Register of Interstate Contaminated Land Auditors

What is the *Director, EPA's Register of Interstate Contaminated Land Auditors*? (hereafter referred to as the Register)

The Register is a listing of persons qualified to perform contaminated land audits under interstate Legislation and who have successfully applied to the Director, EPA to be included on the Register.

The purpose of the Register is to specify which persons are suitable to act as:

(a) *A person approved by the Director* under the Potentially Contaminated Land Code and thus able to certify that land is suitable for the intended use or to approve a plan to manage contamination and associated risk.
(b) A person able to provide a determination as required on a case by case basis under an Environment Protection Notice served under section 44 of the *Environmental Management and Pollution Control Act 1994* (EMPCA) or a Notice served under Part 5A of EMPCA.
(c) A person able to provide a certification under section 39F(1) of the *Macquarie Point Development Corporation Act 2012.*

Who is placed on the Register?

The Director, EPA determines the requirements for inclusion on the Register.

Principally an applicant must be accredited as a contaminated land auditor under one of the following:

- New South Wales – the site auditor scheme administered by the Environment Protection Authority under Part 4 of the *Contaminated Land Management Act 1997*.

- South Australia – the statutory audit system established in the *Environment Protection Act 1993* and the *Environment Protection Regulations 2009*.

- Victoria – the statutory appointment of environmental auditors established under the *Environment Protection Act 1970*.

- Western Australia – Contaminated sites auditors accredited under the *Contaminated Sites Act 2003*.

- Queensland – Contaminated Land Auditors established under the *Environmental Protection Act 1994* and the code of professional conduct.

Contaminated land auditors are highly experienced consultants accredited under legislation listed above, who are able to provide competent technical advice and increased certainty in regards to the 'sign-off' of contaminated site assessments and remediation. Clients can engage an auditor to independently review a consultant's reports on assessment, remediation and validation work to ensure that the consultant's methodology and interpretation of data are consistent with current regulations and EPA-endorsed guidelines.

An auditor wishing to apply for inclusion on the Register should send their request to the Director, EPA and specify the details of their current accreditation including any disciplinary action they may be subject to. EPA requests that only auditors prepared to undertake such work in Tasmania apply.

What is a contaminated land audit and a Contaminated Land Audit Report?

A contaminated land audit is a formal evaluation of the environmental condition of a described site (generally one or more Land Titles) in terms of risks to human health and/or the environment associated with the presence of soil or groundwater contamination. Each jurisdiction may use different terminology in regards to this audit process but technical requirements are generally consistent. The conduct of a contaminated land audit will result in a Contaminated Land Audit Report. Such a report comprises an unambiguous determination, written and signed by the registered auditor, which describes the suitability of the site for specific uses. Where appropriate, the Contaminated Land Audit Report will describe any management conditions that must be applied to ensure ongoing suitability for certain site uses, and any uses for which the site is unsuitable.

As part of the auditing process an auditor may, as appropriate, provide written endorsement of plans for remediation and/or management of sites, prior to the final determination of site suitability. Such endorsements may provide greater certainty for stakeholders in relation to the likely requirements for, and outcomes of, on-site works. However, auditors cannot guarantee remediation outcomes, and will only be able to provide formal determination of site suitability for specified uses in a final Contaminated Land Audit Report once remediation and validation are completed, and it is confirmed that no additional remediation is necessary for the proposed uses. Where a site is not remediated such that it is suitable for the proposed uses, but a formal Audit Report is nonetheless required, an auditor may complete a Contaminated Land Audit Report that describes the issues that prevent the use of the site until remediated, and a general description of the anticipated remediation requirements for the site to be made suitable.

Do auditors need to register before undertaking audits in Tasmania?

Yes. Should a client wish to contract an auditor who is not on the Register but does comply with the principal requirement above it will be a simple matter of sending in a request for the

auditor's inclusion and this can be addressed expediently by EPA, subject to the Director, EPA determining the suitability of the candidate auditor.

What starts the process of a contaminated land audit?

A person may choose to commission an Audit Report where they plan to redevelop a site and a determination by a person approved by the Director, EPA is a requirement under the Acceptable Solution in the Planning Code. Specific site legislation (i.e. the *Macquarie Point Development Corporation Act 2012*) or Notices served under EMPCA may also require the use of an auditor approved by the Director.

Who engages the auditor and how are they chosen?

The contaminated land auditor is normally engaged by the person commissioning the contaminated land assessment work. The client should firstly refer to the Register to determine auditors that have expressed interest in Tasmanian auditing work. When contacting an auditor, clients should confirm that the accreditation remains current in their accrediting State. Other auditors may also be contacted, but they would need to successfully apply for inclusion on the Register to be able to conduct auditing work in Tasmania.

Are there fees, and what is the process, to be placed on the Register?

No, there are no fees. The EPA Division requires an "expression of interest" from an auditor to work in Tasmania, to be considered for inclusion on the Register. This request should be made in writing to the Director and include details of the auditor's accreditation including whether any conditions are in place in relation to their accreditation or whether the auditor is subject to any disciplinary action in any State in which they are accredited. If the accreditation is appropriate, inclusion on the list is expedited.

Do I need an Auditor Insurance Certificate to conduct audits in Tasmania?

Yes. The Auditor Insurance Certificate needs to specifically cover audits carried out in Tasmania. Proof of such insurance must be provided to the EPA on request.

Do auditors have to comply with Jurisdictional Guidelines of the State where they hold their primary accreditation?

Auditors must comply with the technical standards and practices that relate to conducting an audit as detailed in the legislation, mandatory guidelines and Codes of Practice that apply to them in the State/s in which they hold appropriate accreditation. Auditors must comply with the standards expressed in the *National Environment Protection (Assessment of Site Contamination) Measure 1999*, which is a State Policy in Tasmania. Where a policy matter seems ambiguous, a determination from the Director, EPA may be requested and the auditor must comply with Director's determination.

Does an auditor have to notify the EPA Division if he or she has been requested to undertake a contaminated land audit?

Yes, but only where this audit is being conducted in response to a regulatory instrument i.e. an Environment Protection Notice or a Notice served under Part 5A of EMPCA or where the audit is being conducted under the *Macquarie Point Development Corporation Act 2012.* Audits being conducted to satisfy planning requirements do not need to be notified to the EPA Division.

The Director requests that an auditor notifies EPA within 2 weeks of being commissioned to undertake an audit, with the details of the site address, client and reason for the audit. Removal from the Director's Register may occur if this request is not complied with.

Does an auditor have to supply the EPA Division with an Audit Report?

Only reports required by a regulatory instrument (as outlined above) should be submitted to the EPA. Audits being conducted to satisfy planning requirements should not be submitted to the EPA.

What will EPA Division do with Audit Reports?

Reports submitted to satisfy specific Notice conditions will be reviewed by the EPA Division to determine whether the conditions in the Notice have been satisfied.

Are there procedures for disciplinary action for auditors providing false information?

The accrediting state would be provided with information in relation to such matters and would include this in their reviews of the auditor.

The Director, EPA may remove any person from the Register where this is reasonable, including where an auditor fails to comply with relevant technical guidance or legislation, where the auditor's accreditation is under review in the accrediting State or where such accreditation is no longer current. The *Macquarie Point Development Corporation Act 2012,* Section 39F (6), also specifies that the Director may revoke accreditation if the person fails to comply with any conditions of their accreditation.

Where information has been provided under legislation (i.e. an Environment Protection Notice or a Notice served under Part 5A of EMPCA) there are penalties for false and misleading statements (section 43A of EMPCA).

Flowchart: Administrative Process for conducting a contaminated land audit in Tasmania

HOBART TAS 7001

1 March 2016

Dear Mr Ford

RE: Expression of Interest for placement on Tasmania's Register of Interstate Contaminated Land Auditors

In accordance with EPA Tasmania's Fact Sheet '*Register of Interstate Contaminated Land Auditors*' *(V.1, Feb 2016),* I would like to express interest in being placed on the Register.

In relation to my qualification to be placed on the Register, I note the following.

- I am appointed by EPA Victoria as an environmental auditor (Contaminated Land), pursuant to the Environment Protection Act, 1970. My initial appointment was in April 2001, and my current appointment expires 16 May 2019. My Auditor Account Number is 75695.
- I am accredited by SAEPA as a Site Contamination Auditor, with my initial accreditation being in 2009, at the inauguration of the SAEPA system. My current accreditation is until 1 July 2017, and my Accreditation No is 2009016.
- I am not subject to any disciplinary action from either SAEPA or EPA Victoria.

I note that I have been engaged to undertake auditing by Macquarie Point Development Corporation (MPDC). To date, this has been on the basis of conducting 'voluntary' auditing, adopting the guidance and policies (to the extent not available in Tasmania) of the Victorian EPA (where I obtained my initial appointment as an Auditor in 2001). Prior to this engagement, I checked with EPA Victoria and EPA Tasmania to ensure that such a voluntary audit was considered acceptable, given that there was no formal mechanism for conducting an environmental audit in Tasmania. I was assured by both EPAs that such a voluntary 'audit' could be undertaken on the proviso that its voluntary nature was clearly described in any eventual report.

At the time of the initial request to provide a proposal for auditing services to MPDC in late 2014, I anticipated that amendments to Tasmanian legislation could eventually occur which would more formally capture auditing activities. As a precaution, I checked with the Victorian EPA and Tasmanian EPA that the introduction of a formal basis for auditing would not introduce a conflict of interest in the continuation of auditing for the Macquarie Point Site. I was advised that continuing to audit would not be considered to represent any conflict of interest.

I would continue to conduct my auditing activity under the jurisdictional legislation/guidelines in place in Victoria (which includes mandatory reference to the NEPM (Assessment of Site Contamination) 1999 (as amended 2013). In any instance where that legislation/guidance varied from Tasmanian

legislation/guidance I would discuss the difference and communicate with the authority regarding any material implications for final audit reporting.

I am in the process of seeking a certificate of currency for my insurance specifically naming auditing activity in Tasmania, and, once obtained, will be able to provide on request.

I trust that this meets your needs for my registration as an interstate auditor. Should you require any additional information, or clarification of anything in this letter, please let me know.

Yours sincerely

David Lam
Senior Principal and Environmental Auditor, Contaminated Land

Explanation of Terms

Property ID	A unique number used for Valuation purposes.
Date Inspected	The date the property was inspected for the valuation.
Levels At	Levels At - or Levels of Valuation Date means the date at which values of properties are determined for all valuations in a Municipal Area.
Land Value	Land Value is the value of the property including drainage, excavation, filling, reclamation, clearing and any other invisible improvements made to the land. It excludes all visible improvements such as buildings, structures, fixtures, roads, standings, dams, channels, artificially established trees and pastures and other like improvements.
Capital Value	Capital Value is the total value of the property (including the land value), excluding plant and machinery.
AAV	Assessed Annual Value. AAV is the gross annual rental value of the property excluding GST, municipal rates, land tax and fixed water and sewerage, but cannot be less than 4% of the capital value.
Interested Parties	This is a list of persons who have been recorded by the Valuer-General as having interest in the property (ie owner or Government agency).
Postal Address	This is the last advised postal address for the interested parties.
Multiple Tenancies	Properties that have multiple tenants are assessed for separate AAV's. e.g. a house and flat.
Similar Criteria	Properties in the same locality with a Capital Value within a range of 10% of the property.

No information obtained from the LIST may be used for direct marketing purposes.

Much of this data is derived from the Valuation Rolls maintained by the Valuer-General under the provisions of the Valuation of Land Act 2001. The values shown on this report are as at the Levels At date.

While all reasonable care has been taken in collecting and recording the information shown above, this Department assumes no liability resulting from any errors or omissions in this information or from its use in any way.

Mr David Lam
Senior Principal and Environmental
Auditor, Contaminated Land
Coffey Environments Australia Pty Ltd
Level 1, 436 Johnston Street
ABBOTSFORD VIC 3067

Dear Mr Lam

PLACEMENT ON THE REGISTER OF INTERSTATE CONTAMINATED LAND AUDITORS

Thank you for your Expression of Interest for inclusion on the above mentioned Register. I am satisfied with the information you have provided supporting this application. Therefore I can advise that I have placed you on the Register and have noted that you have been engaged by Macquarie Point Development Corporation to undertake site auditing. As communicated to your client, I am not yet promoting the existence of this Register amongst Auditors nor have I placed it on EPA's website. Such communication is expected to occur later this year in conjunction with the commencement of Tasmania's Potentially Contaminated Land Code.

Please inform me if you experience difficulties obtaining the relevant certificate of currency for your insurance.

If you have any queries with respect to this letter, please contact the Contaminated Sites Unit on the details provided at the head of this correspondence.

Yours sincerely

Wes Ford

Attention: Greg Cooper

Dear Greg

Addendum to Contaminated Land Audit - Macquarie Point – Lot B (The Precinct North)

1. PURPOSE OF THIS AUDIT REPORT ADDENDUM

This letter report represents an addendum to the following Contaminated Land Audit Report, which was completed for the Macquarie Point Development Corporation (MPDC):

- Contaminated Land Audit Report - Macquarie Point Development Project – Lot B, 22 November 2021

At the time of the Audit Report submission, the Site area was described as 'Lot B', but was noted at the time to also be described as 'The Precinct North', which is the current name for the area. The area included what had previously been described as Audit Area 7, and small parts of Audit Area 2, Audit Area 4 West, Audit Area 4 East and Audit Area 5. This Site area makes up a portion of the broader MPDC precinct, with The Precinct North area located in the central-western portion as shown on Figure 1 below[1].

The 2021 Audit Report included, as an appendix, a Site Suitability Statement, also dated 22 November 2021, Which was based on the proposed future development at the time the Audit Report was issued (November 2021). However, since Audit completion the proposed land uses have changed which has triggered the need for the site suitability to be reviewed and this Audit addendum.

This addendum sets out:

- The basis for the original Audit Report and Site Suitability Statement
- The outcome of the original Audit Report
- Rationale for reconsideration of Audit Report and Site Suitability Statement
- Findings of the Auditor's Review
- Whether there are material changes requiring reissue of the Site Suitability Statement, based on the review.

[1] Figure extracted from Figure F2 from Review of Site Suitability Statements 2025, AECOM, 1 February 2026.

Figure 1. Macquarie Point Development Corporation Precinct, showing location of The Precinct North (Lot B) Audit Area

This Audit addendum has considered, and should be read in conjunction with, the following documents

- The original 2021 Audit Report described above.
- Review of Site Suitability Statements 2025, AECOM, 1 February, 2026 ('the SSS Review report').
- The Site Environment Management Plan, AECOM (16 February, 2026 ('the SEMP').

The review covers the findings of a range of other AECOM reports, of which the following reports are of key importance.

- Soil, Groundwater and Soil Vapour Investigation 2025, Macquarie Point Development Project, 10 September 2025

- Acid Sulfate Soil Investigations, Macquarie Point Development Project, 4 December 2025
- Macquarie Point - Site-wide Soil Vapour Bore and Groundwater Well Inspection and Gauging, 25 March 2025
- Macquarie Point - Review of Site Specific Remediation Criteria 2025 10 October 2025

Assessment of Potential Off-Site Ecological Impacts - 2025 Addendum 18 December 2025

The SSS Review report is included in Attachment A, which appends the key reports used in the SSS Review.

The SEMP is included in Attachment B.

2. BASIS FOR ORIGINAL AUDIT REPORT AND SITE SUITABILITY STATEMENT

As noted in the Audit Report, while the Environmental Management and Pollution Control Act 1994 (EMPCA) outlined a broad definition of a contaminated land audit, it did not include a formal system for contaminated land auditing. In 2015, the Macquarie Point Development Corporation Act 2012 was amended to allow environmental auditing for the Macquarie Point site, under Tasmanian legislation. The amended Act enabled the Director of the Tasmanian Environment Protection Authority (EPA) to accredit an auditor. David Lam of Tetra Tech Coffey (then Coffey Environments) was appointed as the Environmental Auditor for the Site and has been accredited as an auditor recognised by the amended Act, by inclusion on Tasmania's Register of Interstate Contaminated Land Auditors.

At the time of the Audit Report, an EPA Tasmania Fact Sheet 'Register of Interstate Contaminated Land Auditors' outlined the requirements and approach for auditing, and effectively required the auditor to comply with obligations outlined in legislation, mandatory guidelines and Codes of Practice that apply in the home state/s of accreditation, and the NEPM 1999 (amended 2013). This has been superseded by web-based guidance [2].

Auditing was therefore conducted in accordance (so far as practicable) with Victorian guidelines that applied at the time of audit notification, under the (Victorian) Environment Protection Act 1970 ('Old Act'), and associated policies and guidelines. Although the legislation has been (generally) repealed and superseded by the Environment Protection Act 2017, for audits notified before the changeover date of the legislation (1 July 2021), the Old Act continues to exist, allowing auditing activities to continue to be conducted under the previous system.

The Audit Report was conducted under the Old Act, with some minor differences to suit the site requirements and EPA Tasmania Fact Sheet 'Register of Interstate Contaminated Land Auditors'.

3. OVERALL OUTCOME OF ORIGINAL AUDIT

The outcome of the November 2021 Audit Report is effectively captured in the Site Suitability Statement, which (broadly) found that the Site was suitable for the uses that were proposed at the time (Arts and Institutional Area', which was considered to be a 'Commercial' use setting, involving commercial and cultural uses, including retail). The site was also considered suitable for high density residential uses above – but not

[2] https://epa.tas.gov.au/environment/land/identification-and-assessment-of-contaminated-land/contaminated-land-and-the-planning-process/information-for-contaminated-land-auditors

on - the ground floor, and other less sensitive uses such as industrial use. The suitability for use was subject to a range of conditions, summarised as follows:

1. Nature of the development – site to be developed in accordance with the layout in Figure F2 of the attached SEMP[3]
    a) Design to account for CS3 methane risk, per *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020).
    b) The entire site is to be covered by building footprint/hardstand in its final developed state.
2. SEMP Implementation - owner/occupier of the site and any parties conducting works or otherwise at risk of exposure must implement and maintain the SEMP
    a) Maintenance of barrier layers (hardstand or earthen cap seal) or other engineered break layer to prevent access to soil (which contained some residual contamination).
    b) Garden plantings are to be in above ground planter boxes and not into the soil directly. Any proposal to plant into site soils must be confirmed as suitable by a Site Environmental Auditor.
    c) Specific requirements for managing excavated soil and imported Fill Material.
    d) Any subsurface works including for construction of the development or later maintenance must include a site specific work health and safety plan as detailed in the SEMP
3. Substantive changes to the SEMP to be verified as acceptable to an Environmental Auditor.
4. Groundwater is polluted and not to be used for extractive uses other than monitoring or remediation.

Other related information elements of the Site Suitability Statement addressed a number of matters, including:

- Differences from the Victorian Statement format.
- Notation of change of legislation, but that the audit was conducted under the earlier legislation applicable at the commencement of the audit
- Groundwater was considered to have been cleaned up to the extent practicable, although it was polluted and a number of extractive uses were precluded (Drinking Water, Irrigation, Stock Watering, Industrial use, and Primary Contact Recreation). Groundwater is not considered to preclude Ecosystem Protection at a point of discharge to a surface water, nor Buildings and Structures.
- Groundwater wells to be retained for monitoring where practicable and where monitoring ceases decommissioned in accordance with industry guidance.
- Soil impacts are present in excess of the Future Maintenance Worker remediation criteria in the locations listed below, which will be managed by adherence to the SEMP for any future construction or maintenance works.
    a) An exclusion zone surrounding the original Main Hobart Pipeline (Sewer).
    b) Areas on the site boundary where further soil excavation could not be conducted.
    c) Areas where impacted soil supported surrounding infrastructure.

[3] References to 'the SEMP' in this sub-section are references to the document attached to the July 2021 Audit Report, not to the current version of the SEMP.

4. RATIONALE FOR RECONSIDERATION OF PREVIOUS CONTAMINATED LAND AUDIT AND SITE SUITABILITY STATEMENT

On behalf of the MPDC, AECOM has prepared the SSS Review report.

This SSS Review report sets out a review of the four previously issued Site Suitability Statements. Note that the terminology used references the 'Statements' but the Auditor notes that the Site Suitability Statement is in each instance issued as part of a 'Contaminated Land Audit Report' (Audit Report). It is important to note that each Site Suitability Statement should be read in conjunction with the relevant Audit Report.

The report notes changes that have occurred since the issue of the various Audit Reports (incorporating the Site Suitability Statements). In broad terms, the changes are as follows.

- Issue of the State Policies and Projects (Macquarie Point Precinct) Order 2025, which provides the approval conditions for development of the Site, noting that environmental requirements remain consistent with the *Macquarie Point Development Corporation Act 2012.*
- Changes in proposed future use. For The Precinct North the site suitability statement considered development for a mix of medium to high density residential use and commercial use (mixed use), recreational/public open space and transport use. The proposed development now consists of a part of the Multipurpose Stadium and Associated Concourse. This includes the stadium structure/buildings occupying areas that were previously open space, changing the potential for vapour risks.
    - Parts of the area will be lowered by excavation to final surface elevations of between 1.8 to 4.8 metres Australian Height Datum (mAHD).
    - For construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
- A consolidated SEMP replaces the earlier, area-specific SEMPs.
- The building/structure footprints now proposed are extensive and will overlap areas of potential vapour risk.
- New designs exist for in-ground plants.
- Site Specific Remediation Criteria have been reviewed and updated.
- Additional site assessment data has been obtained across the site broadly, for
    - Acid sulfate soils.
    - Groundwater monitoring (2023, 2024 and 2025).
- Future off-site use patterns are now known which vary from previous knowledge:
    - The Macquarie Point Sewage Treatment Plant off-site to the northeast, will be replaced by a pumping station and emergency storage facility. The Hobart Main Sewer beneath the MPDC precinct will be removed, and replaced by an off-site sewer. Note that this is not considered to affect the characterisation or risk associated with the site or its management and is not considered further in this report.

Because of these changes, consideration of the need to update previously issued Site Suitability Statements (and potentially Audit Reports if warranted) is needed, based on the new information. These considerations are outlined in the following sections.

5. FINDINGS OF THE AUDITOR'S REVIEW

5.1 STATE POLICIES AND PROJECTS (MACQUARIE POINT PRECINCT) ORDER 2025

As noted by AECOM in the SSS Review report, the Order provides the approval conditions for development of the Site. Because the environmental requirements are consistent with those in the Macquarie Point Development Corporation Act 2012, which provided the legislative framework for previous Site Suitability Statements, no change to the process of Site Suitability is considered to arise from the Order.

The Auditor accepts this and considers that there is no requirement to change the existing Audit Report or associated Site Suitability Statement based on the Order.

5.2 REVIEW OF SITE SUITABILITY STATEMENTS 2025, AECOM

The SSS Review report notes the following changes in information and development planning that have the potential to affect the Site Suitability Statement.

- Changes in site development scenario, and
- a range of new or revised assessment reports have been produced (which the Auditor has reviewed).

The key considerations used to assess the need to amend the Site Suitability Statement are discussed in the following sections of this addendum letter report.

5.2.1 Review of Site Specific Remediation Criteria

Site Specific Remediation Criteria were developed to identify remediation requirements to remove or mitigate any unacceptable risks to current and future users of the Site, including as part of the previously issued Site Suitability Statements. It is noted that in some instances remediation works did not remove all contamination exceeding remediation criteria, where this was not practicable, and this was noted where it occurred.

AECOM reviewed the criteria in the report: Review of Site Specific Remediation Criteria 2025. Although some revisions of the criteria were made, there were no instances where the criteria were reduced (lowered), so that considerations made in previous Audit Reports and associated Site Suitability Statements would not be compromised.

This revision of Site Specific Remediation Criteria does not require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.2 Additional Soil Investigations

Soil investigations from grid based soil bores and some new groundwater and soil vapour bores identified contamination generally consistent with the previous information and resulting audit. Tier 1 criteria were exceeded for a range of uses, as had previously been assessed, noting that this included consideration of non-proposed development scenarios, in accordance with Old Act auditing guidelines which required consideration of all possible uses, whether or not intended.

Remediation criteria for soils were exceeded for TRH (C^{10}-C^{16}) at six locations (vapour intrusion risk), naphthalene (Vapour intrusion risk) at one location and lead (maintenance worker) at four locations. It is noted that previous assessment for the earlier Audit Report in 2021 considered direct soil vapour sampling results to take precedence over adsorbed soil concentration exceedances indicating a potential vapour risk, which the auditor accepted at the time. Although there were a number of exceedances of soil concentrations against remediation criteria developed to assess vapour risk (for naphthalene), actual directly measured soil vapour concentrations were not found to exceed commercial use criteria considered applicable to the proposed use.

It was noted that if (non-proposed) residential uses were to occur, these would also not have been at risk where over a basement car park, based on the direct soil vapour monitoring results.

The assessment did note that in any case, vapour mitigation that was required to deal with the CS3 rating for methane (which was present at elevated concentrations) would be expected to cater for hydrocarbons if present at greater concentrations than was measured in direct vapour monitoring.

The SEMP (now a consolidated SEMP for the overall precinct , rather than an area-specific SEMP) is considered to cater for residual contamination present in the audit area, requiring vapour mitigation for both methane and hydrocarbon vapour risks. Further discussion of how vapour risk is being treated in the revised SEMP, and the auditor's opinion on the applicability of that approach, is presented below.

In summary, for soil conditions based on additional monitoring, the amended SEMP will manage residual risks (including for localised high concentration lead that is planned to be removed as part of site development). If the amended SEMP is implemented, the additional soil investigation results do not otherwise require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.3 Additional Groundwater Investigations

Additional groundwater sampling has been undertaken in 12 wells within The Precinct North (variously in one or more of 2022, 2923 or 2025), and a further seven wells in nearby areas. Numerous previously existing wells had been lost/destroyed by soil remediation works. Replacement wells in the area were used for sampling, along with non-destroyed wells. MW155 was sampled in 2023, and again in 2025 along with four other wells (MW167, TW02, MW190 and MW102). MW187 (near former plume A3) was not sampled as it contained an LNAPL sheen.

