Macquarie Point Development Corporation
8A Evans Street
HOBART TAS 7004

Attention: Greg Cooper

Dear Greg,

Addendum to Contaminated Land Audit - Macquarie Point – Lot E and Underground Carpark (The Promenade and Underground Carpark)

1. PURPOSE OF THIS AUDIT REPORT ADDENDUM

This letter report represents an addendum to the following Contaminated Land Audit Report, which was completed for the Macquarie Point Development Corporation (MPDC):

- Contaminated Land Audit Report - Macquarie Point Development Project – Lot E and Underground Carpark, 23 July 2021

At the time of the Audit Report submission, the area was described as 'Lot E and Underground Carpark', but is now described as 'The Promenade and Underground Carpark'. The area included parts of what had previously been described as Audit Area 2 and Audit Area 5. This area makes up a portion of the broader MPDC precinct. The Promenade and Underground Carpark area is shown in the central-western part of the overall Macquarie Point precinct, refer to Figure 1 below[1].

The 2021 Audit Report included, as an appendix, a Site Suitability Statement, which was based on the proposed future development at the time the Audit Report was issued (July 2021). However, since Audit completion the proposed land uses have changed which has triggered the need for the site suitability to be reviewed and this Audit addendum.

This addendum sets out:

- The basis for the original Audit Report and Site Suitability Statement.
- The outcome of the original Audit Report.
- Rationale for reconsideration of Audit Report and Site Suitability Statement.
- Findings of the Auditor's Review.
- Whether there are material changes requiring reissue of the Site Suitability Statement, based on the review.

[1] Figure extracted from Figure F2 from Review of Site Suitability Statements 2025, AECOM, 1 February 2026.

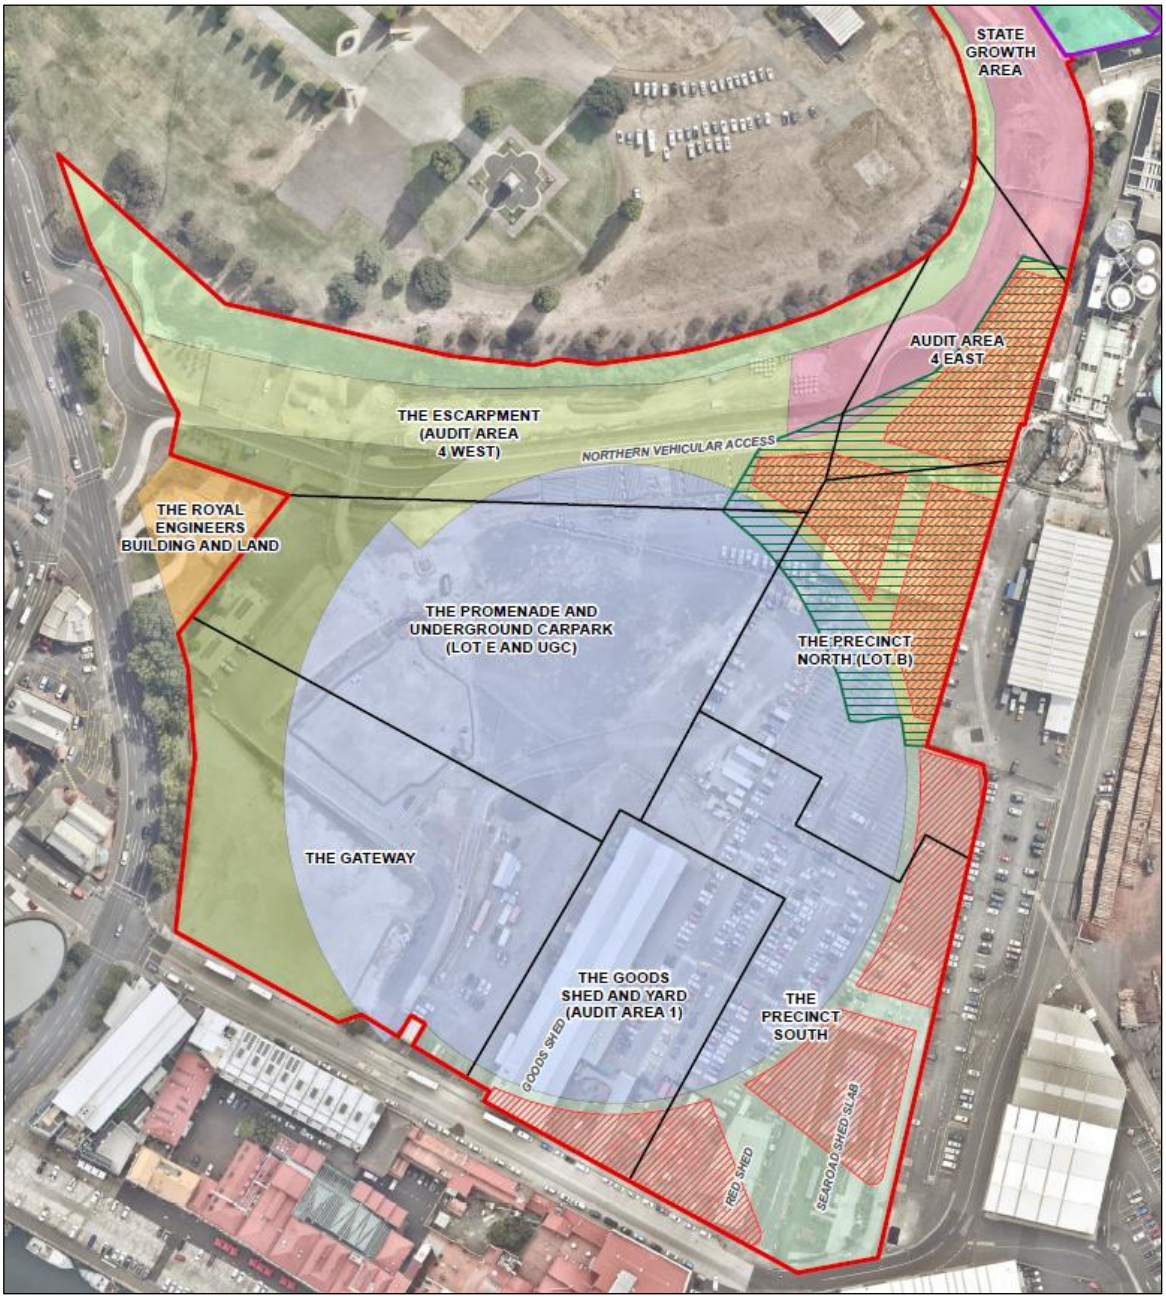

Figure 1, Macquarie Point Development Corporation Precinct, showing location of The Promenade and Underground Carpark

This addendum has considered, and should be read in conjunction with, the following documents:

- The original 2021 Audit Report described above.
- Review of Site Suitability Statements 2025, AECOM, 1 February, 2026 (‘the SSS Review report’).
- The Site Environment Management Plan, AECOM 16 February, 2026 (‘the SEMP’).

The review covers the findings of a range of other AECOM reports, of which, the following reports are of key importance:

- Soil, Groundwater and Soil Vapour Investigation 2025, Macquarie Point Development Project, 10 September 2025
- Acid Sulfate Soil Investigations, Macquarie Point Development Project, 4 December 2025
- Macquarie Point - Site-wide Soil Vapour Bore and Groundwater Well Inspection and Gauging, 25 March 2025
- Macquarie Point - Review of Site Specific Remediation Criteria 2025 10 October 2025
- Assessment of Potential Off-Site Ecological Impacts - 2025 Addendum 18 December 2025

The SSS Review report is included in Attachment A, which appends the key reports used in the SSS Review.

The SEMP is included in Attachment B.

2. BASIS FOR ORIGINAL AUDIT REPORT AND SITE SUITABILITY STATEMENT

As noted in the Audit Report, while the *Environmental Management and Pollution Control Act 1994 (EMPCA*) outlined a broad definition of a contaminated land audit, it did not include a formal system for contaminated land auditing. In 2015, the *Macquarie Point Development Corporation Act 2012* was amended to allow environmental auditing for the Macquarie Point site, under Tasmanian legislation. The amended Act enabled the Director of the Tasmanian Environment Protection Authority (EPA) to accredit an auditor. David Lam of Tetra Tech Coffey (then Coffey Environments) was appointed as the Environmental Auditor for the Site and has been accredited as an auditor recognised by the amended Act, by inclusion on Tasmania's Register of Interstate Contaminated Land Auditors.

At the time of the Audit Report, an EPA Tasmania Fact Sheet 'Register of Interstate Contaminated Land Auditors' outlined the requirements and approach for auditing, and effectively required the auditor to comply with obligations outlined in legislation, mandatory guidelines and Codes of Practice that apply in the home state/s of accreditation, and the NEPM 1999 (amended 2013). This has been superseded by web-based guidance [2].

Auditing was therefore conducted in accordance (so far as practicable) with Victorian guidelines that applied at the time of audit notification, under the (Victorian) Environment Protection Act 1970 ('Old Act'), and associated policies and guidelines. Although the legislation has been (generally) repealed and superseded by the Environment Protection Act 2017, for audits notified before the changeover date of the legislation (1 July 2021), the Old Act continues to exist, allowing auditing activities to continue to be conducted under the previous system.

The Audit Report was conducted under the Old Act, with some minor differences to suit the site requirements and EPA Tasmania Fact Sheet 'Register of Interstate Contaminated Land Auditors'.

[2] https://epa.tas.gov.au/environment/land/identification-and-assessment-of-contaminated-land/contaminated-land-and-the-planning-process/information-for-contaminated-land-auditors

3. OVERALL OUTCOME OF ORIGINAL AUDIT

The outcome of the July 2021 Audit Report is effectively captured in the Site Suitability Statement, which (broadly) found that the Site was suitable for the uses that were proposed at the time (residential, including medium to high density, retail, commercial, recreational/public open space use, transport (roads etc) and other less sensitive uses) subject to a range of conditions, summarised as follows:

1. Nature of the development:
    a) Developed areas to remain consistent with the areas indicated on the plan in the attached SEMP[3].
    b) Depth of the underground carpark not to intersect the watertable. Should the design or changed conditions indicate potential for ingress of groundwater to any part of the underground carpark (including sumps or lift overruns), the SEMP must be reviewed for adequacy and approved by an Environmental Auditor, including any additional mitigation measures which may be required.
    c) The Underground Carpark must include design, installation and maintenance of ventilation as per Building Code of Australia requirements for exhaust fumes, or other controls as specified in EPA NSW, 2020, to mitigate risks from potential methane infiltration.
    d) Deep services below 2 m depth from the current surface level must be installed in protective shrouds or in trenches/corridors of clean fill to minimise the risk of contact with residual contamination for maintenance workers.
2. SEMP Implementation:
    a) Maintenance of barrier layers (hardstand or earthen cap seal) or other engineered break layer to prevent access to soil (which contained some residual contamination).
    b) Garden plantings are to be in above ground planter boxes and not into the soil directly. Any proposal to plant into site soils must be confirmed as suitable by a Site Environmental Auditor.
    c) Specific requirements for managing excavated soil and imported Fill Material.
3. Substantive changes to the SEMP to be verified as acceptable to an Environmental Auditor.
4. Groundwater is polluted and not to be used for extractive uses other than monitoring or remediation.

Other related information reported in the Site Suitability Statement addressed a number of matters, including:

- Differences from the Victorian Statement format.
- Groundwater was considered to have been cleaned up to the extent practicable, although it was polluted and a number of extractive uses were precluded.
- Some industrial uses of groundwater may be possible subject to specific checks on suitability.
- Groundwater wells to be retained for monitoring where practicable and where monitoring ceases decommissioned in accordance with industry guidance.
- Possible presence of some asbestos cement fragments, which would not be considered to pose risks in the completed development, and the need to dispose these if found.

[3] References to 'the SEMP' in this sub-section are references to the document attached to the July 2021 Audit Report, not to the current version of the SEMP.

4. RATIONALE FOR RECONSIDERATION OF PREVIOUS CONTAMINATED LAND AUDIT AND SITE SUITABILITY STATEMENT

On behalf of the MPDC, AECOM has prepared the SSS Review report.

This SSS Review report sets out a review of the four previously issued Site Suitability Statements. Note that the terminology used references the 'Statements' but the Auditor notes that the Site Suitability Statement is in each instance issued as part of a 'Contaminated Land Audit Report' (Audit Report). It is important to note that each Site Suitability Statement should be read in conjunction with the relevant Audit Report.

The report notes changes that have occurred since the issue of the various Audit Reports (incorporating the Site Suitability Statements). In broad terms, the changes are as follows.

- Issue of the State Policies and Projects (Macquarie Point Precinct) Order 2025, which provides the approval conditions for development of the Site, noting that environmental requirements remain consistent with the *Macquarie Point Development Corporation Act 2012.*
- Changes in proposed future use. For The Promenade and Underground Carpark the site suitability statement considered development for a combination of medium to high density residential use and commercial use (mixed use), recreational/public open space and transport use. The proposed development now consists of a part of the Multipurpose Stadium and Associated Concourse. This includes the stadium structure/buildings occupying areas that were previously open space, changing the potential for vapour risks.
    - Parts of the area will be lowered by excavation to final surface elevations of between 1.8 to 4.8 metres Australian Height Datum (mAHD).
    - For construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
- A consolidated SEMP replaces the earlier, area-specific SEMPs.
- The building/structure footprints now proposed are extensive and will overlap areas of potential vapour risk.
- New designs exist for in-ground plants.
- Site Specific Remediation Criteria have been reviewed and updated.
- Additional site assessment data has been obtained across the site broadly, for
    - Acid sulfate soils.
    - Groundwater monitoring (2023, 2024 and 2025).
- Future off-site use patterns are now known which vary from previous knowledge:
    - The Macquarie Point Sewage Treatment Plant off-site to the northeast, will be replaced by a pumping station and emergency storage facility. The Hobart Main Sewer beneath the MPDC precinct will be removed, and replaced by an off-site sewer. Note that this is not considered to affect the characterisation or risk associated with the site or its management and is not considered further in this report.

Because of these changes, consideration of the need to update previously issued Site Suitability Statements (and potentially Audit Reports if warranted) is needed, based on the new information. These considerations are outlined in the following sections.

5. FINDINGS OF THE AUDITOR'S REVIEW

5.1 STATE POLICIES AND PROJECTS (MACQUARIE POINT PRECINCT) ORDER 2025

As noted by AECOM in the SSS Review report, the Order provides the approval conditions for development of the Site. Because the environmental requirements are consistent with those in the *Macquarie Point Development Corporation Act 2012*, which provided the legislative framework for previous Site Suitability Statements, no change to the process of Site Suitability is considered to arise from the Order.

The Auditor accepts this and considers that there is no requirement to change the existing Audit Report or associated Site Suitability Statement based on the Order.

5.2 REVIEW OF SITE SUITABILITY STATEMENTS 2025, AECOM

The SSS Review report notes the following changes in information and development planning that have the potential to affect the Site Suitability Statement.

- Changes in site development scenario, and
- a range of new or revised assessment reports have been produced (which the Auditor has reviewed).

The key considerations used to assess the need to amend the Site Suitability Statement are discussed in the following sections of this addendum letter report.

5.2.1 Review of Site Specific Remediation Criteria

Site Specific Remediation Criteria were developed to identify remediation requirements to remove or mitigate any unacceptable risks to current and future users of the Site, including as part of the previously issued Site Suitability Statements. It is noted that in some instances remediation works did not remove all contamination exceeding remediation criteria, where this was not practicable, and this was noted where it occurred.

AECOM reviewed the criteria in the report: Review of Site Specific Remediation Criteria 2025. Although some revisions of the criteria were made, there were no instances where the criteria were reduced (lowered), so that considerations made in previous Audit Reports and associated Site Suitability Statements would not be compromised.

This revision of Site Specific Remediation Criteria does not require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.2 Additional Soil Investigations

Soil investigations identified contamination generally consistent with the previous information and resulting audit. Tier 1 criteria were exceeded for a range of uses, as had previously been assessed, noting that this included consideration of non-proposed development scenarios, in accordance with Old Act auditing guidelines which required consideration of all possible uses, whether or not intended.

There were no exceedances detected of concentrations exceeding the remediation criteria in (or adjacent to) The Promenade and Underground Carpark.

The SEMP (now a consolidated SEMP for the overall precinct, rather than an area-specific SEMP) is considered to cater for residual contamination present in the audit area, with no change based on additional soil detections.

In summary, for soil conditions based on additional monitoring, the amended SEMP will manage any risks (including for localised high concentration lead that is planned to be removed as part of site development). If

the amended SEMP is implemented, the additional soil investigation results do not otherwise require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.3 Additional Groundwater Investigations

Additional groundwater sampling has been undertaken in 12 wells within the Promenade and Underground Carpark (variously in one or more of 2022, 2923 or 2025), and a further seven wells in nearby areas.

Sampling included wells proximal to the LNAPL plumes which had been subject to practicable limits of remediation, with residual contamination noted to remain in place (unable to be further removed by practicable remediation). Although the SSS Review report considers that measurable LNAPL was not recorded, and nor were concentrations indicating LNAPL, the Auditor notes that a sheen was identified on the water table, and that wells are not present across all parts of the plumes. Some residual LNAPL is virtually certain to remain in some plume areas (as was considered to be the case at the time of the 2021 Audit Report).

The further groundwater investigations identified Tier 1 criteria exceedances of drinking water, primary contact recreation, vapour intrusion (to structures) and ecosystem protection criteria (noting that the ecosystem protection criteria would not apply on-site, but rather at a point of discharge to a surface water). No exceedances of site-specific remediation criteria were detected since the previous Audit Report.

Overall, the results are consistent with groundwater conditions as assessed in 2021. In broad terms, extractive uses of groundwater are precluded at the site, and are considered able to be managed by non-use of groundwater (other than for monitoring or remediation).