Sampling included wells proximal to former LNAPL plume A3. Although the SSS Review report considers that measurable LNAPL was not recorded, and nor were concentrations indicating LNAPL, the Auditor notes that a sheen was identified on the water table (at MW187), and that wells are not present across all parts of the plumes. Some residual LNAPL is virtually certain to remain in some plume areas (as was considered to be the case at the time of the 2021 Audit Report).

The additional groundwater investigations identified Tier 1 criteria exceedances of drinking water, primary contact recreation, vapour intrusion for residential use, and by methane (to structures). Ecosystem protection criteria were also detected (noting that the ecosystem protection criteria would not apply on-site, but rather at a point of discharge to a surface water). No exceedances of site-specific remediation criteria were detected since the Audit Report.

Overall, the results are consistent with groundwater conditions as assessed in 2021. In broad terms, extractive uses of groundwater are precluded at the site, and are considered able to be managed by non-use of groundwater (other than for monitoring or remediation).

Overall, groundwater risks are not considered to have changed materially, and can be managed by implementation of the revised SEMP.

5.2.4 Additional Soil Vapour Investigations

One round of soil vapour monitoring has been conducted across the precinct in June 2025, and included two locations (SV31 and SV32) within The Precinct North Audit area.

The AECOM SSS Review report notes that vapour concentrations in SV31 and SV32 posed potential vapour risks. Methane was detected in June 2025 at 23.5% v/v in SV18, 5.1% v/v in SV33, 75.2% in SV34, and 5.5% v/v in SV35. Naphthalene was present in SV18 above residential use criteria.

Based on the June 2025 vapour monitoring, AECOM evaluated a Modified Wilson and Card CS3 rating for methane for the site generally (excluding The Escarpment), per Table 7 of the Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases (EPA NSW, 2020) ('the NSW guidelines').

This was evaluated on a conservative basis, based on high groundwater methane concentrations and high methane vapour concentrations, and the potential for methane to migrate laterally under large structures (such as the Multipurpose Stadium). As noted above, very high concentrations of methane in soil gas were found in The Precinct North, at SV34 and SV18.

AECOM noted that there was only a single round of flow monitoring to assess a flow-based Gas Screening Value per the NSW guidelines. The Auditor notes that the single round of flow monitoring was conducted without confirmation of prevailing atmospheric conditions, which can significantly affect flows, and so agrees with the determination of CS value. AECOM notes that it may be possible for further sampling to justify a lower CS rating, should additional monitoring be conducted, although the Auditor considers a change to be unlikely given the widespread elevated soil gas and groundwater methane concentrations, and the difficulty in assessing for conditions reflecting final levels following excavation.

AECOM has considered the building type applicable to the Multipurpose Stadium to be a mixture of 'standard commercial' and 'large commercial and industrial' building, and conservatively adopted a 'standard commercial' category. This results in a gas protection guidance value of 2 (for CS3, which incidentally also applies for CS2), per Table 8 of the NSW guidelines.

AECOM also noted the potential for hydrocarbon vapours from other parts of the site to pose a vapour intrusion risk into any continuous structures under which there are any areas of high vapour concentration. The conservatism of this approach is considered appropriate, particularly because there are proposed to be large areas where the surface elevation will be lowered. Previously, AECOM assessed vapour risk across the site by first considering exceedances of Tier 1 criteria for sub-surface media, for a range of uses (including non-proposed uses). This evaluation was then superseded by consideration of data against site-specific remediation criteria developed for the site, and then by consideration of soil vapour readings as a more direct measure of risk. For broad areas of the site, including those under parts of the Multipurpose Stadium and concourse, which extends into part of the Goods Shed and Yard, exceedances of remediation criteria relevant to the now-proposed development have been reported variously for TRH and BTEXN in the Gateway, The Precinct South, The Precinct North and The Promenade and Underground Carpark. Because large parts of the site are to be lowered by excavations, the changed depth to residual contamination may affect the potential for vapour risks to be experienced, including where direct vapour readings not indicating a vapour intrusion risk have been obtained from the site at pre-excavation levels.

Based on the inferred vapour risks, the consolidated sitewide SEMP includes requirements for gas protection to be incorporated into structures which extend across areas where vapour risks exist, to cater for potential ingress of methane or hydrocarbons which are variously present across the Site, to a gas protection guidance value of 2, and to consider suitability for other hydrocarbon species. Based on the potential for petroleum hydrocarbon and methane vapours across broad areas of the site (except for the Escarpment), this means that as assessed by AECOM (and agreed by the Auditor), vapour mitigation is needed beneath all structures across the Gateway, Promenade and Underground Carpark, The Precinct North and The Precinct South, and where continuous structures from those areas extend into The Escarpment. Provided the revised SEMP is implemented, the results of additional soil vapour investigations (and the potential for groundwater concentrations to cause vapours) do not otherwise require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.5 Change of Land Use

The SSS Review report notes the changes of proposed land use associated with the Precinct North area. The original 2021 Audit Report and associated Site Suitability Statement allowed for 'Arts and Institutional Area', which was considered to be a 'commercial' use setting. The site was also considered suitable for high density residential uses above – but not on - the ground floor, and other less sensitive uses such as industrial use.

The changed proposed land use includes part of the Multipurpose Stadium and Associated Concourse, an underground carpark, and buildings associated with the Antarctic Facilities Precinct and the Complementary Integrated Mixed Use Zone. These are considered commercial uses, including the narrow spaces between buildings. Underground carparking which was not considered by the Site Suitability Statement.

The Site Suitability Statement included in Condition 1 a number of conditions related specifically to the nature of the development, including:

- Uses limited to specified areas as defined in a figure showing use layout in the (then) SEMP.
- Methane required design to account for CS3 – moderate risk to manage the methane concentrations on site.
- Site to be covered by building footprint and/or hardstand.

Importantly, the use pattern for which the site was considered suitable was defined by reference to the SEMP that was attached at the time. The consolidated SEMP for the overall precinct, which has been developed to consider management requirements for the Multipurpose Stadium and other planned buildings/uses across the site, redefines the use pattern of the Audit site, and such substantive revision to the SEMP is allowed for in Condition 3 of the Site Suitability Statement. It is therefore considered that the updated (consolidated) SEMP deals with the change of specified uses in a way allowed for by the previously issued Site Suitability Statement, subject to acceptance by an environmental auditor (as is the purpose of this addendum report).

Based on this, although the range of uses noted in the Site Suitability Statement do not need to be updated, with the Multipurpose Stadium considered to be commercial or commercial/industrial in respect of contamination exposure potential. However, management measures are required for building areas in parts that were previously open air at ground level. As long as the (revised, consolidated) SEMP is implemented, including vapour management measures for structures, the Statement of Suitability does not need to be amended.

5.2.6 Change of Elevation

The site surface is to be changed to facilitate the proposed development. This will involve excavations in some parts of the overall Macquarie Point Precinct, which will lower the site surface and change potential exposure to contamination. In other areas, some filling will be undertaken. In terms of final constructed elevations, based on Figure F5 provided in the SSS Review report, the Precinct North will be subject to reduction of level from typically 3.6 to 4.7mAHD to 3 mAHD across the stadium Area. A reduction of elevation for the surrounds from up to approximately 4.2 m to 2.9 m applies to the east of the stadium, while the car park area will have a final elevation of approximately 1.7 mAHD in an area indicated to have a current surface elevation of approximately 4.0 to 5.0 mAHD.

Based on the existing groundwater contours there is potential for groundwater containing contamination to be encountered by the excavations and the final built form including the basement car park.

A number of revisions are included in the SEMP for the broader site to address:

- Acceptable imported fill requirements.
- Subsurface utilities to be within clean soil corridors when otherwise within existing site soil.
- Vapour mitigation system requirement .
- Development to occur once other Audit Reports (with associated Site Suitability Statements) are completed.

- Requirement for any subsurface drains constructed as part of site lowering (and to accommodate structures and associated vapour mitigation) to be considered potentially contaminated and subject to being removed by a licenced waste transporter or discharged under a trade waste agreement. This would prevent additional risk to off-site ecosystems. Potential for groundwater ingress to structures or where groundwater may be present at a depth close to the level of the structure may alternatively be dealt with by tanking. Given the potential for drains to collect some groundwater containing dissolved methane, the drainage system must also be designed to consider the potential for methane off-gas from drainage water to accumulate in drainage infrastructure.

In summary, some amendments to the SEMP, which are considered reasonable by the Auditor are applicable to manage residual risks associated with the site for the proposed use, and is the revised SEMP is implemented the changes in elevation do not require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.7 Addendum to Off-Site Ecological Risk Assessment

An addendum report to the previous 'Assessment of Potential Off-Site Ecological Impacts' (AECOM, 2020) has been conducted as noted earlier in this letter.

This update was required, because the consideration by the Auditor that Clean Up To the Extent Practicable (CUTEP) had occurred was contingent on there being no unacceptable and unmanageable risks following the extent of clean up for groundwater contamination which had occurred. This included active remediation of LNAPL plumes within Promenade and Underground Carpark area, with further remediation not considered practicable.

The addendum report concluded that unacceptable risk to off-site ecological receptors was not occurring. This included consideration of PFAS concentrations which were identified (notably at MW16 within the Precinct South).

The results of the Addendum to 'Off-Site Ecological Risk Assessment' do not require an amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.8 Potential Acid Sulfate Soils

Potential acid sulfate soils were considered in the report: Acid Sulfate Soil Investigations (AECOM, December 2025). This is primarily because of the potential for construction to disturb potential acid sulfate soils (PASS). Although PASS is not strictly contamination, the SEMP has been updated to include requirements for Acid Sulfate Soil Management Plans (ASSMP) and/or Dewatering Management Plans (DWMP) as required, and for building design and water management to consider potential acidity.

If the revised SEMP is implemented, including requirements for managing PASS, the results of the Acid Sulfate Soil Investigations do not require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.9 Updated Designs for Planting Deep Rooted Vegetation

The SSS Review report includes an updated specification for planting deep rooted vegetation.

The updated designs have been included in the SEMP. The Auditor has reviewed the designs and considers that they are protective of potential risks at the Site, not only in respect of the vegetation itself, but in terms of preventing risks though pathways between Site users and deeper residual contamination.

If the revised SEMP is implemented, including updated designs for planting deep-rooted vegetation, there is no requirement to amend the existing Audit Report or associated Site Suitability Statement.

6. CONCLUSION

The review of the Site Suitability Statement for The Precinct North Lot B (which was produced as part of and to be read in conjunction with the overall Contaminated Land Audit Report for Lot B) has identified a number of changes in future site use and available information. Overall, there are no material changes required to the Site Suitability Statement itself, because the changes of use pattern are defined in the revised consolidated SEMP. The SEMP specified the use pattern that was addressed by the original Site Suitability Statement. There are some changes to risks based on different uses and due to level changes in the proposed development, but these changes do not affect the wording suitability subject to SEMP implementation as was included in the previous Site Suitability Statement.

The SEMP that is now being implemented for the entire Macquarie Point Precinct (a consolidated site 'SEMP', rather than one specific to each audit area) includes new content (compared to the SEMP referenced by the original Site Suitability Statement for Lot B). The changes account for new management requirements to control risks based on additional information, changes in site use and some design elements. The original Site Suitability Statement allowed for the SEMP to be amended under the following statement condition:

- Site Suitability Statement Condition 3:

  Any (substantive) changes to the Site Environmental Management Plan referred to in Conditions 1 and 2 must be prepared for the site by a suitably qualified professional and verified as acceptable by an Environmental Auditor.

Based on the above allowance, I (as the appointed Auditor for the Site) am using this addendum report to the provide verification of the acceptance of the revised (consolidated) SEMP, in respect of requirements associated with management of risks under the Site Suitability Statement issued as part of the Contaminated Land Audit Report for Lot B (now described as The Precinct North). One aspect of this acceptance of the revised SEMP is that while the suggested management measures are considered to be protective of the residual risks posed by remaining contamination on the site, the measures are in some instances subject to detailed design of engineering solutions. The Auditor may evaluate whether proposed solutions will meet the intent of the SEMP in managing risks, but is not responsible for the design, or the buildability of design details which are specified at only a conceptual level by the SEMP.

This addendum report should be provided with, and read alongside the following Audit Report and associated Site Suitability Statement:

Contaminated Land Audit Report - Macquarie Point Development Project – Lot B, 22 November 2021

This addendum serves to record that the Audit Report and Site Suitability Statement remains suitable for what was described as Lot B, and is now described as The Precinct North, subject to the implementation of the revised SEMP 16 February 2026).

Regards

Executive Summary

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of a remediation strategy for the Macquarie Point site (the Site) in Hobart, Tasmania.

Prior to the development of Macquarie Point, Division 2, Section 39F(1) of the *Macquarie Point Development Act 2012* (the Act) requires that an accredited site Auditor certifies that remediation of each part of the Site has occurred to a standard that is satisfactory for the purposes of the proposed redevelopment.

For the purposes of Auditor assessment of Site Suitability, the Site has been divided into separate assessment areas, for which Environmental Auditor certification has been sought as environmental investigations and remediation works have been completed.

To date, four Site Suitability Statements have been issued by the EPA-accredited Site Auditor, consisting of:

- The Goods Shed and Yard - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1* (Coffey, 2019a)
- The Escarpment (Audit Area 4 West) - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West* (Coffey, 2020)
- The Promenade and Underground Carpark (Lot E and UGC) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark* (Coffey, 2021a)
- The Precinct North (Lot B) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot B* (Coffey, 2021b).

The Site Suitability Statements should be read in conjunction with the contaminated land audit reports, which form part of the assessment of and requirements for the Site's suitability for the proposed development.

The assessments of the remaining Site areas (consisting of the Precinct South, the Gateway, and Audit Area 4 East) and of Regatta Point, which is anticipated to be included in the Site in the future, are ongoing and separate Site Suitability Statements will be sought for these areas in the future.

However, in 2024, the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024), was released by the Corporation, which updated and modified the vision for development of the Site. As a result, the Site Suitability Statements issued prior to the Precinct Plan (listed above) are no longer accurate to the proposed future uses of the Site and require review and update for the changes in Site uses and proposed development.

E1 Changes Since Issue of the Site Suitability Statements

Review of the proposed changes in Site development, Site data for these assessment areas, both existing and any new data received since issue of the Site Suitability Statements, and of criteria and assessment methods, have been conducted in this report and has identified the items listed on **Table E1**, which are considered to have potential implications or effects on the environmental risk profile for the proposed future Site uses.

Table E1 New Information or Changes in Development Which Have Potential to Affect Suitability

New Information or Change	Description and Consequences
Issue of the *State Policies and Projects (Macquarie Point Precinct) Order 2025* (the Order)	The Order provides the approval conditions for development of the Site. However, the environmental requirements are consistent with those in the *Macquarie Point Development Corporation Act 2012*, which provided the legislative framework for previous Site Suitability Statements, and no change to the process of Site Suitability are considered to arise from this change.
Changes in proposed land use and development - The Goods Shed and Yard (Audit Area 1)	• The Goods Shed building will be removed from this area. • Proposed Open Space use to the west and north of the Goods Shed now forms park of the Multipurpose Stadium and Associated Concourse zone. • Sections of this area will be lowered to final surface elevations of between 2.9 to 3.0 metres Australian Height Datum (mAHD). • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
Changes in proposed land use and development - The Escarpment (Audit Area 4 West)	• Land use of parts of this area has changed to Open Space. It is noted that the Goods Shed building, located in the Goods Shed and Yard (Audit Area 1) is likely to be moved to this area, and assessment for commercial/industrial uses is still considered required. • The south-eastern corner is included in the proposed footprint of the underground carpark. • High density residential use is no longer planned in this area. • Sections of this area will be lower to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
Changes in proposed land use and development -The Promenade and Underground Carpark (Lot E and UGC)	• Open Space land use in the southern portion of this area is now included in the Multipurpose Stadium and Associated Concourse zone. While the majority of this space was assessed for a proposed underground carpark, which was assessed for commercial/industrial use, portions of in the eastern and western areas of this assessment area were only considered for Open Space use. • Land proposed for an “Access Link”, or open transport corridor, in the eastern portion of this area was assessed for Open Space use, but is now considered for commercial/industrial use as part of the Multipurpose Stadium and Associated Concourse zone. • High density residential (above the first floor) is no longer planned in this area. • Sections of this area will be lower to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
Changes in proposed land use and development -The Precinct North (Lot B)	• Land use is still considered to be commercial / light industrial. • A single storey underground carpark is proposed in the northern portion of this assessment area. • Sections of this area will be lower to final surface elevations of between 1.8 and 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.

New Information or Change	Description and Consequences
Updates and consolidation of the SEMPs referenced in Site Suitability Statements	The initial area-specific Site Environment Management Plans (SEMPs) issued for each area have been updated and consolidated into a single Site-wide SEMP. Each iteration of the SEMP has retained the conditions and information from previous versions.
Building and structure footprints overlapping areas of potential vapour intrusion	The current SEMP includes areas specific requirements relating to vapour mitigation in future buildings and structures, with identified soil vapours consisting of methane, total recoverable hydrocarbons (TRH) and benzene, toluene, ethylbenzene, xylenes, and naphthalene (BTEXN). The new planned development includes proposed structures with footprints which extend across areas of elevated potential vapour intrusion.
Designs for in-ground plants, including deep-rooted plants	Additional designs for in-ground plants have been proposed which required assessment for environmental risk and confirmation from the Environmental Auditor to meet the requirements of the SEMP.
Review of the Site-Specific RC	The Site-Specific Remediation Criteria (the RC), which have been used to assess and identify areas of soil and groundwater where remediation is considered required for future development, have been reviewed and updated.
Collection of new environmental data from soil, groundwater, and soil vapour	Additional monitoring and investigation events have been conducted since issue of the Site Suitability Statements and have been assessed for any information which could influence Site Suitability. The following assessments relevant to areas with issued Site Suitability Statements have been considered: • Investigations of Acid Sulfate Soil (ASS) • Groundwater Monitoring Events (GMEs) and groundwater gauging conducted in 2023, 2024 and 2025. • *In situ* characterisation soil sampling conducted for Stage 1 and Stage 2 of the proposed excavation of the Site. • Installation and sampling of new groundwater wells and soil vapour bores in June 2025.
Off-Site land use changes	The Macquarie Point Sewage Treatment Plant (STP), located off-Site to the northeast, is planned for closure and replacement with a new Sewage Pumping Station (SPS) and emergency storage facility. As part of these works, the Hobart Main Pipeline (sewer) beneath the Site will be decommissioned and removed, and a new sewer line installed off Site to the south under Evans Street, and east under TasPorts land.

E2 Outcomes of Review

Based on the review of proposed Site development changes to land use, and new environmental data, the following items require changes in management or mitigation approaches for the Site to be suitable for the intended future use:

- Development of structures across assessment area boundaries.

  The Precinct Plan includes the following proposed structures which extend across multiple assessment areas:

  - The Multipurpose Stadium and Associated Concourse – The Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, the Precinct North, the Precinct South, and the Gateway.
  - The underground carpark and building footprints within the Antarctic Facilities Zone – The Escarpment, the Promenade and Underground Carpark, the Precinct North, and Audit Area 4 East.
  - Building footprints within the Complementary Integrated Mixed Use Zone – The Precinct North and the Precinct South.

  Extension of structures across the assessment area boundaries introduces additional considerations for Site Suitability, and development of structures which extend beyond the boundaries of assessment areas should not be commenced until Site Suitability Statements have been issued for all areas within their footprints.

- Potential soil vapour intrusion into future structures from methane, TRH, and BTEXN.

  This risk has been identified due to:

  - Detections of methane, considered to arise from anaerobic degradation of either residual hydrocarbon contamination, or saturated soil from former river- and sea-bed buried by land degradation, both directly in soil vapour, and above the adopted criteria for vapour intrusion in groundwater, in multiple locations across the Site.
  - Exceedances of the Commercial/Industrial land use RC for TRH >C10-C16 and naphthalene, indicating potential vapour intrusion in soil or groundwater below or adjacent to proposed structures, in both new data collected since issue of the Site Suitability Statement, and in some areas (i.e., former Open Space and the Access Link (an open transport corridor) areas in the Promenade and Underground Carpark) which have been updated to a more sensitive use in the new proposed development.
  - Potential changes in risk profile from proposed excavation/changes in Site elevation, which decrease the distance between some impacts and may lead to increased concentrations in soil at the surface.

  Based on the current land uses and existing leases, and the widespread and likely discontinuous sources of methane in saturated buried soils, remediation of the source of these impacts is not considered practicable. Inclusion of a vapour protection system in future building design is considered required as part of Site Suitability for areas which include potential vapour intrusion risks, consisting of the following areas considered in this report:

  - The Goods Shed and Yard – the Multipurpose Stadium and Associated Concourse.
  - The Escarpment – the Multipurpose Stadium and Associated Concourse, and the underground carpark and building structures within the Antarctic Facilities Zone.

    (It is noted that vapour protection is not considered required for the proposed relocation of the Goods Shed to the northern portion of this area).
  - The Promenade and Underground Carpark – the Multipurpose Stadium and Associated Concourse, and the underground carpark and building structures withing the Antarctic Facilities Zone.

- The Precinct North – the Multipurpose Stadium and Associated Concourse, the underground carpark and building structures withing the Antarctic Facilities Zone, and building structures within the Complementary Integrated Use Zone.

Any vapour protection system must have independent review of design and verification following construction, and this requirement must be documented in the SEMP.

- Potential future contact between intrusive maintenance workers and areas of Site soil with lead concentrations exceeding the adopted RC for this land use:
  - The existing Site Suitability Statements included an assumption that only minor or incidental changes to the surface elevation would occur, and assessed potential risks to intrusive maintenance workers to a maximum depth of 2 m below the current surface elevation.
  - Concentrations of lead were reported in previous assessments in excess of the adopted RC for maintenance workers at depths below 2 m below current surface elevation, and additional soil concentrations in excess of the RC have been identified since issue of the Site Suitability Statements, noting that these exceedances have been detected in soil proposed for excavation.
  - To minimise potential contact between future intrusive maintenance workers and existing Site soil with exceedances of RC:
    - Known locations of exceedances will be documented in the SEMP(s) for management during construction or development activities.
    - Subsurface services will be required to be installed within clean fill/soil corridors, or within protective conduits.
    - Additional Personal Protective Equipment (PPE) requirements will be required during future intrusive maintenance works where contact with current Site soil may occur, to minimise potential ingestion/inhalation of existing Site soil.

  The proposed additional controls, and data regarding locations with concentrations of lead in excess of the RC, must be documented in the SEMP.

- Disturbance of Potential Acid Sulfate Soil (PASS):
  - Assessment of Site soils in 2024 and 2025 identified that, while no ASS is present on Site, PASS with the potential to acidify if disturbed/oxidised is present in saturated soils at the Site.
  - Future development activities on the Site must include management measures for PASS to prevent acidification and environmental impact on the Site, or at any receiving site if PASS is excavated and removed.

  The additional controls and data regarding controls to prevent acidification of PASS must be added to the SEMP.

- Potential groundwater present at the surface, or shallow groundwater where risks may not be quantified by the RC, at the following locations based on the final design elevations for the Site, has been identified at:
  - The north, west, and north-west areas of the Multipurpose Stadium.
  - The Practice Wickets in the north-west corner of the Site.
  - The underground carpark in the north-east corner of the Site.

  Potential shallow groundwater interactions are not considered to introduce unacceptable risks, or risks are considered to be suitably managed or mitigated by development designs, as:
  - In the 70% detailed design of the Multipurpose Stadium:
    - Any drained groundwater is captured and disposed of as potentially contaminated waste under a TWA or similar, and should not be discharged to sensitive receptors.
    - The drainage layer does not intersect and capture LNAPL plumes, which may render groundwater unable to be discharged under TWA.

    - A vapour mitigation layer is present above the drainage layer, and will act as mitigation against potential vapour intrusion risks from shallow groundwater.
    - Any potential soil which may be dewatered by the drainage layer is assessed and managed by a DWMP, as required by the acid sulfate soil investigation.

    Any changes to these features in future design requires review and reassessment of environmental risks.

  - Potential shallow groundwater below the Practice Wickets is not considered to represent an unacceptable risk, as groundwater is not considered likely to infiltrate to the proposed surface elevation of 4.8 mAHD, and vapour intrusion from groundwater is not considered to represent a risk in consideration of the open space use of the area and the Site history and environmental data in this area.
  - The design of the underground water carpark, including the final surface elevation within the carpark (i.e., the level of the lowest floor) is not yet finalised and risks and mitigations from shallow groundwater cannot be assessed. However, the SEMP contains requirements to assess vapour intrusion for structures within 1 m of groundwater, prohibits contact between Site users and groundwater.

  The SEMP should be updated to include the requirement that any future development of the Site which involved modification of the surface elevation must assess the proposed change against groundwater elevations. If groundwater will be or is likely to be ≤1 m below the final surface, the proposed development must include measures and/or mitigations to:

  - Prevent groundwater from reaching the surface or structures, such as drainage or tanking. Any such measures:
    - Must capture any drained groundwater for assessment and disposal as potential contaminated waste.
    - Must not transport or potentially increase the migration of groundwater or other contaminants on groundwater (such as LNAPL or DNAPL) to sensitive receptors (such as stormwater or the River Derwent/Sullivans Cove).
  - Include either:
    - Additional assessment of vapour risks from shallow groundwater which demonstrates that no unacceptable risks are present; or
    - A vapour protection system suitable for potential vapour risks from groundwater.
  - Identify if PASS may be dewatered and, if so, include measures to neutralise potential oxidation and prevent acidification as required by the assessment of acid sulfate soil at the Site.

- Review of potential off-Site ecological impacts:
  - The *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).