Overall, groundwater risks are not considered to have changed materially, and can be managed by implementation of the revised SEMP.

5.2.4 Additional Soil Vapour Investigations

One round of soil vapour monitoring has been conducted across the precinct in June 2025, and included two locations (SV31 and SV32) within the Promenade and Underground Carpark area.

The AECOM SSS Review report notes that vapour concentrations in SV31 and SV32 posed potential vapour risks. Methane was detected at 3.7% and 10.4% v/v in SV31 and SV32 respectively. Although this exceeds the CRC CARE Action Level of 1.25%, negligible flow readings were obtained, indicating a high concentration but potentially limited risk from methane.

Based on the June 2025 vapour monitoring, AECOM evaluated a Modified Wilson and Card CS3 rating for methane for the site generally (excluding The Escarpment), per Table 7 of the Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases (EPA NSW, 2020) (‘the NSW guidelines’). This was evaluated on a conservative basis, and was based on the presence across a number of overall site areas displaying high groundwater methane concentrations and high methane vapour concentrations, and the potential for methane to migrate laterally under large structures (such as the Multipurpose Stadium). As well, AECOM noted that there was only a single round of flow monitoring to assess a flow-based Gas Screening Value per the NSW guidelines. The Auditor notes that the single round of flow monitoring was conducted without confirmation of prevailing atmospheric conditions, which can significantly affect flows, and so agrees with the conservative determination of CS value. AECOM notes that it may be possible for further sampling to justify a lower CS rating, should additional monitoring be conducted, although the Auditor considers a change to be unlikely given the widespread elevated soil gas and groundwater methane concentrations, and the difficulty in assessing for conditions reflecting final levels following excavation.

AECOM has considered the building type applicable to the Multipurpose Stadium to be a mixture of ‘standard commercial’ and ‘large commercial and industrial’ building, and conservatively adopted a ‘standard commercial’ category. This results in a gas protection guidance value of 2 (for CS3, which incidentally also applies for CS2), per Table 8 of the NSW guidelines.

AECOM also noted the potential for hydrocarbon vapours from other parts of the site to pose a vapour intrusion risk into any continuous structures under which there are any areas of high vapour concentration. The conservatism of this approach is considered appropriate, particularly because there are proposed to be large areas where the surface elevation will be lowered. Previously, AECOM assessed vapour risk across the site by first considering exceedances of Tier 1 criteria for sub-surface media, for a range of uses (including non-proposed uses). This evaluation was then superseded by consideration of data against site-specific remediation criteria developed for the site, and then by consideration of soil vapour readings as a more direct measure of risk. For broad areas of the site, including those under parts of the Multipurpose Stadium and concourse, which extends into part of the Goods Shed and Yard, exceedances of remediation criteria relevant to the now-proposed development have been reported variously for TRH and BTEXN in the Gateway, The Precinct South, The Precinct North and The Promenade and Underground Carpark. Because large parts of the site are to be lowered by excavations, the changed depth to residual contamination may affect the potential for vapour risks to be experienced, including where direct vapour readings not indicating a vapour intrusion risk have been obtained from the site at pre-excavation levels.

Based on the inferred vapour risks, the consolidated sitewide SEMP includes requirements for gas protection to be incorporated into structures which extend across areas where vapour risks exist, to cater for potential ingress of methane or hydrocarbons which are variously present across the Site, to a gas protection guidance value of 2 (for CS3 for a commercial building), and to consider suitability for other hydrocarbon species. Based on the potential for petroleum hydrocarbon and methane vapours across broad areas of the site (except for the Escarpment), this means that as assessed by AECOM (and agreed by the Auditor), vapour mitigation is needed beneath all structures across the Gateway, Promenade and Underground Carpark, The Precinct North and The Precinct South, and where continuous structures from those areas extend into The Escarpment. It is noted that vapour mitigation is not considered to be required for the Goods Shed when relocated to The Escarpment.

It is noted that a CS3 rating Provided the revised SEMP is implemented, the results of additional soil vapour investigations (and the potential for groundwater concentrations to cause vapours) do not otherwise require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.5 Change of Land Use

The SSS Review report notes the changes of proposed land use associated with the area. The original Audit Report and associated Site Suitability Statement allowed residential, including medium to high density, retail, commercial, recreational/public open space use, transport (roads etc) and other less sensitive uses, subject to defined conditions.

The Site Suitability Statement noted in Condition 1 of the 2021 Audit Report, stated a number of conditions related specifically to the nature of the development, including:

- Uses limited to specified areas as defined in a figure showing use layout in the (then) SEMP.
- Underground carpark not to intersect groundwater (unless the SEMP was revised accordingly and approved by an environmental auditor).
- Underground carpark to be subject to specific ventilation requirements to manage methane risks.
- Services below 2 m from the then surface to be installed in clean corridors or shrouds to minimise worker contact with residual contamination.

Importantly, the use pattern for which the site was considered suitable was defined by reference to the SEMP that was attached at the time. The revised SEMP redefines the use pattern of the Audit site, and substantive revision to the SEMP is allowed for in Condition 3 of the Site Suitability Statement. It is therefore considered that the updated (consolidated) SEMP deals with the changed of specified uses in accordance with the

existing Site Suitability Statement, where accepted by an environmental auditor (as is the purpose of this addendum report).

In terms of risk level (rather than specified use plan), the changed proposed land use includes a significant part of the Multipurpose Stadium and Associated Concourse, which are considered to represent commercial (or commercial/industrial) and open spaces uses in respect of contamination exposure. These uses are considered in terms of health and environmental risk to be covered by the existing Site Suitability Statement, notwithstanding noted changes to the (now consolidated) SEMP to ensure continued management of risks for the site, including allowing for risks associated with the different specific details of the development scenario now proposed.

Importantly, previously some areas were considered to be suitable for the then proposed open air transport corridor and open space use without vapour management, but would have required vapour management for a commercial building (as now proposed in the form of the Multiuse Stadium).

Based on this, although the range of uses noted in the Site Suitability Statement do not need to be updated, with the Multiuse Stadium considered to be commercial or commercial/industrial in respect of contamination exposure potential. However, management measures are required for building areas in parts that were previously open air at ground level. As long as the (revised, consolidated) SEMP is implemented, including vapour management measures for structures, the Statement of Suitability does not need to be amended.

5.2.6 Change of Elevation

The Site surface is to be changed to facilitate the proposed development. This will involve excavations in some parts of the overall Macquarie Point Precinct, which will lower the site surface and change potential exposure to contamination. In other areas, some filling will be undertaken. In terms of final constructed elevations, based on Figure F5 provided in the SSS Review report, the Promenade and Underground Carpark will be subject to reduction of level from typically 4.0 to more than 7.0 mAHD to 3 mAHD across most of the site (where the stadium will be). Final elevation will be 4.8 m in the practice wicket area in the northwest site corner, and 1.7 m in the car park area.

Based on the existing groundwater contours there is potential for groundwater containing contamination to be encountered by the excavations and the final built form including the basement car park.

A number of revisions are included in the SEMP for the broader site to address:

- Acceptable imported fill requirements.
- Subsurface utilities to be within clean soil corridors when otherwise within existing site soil.
- Vapour mitigation system requirement.
- Development to occur once other Audit Report (with associated Site Suitability Statements) are completed.
- Requirement for any subsurface drains constructed as part of site lowering (and to accommodate structures and associated vapour mitigation) to be considered potentially contaminated and subject to being removed by a licenced waste transporter or discharged under a trade waste agreement. This would prevent additional risk to off-site ecosystems. Potential for groundwater ingress to structures or where groundwater may be present at a depth close to the level of the structure may alternatively be dealt with by tanking. Given the potential for drains to collect some groundwater containing dissolved methane, the drainage system must also be designed to consider the potential for methane off-gas from drainage water to accumulate in drainage infrastructure.

In summary, some amendments to the SEMP, which are considered reasonable by the Auditor, are applicable to manage residual risks associated with the Site for the proposed use. Provided the revised SEMP is

implemented, the changes in elevation do not require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.7 Addendum to Off-Site Ecological Risk Assessment

An addendum report to the previous 'Assessment of Potential Off-Site Ecological Impacts' (AECOM, 2020) has been conducted as noted earlier in this letter.

This update was required, because the consideration by the Auditor that Clean Up To the Extent Practicable (CUTEP) had occurred was contingent on there being no unacceptable and unmanageable risks following the extent of clean up for groundwater contamination which had occurred. This included active remediation of LNAPL plumes within the Promenade and Underground Carpark area, with further remediation not considered practicable.

The addendum report concluded that unacceptable risk to off-site ecological receptors was not occurring. This included consideration of PFAS concentrations which were identified (notably at MW16 within the Precinct South).

The results of the 'Addendum to Off-Site Ecological Risk Assessment' do not trigger an amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.8 Potential Acid Sulfate Soils

Potential acid sulfate soils were considered in the report: 'Acid Sulfate Soil Investigations' (AECOM, December 2025). This is primarily because of the potential for construction to disturb potential acid sulfate soils (PASS). Although PASS is not strictly contamination, the SEMP has been updated to include requirements for Acid Sulfate Soil Management Plans (ASSMP) and/or Dewatering Management Plans (DWMP) as required, and for building design and water management to consider potential acidity.

If the revised SEMP is implemented, including requirements for managing PASS, the results of the Acid Sulfate Soil Investigations do not require amendment to the existing Audit Report or associated Site Suitability Statement.

5.2.9 Updated Designs for Planting Deep Rooted Vegetation

The SSS Review report includes an updated specification for planting deep rooted vegetation.

The updated designs have been included in the SEMP. The Auditor has reviewed the designs and considers that they are protective of potential risks at the Site, not only in respect of the vegetation itself, but in terms of preventing risks though pathways between Site users and deeper residual contamination.

If the revised SEMP is implemented, including updated designs for planting deep-rooted vegetation, there is no requirement to amend the existing Audit Report or associated Site Suitability Statement.

6. CONCLUSION

The review of the Site Suitability Statement for The Promenade E and Underground Carpark (which was produced as part of, and to be read in conjunction with the overall Contaminated Land Audit Report for Audit Lot E and Underground Carpark) has identified a number of changes in future site use and available information. Overall, there are no material changes required to the Site Suitability Statement itself, because the list of uses included in the original Site Suitability Statement is considered to include the newly proposed uses in The Promenade and Underground Carpark, associated with the Multipurpose Stadium and Concourse. There are some changes to risks based on different uses (Stadium structure covering previously intended open space areas) and due to level changes in the proposed development, but these changes do

not affect the wording suitability subject to SEMP implementation as was included in the previous Site Suitability Statement.

The revised SEMP that is to be implemented across the entire precinct (a consolidated site 'SEMP', rather than one specific to each audit area) includes new content (compared to the SEMP referenced by the original Site Suitability Statement for Lot E and Underground Carpark). The changes account for new management requirements to control risks based on additional information, changes in site use and some design elements. The original Site Suitability Statement allowed for the SEMP to be amended under the following statement condition:

- Site Suitability Statement Condition 3:

  Any (substantive) changes to the Site Environmental Management Plan referred to in Conditions 1 and 2 must be prepared for the site by a suitably qualified professional and verified as acceptable by an Environmental Auditor.

Based on the above allowance, I (as the appointed Auditor for the Site) am using this addendum report to the provide verification of the acceptance of the revised (consolidated) SEMP, in respect of requirements associated with management of risks under the Site Suitability Statement issued as part of the Contaminated Land Audit Report for Lot E and Underground Carpark (now described as The Promenade and Underground Carpark). One aspect of this acceptance of the revised SEMP is that while the suggested management measures are considered to be protective of the residual risks posed by remaining contamination on the site, the measures are in some instances subject to detailed design of engineering solutions. The Auditor may evaluate whether proposed solutions will meet the intent of the SEMP in managing risks, but is not responsible for the design, or the buildability of design details which are specified at only a conceptual level by the SEMP.

This audit addendum report should be provided with, and read alongside the following Audit Report and associated Site Suitability Statement:

Contaminated Land Audit Report - Macquarie Point Development Project – Lot E and Underground Carpark, 23 July 2021

This addendum serves to record that the 2021 Audit Report and Site Suitability Statement remains suitable for what was described as Lot E and Underground Carpark, and is now described as The Promenade and Underground Carpark, subject to the implementation of the revised SEMP (AECOM 16 February 2026).

Regards

David Lam

SPoWQM	State Policy on Water Quality Management (1997)
SPS	Sewage Pumping Station
SRS	Site Remediation Strategy
STP	Sewage Treatment Plant
STV	Short Term Trigger Value
SVOC	Semi-volatile Organic Compound
TBT	Tributyl Tin
TC	Tolerable Concentration (in air)
TCC	Total Contaminant Concentration
TEQ	Toxicity Equivalence Quotient
TFE	Total Fluids Extraction
TPH	Total Petroleum Hydrocarbons
TRH	Total Recoverable Hydrocarbons
TSP	Triple Super Phosphate
UGC	Underground Carpark
UKRI	United Kingdom Research and Innovation
US EPA	United States Environmental Protection Agency
VENM	Virgin Excavation Natural Material
VOC	Volatile Organic Compounds
WHO	World Health Organisation

Executive Summary

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of a remediation strategy for the Macquarie Point site (the Site) in Hobart, Tasmania.

Prior to the development of Macquarie Point, Division 2, Section 39F(1) of the *Macquarie Point Development Act 2012* (the Act) requires that an accredited site Auditor certifies that remediation of each part of the Site has occurred to a standard that is satisfactory for the purposes of the proposed redevelopment.

For the purposes of Auditor assessment of Site Suitability, the Site has been divided into separate assessment areas, for which Environmental Auditor certification has been sought as environmental investigations and remediation works have been completed.

To date, four Site Suitability Statements have been issued by the EPA-accredited Site Auditor, consisting of:

- The Goods Shed and Yard - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1* (Coffey, 2019a)
- The Escarpment (Audit Area 4 West) - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West* (Coffey, 2020)
- The Promenade and Underground Carpark (Lot E and UGC) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark* (Coffey, 2021a)
- The Precinct North (Lot B) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot B* (Coffey, 2021b).

The Site Suitability Statements should be read in conjunction with the contaminated land audit reports, which form part of the assessment of and requirements for the Site's suitability for the proposed development.

The assessments of the remaining Site areas (consisting of the Precinct South, the Gateway, and Audit Area 4 East) and of Regatta Point, which is anticipated to be included in the Site in the future, are ongoing and separate Site Suitability Statements will be sought for these areas in the future.

However, in 2024, the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024), was released by the Corporation, which updated and modified the vision for development of the Site. As a result, the Site Suitability Statements issued prior to the Precinct Plan (listed above) are no longer accurate to the proposed future uses of the Site and require review and update for the changes in Site uses and proposed development.

E1 Changes Since Issue of the Site Suitability Statements

Review of the proposed changes in Site development, Site data for these assessment areas, both existing and any new data received since issue of the Site Suitability Statements, and of criteria and assessment methods, have been conducted in this report and has identified the items listed on **Table E1**, which are considered to have potential implications or effects on the environmental risk profile for the proposed future Site uses.

Table E1 New Information or Changes in Development Which Have Potential to Affect Suitability

New Information or Change	Description and Consequences
Issue of the *State Policies and Projects (Macquarie Point Precinct) Order 2025* (the Order)	The Order provides the approval conditions for development of the Site. However, the environmental requirements are consistent with those in the *Macquarie Point Development Corporation Act 2012*, which provided the legislative framework for previous Site Suitability Statements, and no change to the process of Site Suitability are considered to arise from this change.
Changes in proposed land use and development - The Goods Shed and Yard (Audit Area 1)	• The Goods Shed building will be removed from this area. • Proposed Open Space use to the west and north of the Goods Shed now forms park of the Multipurpose Stadium and Associated Concourse zone. • Sections of this area will be lowered to final surface elevations of between 2.9 to 3.0 metres Australian Height Datum (mAHD). • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
Changes in proposed land use and development - The Escarpment (Audit Area 4 West)	• Land use of parts of this area has changed to Open Space. It is noted that the Goods Shed building, located in the Goods Shed and Yard (Audit Area 1) is likely to be moved to this area, and assessment for commercial/industrial uses is still considered required. • The south-eastern corner is included in the proposed footprint of the underground carpark. • High density residential use is no longer planned in this area. • Sections of this area will be lower to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
Changes in proposed land use and development -The Promenade and Underground Carpark (Lot E and UGC)	• Open Space land use in the southern portion of this area is now included in the Multipurpose Stadium and Associated Concourse zone. While the majority of this space was assessed for a proposed underground carpark, which was assessed for commercial/industrial use, portions of in the eastern and western areas of this assessment area were only considered for Open Space use. • Land proposed for an “Access Link”, or open transport corridor, in the eastern portion of this area was assessed for Open Space use, but is now considered for commercial/industrial use as part of the Multipurpose Stadium and Associated Concourse zone. • High density residential (above the first floor) is no longer planned in this area. • Sections of this area will be lower to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
Changes in proposed land use and development -The Precinct North (Lot B)	• Land use is still considered to be commercial / light industrial. • A single storey underground carpark is proposed in the northern portion of this assessment area. • Sections of this area will be lower to final surface elevations of between 1.8 and 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.