    An addendum to this assessment was prepared in 2025 (AECOM, 2025i), and concluded that overall, based on the review of updated Site data and information, the outcomes of the AECOM (2020h) assessment remain valid and suitable for ongoing assessment of the Site. No material changes in the off-Site aquatic ecological risk profile have been identified, and ecological risk to receptors in the River Derwent and Sullivans Cove remains low.

    Ongoing groundwater monitoring was recommended and is included in the SEMP (AECOM, 2025h).

- The upcoming closure and removal of the Macquarie Point STP, and realignment of the Main Hobart Pipeline (Sewer):

- The replacement of the STP with a pumping station, and associated activities including realignment of the Main Hobart, are not considered to change the environment suitability of the Site for future development.

The following changes, or updated information, are not considered to affect the previously issued Site Suitability Statements:

- Approval of the *State Policies and Projects (Macquarie Point Precinct) Order 2025* (the Order)
  - The Order provides approved conditions for the development of the Site. However, the conditions and requirements relating to the Environmental Audit and Site Suitability Statements are consistent with, and reference, the *Macquarie Point Development Act 2012*, and approval of the Order does not affect the assessment or requirements of the suitability of the Site for future development.
- Updates or consolidation of SEMP(s):
  - While the existing Site Suitability Statements reference different SEMPs, issued at the time of the initial assessment of Site's environmental suitability for development, have been updated as new data has been received, each iteration of the SEMP has included the previous requirements from Site Suitability Statements and been reviewed and accepted by the Site Auditor.
  - It is noted that updates to the SEMP are required as part of the assessment of other changes.
- Review and update of Site Specific RC:
  - While modifications to the Site Specific RC were identified as part of review in the context of the Precinct Plan, in all cases the changes increased criteria values, and as a result the RC used at the time of issue of Site Suitability Statements are considered conservative and appropriate for detection of potential environmental risks. As such, re-review of the existing data sets with the updated RC is not considered required.
  - It is noted that some RC (i.e., vapour intrusion, intrusive maintenance worker RC) are depth dependent, and potential changes in risks from the proposed modifications to the Site surface elevation are discussed above.
- Precluded Protected Environmental Values (PEVs):
  - No changes in PEVs precluded since the Site Suitability Statements were initially issued have been identified in this review.
- Light Non-Aqueous Phase Liquid (LNAPL) Plumes:
  - Based on assessment of LNAPL Plumes in 2025, LNAPL was not present at measurable thicknesses in any groundwater wells in or hydraulically up-gradient of the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, or the Precinct North, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3).
  - No groundwater concentrations indicative of free-phase LNAPL, or soil vapour concentrations indicating potentially hazardous vapour generation (other than methane) were detected at the LNAPL Plumes, and LNAPL migration is not considered likely to occur.
  - LNAPL is still considered stable, and further remediation is not considered practicable.

  On this basis, LNAPL Plumes are not considered to make the Site areas considered unsuitable for development, if the management measures within the SEMP are implemented.

Based on the review conducted, the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, and the Precinct North are considered suitable for the proposed updated development if the recommendations provided in **Section E3** below are implemented, and on the basis of ongoing implementation of the SEMP to manage residual environmental impacts at the Site.

Auditor review and verification of this assessment and the recommendations is required.

E3 Recommendations

The following additional controls and mitigations are required to be added to the SEMP in order to mitigate and manage any additional environmental risks identified in the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, and the Precinct North:

- Vapour mitigation is required as part of construction of the structures in the following areas:
  - The Goods Shed and Yard.
  - The Promenade and Underground Carpark.
  - The Precinct North
  - Any buildings which include these areas in their footprint, such as the portion of the Multipurpose Stadium and Associated Concourse in the Escarpment.

  Vapour mitigation must incorporate a minimum gas protection value of 2 (EPA NSW, 2020), and the selected method should be suitable for mitigation of methane, TRH and BTEXN vapours.

  Design and construction documentation must include a documented testing and verification method for vapour intrusion mitigation measures, with reference to Appendix 7 – Verification and construction quality assurance, of *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020). Any design and/or installation of ground gas protection measures will require independent oversight and sign-off by an Environmental Auditor, or other suitably qualified and independent verifier.

- Landscaped areas and gardens should be established in aboveground planter boxes on hardstand and not directly over exposed soil. In the event that gardens are proposed in-ground, the following barrier system shall be installed:
  - Layer 1: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users.
  - Layer 2: Earthen cover (minimum 0.5 m) certified as 'Fill Material' in accordance with IB105.
  - Layer 3: Surface coverage (comprising shallow rooted vegetation).

  Deeper-rooted vegetation may be established using the designs provide in **Appendix E**, with the following additional requirements:

  - Soil imported for in-ground planting must be Level 1 – Fill Material.
  - No plants intended for consumption are to be included in any in-ground planting on the Site.
  - The potential size of plant root structures should be considered when selecting species for cultivation on the Site. Planting structures should have sufficient volume for the plants to develop without requiring root structures to penetrate the earthen liners and extend beyond the clean-fill soil.
  - The earthen liner and barrier layers included in planting designs are to be installed above the Site water table.
  - In-ground planting is only to occur in open space use areas. No in-ground planting is to occur within Site buildings (i.e., within atriums, foyers, or arboretums).
  - Trees, or any other deep-rooted plants, which are cultivated on the Site should be excavated and removed as soon as possible if any of the following occurs:
    - Death or significant rot/reduction in size
    - Toppling/knocking over by wind or impact.
  - In the event that plant removal occurs:
    - Removal of all root structures must be included.
    - If root structures have extended and pierced the earthen liner and/or indicator barrier layer, these must be repaired and restored as part of removal of the plant(s).

- PASS within saturated soils, strongly correlating with estuarine sands, has been identified beneath the Site and should be considered during future works.

  Future activities at Macquarie Point should identify all activities which have the potential to disturb or expose (i.e., dewater) PASS at the Site, as identified in *Acid Sulfate Soil Investigations* (AECOM, 2025b), and:

  - The SEMP should be updated with a description and locations of identified PASS.
  - The SEMP should include overarching management obligations for disturbance of ASS and/or water table drawdown via dewatering, include a requirement for scope specific Acid Sulfate Soil Management Plans (ASSMP) and/or Dewatering Management Plans (DWMP) to be developed for each discrete works package involving civil and general earthworks activities, water table drawdown via dewatering, and any other significant soil disturbance activities or changes to natural groundwater and surface water systems.

    These documents should be prepared by those undertaking works which may disturb PASS, and must include:

    - Estimated volumes and action criteria for PASS which may be disturbed by the proposed works.
    - Procedures for the handling of disturbed PASS, including verification of neutralisation, groundwater generated by dewatering, and monitoring of Site environmental conditions in the vicinity of PASS disturbances.
    - Contingency measures which are specific, measurable, and attainable, and can be implemented in a timely manner in the event that action criteria or trigger values are exceeded.
  - Future structures and infrastructure at the Site should consider the potential effects of sulfides and possible acidification in design and selection of materials, and adopt appropriate mitigation measures to prevent degradation of materials overtime.
  - Any groundwater, or run-off which may have come into contact with PASS, should be considered as potentially contaminated. pH and the potential to acidify should be considered in assessment any such water prior to disposal

- Any engineered fill or other materials used to increase the surface level to 3 mAHD must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.

- The areas of soil listed below, where lead in soil has been identified as exceeding the intrusive maintenance worker RC:
  - Soil surrounding the Hobart Main Pipeline (sewer) (already noted in Section 3.2.3 of the SEMP.
  - Soil surrounding *in situ* sample points K14, K18, L13, M13, M14, K06, L08, M09, N10, F11, G11, G13, H10, H12, H13, I13, J06, J08, J10, J12

  These locations should be noted as a potential area of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.

- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.

- Any future development of the Site which involved modification of the surface elevation must assess the proposed change against groundwater elevations. If groundwater will be or is likely to be ≤1 m below the final surface, the proposed development must include measures and/or mitigations to:
  - Prevent groundwater from reaching the surface or structures, such as drainage or tanking. Any such measures:
    - Must capture any drained groundwater for assessment and disposal as potential contaminated waste.
    - Must not transport or potentially increase the migration of groundwater or other contaminants on groundwater (such as LNAPL or DNAPL) to sensitive receptors (such as stormwater or the River Derwent/Sullivans Cove).
  - Assess and prevent unacceptable risks from groundwater-derived vapour via either:
    - Additional assessment of vapour risks from shallow groundwater which demonstrates that no unacceptable risks are present; or
    - A vapour protection system suitable for potential vapour risks from groundwater.
  - Identify if PASS may be dewatered and, if so, include measures to neutralise potential oxidation and prevent acidification as required by the assessment of acid sulfate soil at the Site.

1.0 Introduction

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of a remediation strategy for the Macquarie Point site on Evans Street, Hobart, Tasmania (the Site). The location of the Site is shown on **Figure F1**.

As part of preparation for development, the Site is undergoing an Environmental Audit as required by Division 2, Section 39F(1) of the *Macquarie Point Development Act 2012* (last amended 1 July 2023), which states:

Redevelopment of a part of the site may not occur until an accredited environmental auditor has certified that the remediation of the part of the site has occurred to a standard that is satisfactory for the purposes of the proposed redevelopment.

For the purposes of the Environmental Audit, the Site has been divided into separate assessment areas, for which Environmental Auditor certification has been sought as environmental investigations and remediation works have been completed. It is required at the completion of the Environmental Audit, Site Suitability Statements should be issued for the entire Site.

Four Site Suitability Statements have been issued to date for the following Site assessment areas (discussed further in **Section 4.0**):

- *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1* (Coffey, 2019a)
- The Escarpment (Audit Area 4 West) - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West* (Coffey, 2020)
- The Promenade and Underground Carpark (Lot E and UGC) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark* (Coffey, 2021a)
- The Precinct North (Lot B) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot B* (Coffey, 2021b).

In 2024, the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024) was released by the Corporation, which updated and modified the vision for development of the Site. As a result, the Site Suitability Statements issued prior to the Precinct Plan (listed above) require reconsideration for applicability to the new proposed future uses of the Site.

This report has been prepared to review and reassess the available environmental data (including any new data collected since issue) for areas with existing Site Suitability Statements and assess if any additional remediation or mitigation/management measures are required to enable the development proposed in the Precinct Plan without any unacceptable risk to human or ecological.

1.1 Objectives

The objectives of this report are to review the four existing Site Suitability Statements and:

- Assess existing Site data, including any new data received since issue of the Site Suitability Statements, against the updated development plan and any identified changes in the Site Specific Remediation Criteria (RC).
- Identify any changes in the risk profile or data gaps which may have arisen from the proposed changes.
- Recommend any additional management and mitigation measures, or additional works which are considered required to support the Environmental Auditor in their certification of Site Suitability for the updated development planned.

It is intended that this report be provided to the Environmental Auditor upon completion to support amendment of the existing Site Suitability Statements.

2.0 Background

2.1 Site Details

The Site details are provided on **Table 1** below.

Details for Regatta Point, which has not yet been transferred to the Site but is intended to be included within the overall Environmental Audit, are also provided.

Table 1 Overall Site Details

Item	Description
Macquarie Point Site	
Site Address	10 Evans Street, Hobart, Tasmania
Site Area	Approximately 9.3 hectares (ha)
Current Site Owners	State of Tasmania (Crown Land)
Title Details	Macquarie Point contains the following land title references: • The majority of Macquarie Point is within land title 113521/1 (formerly CT 114462/1) • A portion of the southwest area (within the Gateway area) is within land title 129483/1.
Current Zoning	In accordance with the Hobart City Council (HCC, 2023), the *Sullivans Cove Planning Scheme 1997* notes that the Macquarie Point site falls within the *Macquarie Point Mixed Use Zone* and is subject to the following use areas: • Commercial and Institutional • Mixed Use • Open Space.
Current Uses	• The majority of Macquarie Point is currently vacant. Portions of the north and west of Macquarie Point are currently in use for remediation activities, including stockpiling of excavated materials. • The Goods Shed, a historical warehouse structure now subject to intermittent use including public events, is located on the southern boundary of Macquarie Point. • An occupied office building (8A Evans Street) is located on the western boundary of Macquarie Point. • The “Red Shed”, located in the south eastern portion of Macquarie Point, is currently used by a microbrewer and includes a public bar. • A warehouse (the SeaRoad Shed) was located in the south-east corner of Macquarie Point but was demolished in 2023. A large slab (the SeaRoad Slab) remains in place and has been used for intermittent storage of construction equipment. • Small retail outlets are located in the area adjacent to the Red Shed (Red Square) which is also used regularly for markets, music and other outdoor events with food vans. • A public car park is present in the south eastern and eastern portion of Macquarie Point. • A roadway (the Northern Vehicular Access) is present on the northern portion of Macquarie Point.

Item	Description
	• Portions of the northern and north eastern areas of the Site are leased to the Tasmanian Water and Sewerage Corporation (TasWater) and used for equipment storage and soil stockpiling as part of construction of a Sewage Pumping Station (SPS) off Site to the east.
Closest Surface Water Body	• Sullivans Cove, approximately 150 m to the south. • River Derwent, approximately 280 m south-east (inferred direction of groundwater flow) and 25 m to the north-east.
Regatta Point	
Address	• Located adjacent to McVilly Drive, Queens Domain. A street address is not allocated for this area.
Area	• Approximately 0.7 ha
Current Land Owners	The land comprised within Regatta Point is under the authority of: • Department of Natural Resources and Environment Tasmania (DNRET) Property Services (Potential Property ID 2513934), under Crown lease. • Regatta Point is currently being transferred to the control of the Corporation.
Title Details	Title details are not available for the public reserve (Potential Property ID 2513934).
Current Zoning	In accordance with the Hobart City Council (HCC, 2023), the *Sullivans Cove Planning Scheme 1997* notes that the Regatta Point site falls within the *Macquarie Point Wharf & River Zone B* and is subject to the following use areas: • Commercial • Mixed Use • Open Space.
Current Uses	The following is noted with regard to current Regatta Point use and features: • A public reserve in the southern portion of Regatta point is used for public open space and recreation. Carparking and access to the River Derwent (via two marine jetties and two boat ramps) are present in this area, and accessible via McVilly Drive. • A pumphouse (under Crown Licence) is present in this area, and is suspected to be related to fuel and oil transfer pipelines which extended beneath Macquarie Point and have been removed in part by remediation between 2020 and 2023. It is not known if this pumphouse is operational, what use is authorised under its licence, or what historical uses it may have had. Investigation work in 2024 identified a previously unknown underground pipeline, believed to be a fuel transfer pipeline, attached to this structure. • A small two-storey building of unknown use is in this area. • A disused rail line and corridor passes to the west of Regatta Point.
Closest Surface Water Bodies	• The River Derwent is located to the east, immediately adjacent to Regatta Point. • Sullivans Cove is located approximately 560 m to the south at the closest point. • Recreational fishing restrictions apply in the waters adjacent to Regatta Point.

2.2 Assessment Areas

The Site has been delineated into eight sub-areas (including Regatta Point added in 2023) for environmental investigation, assessment and remediation. **Figure 1** below shows the location of each assessment area in context of the Site, and each area is shown in context of the proposed future development under the Precinct Plan (discussed in **Section 2.3**) on **Figure F2**.

Figure 1 Site Assessment Areas

The Royal Engineers Building and Land, to the west of Macquarie Point, is included in the Precinct Plan for overall planned development of the area, however no changes in use are planned and it is not intended to include this area in the Environmental Audit at this time.

It is also noted that land in the northern portion of Audit Area 4 East is proposed to be transferred to the control of the Tasmanian Department of State Growth for construction of an access road. However, this title subdivision and transfer have not yet occurred.

2.2.1 Status of Site Suitability Statements

At present, no Site Suitability Statements have been issued for the development of the Site as proposed in the Precinct Plan.

Table 2 below summarises the current status of each Site area, and the actions planned or considered likely to be required to complete the Environmental Audit and allow issue of a Site Suitability Statement.

Table 2 Status of Site Suitability Statements

Site Area	Approx. Area (ha)	Site Suitability Statement and/or Remaining Actions and Activities
Site Suitability Statements Issued		
The Goods Shed and Yard (Audit Area 1)	0.86	*Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1*, issued by Tetra Tech Coffey Pty Ltd on 5 June 2019
The Escarpment (Audit Area 4 West)	1.68	*Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West*, issued by Tetra Tech Coffey Pty Ltd on 24 September 2020
The Promenade and Underground Carpark (Lot E and UGC)	1.73	*Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark*, issued by Tetra Tech Coffey Pty Ltd on 23 July 2021
The Precinct North (Lot B)	1.04	*Contaminated Land Audit Report – Macquarie Point Development Project – Lot B*, issued by Tetra Tech Coffey Pty Ltd on 22 November 2021
The four Site Suitability Statements issued to date form part of and were included as appendices to contaminated land audit reports referenced above, and must be read in conjunction with those reports. This report contains this review and assessment of the requirements for Site Suitability, based on changes in proposed development of the Site since issue.		
Site Suitability Statement Not Issued		
The Precinct South	1.40	No remaining remediation actions identified in this area. An initial CUTEP report for this area was prepared and submitted to the Auditor for review in December 2024 (AECOM, 2024e). An updated CUTEP report (AECOM, 2025g), incorporating additional data collected during 2025, was issued in November 2025 and is awaiting Auditor review and comment.
The Gateway	1.46	Remediation (removal of remnant infrastructure and treatment of gasworks contamination) was completed in 2024 and a Remediation Validation Report has been issued to the Auditor for comment. An additional soil vapour and groundwater investigation was conducted post-remediation in June 2025. A CUTEP report for the Gateway area is currently being prepared and will be issued to the Auditor for review when complete.

Site Area	Approx. Area (ha)	Site Suitability Statement and/or Remaining Actions and Activities
Audit Area 4 East	1.09	Remaining environmental impacts or potential impacts known to be present in Audit Area 4 East are: • A remnant fuel pipeline passes through the central portion of Audit Area 4 East. The southern sections of this pipeline were removed as part of remediation of the Precinct North and the Escarpment, however, the remaining pipelines should be removed and capped at the Site boundary. It is also noted that Buried Asbestos Containing Material (ACM) was uncovered in a hillside in the western portion of the area. The ACM is currently capped and is considered suitable to manage in place. It is currently proposed that the land in the northern section of Audit Area 4 East, including the area of the remnant fuel pipeline, be transferred from the control of the Corporation and to the Tasmanian Department of State Growth, although this title sub-division and transfer has not yet occurred. If this land transfer occurs, Audit Area 4 East will be reduced to approximately 0.47 ha in area. An updated assessment of the area proposed to remain as part of Macquarie Point is currently being prepared and will be issued to the Auditor when complete.
Regatta Point	0.7	This area is not yet included in the Macquarie Point Environmental Audit but is considered likely to be included in the future. Intrusive investigations of Regatta Point were completed in late 2024, and a DSI has been issued to the Auditor for comment. Identified remediation remaining in this area consists of removal of a previously unknown pipeline, considered likely to be an abandoned fuel/oil transfer line, through the centre of the area. A timeline for remediation has not yet been established.
Royal Engineers Building	0.19	This area is not currently included in the Macquarie Point Environmental Audit, and is not currently proposed to be included. The future use of this area is included the Precinct Plan (MPDC, 2024), which details the proposed development of the Site. To date, no potentially contaminating land uses have been identified, or intrusive investigation undertaken, at the Royal Engineers Building.

In addition, update to the Site Environmental Management Plan (the SEMP) (AECOM, 2024b) will be required to capture changes in the proposed future development, Site condition, environmental data, and required mitigations and management procedures for future development and use. Update of the SEMP for all assessment areas excluding Audit Area 4 East and Regatta Point is expected in late 2025.

It is noted that the final assessment and decision on whether each area is suitable for the intended development, and what controls, mitigations, or other measures are required, will be made by the Site Environmental Auditor and may differ from the summary on the table below.

2.2.2 Historical Audit Areas

Prior to 2019, the Site was divided into seven Audit Areas (numbered 1 to 7) for assessment, based on earlier development plans. These Audit Areas and the previous development proposed, which are

referenced in some historic reports and documentation, are presented in context of the current assessment areas on **Figure F3**, and summarised in **Table 3** below.

Table 3 Relationship between Current Assessment Areas and Former Audit Areas

Current Assessment Areas	Former Audit Areas
The Goods Shed and Yard (Audit Area 1)	Audit Area 1
The Escarpment (Audit Area 4 West)	The western portion of Audit Area 4 and the northern portion of Audit Area 2
The Promenade and Underground Carpark (Lot E and UGC)	The southern portion Audit Area 2, and the northeastern portion of Audit Area 5
The Precinct North (Lot B)	Audit Area 7, the eastern portion of Audit Area 2, and the northeastern portion of Audit Area 5
The Precinct South	Audit Area 3 and the southeastern portion of Audit Area 5
The Gateway	Audit Area 6 and the southwestern portion of Audit Area 5
Audit Area 4 East	The eastern portion of Audit Area 4
Regatta Point	Not previously included in Audit Areas.

2.3 Proposed Future Development

The Precinct Plan presents a vision for redevelopment of the Site (and surrounding areas) as a mixed-use precinct comprised of interconnected discrete zones, summarised on **Table 4** and presented on **Plate 1**.

Table 4 Precinct Plan - Proposed Development Precincts

Precinct	Likely Land Use
Aboriginal culturally informed zone	Open space and commercial
Multipurpose stadium and associated concourse zone	Open space and commercial
Royal Engineers building and land	Open space and commercial
Complementary integrated mixed use zone, including restaurants, cafes, hotels, medical facilities and commercial office space	Open space and commercial
Antarctic facilities zone including commercial spaces and connections with the complementary integrated mixed use zone	Commercial and underground car parking
Residential development and public foreshore zone accommodating a variety of tenures and housing opportunities, along with a new public promenade and food and beverage offerings	Medium to high density residential, commercial and open space
A transport corridor and roadway linking Regatta Point to the main areas of the Site	Open space / vehicle traffic / foot traffic
A vegetated area along the northern boundary of the Site, where the escarpment below the Hobart Cenotaph would prevent development or construction	Open space

In addition:

- Subsurface utilities and maintenance activities are anticipated to occur in all Site areas.
- Excavation and modification of the final surface level across the Site is expected to occur as discussed in **Section 5.3**.

Plate 1 Proposed Future Land Uses (MPDC, 2024)

2.4 Regulatory Framework

2.4.1 Site Environmental Audit

In 2015, the *Macquarie Point Development Corporation Act 2012* was amended to enable the accreditation of an environmental auditor under Tasmanian legislation. The amended Act enables the Director of the Tasmanian Environment Protection Authority (EPA) to accredit an auditor. Mr David Lam of Tetra Tech Coffey has been appointed as the Environmental Auditor for the Site and has been accredited as an auditor recognised by the amended Act.

Where there is limited, or a lack of, suitable guidance in Tasmania for the audit, the amended legislation allows for the auditor to defer to other suitable interstate guidance. In this instance, the guidelines supporting the Victorian EPA Environmental Audit Framework have been adopted, as it is the home state of the appointed Auditor.

It is noted that Victoria legislation which defines the Audit process was updated and superseded by the *Environment Protection Act 2017* (the EP Act), which came into effect on 1 July 2021, and contains significant changes to Audit methodology and terminology under the Victorian framework. Under Section 478 of the EP Act, existing Audits where an Auditor has been engaged prior to 1 July 2021, and the Audit has not been completed by 1 July 2021, can be conducted under either the EP Act or the previous framework defined in the *Environment Protection Act 1970*. To maintain continuity with the portions of the Audit already completed, the Site Audit is currently continuing under the previous framework and terminology,

The role of the Auditor is to review the progression of investigation, and remedial planning and execution works at the Site. It is understood that the Auditor shall ensure that the works are carried out in compliance with local Tasmanian legislation and guidelines with consideration given to the requirements of the Victorian EPA Environmental Audit Framework.

The ultimate outcome of the Environmental Audit is to obtain a Site Suitability Statement, such as the ones already issued and review in this report, confirming the Site's suitability for intended future uses.

2.4.2 Clean Up to the Extent Practicable

The Audit will include consideration of Clean Up to the Extent Practicable (CUTEP), similar to that adopted by the Victorian audit scheme. Section 1.0 of Victorian EPA Publication 840.2 (2016) *The cleanup and management of polluted groundwater* (EPA Publication 840.2) notes that:

> '*Where polluted groundwater has been identified, EPA Victoria's role is to require clean up. If it is impracticable to clean up groundwater to the level needed to restore beneficial uses, EPA may accept that cleanup to the extent practicable has occurred and that, subject to appropriate ongoing management, further cleanup is not required*'.

Although remediation and assessment of the Site is being conducted under the previous Victoria Environmental Audit Framework (as discussed in **Section 2.4.1**), this approach is also reflected in Part 2.2 - Non-aqueous phase liquids, Regulation 15 – Clean-up of non-aqueous phase liquids in the Victorian *Environment Protection Regulations 2021*, which states:

> '*A person in management or control of land where a non-aqueous phase liquid is present in soil or groundwater must, so far as reasonably practicable-*
>
> *a. Clean up the non-aqueous phase liquid; and*
>
> *b. If the source of the non-aqueous phase liquid is located on the land, remove or control the source of the liquid.*

The CUTEP process recognises that polluted groundwater should be cleaned up such that the protection of beneficial uses is restored, and where considered acceptable (by the authority, in this case the independent Site Environmental Auditor in conjunction with the Tasmanian EPA), groundwater may be cleaned up to the extent practicable.

It is noted that a CUTEP determination needs to be made for the whole Site, not just individual remediation areas. However, interim agreement has been historically sought from the Site

Environmental Auditor that individual areas have reached remediation end-points, so that active remediation works can cease.

2.4.3 Legislative Changes

Legislative changes since issue of the existing Site Suitability Statements are described in **Section 5.1**.

2.5 Assessment and Remediation Approach

The Corporation has adopted a series of overarching and interrelated remediation objectives in relation to the Site. These include:

- Ensuring that there are no unacceptable risks to human health associated with the Site, both to on-Site and off-Site receptors.
- Ensuring there are no unacceptable risks to the off-Site environment / ecology from the Site.
- Remediating the Site to a suitable standard to allow for redevelopment for the intended future land uses.
- Remediating primary sources of contamination as these represent an ongoing source of pollution to groundwater.

These objectives are generally consistent with those adopted by regulatory authorities around Australia.

2.6 Chemicals of Potential Concern

Prior to European settlement, Hobart and the surrounding areas, including the Site, were occupied and inhabited by the Muwinina people.

Since first European settlement circa 1804, the Site has been subject to land reclamation events, farming, quarrying and various construction and industrial activities, including but not limited to progressive land reclamation events, rail and freight operations, gasworks, and bulk fuel storage.

Based on the known Site history, **Table 5** below presents a summary of the Chemicals of Potential Concern (CoPC) that may be present based on known historical activities or uncovered during investigation of the Site.

Table 5 Chemicals of Potential Concern Summary

Area	Historical Land Uses	Chemicals of Potential Concern
Areas with Site Suitability Statements Issued		
Goods Shed and Yard	• Freight storage and handling • Vehicle Maintenance. • Fuel Storage and Handling • Land Reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Chlorinated solvents associated with vehicle maintenance activities. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.
The Escarpment	• Locomotive refuelling comprising fuel storage and transfer facilities • Railway maintenance workshop • Rail corridor and fuel transfer infrastructure historically located within the area • Concrete batching plant • Land reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Chlorinated solvents associated with locomotive maintenance activities and the storage of hazardous materials. • Heavy metals, chlorinated solvents and hydrocarbons associated with workshop and maintenance areas. • Phosphorus and sulphur associated with locomotive washing. • ACM sourced from historical structures (i.e. cladding). • Hydrocarbons associated with the truck wash. • Heavy metals, chlorinated solvents and hydrocarbons sourced from the historical incineration of paint/ solvents. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.
The Promenade and Underground Carpark	• Locomotive refuelling comprising fuel storage and transfer facilities. • Locomotive maintenance. • Freight storage and handling. • Land reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel (diesel) storage and transfer activities. • LNAPL has been detected on groundwater. • Chlorinated solvents associated with locomotive maintenance activities. • Heavy metals, asbestos and PAHs sourced from materials used to backfill Roundhouse structures. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.

Area	Historical Land Uses	Chemicals of Potential Concern
The Precinct North	• Freight storage and handling. • Fuel storage and handing • Land reclamation	• TPHs, BTEXN, PAHs, and phenolic compounds associated with historical fuel (diesel) storage and transfer activities. • Chlorinated solvents associated with locomotive maintenance activities. • LNAPL has been detected on groundwater. • Metals[1] inferred to be due to historic land reclamation have been detected in fill. • PFAS associated with bulk off-Site fuel handing. While review of historical information has not identified the use of products containing PFAS, there is potential for firefighting foams containing PFAS to have been applied as part of emergency response operations or for training purposes during bulk fuel storage in the short period between the adoption of PFAS-containing firefighting foam in the USA in 1967, and the cessation of bulk fuel storage in the 1970s.
Areas without Site Suitability Statements Issued		
The Precinct South	• Freight storage and handling. • Fuel storage and handling • Land reclamation	• TPHs, BTEXN, PAHs, phenolic compounds, and lead associated with historical fuel storage and transfer activities undertaken adjacent to the Site's eastern boundary. • LNAPL has been detected on groundwater. • Metals[1] inferred to be due to historic land reclamation have been detected in fill. • PFAS associated with bulk off-Site fuel handing. While review of historical information has not identified the use of products containing PFAS, there is potential for firefighting foams containing PFAS to have been applied as part of emergency response operations or for training purposes during bulk fuel storage in the short period between the adoption of PFAS-containing firefighting foam in the USA in 1967, and the cessation of bulk fuel storage in the 1970s.

Area	Historical Land Uses	Chemicals of Potential Concern
The Gateway	• Former Hobart Gasworks. • Locomotive refuelling comprising fuel storage and transfer facilities. • Railway maintenance workshop. • Land reclamation	• TPHs, PAHs, BTEXN and phenols sourced from coal tar and tar oils, or from historical fuel storage and transfer activities. • Heavy metals, chlorinated solvents and hydrocarbons associated with workshop and maintenance areas. • Phosphorus and sulphur associated with locomotive washing. • ACM sourced from historical structures (i.e. cladding). • Chlorinated solvents associated with locomotive maintenance activities and the storage of hazardous materials. • Complex cyanides, free cyanides and metals sourced from spent oxides. • TPHs, PAHs and metals sourced from coke, coke breeze, ash and clinker residues. • TPHs and BTEX associated with light and drip oils. • DNAPL has been detected in soil. • Phenols, nitrates, sulphates, sulphides, ammonia and PAHs sourced from ammoniacal recovery wastes. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.
Audit Area 4 East	• Rail corridor and fuel transfer infrastructure historically located within the area. • Land reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Buried ACM has been identified in a section of Audit Area 4 East and is currently temporally capped with a concrete layer. • Metals[1] inferred to be due to historic land reclamation have been detected in fill
Regatta Point	• Public boating, yachting, and port activities. • Rail corridor • Fuel pipeline • Land reclamation • Metals	• Heavy metals, TPH/TRH, PAH, BTEXN, phenolic compounds, SVOC, VOCs, TBT, OCPs, cyanide, ammonia and ACM have all been identified as potential CoPC in Regatta Point based on current and historical uses. No field assessment has been conducted to date. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.

Notes: TPHs – total petroleum hydrocarbons; TRH – total recoverable hydrocarbons; PAHs – polycyclic aromatic hydrocarbons; BTEXN – benzene, toluene, ethylbenzene, xylene, naphthalene; ACM – asbestos containing material; VOC – volatile organic compounds; SVOC – semi VOC; TBT – tributyl tin; OCP – organochlorinated pesticides; PFAS – Per- and Poly-Fluoroalkyl Substances; LNAPL – Light Non-Aqueous Phase Hydrocarbons; DNAPL – Dense Non-Aqueous Phase Hydrocarbons; 1 – aluminium, arsenic, cadmium, chromium, copper, lead, manganese, nickel and zinc

In additional, Potential Acid Sulfate Soil (PASS) has been identified in saturated estuarine materials below all areas except Regatta Point. The PASS is inferred to be former river/sea bed buried by land reclamation, and may be present in unsaturated fill used in land reclamation in some areas. Soil methane has also been detected at potentially hazardous levels, and may be due to degradation of hydrocarbon impacts from fuel handling and storage and/or organic material in natural materials buried during land reclamation.

2.6.1 Identified NAPL or Former NAPL Areas

Previous investigations at the Site have identified non-aqueous phase liquids (NAPL), consisting of LNAPL and DNAPL, which are summarised in **Table 6** below.

Table 6 Known Existing or Former NAPL Areas

Plume ID	Location	Inferred Contamination Source
Within Areas with Site Suitability Statements		
LNAPL Plume A1	Roundhouse Refuelling Area in the Promenade and Underground Carpark, central portion of the Site	LNAPL (likely diesel) has been identified at the water table and is likely associated with locomotive refuelling activities associated with spills during refuelling activities and potentially leaks from a historical Aboveground Storage Tank (AST) which is known to have been previously present at this location.
LNAPL Plume A2	Roundhouse Refuelling Area in the Promenade and Underground Carpark, central portion of the Site	LNAPL (likely diesel) has been identified at the water table and is likely associated with locomotive refuelling activities associated with spills during refuelling activities and potentially leaks from ASTs.
Former LNAPL Plume A3	Roundhouse Refuelling Area in the Promenade and Underground Carpark on the boundary with the Precinct North, central portion of the Site	Historical documents reference localised LNAPL at this location. Similar to Plume A1, LNAPL is likely associated with locomotive refuelling activities in the Roundhouse Refuelling Area. The LNAPL is understood to have comprised of predominantly diesel fuel, as well as fuel oils associated with diesel engine operation (e.g. lubricants, engine oils etc.) and is likely to be associated with isolated spills. No LNAPL has been detected in wells in this area since 2017.
Within Areas without Site Suitability Statements		
LNAPL Plume B	SeaRoad Shed Slab in the Precinct South, south-east portion of the Site	LNAPL (comprising predominantly diesel with lube oil) has been identified at the water table and is understood to be associated with historical fuel handling and storage activities, in proximity to the SeaRoad Shed.
Former Tar Plume A	Former gasworks area in the Gateway, south-west corner of the Site	Coal tar DNAPL, likely derived from a horizontal retort/oil reformer which was present in this location during gasworks operation, was observed primarily from 4 m bgl extending to underlaying dolerite bedrock, and may extend off-Site to the south and west. DNAPL within the Site boundaries, excluding areas in the exclusion zone surrounding a high voltage power cable, were solidified in 2024 and is no longer considered mobile.

Plume ID	Location	Inferred Contamination Source
Former Tar Plume B	Former gasworks area in the Gateway, south-west corner of the Site	Coal tar DNAPL was observed within a buried vertical tank base. The walls of this tank remained in place and contained DNAPL, which was solidified in 2024 and is no longer considered mobile.
Tar Plume C	Former gasworks area in the Gateway, west boundary of the Site	Coal tar DNAPL was observed below a buried concrete slab and above shallow dolerite, and is considered likely derived from a vertical retort which was present in this location during gasworks operation. DNAPL has been observed between 1.4 and 1.6 m bgl, and is not considered to be in contact with groundwater. The exclusion zone associated with a high voltage power cable prohibits activities which could disturb DNAPL in this area.
Tar Plume D	Former gasworks area in the Gateway, west boundary of the Site	Tar staining, odours and relatively high PID readings (598 ppm) were reported between 3.5 and 4.7 m bgl in this area, and DNAPL present may be resting on the buried base of a former gasholder which appears to be present at 4.7 m bgl. DNAPL is not considered to be in contact with groundwater in this area, and the exclusion zone associated with a high voltage power cable prohibits activities which could disturb DNAPL in this area.

Notes: Chemicals of Potential Concern (CoPC) associated with each of the LNAPL plumes include TPH, PAHs and metals including lead. bgl – below ground level; PID – photoionisation detector.

LNAPL Plumes A1 and A2, and former LNAPL Plume A3, are within the areas with existing Site Suitability Statements considered in this report.

LNAPL Plume B, Former Tar Plumes A and B, and Tar Plumes C and D, are in areas without Site Suitability Statements. The status of these NAPL impacts is not further considered in this assessment, as these locations are outside of the assessed areas, and are not considered to have any potential to migrate into them, as:

- Each plume is hydraulically down gradient, and not considered likely to migrate on groundwater.
- Fluctuations in LNAPL Plume B were detected in 2024. Additional assessment of this plume conducted in 2024 and 2025 (AECOM, 2024d and 2025d), and concluded that the plume was not mobile, and that fluctuations in LNAPL thickness may have been due to temporary disturbance associated with remediation work within the Precinct South to the west, or preparatory works for realignment of the Hobart Main Pipeline (Sewer) off-Site to the east.
- Former Tar Plumes A and B were treated via *in situ* solidification (ISS) in 2024, and are no longer considered liquid or potentially mobile (AECOM, 2025c).
- Tar Plumes C and D are not considered to be currently in contact with groundwater, and activities which could potentially disturb and mobilise them are restricted by an exclusion zone established to protect a buried high voltage power cable which passes through the area they are located. This power cable was installed in late 2023, and no activities to remove or disturb soil around it are known to be planned.

  AECOM (2025c) includes recommendations for controls around future works around Tar Plumes C and D, in the event that the high voltage cable is removed, which have also been documented in the SEMP (AECOM, 2025h).

3.0 Assessment Criteria

3.1 Protected Environmental Values and Tier 1 Criteria

3.1.1 Soil

In the absence of specific Tasmanian guidance regarding the Protected Environmental Values (PEVs) of land, the Victorian Environment Reference Standard (the ERS), (Victorian Government, 2021) has been referenced to identify potential PEVs at the Site relating to land. The ERS replaces and supersedes Victorian *State Environment Protection Policy - Prevention and Management of Contamination of Land* (PMCL SEPP, 2002), which has been previously used in assessment of the Site.

The proposed development of the Site includes retail, commercial, and open space uses. No natural ecosystems are present on the Site, and based on the urban setting and the current and proposed future uses of the land, production of food, flora, and fibre are not considered likely to occur and are not considered as PEVs under the Victorian framework adopted.

As such, the following PEVs are considered relevant for the Site:

- Land dependant ecosystems and species - Modified and Highly Modified Ecosystems
- Human Health
- Buildings and Structures
- Aesthetics.

A summary of the adopted assessment criteria for each land PEV is provided in **Table 7**.

Table 7 Adopted Tier 1 Screening Criteria - Soil

Protected Environmental Value		Adopted Assessment Criteria	Rationale
Land Dependant Ecosystems and Species	Modified Ecosystems	• ASC NEPM (2013) EIL, Urban residential and public open space (assumes most conservative value based on clay content, pH, CEC) • ASC NEPM (2013) ESL, Urban residential and public open space (coarse soil type) • PFAS NEMP (HEPA, 2025) – Ecological Indirect Exposure, intensely developed sites	• No terrestrial ecological receptors are currently present at the Site and it is unlikely that they will be present following development as the Site will be finished with hardstand. • For the purpose of assessing all PEVs, ecological screening criteria have been adopted. It is noted that EILs and ESLs apply to the top 2 m of soil. • As no existing ecologies exist on the Site, and maintenance of a surface layer (covering >75% of the Site surface) is included as a requirement of the SEMP, PFAS soil criteria for ecosystem protection have been adopted for indirect contact, and modified to 0.14 mg/kg.
	Highly Modified Ecosystems	• ASC NEPM (2013) EIL, Commercial and Industrial (assumes most conservative value based on clay content, pH, CEC) • ASC NEPM (2013) ESL, Commercial and Industrial (coarse soil type) • PFAS NEMP (HEPA, 2025) – Ecological Indirect Exposure, intensely developed sites	
Human Health		**Low Density Residential** • ASC NEPM (2013) HIL A • CRC CARE (2011) Vapour Intrusion HSL A (Sand) • US EPA RSLs (2020) • CRC CARE (2011) Direct Contact HSL A (for soil <1.0 m bgl) • PFAS NEMP (HEPA, 2025) HIL A **Medium/High Density Residential** • ASC NEPM (2013) HIL B • CRC CARE (2011) Vapour Intrusion HSL B (Sand) • US EPA RSLs (2020) • CRC CARE (2011) Direct Contact HSL B (for soil <1.0 m bgl) • PFAS NEMP (HEPA, 2025) HIL B **Recreation/Open Space** • ASC NEPM (2013) HIL C • CRC CARE (2011) Vapour Intrusion HSL C (Sand) • US EPA RSLs (2020) • CRC CARE (2011) Direct Contact HSL C (for soil <1.0 m bgl) • PFAS NEMP (HEPA, 2025) HIL C	• Soil HSLs for vapour intrusion and direct contact for TRH fractions have been developed based on typical petroleum mixtures and consider the solubility limits of petroleum mixtures. HSLs cannot be applied to non-petroleum sources such as pure solvents or gasworks wastes, where solubility limits are much higher. The HSL (infinite) values presented in Appendix F of CRC CARE, 2011 have been adopted in accordance with CRC CARE guidance. The theoretical solubility of the pure compound in water was used instead to identify vapour limiting HSLs (i.e. chemicals where a vapour inhalation risk was calculated to be only present at concentrations exceeding the theoretical solubility). • While it is noted that petroleum products do exist at the Site, given the varying types of hydrocarbon impact (i.e. gasworks, diesel, and petrol) the HSL infinite values have been adopted as a conservative approach. • Fill material consists of sand, clays, gravels and cobbles. For the purpose of CRC CARE vapour intrusion, as a conservative approach, sand has been selected as the predominant material type.

Protected Environmental Value	Adopted Assessment Criteria	Rationale
	Commercial/Industrial • ASC NEPM (2013) HIL D • CRC CARE Vapour Intrusion HSL D (Sand) • US EPA RSLs (2020) • CRC CARE (2011) Direct Contact HSL D (for soil <1.0 m bgl) • PFAS NEMP (HEPA, 2025) HIL D **Shallow Trench Worker** • CRC CARE (2011) Vapour Intrusion Shallow Trench Worker (Sand: 0-<2m) • CRC CARE (2011) Direct Contact Shallow Trench Worker (for soil < 1.0 m bgl)	• All soil samples have been screened against CRC CARE Vapour Intrusion criteria for the relevant depths the samples were collected from. • It is noted, in accordance with ASC NEPM (2013), direct contact criteria have been applied to the top 3 m of soil. If deeper soils are disturbed during civil works the material will need to be placed back at the depth that it was excavated or classified for reuse.
Buildings and Structures	• Australian Standard; Pilling – Design and Installation (AS 2159-2009)	• Contamination must not cause the land to adversely affect the integrity of structures and building materials.
Aesthetics	• ERS • PFAS NEMP (HEPA, 2025) Management Limits	• Aesthetic issues, including the quantity, type and distribution of foreign materials or odours, must not adversely affect the use of the land.

***Notes**: HSL – Health Screening Level; HIL – Health Investigation Level; ESL – Ecological Screening Level; EIL – Ecological Investigation Level; CEC - Cation Exchange Capacity; AS 2159-2009 – Australian Standard, Piling – Design and installation; CRC CARE – Corporative Research Council for Contamination Assessments and Remediation of the Environment; US EPA RSLs – United States Environmental Protection Agency Regional Screening Levels, November 2020; PFAS NEMP - PFAS National Environmental Management Plan.*

3.1.2 Groundwater

The PEVs of groundwater under the Tasmanian Government *State Policy on Water Quality Management* (1997) [SPoWQM] which will be considered include:

- Drinking Water
- Irrigation
- Industry
- Stock
- Ecosystem Protection

In addition to the abovementioned groundwater PEVs, recreation (primary and secondary contact), aesthetics, buildings and structures, and human health (via the vapour intrusion pathway) will also be considered as PEVs.

The assessment criteria adopted as Tier 1 screening criteria for groundwater PEVs are provided on **Table 8** below.

Table 8 Adopted Tier 1 Screening Criteria - Groundwater

Protected Environmental Value	Adopted Assessment Criteria	Rationale
Drinking Water	• NHMRC Australian Drinking Water Guidelines (amended 2018) Aesthetic • NHMRC Australian Drinking Water Guidelines (amended 2018) Human Health • PFAS NEMP (2025) Where no high NHMRC guideline values are available, screening values have been adopted from the following sources: • WHO (2017) Guidelines for Drinking-Water Quality: Fourth Edition Incorporating the First Addendum • US EPA RSLs (2020) Tap Water Quality • Health Canada (2020) • NZMH (2018) Drinking Water Standards	• Whilst it is noted that groundwater at or adjacent to the Site is unlikely to be extracted for drinking water purposes, based on the urban setting and reticulated water supply at the Site, this PEV has been conservatively considered.
Irrigation	• ANZECC (2000) Short Term Trigger Values (STVs) for Irrigation Water	• STVs have been adopted on the basis of the surrounding land use, where ongoing irrigation of plants and garden beds is unlikely to occur due to the urban setting and reticulated water supply. STVs can be tolerated for up to 20 years of irrigation.
Industry	• Due to the wide and varied potential industrial uses of groundwater, water quality requirements for use in industrial processes are assessed on an industry-specific basis	• Groundwater at or adjacent to the Site is unlikely to be used for industrial purposes, based on the urban setting and available reticulated water supply. In the absence of any standard or reliable criteria to apply for this PEV without a specific planned industrial use, this PEV has not been considered.
Stock	• ANZECC (2000) Livestock Drinking Water Quality	• Based on the Site setting, it is unlikely that groundwater would be used for stock watering purposes. However, for the purpose of assessing this PEV, the ANZECC (2000) guidance has been adopted.

Protected Environmental Value	Adopted Assessment Criteria	Rationale
Ecosystem Protection	• ANZG (2018) 90% level of ecosystem protection (marine water) • The PFAS NEMP (2025) Interim Marine 95% (slightly to moderately disturbed) level of ecosystem protection (interim marine) Where no high reliability guideline values are available in ANZG (2018), screening values have been adopted from the following sources: • ANZG (2018) low to moderate reliability trigger values (marine) • ANZG (2018) 90% level of ecosystem protection (marine water) draft guidelines released for public comment on 29 June 2020 • US EPA (2013) Ambient Water Quality Criteria (chronic – Marine) • US EPA (2006) Region 3 Mid-Atlantic Biological Technical Assistance Group (BTAG) Screening Benchmarks (marine) • RIVM (2001) Dutch Intervention Values (DIV) for TPH • There are currently no relevant Australian guidelines for TRH in groundwater. Therefore, for the purpose of this assessment, the Netherlands Ministry of Housing - DIV (2000) for Mineral Oil has been adopted	• The nearest surface water ecosystems that may receive groundwater discharge, i.e. River Derwent and Sullivans Cove, would be characterised as a moderately to highly disturbed (i.e. active port area) marine environment according to the ANZECC (2000) definitions. As such, the assessment criteria based on 90% level of ecosystem protection (marine) have been adopted, with the exception of bioaccumulative species (PFAS, anthracene, benzo(a)pyrene, fluoranthene and phenanthrene) where the 95% level of ecosystem protection (interim marine) has been conservatively adopted.
Recreation (Primary Contact)	• NHMRC (2008) Guidelines for Managing Risk in Recreational Water • PFAS NEMP (2025)	• NHMRC (2008) recommends applying Australian Drinking Water Guidelines - *Health* (NHMRC, 2018), adjusted for a 10 fold decrease in ingestion of water.
Recreation (Secondary contact)		• Primary Contact Recreation criteria have been conservatively adopted to assess secondary contact.
Aesthetics	• NHMRC Australian Drinking Water Guidelines (amended 2018) Aesthetic	• This may relate to aesthetic issues associated with the presence of objectionable odours, colours, taints, visible floating material, foam, oil or grease or ‘dirty’ water.

Protected Environmental Value	Adopted Assessment Criteria	Rationale
Buildings and Structures	• Australian Standard (AS) 2159 – 2009	• Building and structures assessment is on the basis of concrete piles in a mild exposure classification scenario in high permeability soils. • In addition to a pH of 5.5, sulphate and chloride concentrations of 1,000 mg/L and 6,000 mg/L respectively has been adopted to assess potential impacts to concrete piles.
Human Health - Vapour Intrusion	CRC CARE (2011) Groundwater Health Screening Levels (HSLs) for vapour intrusion including: • Residential - HSL A/B (sand, depth to groundwater 2.0 – <4.0 m bgl) • Recreation/ Open Space - HSL C (sand, depth to groundwater 2.0 – <4.0 m bgl) • Commercial/ Industrial - HSL D (sand, depth to groundwater 2.0 – <4.0 m bgl) • Intrusive Maintenance Worker- HSL: (sand, depth to groundwater 2.0 – <4.0 m bgl) The British Geological Survey (BGS) (UKRI, 2024) value for assessing risk of methane intrusion from groundwater has been adopted as a screening value.	• Groundwater HSLs for vapour intrusion for TRH fractions have been developed based on typical petroleum mixtures and consider the solubility limits of petroleum mixtures. HSLs cannot be applied to non-petroleum sources such as pure solvents or gasworks wastes, where solubility limits are much higher. The HSL (infinite) values presented in Appendix F of CRC CARE, 2011 have been adopted in accordance with CRC CARE guidance. The theoretical solubility of the pure compound in water has been instead to identify vapour limiting HSLs (i.e. chemicals where a vapour inhalation risk was calculated to be only present at concentrations exceeding the theoretical solubility). Whilst it is noted that petroleum products do exist at the Site, given the varying types of hydrocarbon impact (i.e. gasworks, diesel, and petrol) the HSL infinite values have been adopted as a conservative approach. • HSLs associated with depths to groundwater of between 2.0 and <4.0 m bgl in sand lithology were selected to assess groundwater analytical results on the basis of the depth to water of approximately 2 m bgl across the Site. • The BGS methane criteria assumes all methane in water will outgas to form an explosive atmosphere.

Notes: *NHMRC – National Health and Medical Research Council; WHO – World Health Organisation; NZMH – New Zealand Ministry of Health; ANZECC – Australian and New Zealand Environment and Conservation Council; STV – Short Term Trigger Value; ANZG – Australian and New Zealand Guidelines for Fresh and Marine Water Quality; RIVM – Rijksinstituut voor Volksgezondheid en Milieu; DIV – Dutch Intervention Values; BGS – British Geological Society; UKRI - United Kingdom Research and Innovation*

3.1.3 Soil Vapour

For the purpose of assessing the risks posed to current and future human-health based on the proposed future land uses by Potential Vapour Intrusion (PVI), analytical results will be compared against the residential, recreation/open space and commercial screening criteria provided on **Table 9** below.

Table 9 Adopted Tier 1 Screening Criteria – Soil Vapour

Adopted Assessment Criteria	Rationale
CRC CARE HSLs, 2011 (Appendix F)	• Vapour concentrations will be assessed against residential (HSL A/B), recreation/ open space (HSL C) and commercial (HSL D) criteria. • Fill material at the Site consists of a mixture of sand, clay, with some gravels and cobbles present in limited quantities, and as such, sand has been conservatively selected as the predominant material type. • HSLs cannot be applied to non-petroleum sources such as pure solvents or gasworks wastes, where solubility limits are much higher. While LNAPL Plume B is sourced from a petroleum source, given the potential for gasworks wastes to be present on the Site as a result of land reclamation and historic gasworks, the HSL (infinite) values presented in Appendix F of CRC CARE (2011) will be adopted in accordance with CRC CARE guidance as a conservative approach. • It is noted in Section 9 of CRC CARE (2011) that vapour intrusion in high-density residential buildings is based on occupation of the ground floor, and HSL-B should be applied only if residents occupy ground floor apartments. If the ground floor consists of commercial properties or the building contains a communal basement carpark, HSL-D will be used.
CRC CARE (2013) Action Levels for Subsurface Methane near foundations	Methane detections in soil bores and sub-slab vapour wells will be compared against the action levels for subsurface methane near foundations provided in CRC CARE (2013).