New Information or Change	Description and Consequences
Updates and consolidation of the SEMPs referenced in Site Suitability Statements	The initial area-specific Site Environment Management Plans (SEMPs) issued for each area have been updated and consolidated into a single Site-wide SEMP. Each iteration of the SEMP has retained the conditions and information from previous versions.
Building and structure footprints overlapping areas of potential vapour intrusion	The current SEMP includes areas specific requirements relating to vapour mitigation in future buildings and structures, with identified soil vapours consisting of methane, total recoverable hydrocarbons (TRH) and benzene, toluene, ethylbenzene, xylenes, and naphthalene (BTEXN). The new planned development includes proposed structures with footprints which extend across areas of elevated potential vapour intrusion.
Designs for in-ground plants, including deep-rooted plants	Additional designs for in-ground plants have been proposed which required assessment for environmental risk and confirmation from the Environmental Auditor to meet the requirements of the SEMP.
Review of the Site-Specific RC	The Site-Specific Remediation Criteria (the RC), which have been used to assess and identify areas of soil and groundwater where remediation is considered required for future development, have been reviewed and updated.
Collection of new environmental data from soil, groundwater, and soil vapour	Additional monitoring and investigation events have been conducted since issue of the Site Suitability Statements and have been assessed for any information which could influence Site Suitability. The following assessments relevant to areas with issued Site Suitability Statements have been considered: • Investigations of Acid Sulfate Soil (ASS) • Groundwater Monitoring Events (GMEs) and groundwater gauging conducted in 2023, 2024 and 2025. • *In situ* characterisation soil sampling conducted for Stage 1 and Stage 2 of the proposed excavation of the Site. • Installation and sampling of new groundwater wells and soil vapour bores in June 2025.
Off-Site land use changes	The Macquarie Point Sewage Treatment Plant (STP), located off-Site to the northeast, is planned for closure and replacement with a new Sewage Pumping Station (SPS) and emergency storage facility. As part of these works, the Hobart Main Pipeline (sewer) beneath the Site will be decommissioned and removed, and a new sewer line installed off Site to the south under Evans Street, and east under TasPorts land.

E2 Outcomes of Review

Based on the review of proposed Site development changes to land use, and new environmental data, the following items require changes in management or mitigation approaches for the Site to be suitable for the intended future use:

- Development of structures across assessment area boundaries.

  The Precinct Plan includes the following proposed structures which extend across multiple assessment areas:

  - The Multipurpose Stadium and Associated Concourse – The Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, the Precinct North, the Precinct South, and the Gateway.
  - The underground carpark and building footprints within the Antarctic Facilities Zone – The Escarpment, the Promenade and Underground Carpark, the Precinct North, and Audit Area 4 East.
  - Building footprints within the Complementary Integrated Mixed Use Zone – The Precinct North and the Precinct South.

  Extension of structures across the assessment area boundaries introduces additional considerations for Site Suitability, and development of structures which extend beyond the boundaries of assessment areas should not be commenced until Site Suitability Statements have been issued for all areas within their footprints.

- Potential soil vapour intrusion into future structures from methane, TRH, and BTEXN.

  This risk has been identified due to:

  - Detections of methane, considered to arise from anaerobic degradation of either residual hydrocarbon contamination, or saturated soil from former river- and sea-bed buried by land degradation, both directly in soil vapour, and above the adopted criteria for vapour intrusion in groundwater, in multiple locations across the Site.
  - Exceedances of the Commercial/Industrial land use RC for TRH >C10-C16 and naphthalene, indicating potential vapour intrusion in soil or groundwater below or adjacent to proposed structures, in both new data collected since issue of the Site Suitability Statement, and in some areas (i.e., former Open Space and the Access Link (an open transport corridor) areas in the Promenade and Underground Carpark) which have been updated to a more sensitive use in the new proposed development.
  - Potential changes in risk profile from proposed excavation/changes in Site elevation, which decrease the distance between some impacts and may lead to increased concentrations in soil at the surface.

  Based on the current land uses and existing leases, and the widespread and likely discontinuous sources of methane in saturated buried soils, remediation of the source of these impacts is not considered practicable. Inclusion of a vapour protection system in future building design is considered required as part of Site Suitability for areas which include potential vapour intrusion risks, consisting of the following areas considered in this report:

  - The Goods Shed and Yard – the Multipurpose Stadium and Associated Concourse.
  - The Escarpment – the Multipurpose Stadium and Associated Concourse, and the underground carpark and building structures within the Antarctic Facilities Zone.

    (It is noted that vapour protection is not considered required for the proposed relocation of the Goods Shed to the northern portion of this area).
  - The Promenade and Underground Carpark – the Multipurpose Stadium and Associated Concourse, and the underground carpark and building structures withing the Antarctic Facilities Zone.

  - The Precinct North – the Multipurpose Stadium and Associated Concourse, the underground carpark and building structures withing the Antarctic Facilities Zone, and building structures within the Complementary Integrated Use Zone.

  Any vapour protection system must have independent review of design and verification following construction, and this requirement must be documented in the SEMP.

- Potential future contact between intrusive maintenance workers and areas of Site soil with lead concentrations exceeding the adopted RC for this land use:
  - The existing Site Suitability Statements included an assumption that only minor or incidental changes to the surface elevation would occur, and assessed potential risks to intrusive maintenance workers to a maximum depth of 2 m below the current surface elevation.
  - Concentrations of lead were reported in previous assessments in excess of the adopted RC for maintenance workers at depths below 2 m below current surface elevation, and additional soil concentrations in excess of the RC have been identified since issue of the Site Suitability Statements, noting that these exceedances have been detected in soil proposed for excavation.
  - To minimise potential contact between future intrusive maintenance workers and existing Site soil with exceedances of RC:
    - Known locations of exceedances will be documented in the SEMP(s) for management during construction or development activities.
    - Subsurface services will be required to be installed within clean fill/soil corridors, or within protective conduits.
    - Additional Personal Protective Equipment (PPE) requirements will be required during future intrusive maintenance works where contact with current Site soil may occur, to minimise potential ingestion/inhalation of existing Site soil.

  The proposed additional controls, and data regarding locations with concentrations of lead in excess of the RC, must be documented in the SEMP.

- Disturbance of Potential Acid Sulfate Soil (PASS):
  - Assessment of Site soils in 2024 and 2025 identified that, while no ASS is present on Site, PASS with the potential to acidify if disturbed/oxidised is present in saturated soils at the Site.
  - Future development activities on the Site must include management measures for PASS to prevent acidification and environmental impact on the Site, or at any receiving site if PASS is excavated and removed.

  The additional controls and data regarding controls to prevent acidification of PASS must be added to the SEMP.

- Potential groundwater present at the surface, or shallow groundwater where risks may not be quantified by the RC, at the following locations based on the final design elevations for the Site, has been identified at:
  - The north, west, and north-west areas of the Multipurpose Stadium.
  - The Practice Wickets in the north-west corner of the Site.
  - The underground carpark in the north-east corner of the Site.

  Potential shallow groundwater interactions are not considered to introduce unacceptable risks, or risks are considered to be suitably managed or mitigated by development designs, as:
  - In the 70% detailed design of the Multipurpose Stadium:
    - Any drained groundwater is captured and disposed of as potentially contaminated waste under a TWA or similar, and should not be discharged to sensitive receptors.
    - The drainage layer does not intersect and capture LNAPL plumes, which may render groundwater unable to be discharged under TWA.

  - A vapour mitigation layer is present above the drainage layer, and will act as mitigation against potential vapour intrusion risks from shallow groundwater.
  - Any potential soil which may be dewatered by the drainage layer is assessed and managed by a DWMP, as required by the acid sulfate soil investigation.

  Any changes to these features in future design requires review and reassessment of environmental risks.

- Potential shallow groundwater below the Practice Wickets is not considered to represent an unacceptable risk, as groundwater is not considered likely to infiltrate to the proposed surface elevation of 4.8 mAHD, and vapour intrusion from groundwater is not considered to represent a risk in consideration of the open space use of the area and the Site history and environmental data in this area.
- The design of the underground water carpark, including the final surface elevation within the carpark (i.e., the level of the lowest floor) is not yet finalised and risks and mitigations from shallow groundwater cannot be assessed. However, the SEMP contains requirements to assess vapour intrusion for structures within 1 m of groundwater, prohibits contact between Site users and groundwater.

  The SEMP should be updated to include the requirement that any future development of the Site which involved modification of the surface elevation must assess the proposed change against groundwater elevations. If groundwater will be or is likely to be ≤1 m below the final surface, the proposed development must include measures and/or mitigations to:

- Prevent groundwater from reaching the surface or structures, such as drainage or tanking. Any such measures:
  - Must capture any drained groundwater for assessment and disposal as potential contaminated waste.
  - Must not transport or potentially increase the migration of groundwater or other contaminants on groundwater (such as LNAPL or DNAPL) to sensitive receptors (such as stormwater or the River Derwent/Sullivans Cove).
- Include either:
  - Additional assessment of vapour risks from shallow groundwater which demonstrates that no unacceptable risks are present; or
  - A vapour protection system suitable for potential vapour risks from groundwater.
- Identify if PASS may be dewatered and, if so, include measures to neutralise potential oxidation and prevent acidification as required by the assessment of acid sulfate soil at the Site.

- Review of potential off-Site ecological impacts:
  - The *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).

    An addendum to this assessment was prepared in 2025 (AECOM, 2025i), and concluded that overall, based on the review of updated Site data and information, the outcomes of the AECOM (2020h) assessment remain valid and suitable for ongoing assessment of the Site. No material changes in the off-Site aquatic ecological risk profile have been identified, and ecological risk to receptors in the River Derwent and Sullivans Cove remains low.

    Ongoing groundwater monitoring was recommended and is included in the SEMP (AECOM, 2025h).

- The upcoming closure and removal of the Macquarie Point STP, and realignment of the Main Hobart Pipeline (Sewer):

- The replacement of the STP with a pumping station, and associated activities including realignment of the Main Hobart, are not considered to change the environment suitability of the Site for future development.

The following changes, or updated information, are not considered to affect the previously issued Site Suitability Statements:

- Approval of the *State Policies and Projects (Macquarie Point Precinct) Order 2025* (the Order)
  - The Order provides approved conditions for the development of the Site. However, the conditions and requirements relating to the Environmental Audit and Site Suitability Statements are consistent with, and reference, the *Macquarie Point Development Act 2012*, and approval of the Order does not affect the assessment or requirements of the suitability of the Site for future development.
- Updates or consolidation of SEMP(s):
  - While the existing Site Suitability Statements reference different SEMPs, issued at the time of the initial assessment of Site's environmental suitability for development, have been updated as new data has been received, each iteration of the SEMP has included the previous requirements from Site Suitability Statements and been reviewed and accepted by the Site Auditor.
  - It is noted that updates to the SEMP are required as part of the assessment of other changes.
- Review and update of Site Specific RC:
  - While modifications to the Site Specific RC were identified as part of review in the context of the Precinct Plan, in all cases the changes increased criteria values, and as a result the RC used at the time of issue of Site Suitability Statements are considered conservative and appropriate for detection of potential environmental risks. As such, re-review of the existing data sets with the updated RC is not considered required.
  - It is noted that some RC (i.e., vapour intrusion, intrusive maintenance worker RC) are depth dependent, and potential changes in risks from the proposed modifications to the Site surface elevation are discussed above.
- Precluded Protected Environmental Values (PEVs):
  - No changes in PEVs precluded since the Site Suitability Statements were initially issued have been identified in this review.
- Light Non-Aqueous Phase Liquid (LNAPL) Plumes:
  - Based on assessment of LNAPL Plumes in 2025, LNAPL was not present at measurable thicknesses in any groundwater wells in or hydraulically up-gradient of the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, or the Precinct North, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3).
  - No groundwater concentrations indicative of free-phase LNAPL, or soil vapour concentrations indicating potentially hazardous vapour generation (other than methane) were detected at the LNAPL Plumes, and LNAPL migration is not considered likely to occur.
  - LNAPL is still considered stable, and further remediation is not considered practicable.

  On this basis, LNAPL Plumes are not considered to make the Site areas considered unsuitable for development, if the management measures within the SEMP are implemented.

Based on the review conducted, the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, and the Precinct North are considered suitable for the proposed updated development if the recommendations provided in **Section E3** below are implemented, and on the basis of ongoing implementation of the SEMP to manage residual environmental impacts at the Site.

Auditor review and verification of this assessment and the recommendations is required.

E3 Recommendations

The following additional controls and mitigations are required to be added to the SEMP in order to mitigate and manage any additional environmental risks identified in the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, and the Precinct North:

- Vapour mitigation is required as part of construction of the structures in the following areas:
  - The Goods Shed and Yard.
  - The Promenade and Underground Carpark.
  - The Precinct North
  - Any buildings which include these areas in their footprint, such as the portion of the Multipurpose Stadium and Associated Concourse in the Escarpment.

  Vapour mitigation must incorporate a minimum gas protection value of 2 (EPA NSW, 2020), and the selected method should be suitable for mitigation of methane, TRH and BTEXN vapours.

  Design and construction documentation must include a documented testing and verification method for vapour intrusion mitigation measures, with reference to Appendix 7 – Verification and construction quality assurance, of *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020). Any design and/or installation of ground gas protection measures will require independent oversight and sign-off by an Environmental Auditor, or other suitably qualified and independent verifier.
- Landscaped areas and gardens should be established in aboveground planter boxes on hardstand and not directly over exposed soil. In the event that gardens are proposed in-ground, the following barrier system shall be installed:
  - Layer 1: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users.
  - Layer 2: Earthen cover (minimum 0.5 m) certified as 'Fill Material' in accordance with IB105.
  - Layer 3: Surface coverage (comprising shallow rooted vegetation).

  Deeper-rooted vegetation may be established using the designs provide in **Appendix E**, with the following additional requirements:
  - Soil imported for in-ground planting must be Level 1 – Fill Material.
  - No plants intended for consumption are to be included in any in-ground planting on the Site.
  - The potential size of plant root structures should be considered when selecting species for cultivation on the Site. Planting structures should have sufficient volume for the plants to develop without requiring root structures to penetrate the earthen liners and extend beyond the clean-fill soil.
  - The earthen liner and barrier layers included in planting designs are to be installed above the Site water table.
  - In-ground planting is only to occur in open space use areas. No in-ground planting is to occur within Site buildings (i.e., within atriums, foyers, or arboretums).
  - Trees, or any other deep-rooted plants, which are cultivated on the Site should be excavated and removed as soon as possible if any of the following occurs:
    - Death or significant rot/reduction in size
    - Toppling/knocking over by wind or impact.
  - In the event that plant removal occurs:
    - Removal of all root structures must be included.
    - If root structures have extended and pierced the earthen liner and/or indicator barrier layer, these must be repaired and restored as part of removal of the plant(s).

- PASS within saturated soils, strongly correlating with estuarine sands, has been identified beneath the Site and should be considered during future works.

  Future activities at Macquarie Point should identify all activities which have the potential to disturb or expose (i.e., dewater) PASS at the Site, as identified in *Acid Sulfate Soil Investigations* (AECOM, 2025b), and:

  - The SEMP should be updated with a description and locations of identified PASS.
  - The SEMP should include overarching management obligations for disturbance of ASS and/or water table drawdown via dewatering, include a requirement for scope specific Acid Sulfate Soil Management Plans (ASSMP) and/or Dewatering Management Plans (DWMP) to be developed for each discrete works package involving civil and general earthworks activities, water table drawdown via dewatering, and any other significant soil disturbance activities or changes to natural groundwater and surface water systems.

    These documents should be prepared by those undertaking works which may disturb PASS, and must include:

    - Estimated volumes and action criteria for PASS which may be disturbed by the proposed works.
    - Procedures for the handling of disturbed PASS, including verification of neutralisation, groundwater generated by dewatering, and monitoring of Site environmental conditions in the vicinity of PASS disturbances.
    - Contingency measures which are specific, measurable, and attainable, and can be implemented in a timely manner in the event that action criteria or trigger values are exceeded.
  - Future structures and infrastructure at the Site should consider the potential effects of sulfides and possible acidification in design and selection of materials, and adopt appropriate mitigation measures to prevent degradation of materials overtime.
  - Any groundwater, or run-off which may have come into contact with PASS, should be considered as potentially contaminated. pH and the potential to acidify should be considered in assessment any such water prior to disposal
- Any engineered fill or other materials used to increase the surface level to 3 mAHD must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.
- The areas of soil listed below, where lead in soil has been identified as exceeding the intrusive maintenance worker RC:
  - Soil surrounding the Hobart Main Pipeline (sewer) (already noted in Section 3.2.3 of the SEMP.
  - Soil surrounding *in situ* sample points K14, K18, L13, M13, M14, K06, L08, M09, N10, F11, G11, G13, H10, H12, H13, I13, J06, J08, J10, J12

  These locations should be noted as a potential area of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.
- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.

- Any future development of the Site which involved modification of the surface elevation must assess the proposed change against groundwater elevations. If groundwater will be or is likely to be ≤1 m below the final surface, the proposed development must include measures and/or mitigations to:
  - Prevent groundwater from reaching the surface or structures, such as drainage or tanking. Any such measures:
    - Must capture any drained groundwater for assessment and disposal as potential contaminated waste.
    - Must not transport or potentially increase the migration of groundwater or other contaminants on groundwater (such as LNAPL or DNAPL) to sensitive receptors (such as stormwater or the River Derwent/Sullivans Cove).
  - Assess and prevent unacceptable risks from groundwater-derived vapour via either:
    - Additional assessment of vapour risks from shallow groundwater which demonstrates that no unacceptable risks are present; or
    - A vapour protection system suitable for potential vapour risks from groundwater.
  - Identify if PASS may be dewatered and, if so, include measures to neutralise potential oxidation and prevent acidification as required by the assessment of acid sulfate soil at the Site.

1.0 Introduction

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of a remediation strategy for the Macquarie Point site on Evans Street, Hobart, Tasmania (the Site). The location of the Site is shown on **Figure F1**.

As part of preparation for development, the Site is undergoing an Environmental Audit as required by Division 2, Section 39F(1) of the *Macquarie Point Development Act 2012* (last amended 1 July 2023), which states:

Redevelopment of a part of the site may not occur until an accredited environmental auditor has certified that the remediation of the part of the site has occurred to a standard that is satisfactory for the purposes of the proposed redevelopment.

For the purposes of the Environmental Audit, the Site has been divided into separate assessment areas, for which Environmental Auditor certification has been sought as environmental investigations and remediation works have been completed. It is required at the completion of the Environmental Audit, Site Suitability Statements should be issued for the entire Site.

Four Site Suitability Statements have been issued to date for the following Site assessment areas (discussed further in **Section 4.0**):

- *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1* (Coffey, 2019a)
- The Escarpment (Audit Area 4 West) - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West* (Coffey, 2020)
- The Promenade and Underground Carpark (Lot E and UGC) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark* (Coffey, 2021a)
- The Precinct North (Lot B) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot B* (Coffey, 2021b).

In 2024, the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024) was released by the Corporation, which updated and modified the vision for development of the Site. As a result, the Site Suitability Statements issued prior to the Precinct Plan (listed above) require reconsideration for applicability to the new proposed future uses of the Site.

This report has been prepared to review and reassess the available environmental data (including any new data collected since issue) for areas with existing Site Suitability Statements and assess if any additional remediation or mitigation/management measures are required to enable the development proposed in the Precinct Plan without any unacceptable risk to human or ecological.

1.1 Objectives

The objectives of this report are to review the four existing Site Suitability Statements and:

- Assess existing Site data, including any new data received since issue of the Site Suitability Statements, against the updated development plan and any identified changes in the Site Specific Remediation Criteria (RC).
- Identify any changes in the risk profile or data gaps which may have arisen from the proposed changes.
- Recommend any additional management and mitigation measures, or additional works which are considered required to support the Environmental Auditor in their certification of Site Suitability for the updated development planned.

It is intended that this report be provided to the Environmental Auditor upon completion to support amendment of the existing Site Suitability Statements.

2.0 Background

2.1 Site Details

The Site details are provided on **Table 1** below.

Details for Regatta Point, which has not yet been transferred to the Site but is intended to be included within the overall Environmental Audit, are also provided.

Table 1 Overall Site Details

Item	Description
Macquarie Point Site	
Site Address	10 Evans Street, Hobart, Tasmania
Site Area	Approximately 9.3 hectares (ha)
Current Site Owners	State of Tasmania (Crown Land)
Title Details	Macquarie Point contains the following land title references: • The majority of Macquarie Point is within land title 113521/1 (formerly CT 114462/1) • A portion of the southwest area (within the Gateway area) is within land title 129483/1.
Current Zoning	In accordance with the Hobart City Council (HCC, 2023), the *Sullivans Cove Planning Scheme 1997* notes that the Macquarie Point site falls within the *Macquarie Point Mixed Use Zone* and is subject to the following use areas: • Commercial and Institutional • Mixed Use • Open Space.
Current Uses	• The majority of Macquarie Point is currently vacant. Portions of the north and west of Macquarie Point are currently in use for remediation activities, including stockpiling of excavated materials. • The Goods Shed, a historical warehouse structure now subject to intermittent use including public events, is located on the southern boundary of Macquarie Point. • An occupied office building (8A Evans Street) is located on the western boundary of Macquarie Point. • The “Red Shed”, located in the south eastern portion of Macquarie Point, is currently used by a microbrewer and includes a public bar. • A warehouse (the SeaRoad Shed) was located in the south-east corner of Macquarie Point but was demolished in 2023. A large slab (the SeaRoad Slab) remains in place and has been used for intermittent storage of construction equipment. • Small retail outlets are located in the area adjacent to the Red Shed (Red Square) which is also used regularly for markets, music and other outdoor events with food vans. • A public car park is present in the south eastern and eastern portion of Macquarie Point. • A roadway (the Northern Vehicular Access) is present on the northern portion of Macquarie Point.

Item	Description
	• Portions of the northern and north eastern areas of the Site are leased to the Tasmanian Water and Sewerage Corporation (TasWater) and used for equipment storage and soil stockpiling as part of construction of a Sewage Pumping Station (SPS) off Site to the east.
Closest Surface Water Body	• Sullivans Cove, approximately 150 m to the south. • River Derwent, approximately 280 m south-east (inferred direction of groundwater flow) and 25 m to the north-east.
Regatta Point	
Address	• Located adjacent to McVilly Drive, Queens Domain. A street address is not allocated for this area.
Area	• Approximately 0.7 ha
Current Land Owners	The land comprised within Regatta Point is under the authority of: • Department of Natural Resources and Environment Tasmania (DNRET) Property Services (Potential Property ID 2513934), under Crown lease. • Regatta Point is currently being transferred to the control of the Corporation.
Title Details	Title details are not available for the public reserve (Potential Property ID 2513934).
Current Zoning	In accordance with the Hobart City Council (HCC, 2023), the *Sullivans Cove Planning Scheme 1997* notes that the Regatta Point site falls within the *Macquarie Point Wharf & River Zone B* and is subject to the following use areas: • Commercial • Mixed Use • Open Space.
Current Uses	The following is noted with regard to current Regatta Point use and features: • A public reserve in the southern portion of Regatta point is used for public open space and recreation. Carparking and access to the River Derwent (via two marine jetties and two boat ramps) are present in this area, and accessible via McVilly Drive. • A pumphouse (under Crown Licence) is present in this area, and is suspected to be related to fuel and oil transfer pipelines which extended beneath Macquarie Point and have been removed in part by remediation between 2020 and 2023. It is not known if this pumphouse is operational, what use is authorised under its licence, or what historical uses it may have had. Investigation work in 2024 identified a previously unknown underground pipeline, believed to be a fuel transfer pipeline, attached to this structure. • A small two-storey building of unknown use is in this area. • A disused rail line and corridor passes to the west of Regatta Point.
Closest Surface Water Bodies	• The River Derwent is located to the east, immediately adjacent to Regatta Point. • Sullivans Cove is located approximately 560 m to the south at the closest point. • Recreational fishing restrictions apply in the waters adjacent to Regatta Point.

2.2 Assessment Areas

The Site has been delineated into eight sub-areas (including Regatta Point added in 2023) for environmental investigation, assessment and remediation. **Figure 1** below shows the location of each assessment area in context of the Site, and each area is shown in context of the proposed future development under the Precinct Plan (discussed in **Section 2.3**) on **Figure F2**.

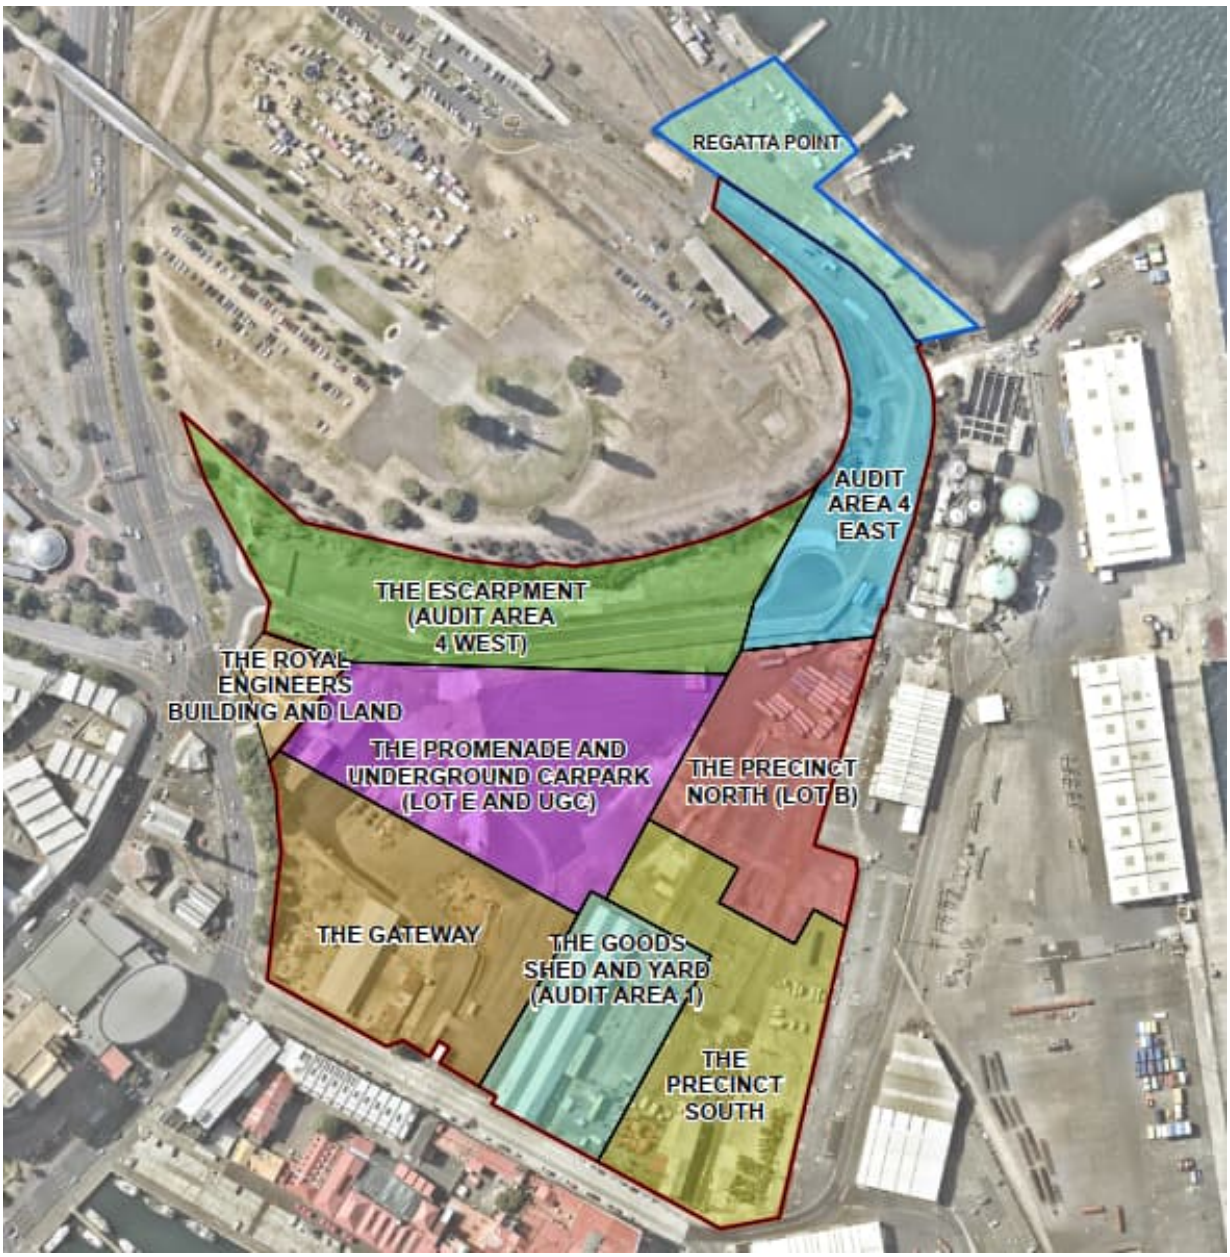

Figure 1 Site Assessment Areas

The Royal Engineers Building and Land, to the west of Macquarie Point, is included in the Precinct Plan for overall planned development of the area, however no changes in use are planned and it is not intended to include this area in the Environmental Audit at this time.

It is also noted that land in the northern portion of Audit Area 4 East is proposed to be transferred to the control of the Tasmanian Department of State Growth for construction of an access road. However, this title subdivision and transfer have not yet occurred.

2.2.1 Status of Site Suitability Statements

At present, no Site Suitability Statements have been issued for the development of the Site as proposed in the Precinct Plan.

Table 2 below summarises the current status of each Site area, and the actions planned or considered likely to be required to complete the Environmental Audit and allow issue of a Site Suitability Statement.

Table 2 Status of Site Suitability Statements

Site Area	Approx. Area (ha)	Site Suitability Statement and/or Remaining Actions and Activities
Site Suitability Statements Issued		
The Goods Shed and Yard (Audit Area 1)	0.86	*Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1*, issued by Tetra Tech Coffey Pty Ltd on 5 June 2019
The Escarpment (Audit Area 4 West)	1.68	*Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West*, issued by Tetra Tech Coffey Pty Ltd on 24 September 2020
The Promenade and Underground Carpark (Lot E and UGC)	1.73	*Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark*, issued by Tetra Tech Coffey Pty Ltd on 23 July 2021
The Precinct North (Lot B)	1.04	*Contaminated Land Audit Report – Macquarie Point Development Project – Lot B*, issued by Tetra Tech Coffey Pty Ltd on 22 November 2021
The four Site Suitability Statements issued to date form part of and were included as appendices to contaminated land audit reports referenced above, and must be read in conjunction with those reports. This report contains this review and assessment of the requirements for Site Suitability, based on changes in proposed development of the Site since issue.		
Site Suitability Statement Not Issued		
The Precinct South	1.40	No remaining remediation actions identified in this area. An initial CUTEP report for this area was prepared and submitted to the Auditor for review in December 2024 (AECOM, 2024e). An updated CUTEP report (AECOM, 2025g), incorporating additional data collected during 2025, was issued in November 2025 and is awaiting Auditor review and comment.
The Gateway	1.46	Remediation (removal of remnant infrastructure and treatment of gasworks contamination) was completed in 2024 and a Remediation Validation Report has been issued to the Auditor for comment. An additional soil vapour and groundwater investigation was conducted post-remediation in June 2025. A CUTEP report for the Gateway area is currently being prepared and will be issued to the Auditor for review when complete.

Site Area	Approx. Area (ha)	Site Suitability Statement and/or Remaining Actions and Activities
Audit Area 4 East	1.09	Remaining environmental impacts or potential impacts known to be present in Audit Area 4 East are: • A remnant fuel pipeline passes through the central portion of Audit Area 4 East. The southern sections of this pipeline were removed as part of remediation of the Precinct North and the Escarpment, however, the remaining pipelines should be removed and capped at the Site boundary. It is also noted that Buried Asbestos Containing Material (ACM) was uncovered in a hillside in the western portion of the area. The ACM is currently capped and is considered suitable to manage in place. It is currently proposed that the land in the northern section of Audit Area 4 East, including the area of the remnant fuel pipeline, be transferred from the control of the Corporation and to the Tasmanian Department of State Growth, although this title sub-division and transfer has not yet occurred. If this land transfer occurs, Audit Area 4 East will be reduced to approximately 0.47 ha in area. An updated assessment of the area proposed to remain as part of Macquarie Point is currently being prepared and will be issued to the Auditor when complete.
Regatta Point	0.7	This area is not yet included in the Macquarie Point Environmental Audit but is considered likely to be included in the future. Intrusive investigations of Regatta Point were completed in late 2024, and a DSI has been issued to the Auditor for comment. Identified remediation remaining in this area consists of removal of a previously unknown pipeline, considered likely to be an abandoned fuel/oil transfer line, through the centre of the area. A timeline for remediation has not yet been established.
Royal Engineers Building	0.19	This area is not currently included in the Macquarie Point Environmental Audit, and is not currently proposed to be included. The future use of this area is included the Precinct Plan (MPDC, 2024), which details the proposed development of the Site. To date, no potentially contaminating land uses have been identified, or intrusive investigation undertaken, at the Royal Engineers Building.

In addition, update to the Site Environmental Management Plan (the SEMP) (AECOM, 2024b) will be required to capture changes in the proposed future development, Site condition, environmental data, and required mitigations and management procedures for future development and use. Update of the SEMP for all assessment areas excluding Audit Area 4 East and Regatta Point is expected in late 2025.

It is noted that the final assessment and decision on whether each area is suitable for the intended development, and what controls, mitigations, or other measures are required, will be made by the Site Environmental Auditor and may differ from the summary on the table below.

2.2.2 Historical Audit Areas

Prior to 2019, the Site was divided into seven Audit Areas (numbered 1 to 7) for assessment, based on earlier development plans. These Audit Areas and the previous development proposed, which are

referenced in some historic reports and documentation, are presented in context of the current assessment areas on **Figure F3**, and summarised in **Table 3** below.

Table 3 Relationship between Current Assessment Areas and Former Audit Areas

Current Assessment Areas	Former Audit Areas
The Goods Shed and Yard (Audit Area 1)	Audit Area 1
The Escarpment (Audit Area 4 West)	The western portion of Audit Area 4 and the northern portion of Audit Area 2
The Promenade and Underground Carpark (Lot E and UGC)	The southern portion Audit Area 2, and the northeastern portion of Audit Area 5
The Precinct North (Lot B)	Audit Area 7, the eastern portion of Audit Area 2, and the northeastern portion of Audit Area 5
The Precinct South	Audit Area 3 and the southeastern portion of Audit Area 5
The Gateway	Audit Area 6 and the southwestern portion of Audit Area 5
Audit Area 4 East	The eastern portion of Audit Area 4
Regatta Point	Not previously included in Audit Areas.

2.3 Proposed Future Development

The Precinct Plan presents a vision for redevelopment of the Site (and surrounding areas) as a mixed-use precinct comprised of interconnected discrete zones, summarised on **Table 4** and presented on **Plate 1**.

Table 4 Precinct Plan - Proposed Development Precincts

Precinct	Likely Land Use
Aboriginal culturally informed zone	Open space and commercial
Multipurpose stadium and associated concourse zone	Open space and commercial
Royal Engineers building and land	Open space and commercial
Complementary integrated mixed use zone, including restaurants, cafes, hotels, medical facilities and commercial office space	Open space and commercial
Antarctic facilities zone including commercial spaces and connections with the complementary integrated mixed use zone	Commercial and underground car parking
Residential development and public foreshore zone accommodating a variety of tenures and housing opportunities, along with a new public promenade and food and beverage offerings	Medium to high density residential, commercial and open space
A transport corridor and roadway linking Regatta Point to the main areas of the Site	Open space / vehicle traffic / foot traffic
A vegetated area along the northern boundary of the Site, where the escarpment below the Hobart Cenotaph would prevent development or construction	Open space

In addition:

- Subsurface utilities and maintenance activities are anticipated to occur in all Site areas.
- Excavation and modification of the final surface level across the Site is expected to occur as discussed in **Section 5.3**.