Results of air samples have also been assessed for Margin of Safety (MOS), as discussed in *Technical Report 23 - Petroleum hydrocarbon vapour intrusion assessment: Australian Guidance* (CRC CARE, 2013) to determine if a suitable number of monitoring rounds has been undertaken based on concentrations versus adopted criteria. Assessment of MOS has been conducted as part of the report in which results were included (AECOM, 2025d).

3.2 Site Specific Remediation Criteria

Site Specific Remediation Criteria (RC), to inform remediation and management works required at the Site, for the protection of human health were initially derived in 2016 (AECOM, 2016), and have been reviewed and updated for the changes in the development of the Site (AECOM, 2025a) as discussed in **Section 5.4**. The updated 2025 RC have been used for assessment of Site data in this report.

Potential risks to ecological receptors were not considered in the RC and were separately assessed (AECOM, 2020h), noting that the only potential ecological receptors identified for the Site are off-Site aquatic receptors via groundwater migrations. Further discussion on risks to ecological receptors, based on additional data collected since issue of the Site Suitability Statements, is provided in **Section 5.5.5**.

The RC consider the following scenarios and land uses based on the initially proposed development of Macquarie Point (MPDC, 2015), which are considered applicable to the currently proposed future development based on the review of RC (AECOM, 2025d)*:*

- High density residential development (slab-on-grade buildings and buildings with a communal basement car park).
- Recreation / open space

- Multi-storey car park
- Commercial/light industrial (slab-on-grade buildings and working within a basement car park).

It is noted that residential development is now only proposed in Regatta Point, which is not one of the assessment areas with existing Site Suitability Statements considered in this report. However, high density residential land use is known to occur off-Site and hydraulically down-gradient along Evans Street to the south of the Site, and the potential exists for groundwater migration from the Site to reach this area. As such, the RC protective of residential use have been applied to groundwater data from the Site.

The risk-based Site RC are derived based on generic, conservative exposure assumptions protective of on-Site and off-Site human health under the above-mentioned potential future land use conditions at the Site, and incorporated the following key assumptions:

- NAPL impacts at the Site will be remediated to the extent practicable and therefore risks associated with exposure to NAPL, and volatile contaminants derived from NAPL were not considered in the derivation of the RC.
- Intrusive maintenance work at up to 1 m bgl may be undertaken in all land uses.
- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of maintenance workers) to have direct contact with soils.
- A reticulated water supply will be available, based on the urban setting of the Site, and abstraction of groundwater for any purposes other than remediation or monitoring, or temporary extraction during construction, will not be required. Potential exposure to contaminants in groundwater during any construction, remediation, or monitoring will be managed by task specific safety documentation informed by the SEMP.
- Groundwater will be 1 m or more below the final surface of the Site.
- A SEMP will be prepared and put in place to maintain/manage surface cover.
- With regard to basements:
    - Use of any future basements is assumed to be limited to car parking. If basements are constructed for other purposes, a risk assessment specific to the intended use should be conducted.
    - Where basements are associated with future residential or commercial buildings, it is assumed that these will be communal areas for multiple properties, for example, as part of a strata scheme that is managed by a body corporate. Private basements will therefore not be associated with individual residences.
    - Where there is access to a basement car park, it is assumed that any groundwater seepage collects in floor drains and a physical barrier is present, and therefore, groundwater will not be directly contacted by basement users, with the exception of maintenance workers. It is assumed that individual tenants will not be involved in the maintenance of any associated services, including drainage pumps or sumps.
    - A basement ventilation rate of 2 air exchange cycles per hour has been assumed for basements when assessing risks and deriving criteria for water seepage into basement carparks. Any future basement carparks must be ventilated at a rate of ≥2 air exchange cycles per hour, unless other measures which eliminate potential groundwater seepage are included and verified by a suitability qualified and experienced professional during basement design and construction.
- For potential future multi-storey car park users, the most sensitive receptor in this scenario would be considered to be a parking attendant present at the Site for a typical eight hour working day. It is considered that RC derived for potential future commercial/light industrial workers (working within a basement) would be protective of all other basement users. This includes multi-storey car park users and residential tenants who access basement car parks and are likely to have lower frequency and duration of exposure, therefore the multi-storey car park users scenario is not evaluated separately in this assessment.

- Adjacent off-Site land uses include open space, commercial/industrial, and residential areas. As these potential land uses have been considered on-Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g. via groundwater migration beyond the Site boundary), as:
  - Extractive groundwater use is not known to occur within 2 km of the Site, based on review of registered groundwater bores undertaken in 2024 (AECOM, 2024c), and the urban setting and reticulated water supply indicate that groundwater extraction and use is unlikely to occur
  - No basements are known to be present in the surrounding buildings, and are considered unlikely due to the additional costs which would be required for basement construction, based on shallow groundwater elevation, hydraulically downgradient of the Site.
- It is considered that potential exposure to workers undertaking remediation and/or development activities can effectively be mitigated through the implementation of an appropriate Construction Environmental Management Plan (CEMP). The CEMP should be prepared during the planning stage for any future remediation and/or development activities.
- A separate assessment of the potential risks to on-Site visitors was not undertaken as it was considered that the chronic exposure duration assessment of commercial/light industrial workers or residents is sufficiently protective of the shorter exposure duration visitor scenario.

These assumptions, including controls and requirements for future development, are currently documented as requirements of the SEMP (AECOM, 2024a), and should be maintained in future SEMPs. Additional assessment of risks to users, and potentially further remediation, would be required in the event of any proposed development or Site use which does not conform to these assumptions.

3.3 Data Quality

The quality and reliability of data presented in the initial Site Suitability Statements was reviewed and considered acceptable for interpretation at the time of issue, and a re-review of data quality has not been conducted.

For new environmental data considered in this report, data quality review has been conducted, and concluded that the data was fit for interpretation, in the reports listed on **Table 10** below.

Table 10 Data Quality Reviews

Report	Data Quality Review Section(s)
The Gateway – Data Gap Assessment (AECOM, 2023a)	• Section 3.0 – Data Quality Objectives • Section 7.0 – Assessment of Data Quality • Appendix G – Data Validation Report
The Precinct South – Well Maintenance and Targeted Groundwater Monitoring Event (AECOM, 2024c)	• Section 3.0 – Data Quality • Appendix A – Data Quality Objectives and Data Validation
In Situ Soil Characterisation and Waste Management Plan – Stage 1 and Stage 2 Bulk Excavation, Macquarie Point Development Project (AEOCM, 2025b)	• Section 4.0 – Data Quality Objectives • Section 7.4 – Assessment of Results – Quality Assurance / Quality Control • Appendix C – Data Validation Report
Soil, Groundwater and Soil Vapour Investigation 2025 (AECOM, 2025d)	• Section 4.0 – Data Quality Objectives • Appendix F – Data Validation
Acid Sulfate Soil Investigations (AECOM, 2025e)	• Section 3.0 – Field Methodology – Assessment of Data Quality • Section 4.0 – Data Validation • Appendix E – Data Validation Report

4.0 Summary of Site Suitability Statements

Sections 4.1 to **4.4** below, provide brief descriptions of each assessment area and the key environmental controls contained within the Site Suitability Statements issued to date for each area.

It is noted that different SEMPs were issued or are in effect for each Site Suitability Statement. Changes and updates to the SEMPs are discussed in **Section 5.2**.

The proposed development layout of each area, at the times which Site Suitability Statements were issued, is shown on **Figure F3**.

4.1 The Goods Shed and Yard (Audit Area 1)

The Goods Shed and Yard (Audit Area 1) is located in the south-western portion of the Site. The site has been subject to a Contaminated Land Audit following progressive site environmental investigations. Full details of identification and assessment of contamination within the Goods Shed and Yard at the time the Site Suitability Statement for this area was issued can be found in:

- *Audit Area 1 – Detailed Site Investigation* (AECOM, 2019a)
- *Audit Area 1, Clean Up to the Extent Practicable Report* (AECOM, 2019b).

No soil or groundwater remediation has been undertaken, and the Contaminated Land Audit Report (Coffey, 2019a) has been issued for the site which states *the site is suitable for the site uses as follows: retail / commercial / recreational / public open space use and other less sensitive uses* subject to specific conditions, which are detailed in Site Suitability Statement.

The proposed development layout of the Goods Shed and Yard at the time of issue of the Site Suitability Statement is shown on **Figure F3**.

Of specific note, that Site Suitability Statement requires:

- The SEMP is implemented along with:
  - Maintenance of flooring and other hard surfaces both in the Goods Shed and in outside areas of Audit Area 1, to prevent human access to soil, or replacement by barrier layers agreed by and Environmental Auditor.
  - Any change of land use in areas external to the Goods Shed that incorporates enclosed buildings must only be undertaken following consideration of the need for remediation of contaminated soil exceeding specified Remediation Criteria.
  - Landscaping and gardening must be above the existing surface, or where in-ground, must incorporate barrier layers specified in the SEMP.
  - Specific requirements must be followed for managing excavated soil and for importation of Fill Material.
- Groundwater at the site is polluted with respect to use for Drinking Water, Irrigation, Stock Watering, and Primary Contact Recreation. Groundwater is not considered to preclude Ecosystem Protection or Buildings and Structures in Audit Area 1. Sulfate and chloride concentrations were elevated just outside the Audit Area 1 boundary. While these concentrations were not within the Audit Area 1 boundary, this indicates a possibility of seawater ingress in localised areas, and so design of construction materials should consider the need to account for possible saline intrusion for all buildings.
- As is the case with any site on which fill soils exist, small quantities of bonded asbestos cement fragments may remain within the soil and be uncovered during excavation works, despite not being identified within AA1 during site investigations. Such fragments are not anticipated to represent a health risk to occupiers of the completed development. If encountered during future development or use of the site, any fragments should be handled and disposed in accordance with the relevant regulations.

- There are suspected asbestos materials in site buildings, which should be managed in accordance with the relevant regulations. This environmental audit report addresses soil and groundwater (and associated) contamination and does not address built structures directly.

4.2 The Escarpment (Audit Area 4 West)

The Escarpment (Audit Area 4 West) is located in the north-western portion of the Site. The Escarpment area has been subject to a Contaminated Land Audit following progressive site environmental investigations and remediation activities.

The Escarpment forms the western portion of the former Audit Area 4 West, and full details of identification, assessment and remediation of contamination within this area can be found in:

- *Audit Area 4 – Detailed Site Investigation* (AECOM, 2020a)
- *Audit Area 4 West – Clean Up to the Extent Practicable Report* (AECOM, 2020b).

Remediation actives undertaken in the Escarpment area (AECOM, 2020c) included the excavation and off-Site disposal of approximately 5,200 m^3 of soil from identified areas of impact for TRH and naphthalene above the RC applied at the time (AECOM, 2016), primarily focusing on the former Concrete Batching Plant area and the Northern Refuelling Area. Excavation was generally down to dolerite rock, and excavations were backfilled with Auditor-approved virgin excavated natural material (VENM).

The Site Suitability Statement (Coffey, 2020) issued for the Escarpment states that *the site is suitable for the site uses as follows: residential, including medium to high density, retail, commercial, recreational/public open space use, transport (roads etc) and other less sensitive uses,* subject to specific conditions which are detailed in Site Suitability Statement.

The proposed development layout of the Escarpment at the time of issue of the Site Suitability Statement is shown on **Figure F3**.

Of specific note, that Site Suitability Statement requires:

- The SEMP (AECOM, 2020g) is implemented along with:
  - The site area must be maintained with a hardstand or earthen cap seal to prevent direct human access to soil. Where the hardstand or earthen cap is breached, such as for construction or maintenance works, it must be reinstated to achieve the same prevention of access to soil.
  - Garden plantings are to be in above ground planter boxes and not into the soil directly. Any proposal to plant into site soils must be confirmed as suitable by a Site Environmental Auditor.
  - Specified requirements must be followed for managing excavated soil and for importation of Fill Material.
- Groundwater at the site is polluted with respect to use for Drinking Water and Primary Contact Recreation. Groundwater is not considered to preclude Ecosystem Protection or Buildings and Structures in Audit Area 4 West.
- Although asbestos was not identified on the Escarpment, asbestos was identified in Audit Area 4 East, and as is the case with any site on which fill soils exist, small quantities of bonded ACM fragments may remain within the soil and be uncovered during excavation works. Such ACM fragments are not anticipated to represent a health risk to occupiers of the completed development. If encountered during future development or use of the site, any fragments should be handled and disposed in accordance with the relevant regulations.

4.3 The Promenade and Underground Carpark (Lot E and UGC)

The Promenade and Underground Carpark area (Lot E and UGC) is located in the central western portion of the Site. The Promenade and Underground Carpark area has been subject to a Contaminated Land Audit following progressive site environmental investigations and remediation activities.

The Promenade and Underground Carpark consists of part or all of former Audit Areas 2 and 5, and full details of identification, assessment and remediation of contamination within this area can be found in:

- *Audit Area 2 – Detailed Site Investigation* (AECOM, 2020d)
- *Audit Area 5 – Detailed Site Investigation* (AECOM, 2021b)
- *Lot E and Underground Carpark – Clean Up to the Extent Practicable Report* (AECOM, 2021c).

Remediation actives were undertaken in the Promenade and Underground Carpark to date and include:

- LNAPL and groundwater extraction and removal via a combination of skimming and Total Fluids Extraction (TFE) (AECOM, 2021i).

  LNAPL extraction was considered to have reached CUTEP and no further remediation was considered required at the time of the issue of the Site Suitability Statement. Additional data on LNAPL collected since this time is discussed in **Section 5.5.4.1**.
- Excavation and removal of pipelines and soil from a former workshop on the northern end of the Goods Shed in 2020 (AECOM, 2021d).
- Excavation and removal of remnant pipeline and impacted soil (AECOM, 2021e) in 2020, in conjunction with remediation of the Precinct North.

Soil remediation conducted in 2020 included excavation and removal of approximately 210 m^3 of remnant infrastructure and soil from a former workshop referred to as the Goods Shed Annexe, and removal of 50 m of fuel line in the Promenade and Underground Carpark and immediate buffer area (i.e. 20 m from the boundary), with soil remediation excavations extending some 2,000 m^2 in the Promenade and Underground Carpark area (Coffey, 2021a). Coffey (2021a) noted that:

- The remediation works removed a range of former underground fuel lines and left them sealed off at the points where pipelines extending beyond the excavation areas were cut.
- A significant quantity of contaminated soil (total of approximately 8,500 m^3) was removed, disposed in accordance with Tasmanian requirements, and the excavations partially backfilled with approved soil.
- A number of exceedances of Tier 1 Criteria remain in situ, with a smaller number of exceedances for site-derived Remediation Criteria.

The Site Suitability Statement (Coffey, 2021a) issued for Lot E and Underground Carpark states that *the site is suitable for the site uses as follows: residential (including medium to high density), commercial/industrial, recreational/public open space use, access way and transport (roads etc) and other less sensitive uses* subject to specific conditions which are detailed in Site Suitability Statement.

The proposed development layout of the Promenade and Underground Carpark at the time of issue of the Site Suitability Statement is shown on **Figure F3**.

Of specific note, that Site Suitability Statement requires:

- The site shall be developed in accordance with the layout (see **Figure F3**) provided in Figure F3 of the SEMP prepared for Promenade and Underground Carpark (AECOM, 2021c), with reference to the following details.
  - Nominated uses are to be limited to the areas indicated, and the Underground Carpark shall be built within the area nominated, such that assumptions regarding vapour risk remain valid.
  - Depth of the Underground Carpark is to be such that it does not intersect the water table. Should the design or changed conditions indicate potential for ingress of groundwater to any part of the underground carpark (including sumps or lift overruns), the SEMP must be reviewed for adequacy and approved by an Environmental Auditor, including any additional mitigation measures which may be required.
  - The Underground Carpark must include design, installation and maintenance of ventilation as per Building Code of Australia requirements for exhaust fumes, or other controls as specified in EPA NSW, 2020, to mitigate risks from potential methane infiltration.

- Deep services below 2 m depth from the current surface level must be installed in protective shrouds or in trenches/corridors of clean fill to minimise the risk of contact with residual contamination for maintenance workers.

- The SEMP (AECOM, 2021c) is implemented along with:
  - The Site area must be maintained with a hardstand or earthen cap seal or other engineered break layer to prevent direct human access to soil. Where the hardstand or earthen cap or other break layer is breached, such as for construction or maintenance works, it must be reinstated to achieve the same or better prevention of access to soil. Further details of layers or physical barriers must be adopted per Section 4 of the SEMP.
  - Garden plantings are to be in above ground planter boxes and not into the soil directly. Any proposal to plant into site soils must be confirmed as suitable by a Site Environmental Auditor.
  - Specified requirements must be followed for managing excavated soil and for importation of Fill Material.
  - Any subsurface works including for construction of the development or later maintenance must include a site specific workplace health and safety plan as detailed in Section 4 of the SEMP and allow for potential contaminant exposures.
- Groundwater at the site is polluted with respect to use for Drinking Water, Irrigation, Stock Watering, Industrial use, and Primary Contact Recreation. Groundwater is not considered to preclude Ecosystem Protection at a point of discharge to a surface water, or Buildings and Structures.
- Some fragments of asbestos containing materials have been identified during investigations on the site (with fibre bundles associated with a fragment at one location), and bonded ACM fragments may remain within the soil and be uncovered during excavation works, with potential for associated fines/fibres. Such ACM fragments are not anticipated to represent a health risk to occupiers of the completed development. It is noted that the SEMP attached to this Site Suitability Statement lists asbestos as a contaminant requiring management for any subsurface works. If encountered during future development or use of the site, any fragments should be handled and disposed in accordance with the relevant regulations.

4.4 The Precinct North (Lot B)

The Precinct North (Lot B) is located in the central eastern portion of the Site. The Precinct North area has been subject to a Contaminated Land Audit following progressive site environmental investigations and remediation activities.

The Precinct North consists of part or all of former Audit Areas 5 and 7, and full details of identification, assessment, and remediation of contamination within this area can be found in:

- *Audit Area 5 – Detailed Site Investigation* (AECOM, 2021b)
- *Audit Area 7 – Detailed Site Investigation* (AECOM, 2020f)
- *Lot B – Clean Up to the Extent Practicable Report* (AECOM, 2021f).

Remediation actives were undertaken in the Precinct North to date include:

- LNAPL and groundwater extraction and removal via a combination of skimming and TFE (AECOM, 2021i).

  LNAPL extraction was considered to have reached CUTEP and no further remediation was considered required at the time of the issue of the Site Suitability Statement. Additional data on LNAPL collected since this time is discussed in **Section 5.5.4.1**.
- Excavation and removal of remnant pipeline and impacted soil (AECOM, 2021e) in 2020, in conjunction with remediation of the Promenade and Underground Carpark.

Soil remediation actives undertaken in the Precinct North in 2020 include the removal of pipelines and associated impacted soil. The pipelines removed include a disused diesel pipe and a disused oil pipe,

with a total of 50 m of pipe removed from the Precinct North and the immediate 20 m buffer area with soil remediation excavation extending some 2,800 m^2 in the Precinct North.

The Site Suitability Statement (Coffey, 2021b) issued for the Precinct North states that *site is suitable for the proposed site use of 'Arts and Institutional Area', which is considered to be a 'Commercial' use setting, involving commercial and cultural uses, including retail, (the site would also be suitable for high density residential uses above – but not on - the ground floor, and other less sensitive uses such as industrial use),* subject to specific conditions which are detailed in Site Suitability Statement.

The proposed development layout of the Precinct North at the time of issue of the Site Suitability Statement is shown on **Figure F3**.

Of specific note, that Site Suitability Statement requires:

- The site shall be developed in accordance with the layout provided in Figure F2 of the SEMP (AECOM, 2021h) with reference to the following details.
  - Methane is present at significant concentrations across Lot B and must be designed to account for CS3 – Moderate Risk, as defined by Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases (EPA NSW, 2020).
  - The entire site is to be covered by building footprint/hardstand in its final developed state.
- The SEMP (AECOM, 2021h) is implemented along with:
  - The Site area must be maintained with a hardstand or earthen cap seal or other engineered break layer to prevent direct human access to soil. Where the hardstand or earthen cap or other break layer is breached, such as for construction or maintenance works, it must be reinstated to achieve the same or better prevention of access to soil. Further details of layers or physical barriers must be adopted per Section 4 of the SEMP.
  - Garden plantings are to be in above ground planter boxes and not into the soil directly, noting that this is a general requirement, and that the coverage of the Lot B area by building footprint means that this requirement is likely redundant. Any proposal to plant into site soils must be confirmed as suitable by a Site Environmental Auditor.
  - Specified requirements must be followed for managing excavated soil and for importation of Fill Material.
  - Any subsurface works including for construction of the development or later maintenance must include a site specific work health and safety plan as detailed in Section 4 of the SEMP and allow for potential contaminant exposures.
- Groundwater at the site is polluted with respect to use for Drinking Water, Irrigation, Stock Watering , Industrial use, and Primary Contact Recreation. Groundwater is not considered to preclude Ecosystem Protection at a point of discharge to a surface water, nor Buildings and Structures.
- While no fragments of asbestos have been noted on the Lot B area (nor has any asbestos been identified in analysis of soil samples), asbestos may be encountered wherever fill soils are present. The SEMP (AECOM, 2021h) outlines requirements in the event that potential ACM is encountered in soil during subsurface works.
- Soil impacts are present in excess of the Future Maintenance Worker remediation criteria in the locations listed below, which will be managed by adherence to the SEMP for any future construction or maintenance works.
  - An exclusion zone surrounding the original Main Hobart Pipeline (Sewer).
  - Areas on the site boundary where further soil excavation could not be conducted.

5.0 Changes Since Issue of Site Suitability Statements

Changes in the proposed future Site development, new or updated environmental data, and other factors have occurred since initial issue of the Site Suitability Statements, and are not currently included in the assessment or consideration of the acceptable uses proposed for the Site.

Review of the following changes, which are considered to potentially affect the suitability for development of the Goods Shed and Yard (Audit Area 1), the Promenade and Underground Carpark (Lot B and the UGC), the Escarpment (Audit Area 4 West), and the Precinct North (Lot B) have been identified and considered in this assessment:

- Updates in legislation relating to the development of the Site.
- Updates to the SEMP(s), consisting of:
  - Update or consolidation of SEMPs issued with Site Suitability Statements.
  - Updated consideration of potential vapour intrusion
  - Updated designs for in-ground planting
- Proposed land uses and final surface elevations
- Review of the Site-Specific Remediation Criteria (the RC)
- Collection of additional environmental data regarding:
  - Acid sulfate soil
  - Groundwater Monitoring Events (GMEs)
  - *In situ* characterisation of soil to be excavated in Stage 1 and Stage 2 of Multipurpose Stadium preparatory works.
  - Additional soil, groundwater and soil vapour data collected between 2022 and 2025
- The upcoming closure of the Macquarie Point Sewage Treatment Plant (STP) and realignment of the Main Hobart Pipeline.

The following Site investigations or assessment reports are attached in **Appendix G**, and have identified as containing new data, or interpretation of existing data, relating to the areas assessed.

- *The Precinct South – Well Maintenance and Targeted Groundwater Monitoring Event* (AECOM, 2024c)
- *The Precinct South – LNAPL Gauging and Transmissivity Testing, March 2024* (AECOM, 2024d)
- *The Precinct South – Remediation Validation Report*, Macquarie Point Development Project (AECOM, 2024f)
- *Review of Site Specific Remediation Criteria 2025* (AECOM, 2025a)
- *In Situ Soil Characterisation and Waste Management Plan – Stage 1 and Stage 2 Bulk Excavation* (AECOM, 2025b)
- *Soil, Groundwater and Soil Vapour Investigation 2025* (AECOM, 2025d)
- *Acid Sulfate Soil Investigations* (AECOM, 2025e)
- *Macquarie Point - Site-wide Soil Vapour Bore and Groundwater Well Inspection and Gauging Event* (AECOM, 2025f)
- *Assessment of Potential Off-Site Ecological Impacts – 2025 Addendum* (AECOM, 2025i)

Some of these changes (updates to the SEMPs, review of the RC, additional environmental data regarding potential methane intrusion and acid sulfate soil, realignment of the Main Hobart Pipeline, and updated deep rooted planting designs) are considered to affect the Site and each assessment area uniformly, and the implications and mitigations/actions recommended to address them, are discussed in the relevant sections below.

Other changes, namely changes in proposed land use and final surface elevation, and new data collected as part of *in situ* characterisation or field investigations in 2025, are assessed and discussed by assessment area in **Section 6.0**.

5.1 Legislative Changes

The Tasmanian Government Department of State Growth announced in September 2022 that the Site is the preferred location for a mixed-use precinct, including a multipurpose stadium. Details of the proposed development of the Site were released in the Precinct Plan (MPDC, 2024).

The proposed development of a multipurpose stadium at the Site was classified as a Project of State Significance (PoSS) by the Governor of Tasmania on 16 October 2024, and was subject to an integrated assessment process by the Tasmanian Planning Commission (TPC) under the *State Policies and Projects Act 1993*.

TPC issued the *Integrated Assessment Report – Macquarie Point Multipurpose Stadium Project of State Significance* (TPC, 2025) in September 2025. With consideration of the TPC report, *State Policies and Projects (Macquarie Point Precinct) Order 2025*, (the Order) was introduced to Tasmanian State Parliament in October 2025. The Order was approved by the Tasmanian House of Assembly on 13 November 2025 and by the Tasmanian Legislative Council on 4 December 2025 and provides conditions and approval for development of the Multipurpose Stadium at the Site.

Schedule 5 of the Order provides general environmental conditions for development of the Site. The conditions in the schedule, and in the Order in general, are consistent with the *Macquarie Point Development Corporation Act 2012*, and in general require completion of a Site Suitability Statement for each area of the Site prior to development of that specific area.

No changes to the Environmental Audit of the Site, or the overall process and requirements for issue of Site Suitability Statements, arise from the Order.