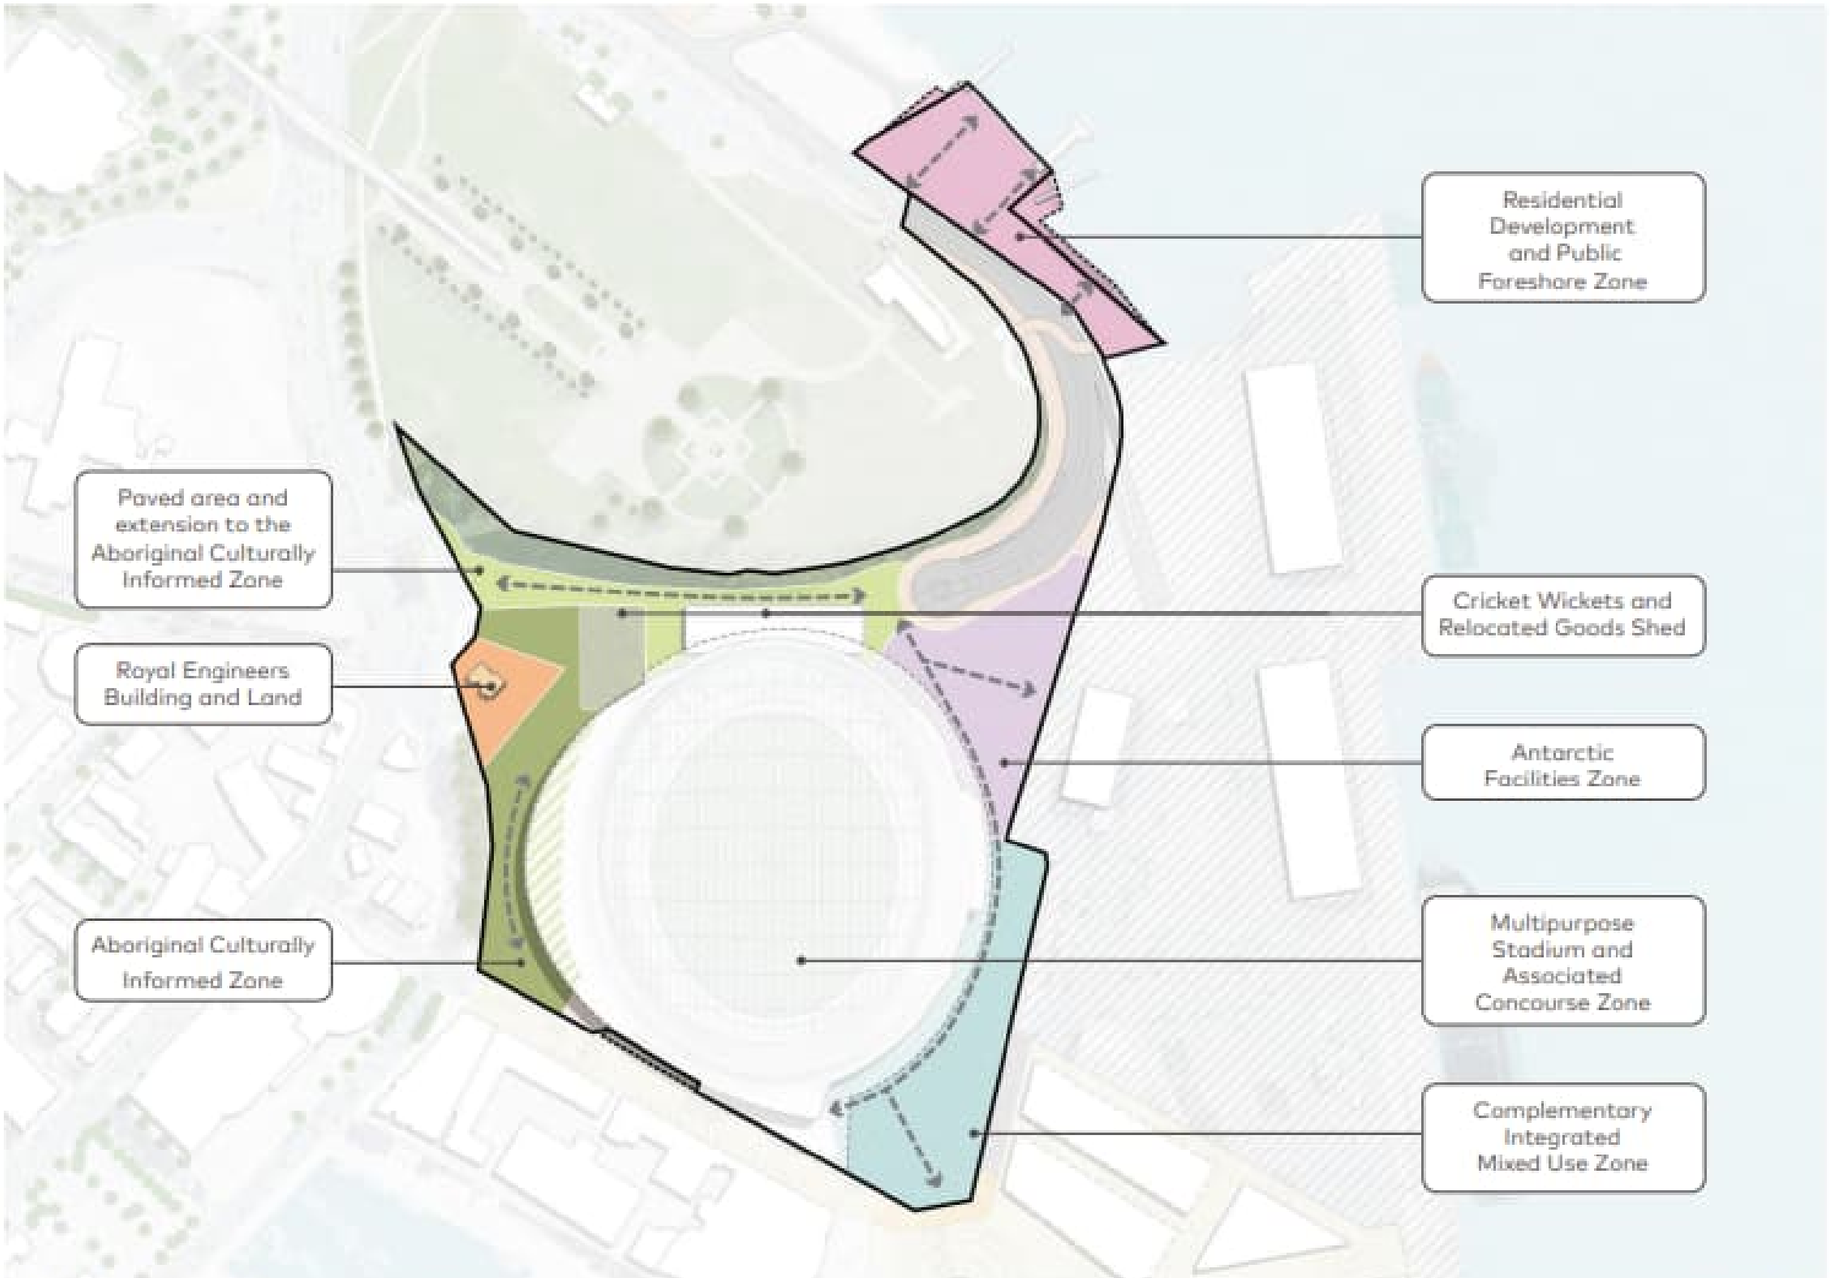

Plate 1 Proposed Future Land Uses (MPDC, 2024)

2.4 Regulatory Framework

2.4.1 Site Environmental Audit

In 2015, the *Macquarie Point Development Corporation Act 2012* was amended to enable the accreditation of an environmental auditor under Tasmanian legislation. The amended Act enables the Director of the Tasmanian Environment Protection Authority (EPA) to accredit an auditor. Mr David Lam of Tetra Tech Coffey has been appointed as the Environmental Auditor for the Site and has been accredited as an auditor recognised by the amended Act.

Where there is limited, or a lack of, suitable guidance in Tasmania for the audit, the amended legislation allows for the auditor to defer to other suitable interstate guidance. In this instance, the guidelines supporting the Victorian EPA Environmental Audit Framework have been adopted, as it is the home state of the appointed Auditor.

It is noted that Victoria legislation which defines the Audit process was updated and superseded by the *Environment Protection Act 2017* (the EP Act), which came into effect on 1 July 2021, and contains significant changes to Audit methodology and terminology under the Victorian framework. Under Section 478 of the EP Act, existing Audits where an Auditor has been engaged prior to 1 July 2021, and the Audit has not been completed by 1 July 2021, can be conducted under either the EP Act or the previous framework defined in the *Environment Protection Act 1970*. To maintain continuity with the portions of the Audit already completed, the Site Audit is currently continuing under the previous framework and terminology,

The role of the Auditor is to review the progression of investigation, and remedial planning and execution works at the Site. It is understood that the Auditor shall ensure that the works are carried out in compliance with local Tasmanian legislation and guidelines with consideration given to the requirements of the Victorian EPA Environmental Audit Framework.

The ultimate outcome of the Environmental Audit is to obtain a Site Suitability Statement, such as the ones already issued and review in this report, confirming the Site's suitability for intended future uses.

2.4.2 Clean Up to the Extent Practicable

The Audit will include consideration of Clean Up to the Extent Practicable (CUTEP), similar to that adopted by the Victorian audit scheme. Section 1.0 of Victorian EPA Publication 840.2 (2016) *The cleanup and management of polluted groundwater* (EPA Publication 840.2) notes that:

> '*Where polluted groundwater has been identified, EPA Victoria's role is to require clean up. If it is impracticable to clean up groundwater to the level needed to restore beneficial uses, EPA may accept that cleanup to the extent practicable has occurred and that, subject to appropriate ongoing management, further cleanup is not required*'.

Although remediation and assessment of the Site is being conducted under the previous Victoria Environmental Audit Framework (as discussed in **Section 2.4.1**), this approach is also reflected in Part 2.2 - Non-aqueous phase liquids, Regulation 15 – Clean-up of non-aqueous phase liquids in the Victorian *Environment Protection Regulations 2021*, which states:

> '*A person in management or control of land where a non-aqueous phase liquid is present in soil or groundwater must, so far as reasonably practicable-*
>
> *a. Clean up the non-aqueous phase liquid; and*
>
> *b. If the source of the non-aqueous phase liquid is located on the land, remove or control the source of the liquid.*

The CUTEP process recognises that polluted groundwater should be cleaned up such that the protection of beneficial uses is restored, and where considered acceptable (by the authority, in this case the independent Site Environmental Auditor in conjunction with the Tasmanian EPA), groundwater may be cleaned up to the extent practicable.

It is noted that a CUTEP determination needs to be made for the whole Site, not just individual remediation areas. However, interim agreement has been historically sought from the Site

Environmental Auditor that individual areas have reached remediation end-points, so that active remediation works can cease.

2.4.3 Legislative Changes

Legislative changes since issue of the existing Site Suitability Statements are described in **Section 5.1**.

2.5 Assessment and Remediation Approach

The Corporation has adopted a series of overarching and interrelated remediation objectives in relation to the Site. These include:

- Ensuring that there are no unacceptable risks to human health associated with the Site, both to on-Site and off-Site receptors.
- Ensuring there are no unacceptable risks to the off-Site environment / ecology from the Site.
- Remediating the Site to a suitable standard to allow for redevelopment for the intended future land uses.
- Remediating primary sources of contamination as these represent an ongoing source of pollution to groundwater.

These objectives are generally consistent with those adopted by regulatory authorities around Australia.

2.6 Chemicals of Potential Concern

Prior to European settlement, Hobart and the surrounding areas, including the Site, were occupied and inhabited by the Muwinina people.

Since first European settlement circa 1804, the Site has been subject to land reclamation events, farming, quarrying and various construction and industrial activities, including but not limited to progressive land reclamation events, rail and freight operations, gasworks, and bulk fuel storage.

Based on the known Site history, **Table 5** below presents a summary of the Chemicals of Potential Concern (CoPC) that may be present based on known historical activities or uncovered during investigation of the Site.

Table 5 Chemicals of Potential Concern Summary

Area	Historical Land Uses	Chemicals of Potential Concern
Areas with Site Suitability Statements Issued		
Goods Shed and Yard	• Freight storage and handling • Vehicle Maintenance. • Fuel Storage and Handling • Land Reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Chlorinated solvents associated with vehicle maintenance activities. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.
The Escarpment	• Locomotive refuelling comprising fuel storage and transfer facilities • Railway maintenance workshop • Rail corridor and fuel transfer infrastructure historically located within the area • Concrete batching plant • Land reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Chlorinated solvents associated with locomotive maintenance activities and the storage of hazardous materials. • Heavy metals, chlorinated solvents and hydrocarbons associated with workshop and maintenance areas. • Phosphorus and sulphur associated with locomotive washing. • ACM sourced from historical structures (i.e. cladding). • Hydrocarbons associated with the truck wash. • Heavy metals, chlorinated solvents and hydrocarbons sourced from the historical incineration of paint/ solvents. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.
The Promenade and Underground Carpark	• Locomotive refuelling comprising fuel storage and transfer facilities. • Locomotive maintenance. • Freight storage and handling. • Land reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel (diesel) storage and transfer activities. • LNAPL has been detected on groundwater. • Chlorinated solvents associated with locomotive maintenance activities. • Heavy metals, asbestos and PAHs sourced from materials used to backfill Roundhouse structures. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.

Area	Historical Land Uses	Chemicals of Potential Concern
The Precinct North	• Freight storage and handling. • Fuel storage and handing • Land reclamation	• TPHs, BTEXN, PAHs, and phenolic compounds associated with historical fuel (diesel) storage and transfer activities. • Chlorinated solvents associated with locomotive maintenance activities. • LNAPL has been detected on groundwater. • Metals[1] inferred to be due to historic land reclamation have been detected in fill. • PFAS associated with bulk off-Site fuel handing. While review of historical information has not identified the use of products containing PFAS, there is potential for firefighting foams containing PFAS to have been applied as part of emergency response operations or for training purposes during bulk fuel storage in the short period between the adoption of PFAS-containing firefighting foam in the USA in 1967, and the cessation of bulk fuel storage in the 1970s.
Areas without Site Suitability Statements Issued		
The Precinct South	• Freight storage and handling. • Fuel storage and handling • Land reclamation	• TPHs, BTEXN, PAHs, phenolic compounds, and lead associated with historical fuel storage and transfer activities undertaken adjacent to the Site's eastern boundary. • LNAPL has been detected on groundwater. • Metals[1] inferred to be due to historic land reclamation have been detected in fill. • PFAS associated with bulk off-Site fuel handing. While review of historical information has not identified the use of products containing PFAS, there is potential for firefighting foams containing PFAS to have been applied as part of emergency response operations or for training purposes during bulk fuel storage in the short period between the adoption of PFAS-containing firefighting foam in the USA in 1967, and the cessation of bulk fuel storage in the 1970s.

Area	Historical Land Uses	Chemicals of Potential Concern
The Gateway	• Former Hobart Gasworks. • Locomotive refuelling comprising fuel storage and transfer facilities. • Railway maintenance workshop. • Land reclamation	• TPHs, PAHs, BTEXN and phenols sourced from coal tar and tar oils, or from historical fuel storage and transfer activities. • Heavy metals, chlorinated solvents and hydrocarbons associated with workshop and maintenance areas. • Phosphorus and sulphur associated with locomotive washing. • ACM sourced from historical structures (i.e. cladding). • Chlorinated solvents associated with locomotive maintenance activities and the storage of hazardous materials. • Complex cyanides, free cyanides and metals sourced from spent oxides. • TPHs, PAHs and metals sourced from coke, coke breeze, ash and clinker residues. • TPHs and BTEX associated with light and drip oils. • DNAPL has been detected in soil. • Phenols, nitrates, sulphates, sulphides, ammonia and PAHs sourced from ammoniacal recovery wastes. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.
Audit Area 4 East	• Rail corridor and fuel transfer infrastructure historically located within the area. • Land reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Buried ACM has been identified in a section of Audit Area 4 East and is currently temporally capped with a concrete layer. • Metals[1] inferred to be due to historic land reclamation have been detected in fill
Regatta Point	• Public boating, yachting, and port activities. • Rail corridor • Fuel pipeline • Land reclamation • Metals	• Heavy metals, TPH/TRH, PAH, BTEXN, phenolic compounds, SVOC, VOCs, TBT, OCPs, cyanide, ammonia and ACM have all been identified as potential CoPC in Regatta Point based on current and historical uses. No field assessment has been conducted to date. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.

Notes: TPHs – total petroleum hydrocarbons; TRH – total recoverable hydrocarbons; PAHs – polycyclic aromatic hydrocarbons; BTEXN – benzene, toluene, ethylbenzene, xylene, naphthalene; ACM – asbestos containing material; VOC – volatile organic compounds; SVOC – semi VOC; TBT – tributyl tin; OCP – organochlorinated pesticides; PFAS – Per- and Poly-Fluoroalkyl Substances; LNAPL – Light Non-Aqueous Phase Hydrocarbons; DNAPL – Dense Non-Aqueous Phase Hydrocarbons; 1 – aluminium, arsenic, cadmium, chromium, copper, lead, manganese, nickel and zinc

In additional, Potential Acid Sulfate Soil (PASS) has been identified in saturated estuarine materials below all areas except Regatta Point. The PASS is inferred to be former river/sea bed buried by land reclamation, and may be present in unsaturated fill used in land reclamation in some areas. Soil methane has also been detected at potentially hazardous levels, and may be due to degradation of hydrocarbon impacts from fuel handling and storage and/or organic material in natural materials buried during land reclamation.

2.6.1 Identified NAPL or Former NAPL Areas

Previous investigations at the Site have identified non-aqueous phase liquids (NAPL), consisting of LNAPL and DNAPL, which are summarised in **Table 6** below.