It is noted that the Order does not replace or supersede the *Macquarie Point Development Corporation Act 2012.* The conditions of both pieces of legislation must be met with regards to environmental development of the Site.

5.2 Updates to the Site Environment Management Plan(s)

5.2.1 Update or Consolidation of Existing SEMPs

A requirement of each Site Suitability Statement issued to date has been the preparation and implementation of a SEMP, which provides details on the environmental status of the area considered and any controls, restrictions or requirements for future maintenance, development and operation of the area. **Table 11** below lists the SEMPs referenced in each Site Suitability Statement.

Table 11 Site Environment Management Plans Referenced in Site Suitability Statements

Site Suitability Statement	Referenced SEMP
Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1 (Coffey, 2019a)	*Site Environment Management Plan, Macquarie Point – Audit Area 1* (AECOM, 2019c)
Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West (Coffey, 2020)	*Audit Area 4 – Site Environment Management Plan* (AECOM, 2020g)
Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark (Coffey, 2021a)	*Lot E and Underground Carpark – Site Environment Management Plan* (AECOM, 2021g)
Contaminated Land Audit Report – Macquarie Point Development Project – Lot B (Coffey, 2021b)	*Site Environment Management Plan* (AECOM, 2021h)

Initially, Site Suitability Statements referenced individual SEMPs for each area. However, as Site investigation, assessment and remediation has progressed, individual SEMPs were consolidated into a

single Site-wide SEMP (AECOM, 2021h) for the Site Suitability Statement for the Precinct North (Lot B) in 2021.

The Site-wide SEMP, which was reviewed and accepted by the Environmental Auditor, incorporated the requirements of each previous SEMP listed on **Table 11**, and is considered to supersede and replace them.

The SEMP includes a requirement for regular review and update, with the most recent version issued in December 2025 (AECOM, 2025h).

It is considered that further updates to the SEMP will be required as part of update of the Site Suitability Statements for each area. Any such updated identified in this review are included in the recommendations at the end of this document (**Section 7.2**).

5.2.2 Vapour Intrusion Mitigation

During soil vapour investigations in 2019, the possibility of potentially hazardous methane migration into buildings or structures in the Promenade and Underground Carpark, the Precinct North and the Precinct South areas during development was identified (AECOM, 2021a). Previous investigations have also identified the potential for hydrocarbon vapours to infiltrate basement structures in the Precinct South and the Promenade and Underground Carpark areas.

Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases (EPA NSW, 2020), provides guidance values for gas protection required for buildings based on:

- The ground gas regime at the Site (referred to as the Characteristic Situation (CS)).
- The proposed use of the building and its design, with five categories of building type listed.

5.2.2.1 Characteristic Situation

EPA NSW (2020) uses the Gas Screening Value (GSV), calculated from the gas concentration ($\%^{v}/_{v}$) multiplied by the measured bore flow rate, to determine the CS as per **Plate 2** below.

	GSV threshold (L/hr)	CS	Risk classification	Additional factors	Typical sources
	<0.07	1	Very low risk	Typically, methane <1% v/v and/or carbon dioxide <5% v/v; otherwise consider increase to CS 2	Natural soils with low organic content Typical fill
	<0.7	2	Low risk	Borehole flow rate not to exceed 70 L/hr; otherwise consider increase to CS 3	Natural soils with high organic content Recent deep fill
	<3.5	3	Moderate risk		Old inert waste landfill Flooded mine workings
	<15	4	Moderate to high risk	Consider need for Level 3 risk assessment	Mine workings susceptible to flooding Closed putrescible waste landfill
	<70	5	High risk	Level 3 risk assessment required	Shallow, unflooded abandoned mine workings
	>70	6	Very high risk		Recently used putrescible waste landfill

1. Site characterisation should be based on monitoring of gas concentrations and borehole flow rates for the minimum periods defined in Section 3.4.
2. The CSM must identify the source of gas and its generation potential.
3. Soil gas investigations should be conducted in accordance with the guidance provided in Section 3.4.
4. Where there is no detectable flow, the lower measurement limit of the instrument should be used.
5. To determine a GSV of <0.07, instruments capable of accurately measuring concentration to 0.5% v/v and flow to 0.1 L/hr are recommended.

Plate 2 Classification of Characteristic Situation (Gas) (EPA NSW, 2020)

Field and laboratory readings for pressure, flowrate, and methane collected during June 2025 (AECO, 2025d) have been presented and GSV calculated on **Table T11**.

The following has been considered in assessing the CS at the Site:

- Methane concentrations between <0.01 $\%^{v}/_{v}$ and 77.9$\%^{v}/_{v}$ (SV34) were recorded in soil vapour in the most recent sampling event (AECOM, 2025d). Historic soil vapour sampling events have reported soil methane concentrations of up to 59$\%^{v}/_{v}$ (AECOM, 2021a).
- 17 of the 18 calculated GSVs were <0.07 L/hr, with a maximum GSV of 0.3 L/hr calculated for SV34 on 24 June 2025.
- Groundwater concentrations of methane have been recorded at greater than an order of magnitude above the adopted criteria (see **Table T8** and **Figure F13c**) in multiple locations across the Site, including locations where soil methane and gas flow rates have not been directly measured or recorded.
- The highest calculated GSV (0.3 in SV34) is approximately 50% of the threshold value. As it is based on one monitoring round only, it may not reflect potential season variations in GSV and soil gas flow.
- Negative differential pressures between -0.02 and -0.09 milliBar were recorded during the sampling events of SV07, SV35, SV37, and SV45, which indicate that barometric pumping of atmospheric air into soil may have been occurring and recorded soil vapour concentrations may be diluted and may not reflect ground conditions.

  While the differential pressures are low and not expected to have driven large-scale displacement, GSVs calculated for these locations may not be reliable for assessment of CS.

While recorded GSV and methane concentrations would generally indicate that the Site is classified CG2, based on the above considerations, it has been conservatively considered to be CS3 – Moderate Risk, with relation to methane in soil vapour.

5.2.2.2 Future Building Category

The building categories are based on a combination of the HILs from Appendix B7 of the ASC NEPM and four building types form British Standard 8485 (BS8485). **Table 12** below provides the description of each building category, and

Table 13 summarises the reference inputs used by EPA NSW (2020).

Table 12 Building Categories (EPA NSW, 2020)

Type	Description
Low-density residential	Usually but not exclusively single-storey dwellings on a separate land title (commonly Torrens title) with single occupancy; no building management and no post-occupancy controls on room use, ventilation or alterations to the internal structure; limited controls on building design and construction due to exempt and complying development provisions in NSW; construction for new buildings is predominantly slab-on-ground, but also suspended floors with crawl space and partial or full basements, particularly on sloping sites; correlates closely with residential component of HIL A and with BS 8485:2015+A1:2019 Type A but the median size (footprint area) of new houses in Australia is significantly larger than in the UK
Medium- and high-density residential	Multiple-occupancy low-, medium- or high-rise townhouses and apartments; usually on a strata title and subject to by-laws, with maintenance of the external structure of the building and common areas managed and controlled by an owner's corporation; includes some public housing and some mixed-occupancy developments, and developments with commercial occupancy of the ground floor; frequently includes basement or undercroft car parking; may involve ground-bearing or piled foundations; usually air-conditioned, with active ventilation of basement car parking; correlates reasonably well with HIL B and partially with BS 8485:2015+A1:2019 Type B
Public buildings, schools, hospitals and shopping centres	Similar in many respects to standard commercial buildings; generally low- to medium-rise rather than high-rise; particular constraints regarding building evacuation in an emergency; frequently includes basement or undercroft car parking; may involve ground-bearing or piled foundations; almost always air-conditioned, with active ventilation throughout (does not apply to many existing schools); correlates generally with HIL D but includes primary schools and childcare centres, which are HIL A; correlates partially with BS 8485:2015+A1:2019 Type C
Standard commercial buildings	Includes offices and some shops, industrial subdivisions and smaller showrooms; building management control of any alterations to the building or its uses and central building management control of building maintenance, including gas protection measures; single or multiple occupancy of ground floor and basement areas; frequently includes basement or undercroft car parking; may involve ground-bearing or piled foundations; small-to large-sized rooms with active ventilation or air-conditioning in all buildings, except those on industrial subdivisions, which will have good passive ventilation; correlates generally with HIL D and BS 8485:2015+A1:2019 Type C
Large commercial and industrial buildings	Includes warehouses, most factories, big-box retail stores, large showrooms, and hardware or garden centres; characterised by large, open, high-volume buildings; often single-storey; may have basement, roof or exterior parking; corporate ownership, owner-occupied or leased; generally easy evacuation; may involve ground-bearing or piled foundations; correlates well with HIL D and BS 8485:2015+A1:2019 Type D

Table 13 Building Categories Reference Standards

Category	Description
ASC NEPM Land Use Scenarios	
HIL A	Residential with a garden or accessible soil; childcare centres and primary schools
HIL B	Residential with minimal opportunities for soil access; secondary schools
HIL C	Public open spaces and recreation areas
HIL D	Commercial and industrial premises.
BS8485 Building Types	
Type A	Private ownership with no building management controls on alterations to the internal structure, the use of rooms, the ventilation of rooms or the structural fabric of the building; some small rooms present.
Type B	Private or commercial properties with central building management control of any alterations to the building or its uses but limited or no central building management control of building maintenance, including the gas protection measures; multiple occupancy; small- to medium-sized rooms with passive ventilation of rooms and other internal spaces throughout ground floor and basement areas.
Type C	Commercial buildings with central building management control of any alterations to the building or its uses and central building management control of building maintenance, including the gas protection measures; single occupancy of ground floor and basement areas; small- to large-sized rooms with active ventilation or good passive ventilation of all rooms and other internal spaces throughout ground floor and basement areas.
Type D	Industrial-style buildings having large volume internal space(s) that are well ventilated; corporate ownership with building management controls on alterations to the ground floor and basement areas of the building and on maintenance of ground gas protective measures.

Future buildings in the Complementary Integrated Mixed Use Zone and the Antarctic Facilities Zone, including the proposed underground carpark, are considered suitable to consider as standard commercial buildings, based on the proposed uses and development.

The following has been considered for the proposed Multipurpose Stadium:

- The Multipurpose Stadium will be a commercial space without residential use or long term occupancy by sensitive receptors (i.e., children), and is considered to correlate with ASC NEPM HIL D.
- The central covered playing area, a key part of the Multipurpose Stadium, will form a large well-ventilated internal volume, with central building control on alterations to the ground floor and maintenance of ground gas protective measures, and considered to correspond most closely with BS8485 Building Type D.
- Smaller rooms such as shops, offices, changing rooms or viewing boxes etc which may be present in the Multipurpose Stadium are considered commercial spaces and will have central building control on alterations to the ground floor and maintenance of ground gas protective measures, and are considered to correspond with BS8485 Building Type C.

While public buildings, schools, hospitals, and shopping centres was considered for the Multipurpose Stadium, this was considered overly conservative. The higher protection level required for this type of structure is driven by additional risks associated with:

- Continuous or longer term occupancy of more sensitive receptors (children) associated with schools and other public buildings (i.e. HIL A). Daily or continuous occupation of the Multipurpose Stadium by children is not expected, with attendance only during events such as sporting events or concerts, rather than the longer and more frequent occupancy which would be expected for schools or hospitals.

- Particular constraints regarding building evacuation during emergency. The Multipurpose Stadium is not anticipated to have particular constraints as stadium design should anticipate large numbers of people entering and exiting simultaneously as part of standard operation (i.e., the start and end of events) and will have dedicated crowd control staff during events, and the central building management would be expected to have a prepared and practised evacuation plan for events and for non-event periods where there would typically be low numbers of people within the building.
- The playing field and stands of the Multipurpose Stadium will not be a fully enclosed structure, unlike the example buildings (hospitals, schools, shopping centres. The 70% design includes open spaces on each side of the structure to allow natural ventilation and airflow, as part of the temperature control within the stadium to prevent overheating/greenhouse effects during use.

On the basis of this assessment, the Multipurpose Stadium is considered a mixture of the standard commercial building and large commercial and industrial building categories. The standard commercial building category has been conservatively adopted as under some Characteristic Situations, a higher level of protection is required (refer to **Plate 3**).

5.2.2.3 Required Protection Level

Plate 3 below provides a matrix (EPA NSW, 2020) used to assess the level of gas protection required, based on these factors.

CS	Required gas protection guidance value				
	Low-density residential	Medium-to high-density residential (strata title)	Public buildings, schools, hospitals and shopping centres	Standard commercial buildings (offices, etc.)	Large commercial (warehousing) and industrial buildings
1	0	0	0	0	0
2	3	3	3	2	1[a]
3	4	3	3	2	2
4	6[b]	5[b]	5	4	3
5	-[b]	6[b]	6[c]	5	4
6	-[d]	-[d]	6[c]	6	6

(a) If maximum measured methane concentration exceeds 20% v/v, increase to CS 3.
(b) Residential development is not recommended at CS 4 and above without pathway intervention (for example, source depressurisation or control of lateral migration) external to the buildings and a high level of management. These requirements necessarily preclude low-density residential (NEPM HIL A residential) development.
(c) Evacuation issues and social risks must be considered.
(d) Level 3 risk assessment is required.

Plate 3 Guidance Values for Gas Protection (EPA NSW, 2020)

Based on an assessed rating of CS3, and proposed buildings in the assessment areas considered to correspond to standard commercial buildings, a gas protection guidance value of 2 is considered required for future buildings and structures for the Site based on the matrix provided on **Plate 3**. It is noted that the required gas protection guidance values for CS2 and CS3 are the same for the proposed Site land use, and further soil vapour assessment is not considered required to refine assessment of risks or identification of mitigation/management controls.

The change in land use and proposed development includes large continuous structures, such as the Multipurpose Stadium, which cover and extend from areas where methane or other potentially hazardous vapours have been detected. The potential exists for vapour to migrate along the base of any such large structures, and as such any requirement for vapour protection must extend to the entirety of any structure which covers areas of potential intrusion.

In addition, due to the potential risks, and high level of cost likely required to rectify any fault in vapour intrusion measures, independent verification of design and installation of vapour intrusion prevention

measures should be undertaken for the current proposed, and any future proposed, structures at the Site.

On this basis, the following information and management measures are required and should be included in the SEMP:

- The existing requirements for gas protection are to be incorporated into any structures (such as buildings or service pits) which cover areas where methane or other potential hazardous vapours (TRH and BTEXN[1]) may migrate into structures.
- Conduits or services which pass through soil between or outside of structures and have air-space which vapour could potentially intrude into (for example, air space in protective conduits around buried cables) must be sealed and gas-impermeable, or have duct sealing at any points where air/vapour within the conduits could potentially vent into an enclosed space.
- Design and construction documentation must include a documented testing and verification method for vapour intrusion mitigation measures, with reference to Appendix 7 – Verification and construction quality assurance, of *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020). Any design and/or installation of ground gas protection measures will require independent oversight and sign-off by an Environmental Auditor, or other suitably qualified and independent verifier.

It is noted that, if the selected vapour protection system prevents potential groundwater seepage into any basement structures, the ventilation rate of ≥2 air exchange cycles per hour assumed in the RC (see **Section 3.2**) will not be required.

5.2.3 Updated Designs for Planting Deep Rooted Vegetation

The SEMP includes the following requirements for establishment of landscaped areas and gardens:

Landscaped areas and gardens should be established in above ground planter boxes on hardstand and not directly over exposed soil. In the event that gardens are proposed in-ground, the following barrier system shall be installed:

- *Layer 1: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users.*
- *Layer 2: Earthen cover (minimum 0.5 m) certified as 'Fill Material' in accordance with Tasmanian EPA Bulletin 105 (IB105).*
- *Layer 3: Surface coverage (comprising shallow rooted vegetation).*

Allowance may be made for the establishment of deep rooted vegetation; however, the barrier thickness may need to be increased, or the design modified. In-ground garden designs should be confirmed with a Contaminated Land Auditor.

These requirements have been included to minimise the potential for contact between potentially contaminated soil and future Site users, such as workers maintaining plant life or workers/visitors who may come into contact with garden spaces.

As part of development of the Site, updated designs for planting of trees and inground plants, including potentially deeper rooted plants, have been developed and are attached in **Appendix D**. These designs have been included in the SEMP (AECOM, 2025h), with the following additional controls:

- Soil imported for in-ground planting must be Level 1 – Fill Material, as defined in *Information Bulletin No 105 – Classification and Management of Contaminated Soil for Disposal* (IB105) (EPA, 2018).
- No plants intended for consumption are to be included in any in-ground planting on the Site.
- The potential size of plant root structures should be considered when selecting species for cultivation on the Site. Planting structures should have sufficient volume for the plants to develop

[1] Identification of other potentially hazardous soil vapours is discussed by assessment area in **Section 6.0**. The identified CoPC are included here to minimise the potential for error during future implementation of requirements.

without requiring root structures to penetrate the earthen liners and extend beyond the clean-fill soil.

- The earthen liner and barrier layers included in planting designs are to be installed above the Site water table.
- In-ground planting is only to occur in open space use areas. No in-ground planting is to occur within Site buildings (i.e., within atriums, foyers, or arboretums).
- Trees, or any other deep-rooted plants, which are cultivated on the Site should be excavated and removed as soon as possible if any of the following occurs:
  - Death or significant rot/reduction in size;
  - Toppling/knocking over by wind or impact.
- In the event that plant removal occurs:
  - Removal of all root structures must be included.
  - If root structures have extended and pierced the earthen liner and/or indicator barrier layer, these must be repaired and restored as part of removal of the plant(s).

The proposed designs are not considered to introduce any additional risk of environmental harm, with the additional controls described above, as:

- All designs maintain a barrier layer equal to or greater in thickness than requirements (0.5 m) in the previous Site Suitability Statements, and include the marker layer indicating where current, potentially contaminated Site soil begins.
- The proposed earthen liner will limit the potential for plant roots to come into contact with Site soil or groundwater. In the event that root structures do penetrate these barriers, it is not considered to create unacceptable risks to Site users or environment as:
  - Planting will only occur in open space use areas and will not be conducted above vapour protection systems.
  - No plants intended for consumption are to be planted on the Site, and any contamination which plants may accumulate if roots penetrate liners will not be consumed by humans. In addition, the primary CoPC in Site soil and groundwater are lead, PAHs, and TPHs.
    - Lead and PAHs both have relatively low bioavailablity in soil, and limited ability to translocate from root structures to above-ground biomass (Appendix B7 of the ASC NEPM). If plants were to penetrate the earthen liner and marker layer, any soil contamination taken up by the plant would predominantly be present in the skin or outer layers of root material, and would not be transported to the surface or come into contact with human receptors.
    - The majority of chemicals found in petroleum hydrocarbons are generally not taken up or absorbed by plants, and plant uptake and consumption is not included as a significant exposure pathway in the HSLs provided by CRC CARE, 2011.

    Other CoPC detected above the Tier 1 criteria adopted for human health (benzene, metals (arsenic, cadmium, copper, manganese, nickel, copper, vanadium and zinc), and cyanide) are not considered to have an additional risk pathway or to represent any new or increased risk to future Site users based on the planting designs attached, as these CoPC:
    - Are limited in extent and area in Site soil and groundwater.
    - Are noted in most cases in Appendix B7 of the ASC NEPM to have either limited update in plants, or be likely to adversely affect plant growth before reaching a level where human harm would occur.
    - Will have limited intake by humans via plant species, based on the proposed limitation on edible plants to be included in the SEMP.

5.3 Changes in Proposed Land Use and Final Surface Elevations

5.3.1 Land Use

The original development of the Site, provided in *Strategic Framework and Masterplan 2015 – 2030* (the former Masterplan) (MPDC, 2015) and presented on **Figure F3**, proposes the Site be developed for a mix of uses comprising:

- Residential, including medium to high density
- Commercial, including visitor accommodation, retail, arts and institutional
- Open space, including parks and recreations areas
- Transport, including roads, light rail, cycleway, and pedestrian access
- A single storey underground carpark proposed to be constructed in the Promenade and Underground Carpark Area.

Subsurface utilities and maintenance activities were also anticipated to occur in all Site areas.

Table 14 below summarises the changes for each area to be assessed when compared to the updated planned development of the Site, discussed in **Section 2.3** and presented on **Figure F2**.

Table 14 Changes in Land Use by Area

Assessment Area	Changes in Land Use
The Goods Shed and Yard (Audit Area 1)	• The Goods Shed will be removed from this area. • Proposed Open Space use to the west and north of the Goods Shed now forms park of the Multipurpose Stadium and Associated Concourse zone. • Sections of this area will be lowered to final surface elevations of between 2.9 to 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Escarpment (Audit Area 4 West)	• Land use of parts of this area has changed to Open Space. It is noted that the Goods Shed is likely to be moved to this area, and assessment for commercial/industrial uses is still considered required. • The south-eastern corner is included in the proposed footprint of the underground carpark. • High density residential use is no longer planned in this area. • Sections of this area will be lowered to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.

Assessment Area	Changes in Land Use
The Promenade and Underground Carpark (Lot E and UGC)	• Open Space land use in the southern portion of this area is now included in the Multipurpose Stadium and Associated Concourse zone. While, the majority of this space was assessed for a proposed underground carpark, which was assessed for commercial/industrial use, portions of in the eastern and western areas of this assessment area were only considered for Open Space use. • Land proposed for an "Access Link", or open transport corridor, in the eastern portion of this area was assessed for Open Space use, but is now considered for commercial/industrial use as part of the Multipurpose Stadium and Associated Concourse zone. • The north-eastern corner is included in the proposed footprint of the underground carpark. • High density residential (above the first floor) is no longer planned in this area. • Sections of this area will be lowered to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Precinct North (Lot B)	• Land use is still considered to be commercial / light industrial. • A single storey underground carpark is proposed in the northern portion of this assessment area. • Sections of this area will be lowered to final surface elevations of between 1.8 and 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.

The Precinct Plan proposes a mixture of Commercial/Industrial and Open Space uses across all four areas considered in this assessment, with Intrusive Maintenance Worker uses also likely to occur. An underground carpark is now proposed in the north-east portion of the Site within the Escarpment, Promenade and Underground Carpark, and Precinct North, as well as within Audit Area 4 East which has not had a Site Suitability Statement issued to date.

Residential use is no longer planned in any of the four areas with previously issued Site Suitability Statements, however this use has been assessed for consideration of potential risks to off-Site residential receptors (discussed in **Section 3.0**).

It is noted that as part of the updated development plans, buildings and structures which extend over the boundaries of previously established assessment areas are proposed. Assessment of environmental risks associated with buildings which cover multiple assessment areas is included in **Section 6.5.**

5.3.2 Surface Elevation

As part of the development of the Site and preparation of preliminary designs for the Multipurpose Stadium, modification of the final Site surface level is proposed, consisting of excavation and backfilling with engineered materials in some area of the Site, or installation of surface layers in others.

Increase in final surface elevation (i.e., building up areas) is not considered to increase environmental risks as:

- Vapour intrusion risks will be reduced by the additional pore space and travel time to the surface, allowing additional degradation or dilution of potentially hazardous vapours.
- Increase in surface elevation reduces potential contact with groundwater due to increased distance between the surface and the water table.
- A barrier layer between the surface and existing Site soil is required as part of the conditions which inform the Site Specific Remediation Criteria (discussed in **Sections 5.4** and **3.2**).

However, decreases in surface elevation may affect the environmental risks associated with Site contamination associated with soil vapour (generated from soil and groundwater) and with potential contact by intrusive maintenance workers with deeper soils previously not considered likely to be disturbed following development.

The extents of excavation and backfill proposed at the 50% detailed design of the Multipurpose Stadium are attached as **Appendix C**, and displayed in context of the current surface elevation of the Site (shown on based on surface surveys completed in 2024) on **Figure F5** and **Figure F6**. The proposed surface elevations have not changed in the 70% detailed design (recently completed).

Decreases in final surface elevation are proposed in the following locations:

- The playing surface of the Multipurpose Stadium, and the ground floor level of the surrounding stands, is proposed at 3.0 mAHD.
- The area to the south and east (the Complementary Integrated Mixed Use Zone) has a proposed final surface level of 2.9 mAHD.
- The surface of the practice wickets area north-west of the stadium is proposed at 4.8 mAHD.
- A single storey underground carpark to the north-east of the stadium (within the Antarctic Facilities Zone) is proposed to 1.8 mAHD.

In addition, there is an area to the south-west of the stadium with a proposed final surface elevation of 3.3 mAHD (reduction in elevation of approximately 0.7 m). This area is within the Gateway assessment area, and will be considered separately as part of the environmental audit of this area.

Areas where a decrease in surface elevation is proposed, and the elevation used for assessment of environmental risks, are summarised on **Table 15** below.

Table 15 Proposed Decreases in Surface Elevations

Proposed Decreased Surface Elevation Area	Final Proposed Elevation (mAHD)		Affected Assessment Area			
	Design	Assessment[1]	The Goods Shed and Yard	The Escarpment	The Promenade and Underground Carpark	The Precinct North
Multipurpose Stadium	3	2.5	✓	✓	✓	✓
Complementary Integrated Mixed Use Zone	2.9		✓	×	×	✓
Practise Wickets	4.8	4.3	×	✓	×	×
Underground Carpark (Antarctic Facilities Zone)	1.8	1.3	×	×	×	✓

Notes: ✓ - Change in elevation is within the boundaries of this assessment area; × - Change in elevation is not within the boundaries of this assessment area; 1. The Assessment Final Proposed Elevation, which incorporates a margin of safety of 0.4-0.5 m to allow for minor changes which may arise, has been used when considering changes in environmental risks.

For the purposes of assessing environmental risks associated with the change in design elevation:

- A safety margin of 0.4-0.5 m below the proposed final surface elevations has been included in assessment of Site data in **Section 6.0** to allow for any potential minor variations or changes which may occur as development design is finalised, or during construction.
- If final surface elevation in any area is less than the assessment elevation for that area listed on **Table 15**,

- No review of changes in precluded PEVs has been conducted as part of the assessment, and it has been assumed that any PEVs identified as precluded in existing Site Suitability Statements remain precluded.