Table 6 Known Existing or Former NAPL Areas

Plume ID	Location	Inferred Contamination Source
Within Areas with Site Suitability Statements		
LNAPL Plume A1	Roundhouse Refuelling Area in the Promenade and Underground Carpark, central portion of the Site	LNAPL (likely diesel) has been identified at the water table and is likely associated with locomotive refuelling activities associated with spills during refuelling activities and potentially leaks from a historical Aboveground Storage Tank (AST) which is known to have been previously present at this location.
LNAPL Plume A2	Roundhouse Refuelling Area in the Promenade and Underground Carpark, central portion of the Site	LNAPL (likely diesel) has been identified at the water table and is likely associated with locomotive refuelling activities associated with spills during refuelling activities and potentially leaks from ASTs.
Former LNAPL Plume A3	Roundhouse Refuelling Area in the Promenade and Underground Carpark on the boundary with the Precinct North, central portion of the Site	Historical documents reference localised LNAPL at this location. Similar to Plume A1, LNAPL is likely associated with locomotive refuelling activities in the Roundhouse Refuelling Area. The LNAPL is understood to have comprised of predominantly diesel fuel, as well as fuel oils associated with diesel engine operation (e.g. lubricants, engine oils etc.) and is likely to be associated with isolated spills. No LNAPL has been detected in wells in this area since 2017.
Within Areas without Site Suitability Statements		
LNAPL Plume B	SeaRoad Shed Slab in the Precinct South, south-east portion of the Site	LNAPL (comprising predominantly diesel with lube oil) has been identified at the water table and is understood to be associated with historical fuel handling and storage activities, in proximity to the SeaRoad Shed.
Former Tar Plume A	Former gasworks area in the Gateway, south-west corner of the Site	Coal tar DNAPL, likely derived from a horizontal retort/oil reformer which was present in this location during gasworks operation, was observed primarily from 4 m bgl extending to underlaying dolerite bedrock, and may extend off-Site to the south and west. DNAPL within the Site boundaries, excluding areas in the exclusion zone surrounding a high voltage power cable, were solidified in 2024 and is no longer considered mobile.

Plume ID	Location	Inferred Contamination Source
Former Tar Plume B	Former gasworks area in the Gateway, south-west corner of the Site	Coal tar DNAPL was observed within a buried vertical tank base. The walls of this tank remained in place and contained DNAPL, which was solidified in 2024 and is no longer considered mobile.
Tar Plume C	Former gasworks area in the Gateway, west boundary of the Site	Coal tar DNAPL was observed below a buried concrete slab and above shallow dolerite, and is considered likely derived from a vertical retort which was present in this location during gasworks operation. DNAPL has been observed between 1.4 and 1.6 m bgl, and is not considered to be in contact with groundwater. The exclusion zone associated with a high voltage power cable prohibits activities which could disturb DNAPL in this area.
Tar Plume D	Former gasworks area in the Gateway, west boundary of the Site	Tar staining, odours and relatively high PID readings (598 ppm) were reported between 3.5 and 4.7 m bgl in this area, and DNAPL present may be resting on the buried base of a former gasholder which appears to be present at 4.7 m bgl. DNAPL is not considered to be in contact with groundwater in this area, and the exclusion zone associated with a high voltage power cable prohibits activities which could disturb DNAPL in this area.

Notes: Chemicals of Potential Concern (CoPC) associated with each of the LNAPL plumes include TPH, PAHs and metals including lead. bgl – below ground level; PID – photoionisation detector.

LNAPL Plumes A1 and A2, and former LNAPL Plume A3, are within the areas with existing Site Suitability Statements considered in this report.

LNAPL Plume B, Former Tar Plumes A and B, and Tar Plumes C and D, are in areas without Site Suitability Statements. The status of these NAPL impacts is not further considered in this assessment, as these locations are outside of the assessed areas, and are not considered to have any potential to migrate into them, as:

- Each plume is hydraulically down gradient, and not considered likely to migrate on groundwater.
- Fluctuations in LNAPL Plume B were detected in 2024. Additional assessment of this plume conducted in 2024 and 2025 (AECOM, 2024d and 2025d), and concluded that the plume was not mobile, and that fluctuations in LNAPL thickness may have been due to temporary disturbance associated with remediation work within the Precinct South to the west, or preparatory works for realignment of the Hobart Main Pipeline (Sewer) off-Site to the east.
- Former Tar Plumes A and B were treated via *in situ* solidification (ISS) in 2024, and are no longer considered liquid or potentially mobile (AECOM, 2025c).
- Tar Plumes C and D are not considered to be currently in contact with groundwater, and activities which could potentially disturb and mobilise them are restricted by an exclusion zone established to protect a buried high voltage power cable which passes through the area they are located. This power cable was installed in late 2023, and no activities to remove or disturb soil around it are known to be planned.

  AECOM (2025c) includes recommendations for controls around future works around Tar Plumes C and D, in the event that the high voltage cable is removed, which have also been documented in the SEMP (AECOM, 2025h).

3.0 Assessment Criteria

3.1 Protected Environmental Values and Tier 1 Criteria

3.1.1 Soil

In the absence of specific Tasmanian guidance regarding the Protected Environmental Values (PEVs) of land, the Victorian Environment Reference Standard (the ERS), (Victorian Government, 2021) has been referenced to identify potential PEVs at the Site relating to land. The ERS replaces and supersedes Victorian *State Environment Protection Policy - Prevention and Management of Contamination of Land* (PMCL SEPP, 2002), which has been previously used in assessment of the Site.

The proposed development of the Site includes retail, commercial, and open space uses. No natural ecosystems are present on the Site, and based on the urban setting and the current and proposed future uses of the land, production of food, flora, and fibre are not considered likely to occur and are not considered as PEVs under the Victorian framework adopted.

As such, the following PEVs are considered relevant for the Site:

- Land dependant ecosystems and species - Modified and Highly Modified Ecosystems
- Human Health
- Buildings and Structures
- Aesthetics.

A summary of the adopted assessment criteria for each land PEV is provided in **Table 7**.

Table 7 Adopted Tier 1 Screening Criteria - Soil

Protected Environmental Value		Adopted Assessment Criteria	Rationale
Land Dependant Ecosystems and Species	Modified Ecosystems	• ASC NEPM (2013) EIL, Urban residential and public open space (assumes most conservative value based on clay content, pH, CEC) • ASC NEPM (2013) ESL, Urban residential and public open space (coarse soil type) • PFAS NEMP (HEPA, 2025) – Ecological Indirect Exposure, intensely developed sites	• No terrestrial ecological receptors are currently present at the Site and it is unlikely that they will be present following development as the Site will be finished with hardstand. • For the purpose of assessing all PEVs, ecological screening criteria have been adopted. It is noted that EILs and ESLs apply to the top 2 m of soil. • As no existing ecologies exist on the Site, and maintenance of a surface layer (covering >75% of the Site surface) is included as a requirement of the SEMP, PFAS soil criteria for ecosystem protection have been adopted for indirect contact, and modified to 0.14 mg/kg.
	Highly Modified Ecosystems	• ASC NEPM (2013) EIL, Commercial and Industrial (assumes most conservative value based on clay content, pH, CEC) • ASC NEPM (2013) ESL, Commercial and Industrial (coarse soil type) • PFAS NEMP (HEPA, 2025) – Ecological Indirect Exposure, intensely developed sites	
Human Health		**Low Density Residential** • ASC NEPM (2013) HIL A • CRC CARE (2011) Vapour Intrusion HSL A (Sand) • US EPA RSLs (2020) • CRC CARE (2011) Direct Contact HSL A (for soil <1.0 m bgl) • PFAS NEMP (HEPA, 2025) HIL A **Medium/High Density Residential** • ASC NEPM (2013) HIL B • CRC CARE (2011) Vapour Intrusion HSL B (Sand) • US EPA RSLs (2020) • CRC CARE (2011) Direct Contact HSL B (for soil <1.0 m bgl) • PFAS NEMP (HEPA, 2025) HIL B **Recreation/Open Space** • ASC NEPM (2013) HIL C • CRC CARE (2011) Vapour Intrusion HSL C (Sand) • US EPA RSLs (2020) • CRC CARE (2011) Direct Contact HSL C (for soil <1.0 m bgl) • PFAS NEMP (HEPA, 2025) HIL C	• Soil HSLs for vapour intrusion and direct contact for TRH fractions have been developed based on typical petroleum mixtures and consider the solubility limits of petroleum mixtures. HSLs cannot be applied to non-petroleum sources such as pure solvents or gasworks wastes, where solubility limits are much higher. The HSL (infinite) values presented in Appendix F of CRC CARE, 2011 have been adopted in accordance with CRC CARE guidance. The theoretical solubility of the pure compound in water was used instead to identify vapour limiting HSLs (i.e. chemicals where a vapour inhalation risk was calculated to be only present at concentrations exceeding the theoretical solubility). • While it is noted that petroleum products do exist at the Site, given the varying types of hydrocarbon impact (i.e. gasworks, diesel, and petrol) the HSL infinite values have been adopted as a conservative approach. • Fill material consists of sand, clays, gravels and cobbles. For the purpose of CRC CARE vapour intrusion, as a conservative approach, sand has been selected as the predominant material type.

Protected Environmental Value	Adopted Assessment Criteria	Rationale
	Commercial/Industrial • ASC NEPM (2013) HIL D • CRC CARE Vapour Intrusion HSL D (Sand) • US EPA RSLs (2020) • CRC CARE (2011) Direct Contact HSL D (for soil <1.0 m bgl) • PFAS NEMP (HEPA, 2025) HIL D **Shallow Trench Worker** • CRC CARE (2011) Vapour Intrusion Shallow Trench Worker (Sand: 0-<2m) • CRC CARE (2011) Direct Contact Shallow Trench Worker (for soil < 1.0 m bgl)	• All soil samples have been screened against CRC CARE Vapour Intrusion criteria for the relevant depths the samples were collected from. • It is noted, in accordance with ASC NEPM (2013), direct contact criteria have been applied to the top 3 m of soil. If deeper soils are disturbed during civil works the material will need to be placed back at the depth that it was excavated or classified for reuse.
Buildings and Structures	• Australian Standard; Pilling – Design and Installation (AS 2159-2009)	• Contamination must not cause the land to adversely affect the integrity of structures and building materials.
Aesthetics	• ERS • PFAS NEMP (HEPA, 2025) Management Limits	• Aesthetic issues, including the quantity, type and distribution of foreign materials or odours, must not adversely affect the use of the land.

***Notes**: HSL – Health Screening Level; HIL – Health Investigation Level; ESL – Ecological Screening Level; EIL – Ecological Investigation Level; CEC - Cation Exchange Capacity; AS 2159-2009 – Australian Standard, Piling – Design and installation; CRC CARE – Corporative Research Council for Contamination Assessments and Remediation of the Environment; US EPA RSLs – United States Environmental Protection Agency Regional Screening Levels, November 2020; PFAS NEMP - PFAS National Environmental Management Plan.*

3.1.2 Groundwater

The PEVs of groundwater under the Tasmanian Government *State Policy on Water Quality Management* (1997) [SPoWQM] which will be considered include:

- Drinking Water
- Irrigation
- Industry
- Stock
- Ecosystem Protection

In addition to the abovementioned groundwater PEVs, recreation (primary and secondary contact), aesthetics, buildings and structures, and human health (via the vapour intrusion pathway) will also be considered as PEVs.

The assessment criteria adopted as Tier 1 screening criteria for groundwater PEVs are provided on **Table 8** below.

Table 8 Adopted Tier 1 Screening Criteria - Groundwater

Protected Environmental Value	Adopted Assessment Criteria	Rationale
Drinking Water	• NHMRC Australian Drinking Water Guidelines (amended 2018) Aesthetic • NHMRC Australian Drinking Water Guidelines (amended 2018) Human Health • PFAS NEMP (2025) Where no high NHMRC guideline values are available, screening values have been adopted from the following sources: • WHO (2017) Guidelines for Drinking-Water Quality: Fourth Edition Incorporating the First Addendum • US EPA RSLs (2020) Tap Water Quality • Health Canada (2020) • NZMH (2018) Drinking Water Standards	• Whilst it is noted that groundwater at or adjacent to the Site is unlikely to be extracted for drinking water purposes, based on the urban setting and reticulated water supply at the Site, this PEV has been conservatively considered.
Irrigation	• ANZECC (2000) Short Term Trigger Values (STVs) for Irrigation Water	• STVs have been adopted on the basis of the surrounding land use, where ongoing irrigation of plants and garden beds is unlikely to occur due to the urban setting and reticulated water supply. STVs can be tolerated for up to 20 years of irrigation.
Industry	• Due to the wide and varied potential industrial uses of groundwater, water quality requirements for use in industrial processes are assessed on an industry-specific basis	• Groundwater at or adjacent to the Site is unlikely to be used for industrial purposes, based on the urban setting and available reticulated water supply. In the absence of any standard or reliable criteria to apply for this PEV without a specific planned industrial use, this PEV has not been considered.
Stock	• ANZECC (2000) Livestock Drinking Water Quality	• Based on the Site setting, it is unlikely that groundwater would be used for stock watering purposes. However, for the purpose of assessing this PEV, the ANZECC (2000) guidance has been adopted.

Protected Environmental Value	Adopted Assessment Criteria	Rationale
Ecosystem Protection	• ANZG (2018) 90% level of ecosystem protection (marine water) • The PFAS NEMP (2025) Interim Marine 95% (slightly to moderately disturbed) level of ecosystem protection (interim marine) Where no high reliability guideline values are available in ANZG (2018), screening values have been adopted from the following sources: • ANZG (2018) low to moderate reliability trigger values (marine) • ANZG (2018) 90% level of ecosystem protection (marine water) draft guidelines released for public comment on 29 June 2020 • US EPA (2013) Ambient Water Quality Criteria (chronic – Marine) • US EPA (2006) Region 3 Mid-Atlantic Biological Technical Assistance Group (BTAG) Screening Benchmarks (marine) • RIVM (2001) Dutch Intervention Values (DIV) for TPH • There are currently no relevant Australian guidelines for TRH in groundwater. Therefore, for the purpose of this assessment, the Netherlands Ministry of Housing - DIV (2000) for Mineral Oil has been adopted	• The nearest surface water ecosystems that may receive groundwater discharge, i.e. River Derwent and Sullivans Cove, would be characterised as a moderately to highly disturbed (i.e. active port area) marine environment according to the ANZECC (2000) definitions. As such, the assessment criteria based on 90% level of ecosystem protection (marine) have been adopted, with the exception of bioaccumulative species (PFAS, anthracene, benzo(a)pyrene, fluoranthene and phenanthrene) where the 95% level of ecosystem protection (interim marine) has been conservatively adopted.
Recreation (Primary Contact)	• NHMRC (2008) Guidelines for Managing Risk in Recreational Water • PFAS NEMP (2025)	• NHMRC (2008) recommends applying Australian Drinking Water Guidelines - *Health* (NHMRC, 2018), adjusted for a 10 fold decrease in ingestion of water.
Recreation (Secondary contact)		• Primary Contact Recreation criteria have been conservatively adopted to assess secondary contact.
Aesthetics	• NHMRC Australian Drinking Water Guidelines (amended 2018) Aesthetic	• This may relate to aesthetic issues associated with the presence of objectionable odours, colours, taints, visible floating material, foam, oil or grease or ‘dirty’ water.

Protected Environmental Value	Adopted Assessment Criteria	Rationale
Buildings and Structures	• Australian Standard (AS) 2159 – 2009	• Building and structures assessment is on the basis of concrete piles in a mild exposure classification scenario in high permeability soils. • In addition to a pH of 5.5, sulphate and chloride concentrations of 1,000 mg/L and 6,000 mg/L respectively has been adopted to assess potential impacts to concrete piles.
Human Health - Vapour Intrusion	CRC CARE (2011) Groundwater Health Screening Levels (HSLs) for vapour intrusion including: • Residential - HSL A/B (sand, depth to groundwater 2.0 – <4.0 m bgl) • Recreation/ Open Space - HSL C (sand, depth to groundwater 2.0 – <4.0 m bgl) • Commercial/ Industrial - HSL D (sand, depth to groundwater 2.0 – <4.0 m bgl) • Intrusive Maintenance Worker- HSL: (sand, depth to groundwater 2.0 – <4.0 m bgl) The British Geological Survey (BGS) (UKRI, 2024) value for assessing risk of methane intrusion from groundwater has been adopted as a screening value.	• Groundwater HSLs for vapour intrusion for TRH fractions have been developed based on typical petroleum mixtures and consider the solubility limits of petroleum mixtures. HSLs cannot be applied to non-petroleum sources such as pure solvents or gasworks wastes, where solubility limits are much higher. The HSL (infinite) values presented in Appendix F of CRC CARE, 2011 have been adopted in accordance with CRC CARE guidance. The theoretical solubility of the pure compound in water has been instead to identify vapour limiting HSLs (i.e. chemicals where a vapour inhalation risk was calculated to be only present at concentrations exceeding the theoretical solubility). Whilst it is noted that petroleum products do exist at the Site, given the varying types of hydrocarbon impact (i.e. gasworks, diesel, and petrol) the HSL infinite values have been adopted as a conservative approach. • HSLs associated with depths to groundwater of between 2.0 and <4.0 m bgl in sand lithology were selected to assess groundwater analytical results on the basis of the depth to water of approximately 2 m bgl across the Site. • The BGS methane criteria assumes all methane in water will outgas to form an explosive atmosphere.

Notes: *NHMRC – National Health and Medical Research Council; WHO – World Health Organisation; NZMH – New Zealand Ministry of Health; ANZECC – Australian and New Zealand Environment and Conservation Council; STV – Short Term Trigger Value; ANZG – Australian and New Zealand Guidelines for Fresh and Marine Water Quality; RIVM – Rijksinstituut voor Volksgezondheid en Milieu; DIV – Dutch Intervention Values; BGS – British Geological Society; UKRI - United Kingdom Research and Innovation*

3.1.3 Soil Vapour

For the purpose of assessing the risks posed to current and future human-health based on the proposed future land uses by Potential Vapour Intrusion (PVI), analytical results will be compared against the residential, recreation/open space and commercial screening criteria provided on **Table 9** below.

Table 9 Adopted Tier 1 Screening Criteria – Soil Vapour

Adopted Assessment Criteria	Rationale
CRC CARE HSLs, 2011 (Appendix F)	• Vapour concentrations will be assessed against residential (HSL A/B), recreation/ open space (HSL C) and commercial (HSL D) criteria. • Fill material at the Site consists of a mixture of sand, clay, with some gravels and cobbles present in limited quantities, and as such, sand has been conservatively selected as the predominant material type. • HSLs cannot be applied to non-petroleum sources such as pure solvents or gasworks wastes, where solubility limits are much higher. While LNAPL Plume B is sourced from a petroleum source, given the potential for gasworks wastes to be present on the Site as a result of land reclamation and historic gasworks, the HSL (infinite) values presented in Appendix F of CRC CARE (2011) will be adopted in accordance with CRC CARE guidance as a conservative approach. • It is noted in Section 9 of CRC CARE (2011) that vapour intrusion in high-density residential buildings is based on occupation of the ground floor, and HSL-B should be applied only if residents occupy ground floor apartments. If the ground floor consists of commercial properties or the building contains a communal basement carpark, HSL-D will be used.
CRC CARE (2013) Action Levels for Subsurface Methane near foundations	Methane detections in soil bores and sub-slab vapour wells will be compared against the action levels for subsurface methane near foundations provided in CRC CARE (2013).

Results of air samples have also been assessed for Margin of Safety (MOS), as discussed in *Technical Report 23 - Petroleum hydrocarbon vapour intrusion assessment: Australian Guidance* (CRC CARE, 2013) to determine if a suitable number of monitoring rounds has been undertaken based on concentrations versus adopted criteria. Assessment of MOS has been conducted as part of the report in which results were included (AECOM, 2025d).

3.2 Site Specific Remediation Criteria

Site Specific Remediation Criteria (RC), to inform remediation and management works required at the Site, for the protection of human health were initially derived in 2016 (AECOM, 2016), and have been reviewed and updated for the changes in the development of the Site (AECOM, 2025a) as discussed in **Section 5.4**. The updated 2025 RC have been used for assessment of Site data in this report.

Potential risks to ecological receptors were not considered in the RC and were separately assessed (AECOM, 2020h), noting that the only potential ecological receptors identified for the Site are off-Site aquatic receptors via groundwater migrations. Further discussion on risks to ecological receptors, based on additional data collected since issue of the Site Suitability Statements, is provided in **Section 5.5.5**.

The RC consider the following scenarios and land uses based on the initially proposed development of Macquarie Point (MPDC, 2015), which are considered applicable to the currently proposed future development based on the review of RC (AECOM, 2025d)*:*

- High density residential development (slab-on-grade buildings and buildings with a communal basement car park).
- Recreation / open space

- Multi-storey car park
- Commercial/light industrial (slab-on-grade buildings and working within a basement car park).

It is noted that residential development is now only proposed in Regatta Point, which is not one of the assessment areas with existing Site Suitability Statements considered in this report. However, high density residential land use is known to occur off-Site and hydraulically down-gradient along Evans Street to the south of the Site, and the potential exists for groundwater migration from the Site to reach this area. As such, the RC protective of residential use have been applied to groundwater data from the Site.

The risk-based Site RC are derived based on generic, conservative exposure assumptions protective of on-Site and off-Site human health under the above-mentioned potential future land use conditions at the Site, and incorporated the following key assumptions:

- NAPL impacts at the Site will be remediated to the extent practicable and therefore risks associated with exposure to NAPL, and volatile contaminants derived from NAPL were not considered in the derivation of the RC.
- Intrusive maintenance work at up to 1 m bgl may be undertaken in all land uses.
- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of maintenance workers) to have direct contact with soils.
- A reticulated water supply will be available, based on the urban setting of the Site, and abstraction of groundwater for any purposes other than remediation or monitoring, or temporary extraction during construction, will not be required. Potential exposure to contaminants in groundwater during any construction, remediation, or monitoring will be managed by task specific safety documentation informed by the SEMP.
- Groundwater will be 1 m or more below the final surface of the Site.
- A SEMP will be prepared and put in place to maintain/manage surface cover.
- With regard to basements:
    - Use of any future basements is assumed to be limited to car parking. If basements are constructed for other purposes, a risk assessment specific to the intended use should be conducted.
    - Where basements are associated with future residential or commercial buildings, it is assumed that these will be communal areas for multiple properties, for example, as part of a strata scheme that is managed by a body corporate. Private basements will therefore not be associated with individual residences.
    - Where there is access to a basement car park, it is assumed that any groundwater seepage collects in floor drains and a physical barrier is present, and therefore, groundwater will not be directly contacted by basement users, with the exception of maintenance workers. It is assumed that individual tenants will not be involved in the maintenance of any associated services, including drainage pumps or sumps.
    - A basement ventilation rate of 2 air exchange cycles per hour has been assumed for basements when assessing risks and deriving criteria for water seepage into basement carparks. Any future basement carparks must be ventilated at a rate of ≥2 air exchange cycles per hour, unless other measures which eliminate potential groundwater seepage are included and verified by a suitability qualified and experienced professional during basement design and construction.
- For potential future multi-storey car park users, the most sensitive receptor in this scenario would be considered to be a parking attendant present at the Site for a typical eight hour working day. It is considered that RC derived for potential future commercial/light industrial workers (working within a basement) would be protective of all other basement users. This includes multi-storey car park users and residential tenants who access basement car parks and are likely to have lower frequency and duration of exposure, therefore the multi-storey car park users scenario is not evaluated separately in this assessment.

- Adjacent off-Site land uses include open space, commercial/industrial, and residential areas. As these potential land uses have been considered on-Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g. via groundwater migration beyond the Site boundary), as:
  - Extractive groundwater use is not known to occur within 2 km of the Site, based on review of registered groundwater bores undertaken in 2024 (AECOM, 2024c), and the urban setting and reticulated water supply indicate that groundwater extraction and use is unlikely to occur
  - No basements are known to be present in the surrounding buildings, and are considered unlikely due to the additional costs which would be required for basement construction, based on shallow groundwater elevation, hydraulically downgradient of the Site.
- It is considered that potential exposure to workers undertaking remediation and/or development activities can effectively be mitigated through the implementation of an appropriate Construction Environmental Management Plan (CEMP). The CEMP should be prepared during the planning stage for any future remediation and/or development activities.
- A separate assessment of the potential risks to on-Site visitors was not undertaken as it was considered that the chronic exposure duration assessment of commercial/light industrial workers or residents is sufficiently protective of the shorter exposure duration visitor scenario.

These assumptions, including controls and requirements for future development, are currently documented as requirements of the SEMP (AECOM, 2024a), and should be maintained in future SEMPs. Additional assessment of risks to users, and potentially further remediation, would be required in the event of any proposed development or Site use which does not conform to these assumptions.

3.3 Data Quality

The quality and reliability of data presented in the initial Site Suitability Statements was reviewed and considered acceptable for interpretation at the time of issue, and a re-review of data quality has not been conducted.

For new environmental data considered in this report, data quality review has been conducted, and concluded that the data was fit for interpretation, in the reports listed on **Table 10** below.

Table 10 Data Quality Reviews

Report	Data Quality Review Section(s)
The Gateway – Data Gap Assessment (AECOM, 2023a)	• Section 3.0 – Data Quality Objectives • Section 7.0 – Assessment of Data Quality • Appendix G – Data Validation Report
The Precinct South – Well Maintenance and Targeted Groundwater Monitoring Event (AECOM, 2024c)	• Section 3.0 – Data Quality • Appendix A – Data Quality Objectives and Data Validation
In Situ Soil Characterisation and Waste Management Plan – Stage 1 and Stage 2 Bulk Excavation, Macquarie Point Development Project (AEOCM, 2025b)	• Section 4.0 – Data Quality Objectives • Section 7.4 – Assessment of Results – Quality Assurance / Quality Control • Appendix C – Data Validation Report
Soil, Groundwater and Soil Vapour Investigation 2025 (AECOM, 2025d)	• Section 4.0 – Data Quality Objectives • Appendix F – Data Validation
Acid Sulfate Soil Investigations (AECOM, 2025e)	• Section 3.0 – Field Methodology – Assessment of Data Quality • Section 4.0 – Data Validation • Appendix E – Data Validation Report

4.0 Summary of Site Suitability Statements

Sections 4.1 to **4.4** below, provide brief descriptions of each assessment area and the key environmental controls contained within the Site Suitability Statements issued to date for each area.

It is noted that different SEMPs were issued or are in effect for each Site Suitability Statement. Changes and updates to the SEMPs are discussed in **Section 5.2**.

The proposed development layout of each area, at the times which Site Suitability Statements were issued, is shown on **Figure F3**.

4.1 The Goods Shed and Yard (Audit Area 1)

The Goods Shed and Yard (Audit Area 1) is located in the south-western portion of the Site. The site has been subject to a Contaminated Land Audit following progressive site environmental investigations. Full details of identification and assessment of contamination within the Goods Shed and Yard at the time the Site Suitability Statement for this area was issued can be found in:

- *Audit Area 1 – Detailed Site Investigation* (AECOM, 2019a)
- *Audit Area 1, Clean Up to the Extent Practicable Report* (AECOM, 2019b).

No soil or groundwater remediation has been undertaken, and the Contaminated Land Audit Report (Coffey, 2019a) has been issued for the site which states *the site is suitable for the site uses as follows: retail / commercial / recreational / public open space use and other less sensitive uses* subject to specific conditions, which are detailed in Site Suitability Statement.

The proposed development layout of the Goods Shed and Yard at the time of issue of the Site Suitability Statement is shown on **Figure F3**.

Of specific note, that Site Suitability Statement requires:

- The SEMP is implemented along with:
    - Maintenance of flooring and other hard surfaces both in the Goods Shed and in outside areas of Audit Area 1, to prevent human access to soil, or replacement by barrier layers agreed by and Environmental Auditor.
    - Any change of land use in areas external to the Goods Shed that incorporates enclosed buildings must only be undertaken following consideration of the need for remediation of contaminated soil exceeding specified Remediation Criteria.
    - Landscaping and gardening must be above the existing surface, or where in-ground, must incorporate barrier layers specified in the SEMP.
    - Specific requirements must be followed for managing excavated soil and for importation of Fill Material.
- Groundwater at the site is polluted with respect to use for Drinking Water, Irrigation, Stock Watering, and Primary Contact Recreation. Groundwater is not considered to preclude Ecosystem Protection or Buildings and Structures in Audit Area 1. Sulfate and chloride concentrations were elevated just outside the Audit Area 1 boundary. While these concentrations were not within the Audit Area 1 boundary, this indicates a possibility of seawater ingress in localised areas, and so design of construction materials should consider the need to account for possible saline intrusion for all buildings.
- As is the case with any site on which fill soils exist, small quantities of bonded asbestos cement fragments may remain within the soil and be uncovered during excavation works, despite not being identified within AA1 during site investigations. Such fragments are not anticipated to represent a health risk to occupiers of the completed development. If encountered during future development or use of the site, any fragments should be handled and disposed in accordance with the relevant regulations.

- There are suspected asbestos materials in site buildings, which should be managed in accordance with the relevant regulations. This environmental audit report addresses soil and groundwater (and associated) contamination and does not address built structures directly.

4.2 The Escarpment (Audit Area 4 West)

The Escarpment (Audit Area 4 West) is located in the north-western portion of the Site. The Escarpment area has been subject to a Contaminated Land Audit following progressive site environmental investigations and remediation activities.

The Escarpment forms the western portion of the former Audit Area 4 West, and full details of identification, assessment and remediation of contamination within this area can be found in:

- *Audit Area 4 – Detailed Site Investigation* (AECOM, 2020a)
- *Audit Area 4 West – Clean Up to the Extent Practicable Report* (AECOM, 2020b).

Remediation actives undertaken in the Escarpment area (AECOM, 2020c) included the excavation and off-Site disposal of approximately 5,200 m^3 of soil from identified areas of impact for TRH and naphthalene above the RC applied at the time (AECOM, 2016), primarily focusing on the former Concrete Batching Plant area and the Northern Refuelling Area. Excavation was generally down to dolerite rock, and excavations were backfilled with Auditor-approved virgin excavated natural material (VENM).

The Site Suitability Statement (Coffey, 2020) issued for the Escarpment states that *the site is suitable for the site uses as follows: residential, including medium to high density, retail, commercial, recreational/public open space use, transport (roads etc) and other less sensitive uses,* subject to specific conditions which are detailed in Site Suitability Statement.

The proposed development layout of the Escarpment at the time of issue of the Site Suitability Statement is shown on **Figure F3**.

Of specific note, that Site Suitability Statement requires:

- The SEMP (AECOM, 2020g) is implemented along with:
    - The site area must be maintained with a hardstand or earthen cap seal to prevent direct human access to soil. Where the hardstand or earthen cap is breached, such as for construction or maintenance works, it must be reinstated to achieve the same prevention of access to soil.
    - Garden plantings are to be in above ground planter boxes and not into the soil directly. Any proposal to plant into site soils must be confirmed as suitable by a Site Environmental Auditor.
    - Specified requirements must be followed for managing excavated soil and for importation of Fill Material.
- Groundwater at the site is polluted with respect to use for Drinking Water and Primary Contact Recreation. Groundwater is not considered to preclude Ecosystem Protection or Buildings and Structures in Audit Area 4 West.
- Although asbestos was not identified on the Escarpment, asbestos was identified in Audit Area 4 East, and as is the case with any site on which fill soils exist, small quantities of bonded ACM fragments may remain within the soil and be uncovered during excavation works. Such ACM fragments are not anticipated to represent a health risk to occupiers of the completed development. If encountered during future development or use of the site, any fragments should be handled and disposed in accordance with the relevant regulations.

4.3 The Promenade and Underground Carpark (Lot E and UGC)

The Promenade and Underground Carpark area (Lot E and UGC) is located in the central western portion of the Site. The Promenade and Underground Carpark area has been subject to a Contaminated Land Audit following progressive site environmental investigations and remediation activities.

The Promenade and Underground Carpark consists of part or all of former Audit Areas 2 and 5, and full details of identification, assessment and remediation of contamination within this area can be found in:

- *Audit Area 2 – Detailed Site Investigation* (AECOM, 2020d)
- *Audit Area 5 – Detailed Site Investigation* (AECOM, 2021b)
- *Lot E and Underground Carpark – Clean Up to the Extent Practicable Report* (AECOM, 2021c).

Remediation actives were undertaken in the Promenade and Underground Carpark to date and include:

- LNAPL and groundwater extraction and removal via a combination of skimming and Total Fluids Extraction (TFE) (AECOM, 2021i).

  LNAPL extraction was considered to have reached CUTEP and no further remediation was considered required at the time of the issue of the Site Suitability Statement. Additional data on LNAPL collected since this time is discussed in **Section 5.5.4.1**.
- Excavation and removal of pipelines and soil from a former workshop on the northern end of the Goods Shed in 2020 (AECOM, 2021d).
- Excavation and removal of remnant pipeline and impacted soil (AECOM, 2021e) in 2020, in conjunction with remediation of the Precinct North.

Soil remediation conducted in 2020 included excavation and removal of approximately 210 m^3 of remnant infrastructure and soil from a former workshop referred to as the Goods Shed Annexe, and removal of 50 m of fuel line in the Promenade and Underground Carpark and immediate buffer area (i.e. 20 m from the boundary), with soil remediation excavations extending some 2,000 m^2 in the Promenade and Underground Carpark area (Coffey, 2021a). Coffey (2021a) noted that:

- The remediation works removed a range of former underground fuel lines and left them sealed off at the points where pipelines extending beyond the excavation areas were cut.
- A significant quantity of contaminated soil (total of approximately 8,500 m^3) was removed, disposed in accordance with Tasmanian requirements, and the excavations partially backfilled with approved soil.
- A number of exceedances of Tier 1 Criteria remain in situ, with a smaller number of exceedances for site-derived Remediation Criteria.

The Site Suitability Statement (Coffey, 2021a) issued for Lot E and Underground Carpark states that *the site is suitable for the site uses as follows: residential (including medium to high density), commercial/industrial, recreational/public open space use, access way and transport (roads etc) and other less sensitive uses* subject to specific conditions which are detailed in Site Suitability Statement.

The proposed development layout of the Promenade and Underground Carpark at the time of issue of the Site Suitability Statement is shown on **Figure F3**.

Of specific note, that Site Suitability Statement requires:

- The site shall be developed in accordance with the layout (see **Figure F3**) provided in Figure F3 of the SEMP prepared for Promenade and Underground Carpark (AECOM, 2021c), with reference to the following details.
  - Nominated uses are to be limited to the areas indicated, and the Underground Carpark shall be built within the area nominated, such that assumptions regarding vapour risk remain valid.
  - Depth of the Underground Carpark is to be such that it does not intersect the water table. Should the design or changed conditions indicate potential for ingress of groundwater to any part of the underground carpark (including sumps or lift overruns), the SEMP must be reviewed for adequacy and approved by an Environmental Auditor, including any additional mitigation measures which may be required.
  - The Underground Carpark must include design, installation and maintenance of ventilation as per Building Code of Australia requirements for exhaust fumes, or other controls as specified in EPA NSW, 2020, to mitigate risks from potential methane infiltration.

  - Deep services below 2 m depth from the current surface level must be installed in protective shrouds or in trenches/corridors of clean fill to minimise the risk of contact with residual contamination for maintenance workers.