  While the proposed excavation may remove some soil impacts which preclude PEVs, Site Suitability Statements must consider the conditions which exist at the time of assessment and cannot be predicated on the future planned actions (i.e., excavation of soil) being completed at the Site.

It is noted that the inferred elevation of groundwater is equal to or greater than the proposed final design level in some areas (see **Figure F15**). Assessment and management measures for groundwater in these areas are discussed in **Section 6.5.2**.

5.4 Review of Site Specific Remediation Criteria

As part of previous assessment of the Site, Site Specific Remediation Criteria (RC) were initially developed in 2016 (AECOM, 2016) and have been used as part of environmental investigations to identify remediation requirements to remove or mitigate any unacceptable risks to current and future users of the Site, including as part of the previously issued Site Suitability Statements.

The RC were reviewed in *Review of Site Specific Remediation Criteria 2025* (AECOM, 2025a) and have been updated to consider changes since the RC were initially derived, including changes in:

- Proposed Site development.
- Relevant Australian or international guidance used to assess potential risks and derive RC.

The review of RC concluded that the AECOM (2016) RC are overall appropriate for ongoing assessment of potential human health risks which may arise from the land uses proposed in the Precinct Plan, including stadium construction, in areas where groundwater will be 1 m below the final surface or deeper.

Minor updates to the RC were recommended, to align with the updated tolerable concentration in air (TC) adopted for ethylbenzene in the HSLs from the ASC NEPM and to clarify where RC based on the vapour inhalation pathway exceed theoretical soil saturation limits or water solubility limits and therefore this pathway is not limiting.

As all recommended changes increase adopted RC values, the results of previous assessments using the AECOM (2016) RC are considered conservative and applicable for assessment of potential risks for development under the Precinct Plan (MPDC, 2024). As such, re-review of existing assessments for updated criteria is not considered required.

However, the updated RC derived in AEOCM (2025b), described in **Section 3.2**, have been used to assess if any additional remediation or management measures are required for the proposed future development of the Site.

5.5 Collection of Additional Environmental Data

Since issue of the Site Suitability Statements between 2019 and 2021, the following investigations or assessments have been conducted which have collected additional data from soil, groundwater or soil vapour relevant to the areas considered in this review:

- Acid Sulfate Soil (ASS) investigations conducted between 2024 and 2025
- Groundwater Monitoring Events (GMEs) conducted involving wells in or adjacent to the areas of Site Suitability Statements between 2022 and 2025.
- *In Situ* Soil Characterisation Sampling - Stadium Footprint Stage 1 and Stage 2 Bulk Excavation conducted in 2024
- Soil, groundwater and soil vapour investigations.

Each investigation is summarised below. Data from these investigations has been included in the data assessed in **Section 6.0**.

5.5.1 Acid Sulfate Soil Investigations

Acid Sulfate Soils (ASS) are soils containing sulfides, most commonly iron sulfides, which have been generated by natural bacterial activity in anerobic, sulfate rich water (e.g. coastal swamps or wetlands) and remain buried generally beneath the water table. If ASS is oxidised, sulfuric acid may be produced, in potentially high quantities which may represent a risk to surrounding land and aquatic organism and ecosystems. Unoxidised ASS, for example ASS below the water table, is referred to as Potential Acid Sulfate Soil (PASS), while ASS which has oxidised is referred to as Actual Acid Sulfate Soil (AASS).

Prior to issue of the Precinct Plan, development below the Site surface where ASS (as either AASS or PASS) was not proposed. However, the updated development includes excavation of soil, and advancement of footings to dolerite below the water table. These activities were identified as potentially contacting and disturbing ASS, if present, as the Site:

- Is located at less than 20 mAHD in close proximity to surface water bodies.
- Has been subject to historic land reclamation, where river and sea beds have been covered in fill material, as demonstrated by estuarine sands identified in soil bores.
- Is mapped as a Low (6-70%) probability of PASS on the LISTMap Coastal Acid Sulfate Soils (0-20 mAHD) layer.

In order to identify if ASS (as either AASS or PASS) is present on the Site, and to quantify what management requirements may be needed for any future development activities which may disturb it, an assessment methodology and framework, derived from the *Tasmanian Acid Sulfate Management Guidelines* (TASSMG) (DPIPWE, 2009), was prepared and implemented on-Site between April 2024 and July 2025, and is described in *Acid Sulfate Soil Investigation* (AECOM, 2025e). The locations of ASS sample bores are shown on **Figure F7**.

Overall, assessment of ASS at the Site has concluded:

- No AASS has been detected at Macquarie Point, and no ASS (either AASS or PASS) has been detected at Regatta Point.
- Oxidisable sulfides have been detected at Macquarie Point, consisting generally of sands and clays consistent with estuarine materials, and it is considered likely that river- and lake-bed materials (either originally present on Site, or used as part of historic land reclamation) is the ultimate source of this material.

  Soil with a high potential to acidify due to the presence of reduced inorganic sulphur, which is considered PASS, has been identified in:

  - Saturated soil, and soil which may have been intermittently wet at the water table.
  - Pockets of unoxidised estuarine sands in fill, characterised as black sand and gravel, which has not oxidised prior or during land reclamation, or while *in situ* on the Site.

  Management will be required for any work which may disturb or dewater PASS.
- Review of historic data identified indicators that Site groundwater may have been affected by the oxidation of sulfides, but that acidification has not occurred. Site groundwater is assessed as reasonably adequate to maintain a neutral pH in future, noting that this does not constitute protection against environmental impact if widespread or uncontrolled acidification occurs due to Site activities.
- PASS management is not considered required for the remaining unsaturated soil at the Site based on the existing Acid Neutralising Capacity (ANC) of soil, which is an order of magnitude or greater than the potential acidity. While the reported ANC may be inflated by sample preparation, it is considered suitable for use in interpretation with the safety margin of 10x, following corroboration by chip tray analysis.
- Indicative dosage rates of to treat and neutralise PASS of between 28 and 73 kg/tonne with a generic agricultural lime (aglime) if disturbed have been calculated, based on the location and treatment scenario (*in situ* vs stockpiled PASS).

The estimated rates are based on a generic assumed aglime with an Stated Neutralisation Value (SNV) ≥ 85% calcium carbonate ($CaCO_3$), and in which ≥80% of aglime particles are < 0.3mm. These parameters have been assumed based on typical aglime available in eastern Australia.

Any neutralisation agent proposed for use on the Site should be compared to these properties. While alternatives may be suitable for PASS treatment, the suitability and dosage rate of any alternative should be reviewed and verified by a suitability qualified and experienced environmental practitioner with consideration of:

- SNV and particle size distribution
- Solubility and longevity
- Potential for other environmental effects.

Any neutralisation of PASS must be verified by post-treatment laboratory analytical results.

Based on the outcomes of this assessment, it is recommended that:

- Future activities at Macquarie Point should identify all activities which have the potential to disturb or expose (i.e., dewater) PASS at the Site, and:
  - The Site Environment Management Plan (SEMP) and Construction Environment Management Plans (CEMPs) should include overarching management obligations for disturbance of ASS and/or water table drawdown via dewatering.
  - A scope specific Acid Sulfate Soil Management Plan (ASSMP) and Dewatering Management Plan (DWMP) should be developed for each discrete works package involving civil and general earthworks activities, water table drawdown via dewatering, and any other significant soil disturbance activities or changes to natural groundwater and surface water systems.

    These documents should be prepared by those undertaking works which may disturb PASS, and must include:

    - Estimated volumes and action criteria for PASS which may be disturbed by the proposed works.
    - Procedures for the handling of disturbed PASS, including verification of neutralisation, groundwater generated by dewatering, and monitoring of Site environmental conditions in the vicinity of PASS disturbances.
    - Contingency measures which are specific, measurable, and attainable, and can be implemented in a timely manner in the event that action criteria or trigger values are exceeded.
- Future structures and infrastructure at the Site should consider the potential effects of sulfides and possible acidification in design and selection of materials, and adopt appropriate mitigation measures to prevent degradation of materials overtime.
- Any groundwater, or run-off which may have come into contact with PASS, should be considered as potentially contaminated. pH and the potential to acidify should be considered in assessment any such water prior to disposal

The above recommendations should be documented in the Site Environment Management Plan (SEMP; AECOM, 2025a).

5.5.2 Groundwater Monitoring Events (GMEs) and Gauging

Since 2021, when the most recent Site Suitability Statement (Coffey, 2021b) was issued, three Groundwater Monitoring Events (GMEs) have been conducted at the Site where wells within the areas with existing Site Suitability Statements have been sampled, as listed on **Table 16** below. An additional GME was conducted at Regatta Point in 2024, but did not include any groundwater wells in the vicinity of the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, or the Precinct North, and data from this GME have not been included in this assessment.

Groundwater well locations are shown on **Figure F10** and gauging and analytical data collected from these programs are attached on **Table T5** to **Table T9**, with exceedances of adopted criteria are shown

on **Figure F13a-c**,. Results of samples with reference to Site suitability are discussed by area in **Sections 6.0** to **6.4**.

Table 16 Groundwater Monitoring and Gauging Events Completed Since 2021

Description	Dates	Wells Gauged/Sampled	Report
Targeted GME – The Gateway	30 November to 2 December 2022	The Goods Shed and Yard • MW127A, MW127B The Promenade and Underground Carpark • MW36, MW174 The Gateway • MW100, MW102, MW122, MW173, RS6 Off-Site • MW123A, MW123B, MW130_GHD, MW131_GHD, MW132_GHD, MW133_GHD, MW150	*The Gateway – Data Gap Assessment* (AECOM, 2023a)
Targeted GME – The Precinct South	29 November to 6 December 2023	The Goods Shed and Yard • MW55, MW124A, MW124B, MW127A, MW127B The Promenade and Underground Carpark • MW146, MW175, MW176 The Precinct North • MW155 The Precinct South • MW03*; MW05*; MW6, MW16, MW60, MW125A, MW125B, MW126A, MW126B, MW154, MW162, MW163, MW164, PW02*; RN4, S4, S6, S8* Off-Site • MW150, MW151, MW152, MW153	*The Precinct South – Well Maintenance and Targeted Groundwater Monitoring Event* (AECOM, 2024c)

Description	Dates	Wells Gauged/Sampled	Report
Site-Wide Gauging and Well Inspection	26 to 28 February 2025	<u>The Goods Shed and Yard</u> • MW127A*, MW127B*, MW55* <u>The Escarpment</u> • NR3* <u>The Promenade and Underground Carpark</u> • M121*, MW146*, MW175*, MW176*, MW36* <u>The Precinct North</u> • MW155*, MW167*, RN4* <u>The Precinct South</u> • MW03*, MW05&, MW125A*, MW125B*, MW126A*, MW126B*, MW154*, MW16*, MW163*, MW164*, MW6*, MW60*, PW02*, S8* <u>The Gateway</u> • MW100*, MW101*, MW102*, MW122*, MW128A*, MW128B*, RS6* <u>Audit Area 4 East</u> • MW159*, MW160*, MW161*, MW177A*, NR1* <u>Regatta Point</u> • MW178*, MW179*, MW180*, MW181* <u>Off-Site</u> • C1*, MW123A*, MW123B*, MW134_GHD*, MW135_GHD*, MW136_GHD*, MW151*, MW152*, MNW153*, PC05*, PC12*, PC13*	*Site-wide Soil Vapour Bore and Groundwater Well Inspection and Gauging Event* (AECOM, 2025f)

Description	Dates	Wells Gauged/Sampled	Report
2025 Site-wide GME	12 to 25 June, 2025	<u>The Goods Shed and Yard</u> • MW55, MW127A, MW124A*, MW124B*, MW127B*, MW149* <u>The Escarpment</u> • BG1, MW120A, MW194, MW103A*, <u>The Promenade and Underground Carpark</u> • MW36, MW121, MW183, MW184, MW186, MW191, MW146*, MW175*, MW176*, MW177*, MW182* <u>The Precinct North</u> • MW155, MW167, MW190, MW192, RN2, TW02, MW125A*, MW125B*, MW187*, <u>The Precinct South</u> • MW6, MW16, MW60, MW125A, MW126A, MW164, MW188, MW193, RN4, MW05*, MW126A*, MW126B*, MW154*, MW162*, MW163*, MW3*, PW02*, S8* <u>The Gateway</u> • BH2_PS, MW101, MW102, MW122, MW128A, MW148, MW173, MW196, MW197, MW198, RS6, MW100*, MQ128B*, MW129* <u>Audit Area 4 East</u> • MW159, MW160, MW161, MW177A, MW189, NR1, NR2A, MW145* <u>Regatta Point</u> • MW178, MW179, MW180, MW182 <u>Off-Site</u> • MW123A, MW130_GHD, MW131_GHD, MW132_GHD, MW150, MW151, MW152, MW153, MW123B*, MW133_GHD*, MW124_GHD*	*Soil, Groundwater and Soil Vapour Investigations 2025* (AECOM, 2025d)

Notes: * Gauged only

5.5.2.1 Groundwater Hydraulic Contours and Flow Direction

At the time of issue of the Site Suitability Statements, the most recent Site-wide groundwater contours used to infer groundwater flow direction were collected in November 2019 (**Figure F12a**) (AECOM, 2020i).

At that time, it was assessed that:

- The Site is underlain by a single aquifer unit (within multiple lithological units) extending to depths greater than 25.0 m bgl (the maximum depth assessed).
- Groundwater has generally been encountered in dolerite in the northern portion of the Site, and in fill material in the central, southern and eastern portions, extending into the underlying natural material including estuarine/ marine deposits, weathered Dolerite and fractured Dolerite.

- The inferred groundwater flow direction in the central and eastern areas of the Site is in a generally south to southeast direction, with steeper gradients in the north and western portion of the Site likely influenced by shallow dolerite bedrock.

  The relatively flat hydraulic gradient in the central and eastern areas of the Site is likely due to the increased depth of low permeability bedrock, and greater cross-sectional area of relatively high permeability fill and estuarine sands, increasing the potential saturated thickness of soil profile.

- Buried seawalls are noted to be below the Site and likely to have localised influence on groundwater flow direction

- The majority of Site groundwater is inferred to discharge to Sullivans Cove to the south and east of the Site. Some groundwater in the north-east may discharge to River Derwent, potentially via discharge to the Hobart Rivulet which passes under the Cenotaph grounds to the north of the Site and is understood to be in contact with groundwater.

Inferred groundwater contours at the Site developed as part of GMEs or other monitoring events conducted between 2022 and 2025, are attached as **Figure F12b-d**. A review of these contours, in particular the most recent Site-wide gauging events in February and June 2025, notes that:

- The overall flow direction (south to southeast) is generally consistent with the 2019 contours. Westerly groundwater flow into the Site from TasPorts/TasWater land on the eastern boundary is not detected in the June 2025 contours, potentially as no access to off-Site wells to the east was granted by TasPorts for this monitoring event. Some inflow from TasWater land was detected at MW159 in February 20205, and at MW167 in June 2025.

  However, this inflow, which may be related to a buried seawall from historic land reclamation (shown on **Figure F12a**) was apparent in December 2023 and February 2025, and is considered likely to be present.

- The February 2025 contours display a potential northerly flow in the Escarpment area. This was attributed at the time to lack of access to wells in this area, and the contours in June 2025 do not display any flow from the northern boundary of the Site (other than in Regatta Point), and it is not considered that groundwater from the Escarpment is likely to discharge on the northern boundary.

- The depth to groundwater in dolerite in the Escarpment and other northern areas of the Site was >3.5 mAHD in June 2025, shallower than November 2019. Historic gauging (AECOM, 2022a) had recorded groundwater elevations in this area as high as 4 to 4.5 mAHD in June 2025, and it is considered that there may be seasonal fluctuations, with increased groundwater in the north of the Site during wetter winter months.

  The detected depth of groundwater in the central and eastern areas of the Site (approximately 0.5 to 1.5 mAHD) is consistent across GMEs.

- Following installation of five groundwater wells in or near Regatta Point in 2024 (MW177A, MW178, MW179, MW180 and MW181), groundwater in the north-east portion of the Site is inferred to discharge to the River Derwent.

Overall groundwater depths, and inferred contours and flow directions, are consistent with those considered in the Site Suitability Statements and the overall discharge points of groundwater are considered the same (i.e., to Sullivans Cove and the River Derwent).

It is noted that proposed construction may come into contact with groundwater, in particular in the northern portion of the Site by the Multipurpose Stadium and Associated Concourse, and in the northeast in the proposed underground carpark, and is discussed by area in **Section 6.0**.

5.5.3 *In Situ* Soil Characterisation Sampling - Stadium Footprint Stage 1 and Stage 2 Bulk Excavation

As part of the proposed development of the Site, bulk excavation of soil is proposed to lower the surface elevation in some areas of the Site, and improve the geotechnical properties of soil beneath structures, as discussed in **Section 5.3.**

In order to facilitate off-Site disposal of soil to be excavated, additional sampling was conducted between 25 November and 11 December 2024 across the stadium footprint to a depth of approximately

2.4 mAHD to collect data for *in situ* waste categorisation of approximately 104,000 m^3 *in situ* (138,000 m^3 *ex situ* with a bulking factor of 1.33 applied) of soil.

The waste characterisation process was conducted with reference to:

- Tasmanian waste categories provided in *Information Bulletin No. 105: Classification and Management of Contaminated Soil for Disposal, Revision* (IB105) (EPA, 2018), with additional classification categories for Level 1 – Fill material introduced by amendment of the *Environmental Management and Pollution Control Act 1994* (the EMPCA) and the *Environmental Management and Pollution Control (Waste Management) Regulations 2020* in 2021.
- Sample density and statistical assessment of waste categories provided in *Publication IWRG702 - Industrial Waste Resource Guidelines: Soil Sampling for Waste Soils* (IWRG702) (EPA Victoria, 2024).

The assessment of soil was reported in *In Situ Soil Characterisation and Waste Management Plan – Stage 1 and Stage 2 Bulk Excavation, Macquarie Point Development Project* (AECOM, 2025b), and consisted of:

- Advancement of 125 boreholes on an approximate 20 x 20 grid across the proposed Stage 1 and Stage 2 excavation areas, as shown on **Figure F8**. It is noted that some deviations from the grid occurred due to the existence of existing structures (the Goods Shed).

  IB105 notes that, in the event *in situ* classification of soil is conducted, *Australian Standard 4482.1 - Guide to the investigation and sampling of sites with potentially contaminated soil. Part 1: Non-volatile and semi-volatile compounds* (AS4482.1) should be consulted to obtain a representative number of samples. Table E1 in Appendix E of AS4482.1 suggests that the minimum of 55 sample points using a square grid are required to characterise an area of 5.0 ha, and that sites greater than this area should be subdivided into smaller areas. The proposed excavation extent is approximately 5.8 ha, and a greater number of sample points was required. The 125 boreholes advanced were considered sufficient to collect representative samples of the Site.

- Collection 518 primary soil samples. Samples were collected at 0.5 m bgl and every 0.5 m following until the target depth of the borehole (~2.4 mAHD) was reached. Additional samples were collected if a change in lithology was observed by field staff.

  Key field observations during advancement of boreholes were:

  - Anthropogenic material (such as fragments of brick, metal, plastic, glass, wood, bitumen, ceramics, concrete and coal noted in various locations) were noted in anthropogenic fill at the surface to between 1 and >3.5 m bgl, and is considered likely to be the material introduced to the Site during progressive historical land reclamation events.
  - Odours and elevated vapour levels (recorded by photo-ionisation detector [PID]) were detected in locations:
    - In the former gasworks area, and are attributed to gasworks operations. This area is outside the areas assessed in the report and will be considered as part of the Gateway assessment area for the purposes of the Environmental Audit.
    - At 3 m bgl in bore H10, located in the Promenade and Underground Carpark area. This reading was close the water table and in the vicinity of historic Light Non-Aqueous Phase Liquid (LNAPL) Plume A2, and is attributed to groundwater fluctuation.
  - One fragment of ACM was observed at 0.5 m bgl in borehole E13, located in the Gateway area, which is not considered in this report. However, the ACM was non-friable and no asbestos fibres were observed at the Limit of Reporting (LOR) of 0.01%$^{w}/_{w}$ in the soil surrounding the fragment, and this fragment is not considered to constitute a potential hazard to future development.

- Samples were analysed for the following suites:

  - 168 samples (33%) were analysed for Total Contaminant Concentrations (TCC) of the CoPC listed on Table 2 of IB105, excluding tributyltin (TBT) which has not been detected on Site or identified as a CoPC based on historic uses.

- 350 samples (67%) were analysed for TCC of a targeted CoPC suite, based on previous investigations of the Site, consisting of BTEXN, TPH/TRH, lead, arsenic, and PAHs
- 179 samples were further analysed for Leachate Contaminant Concentration (LCC) for waste classification purposes, consisting of:
  - 75 samples analysed for metals, primarily lead, but also including mercury, arsenic, cadmium, chromium and zinc in targeted locations.
  - 139 samples were analysed for PAH LCC.

- Analytical results were screened against the waste categorisation criteria provided in IB105, and against the HIL D – Commercial/Industrial Land Use provided in the ASC NEPM to assess for potential land fill disposal.

  The screening of results concluded that the soil to be excavated in the Stage 1 and Stage 2 areas was primarily suitable to classify as Level 2 – Low Level Contaminated Soil, with the exception of three areas of potential Level 3 – Contaminated Soil or Level 4 – Contaminated Soil Requiring Remediation soil, consisting of:

  - Potential hotspots of approximately 18 m radius centred on:
    - J06, located on the boundary of the Escarpment and the Promenade and Underground Carpark, where lead and benzo(a)pyrene toxicity equivalency quotient (TEQ) LCC exceeded the Level 2 criteria in IB105
    - M13, located in the Goods Shed and Yard, where lead LCC exceeded the Level 2 criteria in IB105
  - Soil to be excavated in the former gasworks area (the Gateway), surrounding soil bores E15-E16, F15-16, G15-G18 and H15-H18, which had elevated concentrations of naphthalene. The Gateway is outside the areas considered in this report and will be considered separately.

Section 6.0 presents the soil data collected by this program for each assessment area, considered against Site criteria in **Section 3.0**.

5.5.4 Soil, Groundwater and Soil Vapour Investigation 2025

In early 2025, an inspection at the Site (AECOM, 2025f) identified a number of the groundwater wells and soil vapour bores which informed the previous Site Suitability Statements were lost, destroyed, or otherwise unsuitable for monitoring to review and assess if any changes in the Site condition had occurred. In order to restore the monitoring network, and collect updated data on the Site condition, in June 2025, the following activities were conducted at the Site:

- Advancement of 45 locations via sonic core drill rig and hand augering, consisting of :
  - 19 new groundwater wells
  - 16 new soil vapour bores
  - 10 new soil bores for assessment of ASS
- Repair of 25 damaged groundwater wells.
- Development of 20 groundwater wells (19 new wells, and one well [MW128B], which had an obstruction removed)
- Completion of a Site-wide GME and soil vapour monitoring event, including LNAPL transmissivity testing at three locations.

The completed works and outcomes are discussed in *Soil, Groundwater and Soil Vapour Investigation 2025* (AECOM, 2025d). Data collected with regards to soil, groundwater and soil vapour contamination relevant to this report are discussed by assessment area in **Section 6.0**, with specific assessment of LNAPL Plumes, and risks of off-Site ecological receptors, are provided in **Section 5.5.4.1** and **Section 5.5.5** below respectively.

5.5.4.1 LNAPL Plume Assessment

As part of the 2025 assessment (AECOM, 2025d), specific activities undertaken to investigate/assess LNAPL Plumes A1 and A2, and former LNAPL Plume A3, were:

- Installation of replacement wells to assess and delineate the LNAPL Plumes.
- Where LNAPL was present, completion of LNAPL transmissivity testing or, if sufficient LNAPL for this test was not present, qualitative assessment of LNAPL recharge.
- Sampling of groundwater was conducted for CoPC associated with the LNAPL previously identified in this plumes (degraded diesel), consisting of TRH, BTEXN, and metals.
- Soil vapour bores were installed at each LNAPL plume to assess potential vapour concentrations.

Groundwater wells and soil vapour bores delineating and/or assessing LNAPL and former LNAPL plumes are listed on **Table 17** and **Table 18** below.

Table 17 LNAPL Plume A1 and A2, and Former LNAPL Plume A3, Groundwater Assessment Wells

Well ID	Purpose	Groundwater Sampled?
MW36	Delineate LNAPL Plume A2 to the west	Yes
MW146	Delineate LNAPL Plume A2 to the east	No
MW155	Delineate Former LNAPL Plume A3 to the east	Yes
MW176	Delineate LNAPL Plume A2 to the south-east	No
MW177	Delineate LNAPL Plume A1 to the east / Former LNAPL Plume A3 to the north-east	No
MW182	Delineate LNAPL Plume A1 to the north-east	Yes
MW183	Target LNAPL Plume A1 location	Yes
MW184	Delineate LNAPL Plume A1 to the south / LNAPL Plume A2 to the north	Yes
MW185	Target LNAPL Plume A2 location	No
MW186	Delineate LNAPL Plume A2 to the south	Yes
MW187	Target Former LNAPL Plume A3 location	No
MW190	Delineate LNAPL Plume A1 to the north-east	Yes
MW191	Delineate LNAPL Plume A1 to the west / LNAPL Plume A2 to the north-west	Yes

Table 18 LNAPL Plumes A1 and A2, and Former LNAPL Plume A3, Soil Vapour Assessment Bores

Soil Vapour Bore ID	LNAPL Plume
SV31	LNAPL Plume A1
SV32	LNAPL Plume A2
SV33	Former LNAPL Plume A3

The following was observed during investigation in 2025:

- LNAPL sheen and a hydrocarbon odour were noted on soil during installation of MW186, and hydrocarbon odours and/or staining were noted during installation of MW183, MW185, MW190, and SV31.
- LNAPL sheen was observed in MW185 (targeting LNAPL Plume A2) and MW187 (targeting Former LNAPL Plume A3), and LNAPL (5mm) was noted in groundwater removed from MW185 during development on 13 June 2025. However, no measurable LNAPL was present in these wells up to three weeks following installation.
- No LNAPL was observed in well MW183, which was targeting the historic location of LNAPL Plume A1, or in surrounding wells.

- No groundwater concentrations indicative of LNAPL (i.e., exceeding the ASC NEPM solubility limits) were detected in any sampled well in 2025 in the vicinity of LNAPL Plumes A1, A2 or Former LNAPL Plume A3.
- Methane in excess of the adopted criteria for soil vapour was detected in all three soil vapour bores. However, no hydrocarbons vapours indicative of potential risks to future Site uses were detected.

Remediation of LNAPL using a fixed TFE system was last conducted between 2015 and 2017, and further direct remediation was assessed as no longer practicable (AECOM, 2021i) as:

- LNAPL recovery by the TFE system was asymptotic and demonstrated marginal recovery rates.
- The residual LNAPL in plumes was stable or decreasing.
- No unacceptable risks to future human health or ecological receptors associated with the LNAPL plumes was identified if the procedures within the SEMP were adopted for current and future Site uses.

These end-points were assessed in June 2025 (AECOM, 2025d), and, based on field observations and soil vapour and groundwater data collected from replacement wells, were considered to be still valid. The historic LNAPL plumes are not considered represent a risk to future Site users, if the Site is managed as described in the SEMP, and further active remediation or clean-up is not likely be practicable or remove quantities of LNAPL for the Site which will meaningfully affect the environmental condition or risks to future users of the Site or surrounding areas.

While the replacement well and soil vapour bore network is not as extensive as previously present, and some residual LNAPL may be present between current bore locations, it is not considered that this would represent a risk to future development or Site use.

It is also noted that LNAPL Plume B, located in the Precinct South, was also assessed as part of the 2025 GME, and is not considered likely to be mobile. LNAPL Plume B is hydraulically down-gradient of the areas which have had issued Site Suitability Statements and is not considered to have potential to affect the environmental status of these areas. Assessment and management of environmental risks associated with LNAPL Plume B is included in the Precinct South CUTEP report (AECOM, 2025g).

5.5.5 Risks to Off-Site Ecological Receptors

While soil at the Site has reported CoPC concentrations which could present risk to ecological receptors, no ecological receptors are currently present on the Site, or are proposed to be present following development. Risks from soil to ecological receptors are managed by the SEMP, which removes pathways between soil and receptors by:

- Barrier layers (either at the surface, or as part of planting design for in-ground plants as discussed in **Section 5.2.3**) are required in the SEMP and will prevent contact with Site soil.
- No extractive use of groundwater will be permitted.

Contamination present in groundwater may impact off-Site ecological receptors at the point of discharge, which have been inferred (based on groundwater flow direction) as:

- Sullivan’s Cove to the south and east of the Site
- The River Derwent to the north (potentially via the Hobart Rivulet, which is understood to be in contact with groundwater to the north-east of the Site)

The *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), conducted based on groundwater data available to 2019, concluded based on a weight of evidence approach that groundwater emanating from the Site was unlikely to represent an unacceptable risk to off-Site ecological receptors in either of these aquatic systems.

An addendum to this assessment was prepared in 2025 (AECOM, 2025i), and concluded that overall, based on the review of updated Site data and information, the outcomes of the AECOM (2020h) assessment remain valid and suitable for ongoing assessment of the Site. No material changes in the off-Site aquatic ecological risk profile have been identified, and ecological risk to receptors in the River Derwent and Sullivans Cove remains low.

5.6 Closure of the Macquarie Point Sewage Treatment Plant (STP) and Realignment of the Main Hobart Pipeline

At present, the Main Hobart Pipeline, a sewer line connected from metropolitan Hobart to the Macquarie Point Sewage Treatment Plan (the STP) to the east of the Site, enters the Site from Evans Street on the south boundary of the Site and passes north though the Goods Shed and Yard, the Promenade and Underground Carpark, and the Precinct North.

TasWater, who own and operate the Main Hobart Pipeline and the STP, are currently constructing a Sewage Pumping Station (SPS) and emergency storage basin to the east of Macquarie Point and south of the STP, and plan to shut down and decommission the STP once completed, with details of the proposed land use available in the Environmental Impact Statement (EIS) for the new pumping station (TasWater, 2023).

In addition, the Main Hobart Pipeline will also be shut down and either removed or filled with grout, with removal as the preferred option, and replaced by a new off-Site sewer line to the south and east of the Site.

Installation of the new sewer line will be undertaken by the Corporation, who currently plan to undertake installation using horizontal micro-tunnelling, a trenchless horizontal drilling process where a surface controlled boring machine advances the excavation and installs pipeline sections behind it as it goes. Groundwater and soil is removed behind the boring machine as a slurry, with bentonite introduced to provide support around the pipeline. The Corporation has undertaken an initial costing assessment and will engage a contractor to undertake sewer installation once approval for the work is received from the Tasmanian Government.

The Corporation's planned route for the new line is attached as **Appendix E**. While not currently contemplated, if the route was modified such that the pipeline was installed within the Site, additional assessment of Site Suitability would be required.

These changes are not anticipated to increase the overall environmental risk profile of the Site as:

- The existing Main Hobart Pipeline is likely to be removed as part of future construction work, although an option to seal and fill it with grout may be considered. No environmental risks associated with this pipeline have been previously identified while in operation, and it is not considered that either removal or decommissioning via grouting would introduce any additional risks to future Site users, and that risks associated with either option could be managed by a CEMP informed by the SEMP.

  Elevated lead concentrations, in excess of the RC protective of future Intrusive Maintenance Workers, were identified in soil in an exclusion zone around the pipeline during remediation work in 2020 (AECOM, 2021e). Excavation and validation of removal of these impacts is not considered to be required as:

  - The affected area will be below the future Multipurpose Stadium, and specifically below the playing surface and will not be frequently accessed by intrusive maintenance workers.
  - The typical minimal level of Personal Protective Equipment (PPE) within the SEMP includes measures to minimise potential ingestion or inhalation of soil, including neck to toe clothing, impervious gloves for contact with soil, and potential disposal coveralls/dust masks.
  - Potential risks associated with this soil are included in the SEMP, and are required to be managed during removal by a CEMP, or during Site maintenance activities.

  As an additional measure, the SEMP will be updated with:

  - A requirement that any subsurface lines or services beneath proposed buildings or structures be installed in conduits or clean soil corridors (as previously required for services in the Promenade and Underground Carpark [Coffey, 2021a]).
  - Explicit mention of inhalation/ingestion risks for existing Site soils in the section discussing PPE.

- The new sewer line will be located off Site and hydraulically down-gradient. While the new sewer line will be in contact with groundwater, the micro-tunnelling process does not require excavation of

a trench or introduction of potentially higher permeability materials around the pipeline (i.e., bedding sands) which could produce a preferential pathway for potentially contaminated groundwater transport.

The Environmental Impact Statement (EIS) for the new pumping station (TasWater, 2023) did not identify any new impacts or environmental risks arising from the pumping station. This EIS has been submitted to and accepted by EPA Tasmania.

It is noted that AECOM provided input into the EIS for TasWater, separate to our ongoing consulting role for the Corporation as part of the development of the Site.

In addition, soil excavated as part of the construction of the pumping station was temporarily stockpiled and treated on the Site in 2025, and consisted of:

- Mixing Area 1 - Saturated fill and estuarine sands, considered potential PASS, was stockpiled in the Escarpment and treated with:
  - Agricultural lime (aglime) to neutralise possible acidification of PASS
  - Triple Super Phosphate (TSP) and moisture to reduce potential lead and copper leachability.
- Mixing Area 2 - Unsaturated fill was stockpiled in the Promenade and Underground Carpark, and the Gateway, and treated with TSP to reduce potential lead and copper leachability.

Mixing Area 1 and 2 are shown on **Figure 2** below.

Figure 2 TasWater Stockpiling and Soil Treatment Areas, 2025 (TasWater, 2025)

TasWater's proposed soil handling and stockpile management methodologies were developed to prevent any contact between Site soil and the soil excavated off-Site. The treatment and disposal of up to 17,500 m^3 of soil was undertaken under Environmental Approval No. 11933_2 and waste disposal letters D234398 and D24-212896, issued by EPA Tasmania, and the proposed interim use, including TasWater soil handling and stockpile management methodologies, was reviewed and approved by the Environmental Auditor prior to commencing with key controls against contamination of the Site including:

- Stockpiling of materials on hardstand
- Bunding and run-off capture.

All TasWater stockpiles of soil generated by the excavation of the pumping station were removed from the Site as of October 2025. Two small stockpiles of fine crushed rock (road base) which were imported to the Site for stockpile manager remain in Mixing Area 1, but have not come into contact with excavated soil and are not considered a potential source of contamination.

No spills or releases of soil or treatment reagents were recorded by TasWater during the treatment process. No residual soil, or damage to the underlaying hardstand in the stockpiling areas which could indicate large scale release or impact to the Site, were present in the final condition report photographs provided by TasWater. All stockpiles temporarily stored on the Site were categorised and disposed of as either Level 1 – Fill Material, or Level 2 – Low Level Contaminated Soil (IB105).

6.0 Area Specific Data Assessment

Summaries of the currently existing Site Suitability Statements are provided in **Section 4.0**. In addition, general changes, applicable to all areas, have been identified and are discussed in **Section 5.0** regarding:

- Changes to SEMP(s) issued at the time of Site Suitability Statements, including:
  - Issue of a Site-wide SEMP, superseding the initial area-specific SEMPs previously issued.
  - Extension of vapour intrusion mitigation requirements
  - Updated designs for in-ground planting
- Review and update of the Site Specific RC
- Collection of additional environmental data relating to ASS,, and other soil, groundwater and soil vapour
- Closure of the Macquarie Point Sewerage Treatment Plan and removal of the Main Hobart Pipeline sewer line.

Specific additional environmental data, and the area specific implications of the updated land uses and surface elevations proposed, are discussed by assessment area in **Sections 6.1** to **6.4** below.

6.1 The Goods Shed and Yard

6.1.1 Additional Environmental Data

6.1.1.1 Soil

Additional soil data for the Goods Shed and Yard collected since issue of the Site Suitability Statement consists of:

- 54 samples collected during *in situ* sampling to categorise soil to be excavated from this area (AECOM, 2025b), from 18 locations at *in situ* categorisation grid based sample bores K13 to K18, L13 to L18, and M13 to M18.
- One sample collected during installation of soil vapour bore SV36 in 2025 (AECOM, 2025d).

Locations of soil samples which have provided new data are shown on **Figure F8** and **Figure F10**. Results of soil sampling are screened against the Tier 1 criteria in **Table T1** to **Table T3**, and against the RC in **Table T4**.

Soil locations with exceedances of adopted criteria collected since issue of the Site Suitability Statements are shown screened against criteria in **Figure F11a-e**.

Due to the number and density of sample locations, visual display of exceedances of Tier 1criteria for the *in situ* characterisation samples (AECOM, 2025b) on a figure is not practicable, and review of these samples against Tier 1 criteria are discussed below. Exceedances of the RC in the *in situ* characterisation samples is shown on **Figure F11e**.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in soil samples collected after issue of the Site Suitability Statement:

- Low / Medium to High Density Residential – TRH >C16-C34; metals (lead); PAHs (benzo(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3)pyrene)
- Commercial/Industrial – lead, PAHs (benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3)pyrene)
- Recreation / Open Space - TRH >C16-C34; lead; PAHs (benzo(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3)pyrene)

- Modified / Highly Modified Ecosystems – TRH >C16-C34, metals (copper, lead[2], nickel, zinc), PAHs (benzo(a)pyrene)
- Vapour Intrusion (Residential) – TRH >C10-C16 (excluding naphthalene).

Residential use is not proposed in this area, or in any structures which have footprints which included this area, and thus the detected exceedance of the vapour intrusion criteria for residential use is not considered to represent an unacceptable risk to human health for the proposed development. The required vapour mitigation measures provided in the SEMP and discussed in **Section 5.2.2** provide additional mitigation against vapour intrusion.

The other PEVs which are precluded, based on exceedances of criteria detected in soil in the new data considered in this assessment, are consistent with the level of residual contamination described in the existing Site Suitability Statement. The Site is considered suitable for the new development if the mitigation and management measures detailed in the SEMP are implemented to prevent a complete exposure pathway from being established between future Site users and residual soil contamination.

Exceedances of the RC were detected for Intrusive Maintenance Workers for lead in *in situ* categorisation grids K14, K18, L13, M13 and M14, shown on **Figure F11e**.

Appendix B7 of the ASC NEPM notes that, in a situation where contamination concentrations in some samples exceed the nominated criteria, a statistical appraisal may be undertaken to assess the significance of the exceedance(s).

The Site may be considered suitable for the intended use if:

- The 95% upper confidence limit (UCL) of the arithmetic mean concentration of the contaminant is less than the criteria.
- No individual sample concentration exceeds 250% of the criteria value.
- The standard deviation of the sample concentrations does not exceed 50% of the criteria value.
- A sufficient number of samples has been collected using a spatially representative sample design.

While Appendix B7 of the ASC NEPM specifically references HILs, this statistical approach is considered suitable for application to other adopted criteria, as it assessed the likely overall exposure to contaminants a Site user may experience.

Statistical characteristics of lead concentrations from new samples in the Goods Shed and Yard, including 95%UCL and standard deviation, has been calculated using *ProUCL 5.1.001 – Statistical Software for Environmental Data Sets with and without Nondetect Observations* (ProUCL) (US EPA, 2016). Inputs and outputs generated and used in ProUCL are attached in **Appendix F**, and are assessed in **Table 19** below

It is noted that:

- For sample points where multiple samples were collected and submitted for analysis (i.e., laboratory duplicate samples), the higher reported CoPC concentration was used when calculating statistical values.
- Statistical assessment of lead in soil was conducted for both all new samples collected, and for all new samples excluding one sample, M13_1.0. The rational for exclusion of this sample is discussed below **Table 19**.

[2] It is noted the only lead exceedance of Tier 1 criteria for ecosystems occurred in sample M13_1.0, which is considered an outlier as discussed below **Table 19.**

Table 19 Statistical Appraisal of New Soil Data (Lead) - The Goods Shed and Yard

Requirement	Criteria (Lead)	Assessed Data Points	
		All Data Points	M13_1.0 Excluded
The 95% UCL of the arithmetic mean concentration is less than the criteria	95%UCL < 620 mg/kg	537.7 mg/kg - PASS	251.4 mg/kg – PASS
No individual sample concentration exceeds 250% of the criteria value	Maximum concentration < 1,550 mg/kg	9,220 mg/kg - FAIL	1,100 mg/kg – PASS
The standard deviation of the sample concentrations does not exceed 50% of the criteria value	Standard Deviation < 310 mg/kg	1,195 mg/kg - FAIL	229.8 mg/kg - PASS
A sufficient number of samples has been collected using a spatially representative design	As discussed in **Section 5.5.3**, the number of boreholes advanced in a grid pattern (within the practicable limitations of existing Site structures) for this assessment exceeded the density recommended by AS4482.1, and soil samples were collected every 0.5 m of depth. This sampling density and volume are considered to be sufficient and spatially representative of the volume of soil considered.		

From this assessment, the lead concentration in soil in one sample, collected at 1 m bgl in bore M13, was significantly elevated. If data from this sample is excluded in statistical assessment, the standard deviation and individual maximum concentration criteria from the ASC NEPM are passed.

However, it is considered that this detection represents an outlier and is not characteristic of the bulk soil in the area, as the detected concentration (9,220 mg/kg), is approximately 838% of the next highest detected lead in soil concentration in this data set (1,100 mg/kg at 1.5 m bgl in bore K14), and 560% of the highest lead concentration detected in soil (1,640 mg/kg at 1.9 m bgl in bore BH39) in the data which informed the Site Suitability Statement for this area (Coffey, 2019).

If excluded from the statistical assessment, the remaining lead detections in soil in this area pass the statistical appraisal requirements of the ASC NEPM and are not considered to represent a risk to future intrusive maintenance.

Remediation via excavation of this area is not currently practicable due to the active Site use as a carpark and transport corridor for Site tenants. It is noted that the soil at M13, and all the locations where additional new soil data considered in assessment of this area was collected, is planned for excavation and removal as part of the proposed Site development. The detection at M13_1.0 is delineated vertically (by M13_1.5) and laterally (by M11, M12, L13, and N13) and is not considered likely to indicate an extensive area of impact.

In order to prevent unacceptable risk during removal, or in the event that excavation does not occur, the SEMP should be updated with the following information and requirements:

- The elevated lead detection at M13 should be noted as a potential area of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.
- Any subsurface services in this area should be installed in sealed conduits or clean soil corridors to minimise any ongoing contact with existing Site soil by future maintenance workers.

Based on the soil data collected since the Site Suitability Statement, no new unacceptable risks to future Site users are considered to be present if these mitigations are incorporated into the SEMP.

6.1.1.2 Groundwater

The groundwater wells, in or adjacent to the Goods Shed and Yard, which have had groundwater samples collected and analysed since the Site Suitability Statement for this area was issued are listed on **Table 20** below.

Table 20 Groundwater Wells in and adjacent to the Goods Shed and Yard

Well ID	Description	Included in Existing Site Suitability Statement?	Recent GME Data		
			Targeted GME – The Gateway (2022)	Targeted GME – The Precinct South (2023)	Site-Wide GME (2025
Within the Goods Shed and Yard					
MW124A	Shallow (<10 m bgl) aquifer well, south central area	✓	×	✓	×
MW124B	Deep (>10 m bgl) aquifer well, south central area	✓	×	✓	×
MW127A	Shallow (<10 m bgl) aquifer well, central area	✓	✓	✓	✓
MW127B	Deep (<10 m bgl) aquifer well, central area	✓	✓	✓	×
MW55	Shallow (<10 m bgl) aquifer well, northern area	✓	×	✓	✓
MW149	Shallow (<10 m bgl) aquifer well, southern area	✓	×	×	×
Adjacent Areas					
MW146	Shallow (<10 m bgl) aquifer well, north and upgradient in the Promenade and Underground Carpark	×	×	✓	×
MW175	Shallow (<10 m bgl) aquifer well, north-west and upgradient in the Promenade and Underground Carpark	×	×	✓	×
MW176	Shallow (<10 m bgl) aquifer well, north-west and upgradient in the Promenade and Underground Carpark	×	×	✓	×
MW186	Shallow (<10 m bgl) aquifer well, north-west and upgradient in the Promenade and Underground Carpark. Southern delineation of LNAPL Plume A2	×	×	×	✓
MW125A	Shallow (<10 m bgl) aquifer well, east and cross/upgradient in the Precinct South	×	×	✓	✓
MW125B	Deep (>10 m bgl) aquifer well, east and cross/upgradient in the Precinct South	×	×	✓	×
MW162	Shallow (<10 m bgl) aquifer well, north and upgradient in the Precinct South	×	×	✓	×
RN4	Shallow (<10 m bgl) aquifer well, north and upgradient in the Precinct South	×	×	✓	✓
MW122	Shallow (<10 m bgl) aquifer well, west and cross-gradient in the Gateway	✓	✓	×	✓
MW148	Shallow (<10 m bgl) aquifer well, west and cross-gradient in the Gateway	✓	×	×	✓
MW133_GHD	Shallow (<10 m bgl) aquifer well, south-west and down-gradient off-Site	✓	✓	×	✓
MW150	Shallow (<10 m bgl) aquifer well, south-east and down-gradient off-Site	×	✓	✓	✓
MW129	Deep (<10 m bgl) aquifer well, south-west and cross-gradient in the Gateway	✓	×	×	×
RS6	Shallow (<10 m bgl) aquifer well, south-west and cross-gradient in the Gateway	✓	✓	×	✓

Notes: ✓: Analytical data available; ×: Analytical data not available

Sampling has been undertaken with good spatial and temporal distribution around the Goods Shed and Yard since issue of the existing Site Suitability Statement, and is considered sufficient to identify if any changes in groundwater contamination which could affect risk status have occurred.

Groundwater well locations are shown on **Figure F10**. Results of groundwater sampling are screened against the Tier 1 criteria in **Table T6** to **Table T8**, and against the RC on **Table T9**, with exceedances of adopted criteria are shown on **Figure F13a-c**. Groundwater samples have typically been assessed for key CoPC with exceedances detected in previous GMEs, including TRH/TPH, PAHs, and metals.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in groundwater samples collected after issue of the Site Suitability Statement:

- Drinking Water (Human Health) – Metals (arsenic, manganese); PAHs (naphthalene, benz(a)anthracene, benzo(a)pyrene); Cyanide (total)
- Drinking Water (Aesthetics) – Major Ions (chloride, sodium); Total Dissolved Solids (TDS)
- Recreation (Primary/Secondary Contact) – Metals (manganese); PAHs (naphthalene, benz(a)anthracene, benzo(a)pyrene)
- Eco-system protection – TRH (>C10-C40 (sum)); metals (aluminium, copper, manganese); PAHs (anthracene, phenanthrene, fluoranthene, benzo(a)pyrene); Nutrients (ammonia (as N))
- Vapour Intrusion (Structures) – Methane.

These CoPC and concentrations are consistent with the data considered in the existing Site Suitability Statement, with the exception of the methane in groundwater, It is noted that:

- Groundwater is not considered likely to be extracted for drinking purposes, based on the available urban reticulated water supply at the Site and surrounding areas and the high TDS concentrations, and extraction of groundwater for drinking purposes is restricted by the SEMP.
- Exceedances of recreation criteria are delineated and below criteria in MW153, located down-gradient of the Site prior to the inferred point of discharge (Sullivan's Cove to the south), and are not considered likely to be above criteria at the point of discharge or where contact with receptors may potentially occur.
- Assessment of vapour intrusion based on methane concentrations in groundwater was not assessed in the existing Site Suitability Statement, where vapour intrusion risks in existing structures were assessed via soil vapour and indoor air sampling. Methane intrusion was not considered to represent an unacceptable risk to users of the existing structure in area (the Goods Shed), based on the previous sampling.

  However, the concentrations of methane detected in new groundwater data represent a potential risk of methane infiltration for future development which will require mitigation as described in **Section 5.2.2** and documented in the SEMP.
- As discussed in **Section 5.5.5,** the *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), including the 2025 addendum (AECOM, 2025i) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).

LNAPL Plumes A1 and A2 are inferred upgradient of the Goods Shed and Yard. However, LNAPL was not detected in intervening wells MW175, MW176, or MW146 in the 2025 GME (AECOM, 2025d).

Based on assessment of LNAPL Plumes in 2025 (refer to **Section 5.5.4.1**), detectable LNAPL was not present in or adjacent to this assessment area, although sheen was reported in well MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3). No groundwater concentrations indicative of free-phase LNAPL were detected, and LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development, provided the controls in the SEMP (AECOM, 2025h) are implemented.

LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development.

No exceedances of groundwater RC have been detected in or adjacent to the Goods Shed and Yard in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in the Site Suitability Statement for this area, and no requirement for groundwater remediation is considered to be present.

Additional management of risks of potential future methane infiltration are considered to be required for the Goods Shed and Yard to be suitable for future development, with management measures documented in the SEMP and described in **Section 5.2.2**.

Based on the distribution (temporal and spatial) of groundwater sampling, the consistency of results with previous monitoring, and no exceedances of RC detected, there have been no other changes in groundwater conditions which would indicate an unacceptable risk to future Site users since issue of the Site Suitability Statement for this area, if the management controls within the SEMP are implemented.

6.1.1.3 Soil Vapour

One soil vapour sampling event, conducted in 2025 (AECOM, 2025d), has occurred involving locations in the Promenade and Underground Carpark since the issue of the Site Suitability Statement. Soil vapour sampling locations and results are shown on **Figure F14**, and results of sampling are presented in **Table T10**.

No exceedances of the adopted soil vapour criteria have been detected in the one soil vapour bore within the Goods Shed and Yard (SV36) which has been sampled after the Site Suitability Statement was issued.

However, it is considered that there are potential risks of soil vapour intrusion under the proposed development of the Site as:

- Methane concentrations in groundwater, which exceed the adopted criteria for potential risk near foundations (**Section 6.1.1.2**).

  Methane in groundwater was not considered in the existing Site Suitability Statement, as potential risks of methane (and other vapour) intrusion into existing buildings was assessed on the basis of direct sampling of sub-slab vapour and indoor air and did not identify any risks. However, new buildings and structures will have different interaction with soil vapour and may have different migration pathways and potential concentrations.

- Soil vapour from other parts of the Site has the potential to laterally migrate along the base of proposed structures (i.e., the Multipurpose Stadium) which extend beyond the boundaries of this area, and may have a risk of infiltration in this area (**Section 6.5**). Concentrations of methane, BTEXN, and TPH/TRH have been detected in soil vapour in areas of the Site which share a building footprint with this area.

On this basis, it is considered that there are potential risks of vapour intrusion into new structures in this area by methane, and by BTEXN and TPH/TRH vapours if development continues as proposed.

Mitigation and management measures, as discussed in **Section 5.2.2**, will be required for future development.

6.1.2 Change in Land Use and Elevation

The current Site Suitability Statement for the Goods Shed and Yard allows for *retail / commercial / recreational / public open space use and other less sensitive uses*, subject to specific conditions which are detailed in Site Suitability Statement. The updated uses of this assessment area, consisting of the Multipurpose Stadium and Associated Concourse, are considered commercial/industrial uses, and the existing Site Suitability Statement is considered applicable for the current surface elevation.

The proposed final surface elevation of the majority of the area is between 2.9 to 3.0 mAHD, which would require a reduction of 0.5 to 1.5 m below the current grade, as shown on **Figure F5**. Deeper excavations may be required for installation of:

- Footings or foundations, which are likely to extent to bedrock.