- The SEMP (AECOM, 2021c) is implemented along with:
  - The Site area must be maintained with a hardstand or earthen cap seal or other engineered break layer to prevent direct human access to soil. Where the hardstand or earthen cap or other break layer is breached, such as for construction or maintenance works, it must be reinstated to achieve the same or better prevention of access to soil. Further details of layers or physical barriers must be adopted per Section 4 of the SEMP.
  - Garden plantings are to be in above ground planter boxes and not into the soil directly. Any proposal to plant into site soils must be confirmed as suitable by a Site Environmental Auditor.
  - Specified requirements must be followed for managing excavated soil and for importation of Fill Material.
  - Any subsurface works including for construction of the development or later maintenance must include a site specific workplace health and safety plan as detailed in Section 4 of the SEMP and allow for potential contaminant exposures.
- Groundwater at the site is polluted with respect to use for Drinking Water, Irrigation, Stock Watering, Industrial use, and Primary Contact Recreation. Groundwater is not considered to preclude Ecosystem Protection at a point of discharge to a surface water, or Buildings and Structures.
- Some fragments of asbestos containing materials have been identified during investigations on the site (with fibre bundles associated with a fragment at one location), and bonded ACM fragments may remain within the soil and be uncovered during excavation works, with potential for associated fines/fibres. Such ACM fragments are not anticipated to represent a health risk to occupiers of the completed development. It is noted that the SEMP attached to this Site Suitability Statement lists asbestos as a contaminant requiring management for any subsurface works. If encountered during future development or use of the site, any fragments should be handled and disposed in accordance with the relevant regulations.

4.4 The Precinct North (Lot B)

The Precinct North (Lot B) is located in the central eastern portion of the Site. The Precinct North area has been subject to a Contaminated Land Audit following progressive site environmental investigations and remediation activities.

The Precinct North consists of part or all of former Audit Areas 5 and 7, and full details of identification, assessment, and remediation of contamination within this area can be found in:

- *Audit Area 5 – Detailed Site Investigation* (AECOM, 2021b)
- *Audit Area 7 – Detailed Site Investigation* (AECOM, 2020f)
- *Lot B – Clean Up to the Extent Practicable Report* (AECOM, 2021f).

Remediation actives were undertaken in the Precinct North to date include:

- LNAPL and groundwater extraction and removal via a combination of skimming and TFE (AECOM, 2021i).

  LNAPL extraction was considered to have reached CUTEP and no further remediation was considered required at the time of the issue of the Site Suitability Statement. Additional data on LNAPL collected since this time is discussed in **Section 5.5.4.1**.
- Excavation and removal of remnant pipeline and impacted soil (AECOM, 2021e) in 2020, in conjunction with remediation of the Promenade and Underground Carpark.

Soil remediation actives undertaken in the Precinct North in 2020 include the removal of pipelines and associated impacted soil. The pipelines removed include a disused diesel pipe and a disused oil pipe,

with a total of 50 m of pipe removed from the Precinct North and the immediate 20 m buffer area with soil remediation excavation extending some 2,800 m^2 in the Precinct North.

The Site Suitability Statement (Coffey, 2021b) issued for the Precinct North states that *site is suitable for the proposed site use of 'Arts and Institutional Area', which is considered to be a 'Commercial' use setting, involving commercial and cultural uses, including retail, (the site would also be suitable for high density residential uses above – but not on - the ground floor, and other less sensitive uses such as industrial use),* subject to specific conditions which are detailed in Site Suitability Statement.

The proposed development layout of the Precinct North at the time of issue of the Site Suitability Statement is shown on **Figure F3**.

Of specific note, that Site Suitability Statement requires:

- The site shall be developed in accordance with the layout provided in Figure F2 of the SEMP (AECOM, 2021h) with reference to the following details.
    - Methane is present at significant concentrations across Lot B and must be designed to account for CS3 – Moderate Risk, as defined by Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases (EPA NSW, 2020).
    - The entire site is to be covered by building footprint/hardstand in its final developed state.
- The SEMP (AECOM, 2021h) is implemented along with:
    - The Site area must be maintained with a hardstand or earthen cap seal or other engineered break layer to prevent direct human access to soil. Where the hardstand or earthen cap or other break layer is breached, such as for construction or maintenance works, it must be reinstated to achieve the same or better prevention of access to soil. Further details of layers or physical barriers must be adopted per Section 4 of the SEMP.
    - Garden plantings are to be in above ground planter boxes and not into the soil directly, noting that this is a general requirement, and that the coverage of the Lot B area by building footprint means that this requirement is likely redundant. Any proposal to plant into site soils must be confirmed as suitable by a Site Environmental Auditor.
    - Specified requirements must be followed for managing excavated soil and for importation of Fill Material.
    - Any subsurface works including for construction of the development or later maintenance must include a site specific work health and safety plan as detailed in Section 4 of the SEMP and allow for potential contaminant exposures.
- Groundwater at the site is polluted with respect to use for Drinking Water, Irrigation, Stock Watering , Industrial use, and Primary Contact Recreation. Groundwater is not considered to preclude Ecosystem Protection at a point of discharge to a surface water, nor Buildings and Structures.
- While no fragments of asbestos have been noted on the Lot B area (nor has any asbestos been identified in analysis of soil samples), asbestos may be encountered wherever fill soils are present. The SEMP (AECOM, 2021h) outlines requirements in the event that potential ACM is encountered in soil during subsurface works.
- Soil impacts are present in excess of the Future Maintenance Worker remediation criteria in the locations listed below, which will be managed by adherence to the SEMP for any future construction or maintenance works.
    - An exclusion zone surrounding the original Main Hobart Pipeline (Sewer).
    - Areas on the site boundary where further soil excavation could not be conducted.

5.0 Changes Since Issue of Site Suitability Statements

Changes in the proposed future Site development, new or updated environmental data, and other factors have occurred since initial issue of the Site Suitability Statements, and are not currently included in the assessment or consideration of the acceptable uses proposed for the Site.

Review of the following changes, which are considered to potentially affect the suitability for development of the Goods Shed and Yard (Audit Area 1), the Promenade and Underground Carpark (Lot B and the UGC), the Escarpment (Audit Area 4 West), and the Precinct North (Lot B) have been identified and considered in this assessment:

- Updates in legislation relating to the development of the Site.
- Updates to the SEMP(s), consisting of:
  - Update or consolidation of SEMPs issued with Site Suitability Statements.
  - Updated consideration of potential vapour intrusion
  - Updated designs for in-ground planting
- Proposed land uses and final surface elevations
- Review of the Site-Specific Remediation Criteria (the RC)
- Collection of additional environmental data regarding:
  - Acid sulfate soil
  - Groundwater Monitoring Events (GMEs)
  - *In situ* characterisation of soil to be excavated in Stage 1 and Stage 2 of Multipurpose Stadium preparatory works.
  - Additional soil, groundwater and soil vapour data collected between 2022 and 2025
- The upcoming closure of the Macquarie Point Sewage Treatment Plant (STP) and realignment of the Main Hobart Pipeline.

The following Site investigations or assessment reports are attached in **Appendix G**, and have identified as containing new data, or interpretation of existing data, relating to the areas assessed.

- *The Precinct South – Well Maintenance and Targeted Groundwater Monitoring Event* (AECOM, 2024c)
- *The Precinct South – LNAPL Gauging and Transmissivity Testing, March 2024* (AECOM, 2024d)
- *The Precinct South – Remediation Validation Report*, Macquarie Point Development Project (AECOM, 2024f)
- *Review of Site Specific Remediation Criteria 2025* (AECOM, 2025a)
- *In Situ Soil Characterisation and Waste Management Plan – Stage 1 and Stage 2 Bulk Excavation* (AECOM, 2025b)
- *Soil, Groundwater and Soil Vapour Investigation 2025* (AECOM, 2025d)
- *Acid Sulfate Soil Investigations* (AECOM, 2025e)
- *Macquarie Point - Site-wide Soil Vapour Bore and Groundwater Well Inspection and Gauging Event* (AECOM, 2025f)
- *Assessment of Potential Off-Site Ecological Impacts – 2025 Addendum* (AECOM, 2025i)

Some of these changes (updates to the SEMPs, review of the RC, additional environmental data regarding potential methane intrusion and acid sulfate soil, realignment of the Main Hobart Pipeline, and updated deep rooted planting designs) are considered to affect the Site and each assessment area uniformly, and the implications and mitigations/actions recommended to address them, are discussed in the relevant sections below.

Other changes, namely changes in proposed land use and final surface elevation, and new data collected as part of *in situ* characterisation or field investigations in 2025, are assessed and discussed by assessment area in **Section 6.0**.

5.1 Legislative Changes

The Tasmanian Government Department of State Growth announced in September 2022 that the Site is the preferred location for a mixed-use precinct, including a multipurpose stadium. Details of the proposed development of the Site were released in the Precinct Plan (MPDC, 2024).

The proposed development of a multipurpose stadium at the Site was classified as a Project of State Significance (PoSS) by the Governor of Tasmania on 16 October 2024, and was subject to an integrated assessment process by the Tasmanian Planning Commission (TPC) under the *State Policies and Projects Act 1993*.

TPC issued the *Integrated Assessment Report – Macquarie Point Multipurpose Stadium Project of State Significance* (TPC, 2025) in September 2025. With consideration of the TPC report, *State Policies and Projects (Macquarie Point Precinct) Order 2025*, (the Order) was introduced to Tasmanian State Parliament in October 2025. The Order was approved by the Tasmanian House of Assembly on 13 November 2025 and by the Tasmanian Legislative Council on 4 December 2025 and provides conditions and approval for development of the Multipurpose Stadium at the Site.

Schedule 5 of the Order provides general environmental conditions for development of the Site. The conditions in the schedule, and in the Order in general, are consistent with the *Macquarie Point Development Corporation Act 2012*, and in general require completion of a Site Suitability Statement for each area of the Site prior to development of that specific area.

No changes to the Environmental Audit of the Site, or the overall process and requirements for issue of Site Suitability Statements, arise from the Order.

It is noted that the Order does not replace or supersede the *Macquarie Point Development Corporation Act 2012.* The conditions of both pieces of legislation must be met with regards to environmental development of the Site.

5.2 Updates to the Site Environment Management Plan(s)

5.2.1 Update or Consolidation of Existing SEMPs

A requirement of each Site Suitability Statement issued to date has been the preparation and implementation of a SEMP, which provides details on the environmental status of the area considered and any controls, restrictions or requirements for future maintenance, development and operation of the area. **Table 11** below lists the SEMPs referenced in each Site Suitability Statement.

Table 11 Site Environment Management Plans Referenced in Site Suitability Statements

Site Suitability Statement	Referenced SEMP
Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1 (Coffey, 2019a)	*Site Environment Management Plan, Macquarie Point – Audit Area 1* (AECOM, 2019c)
Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West (Coffey, 2020)	*Audit Area 4 – Site Environment Management Plan* (AECOM, 2020g)
Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark (Coffey, 2021a)	*Lot E and Underground Carpark – Site Environment Management Plan* (AECOM, 2021g)
Contaminated Land Audit Report – Macquarie Point Development Project – Lot B (Coffey, 2021b)	*Site Environment Management Plan* (AECOM, 2021h)

Initially, Site Suitability Statements referenced individual SEMPs for each area. However, as Site investigation, assessment and remediation has progressed, individual SEMPs were consolidated into a

single Site-wide SEMP (AECOM, 2021h) for the Site Suitability Statement for the Precinct North (Lot B) in 2021.

The Site-wide SEMP, which was reviewed and accepted by the Environmental Auditor, incorporated the requirements of each previous SEMP listed on **Table 11**, and is considered to supersede and replace them.

The SEMP includes a requirement for regular review and update, with the most recent version issued in December 2025 (AECOM, 2025h).

It is considered that further updates to the SEMP will be required as part of update of the Site Suitability Statements for each area. Any such updated identified in this review are included in the recommendations at the end of this document (**Section 7.2**).

5.2.2 Vapour Intrusion Mitigation

During soil vapour investigations in 2019, the possibility of potentially hazardous methane migration into buildings or structures in the Promenade and Underground Carpark, the Precinct North and the Precinct South areas during development was identified (AECOM, 2021a). Previous investigations have also identified the potential for hydrocarbon vapours to infiltrate basement structures in the Precinct South and the Promenade and Underground Carpark areas.

Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases (EPA NSW, 2020), provides guidance values for gas protection required for buildings based on:

- The ground gas regime at the Site (referred to as the Characteristic Situation (CS)).
- The proposed use of the building and its design, with five categories of building type listed.

5.2.2.1 Characteristic Situation

EPA NSW (2020) uses the Gas Screening Value (GSV), calculated from the gas concentration ($\%^{v}/_{v}$) multiplied by the measured bore flow rate, to determine the CS as per **Plate 2** below.

	GSV threshold (L/hr)	CS	Risk classification	Additional factors	Typical sources
	<0.07	1	Very low risk	Typically, methane <1% v/v and/or carbon dioxide <5% v/v; otherwise consider increase to CS 2	Natural soils with low organic content Typical fill
	<0.7	2	Low risk	Borehole flow rate not to exceed 70 L/hr; otherwise consider increase to CS 3	Natural soils with high organic content Recent deep fill
	<3.5	3	Moderate risk		Old inert waste landfill Flooded mine workings
	<15	4	Moderate to high risk	Consider need for Level 3 risk assessment	Mine workings susceptible to flooding Closed putrescible waste landfill
	<70	5	High risk	Level 3 risk assessment required	Shallow, unflooded abandoned mine workings
	>70	6	Very high risk		Recently used putrescible waste landfill

1. Site characterisation should be based on monitoring of gas concentrations and borehole flow rates for the minimum periods defined in Section 3.4.
2. The CSM must identify the source of gas and its generation potential.
3. Soil gas investigations should be conducted in accordance with the guidance provided in Section 3.4.
4. Where there is no detectable flow, the lower measurement limit of the instrument should be used.
5. To determine a GSV of <0.07, instruments capable of accurately measuring concentration to 0.5% v/v and flow to 0.1 L/hr are recommended.

Plate 2 Classification of Characteristic Situation (Gas) (EPA NSW, 2020)

Field and laboratory readings for pressure, flowrate, and methane collected during June 2025 (AECO, 2025d) have been presented and GSV calculated on **Table T11**.

The following has been considered in assessing the CS at the Site:

- Methane concentrations between <0.01 %$^{v}/_{v}$ and 77.9%$^{v}/_{v}$ (SV34) were recorded in soil vapour in the most recent sampling event (AECOM, 2025d). Historic soil vapour sampling events have reported soil methane concentrations of up to 59%$^{v}/_{v}$ (AECOM, 2021a).
- 17 of the 18 calculated GSVs were <0.07 L/hr, with a maximum GSV of 0.3 L/hr calculated for SV34 on 24 June 2025.
- Groundwater concentrations of methane have been recorded at greater than an order of magnitude above the adopted criteria (see **Table T8** and **Figure F13c**) in multiple locations across the Site, including locations where soil methane and gas flow rates have not been directly measured or recorded.
- The highest calculated GSV (0.3 in SV34) is approximately 50% of the threshold value. As it is based on one monitoring round only, it may not reflect potential season variations in GSV and soil gas flow.
- Negative differential pressures between -0.02 and -0.09 milliBar were recorded during the sampling events of SV07, SV35, SV37, and SV45, which indicate that barometric pumping of atmospheric air into soil may have been occurring and recorded soil vapour concentrations may be diluted and may not reflect ground conditions.

  While the differential pressures are low and not expected to have driven large-scale displacement, GSVs calculated for these locations may not be reliable for assessment of CS.

While recorded GSV and methane concentrations would generally indicate that the Site is classified CG2, based on the above considerations, it has been conservatively considered to be CS3 – Moderate Risk, with relation to methane in soil vapour.

5.2.2.2 Future Building Category

The building categories are based on a combination of the HILs from Appendix B7 of the ASC NEPM and four building types form British Standard 8485 (BS8485). **Table 12** below provides the description of each building category, and

Table 13 summarises the reference inputs used by EPA NSW (2020).

Table 12 Building Categories (EPA NSW, 2020)

Type	Description
Low-density residential	Usually but not exclusively single-storey dwellings on a separate land title (commonly Torrens title) with single occupancy; no building management and no post-occupancy controls on room use, ventilation or alterations to the internal structure; limited controls on building design and construction due to exempt and complying development provisions in NSW; construction for new buildings is predominantly slab-on-ground, but also suspended floors with crawl space and partial or full basements, particularly on sloping sites; correlates closely with residential component of HIL A and with BS 8485:2015+A1:2019 Type A but the median size (footprint area) of new houses in Australia is significantly larger than in the UK
Medium- and high-density residential	Multiple-occupancy low-, medium- or high-rise townhouses and apartments; usually on a strata title and subject to by-laws, with maintenance of the external structure of the building and common areas managed and controlled by an owner's corporation; includes some public housing and some mixed-occupancy developments, and developments with commercial occupancy of the ground floor; frequently includes basement or undercroft car parking; may involve ground-bearing or piled foundations; usually air-conditioned, with active ventilation of basement car parking; correlates reasonably well with HIL B and partially with BS 8485:2015+A1:2019 Type B
Public buildings, schools, hospitals and shopping centres	Similar in many respects to standard commercial buildings; generally low- to medium-rise rather than high-rise; particular constraints regarding building evacuation in an emergency; frequently includes basement or undercroft car parking; may involve ground-bearing or piled foundations; almost always air-conditioned, with active ventilation throughout (does not apply to many existing schools); correlates generally with HIL D but includes primary schools and childcare centres, which are HIL A; correlates partially with BS 8485:2015+A1:2019 Type C
Standard commercial buildings	Includes offices and some shops, industrial subdivisions and smaller showrooms; building management control of any alterations to the building or its uses and central building management control of building maintenance, including gas protection measures; single or multiple occupancy of ground floor and basement areas; frequently includes basement or undercroft car parking; may involve ground-bearing or piled foundations; small-to large-sized rooms with active ventilation or air-conditioning in all buildings, except those on industrial subdivisions, which will have good passive ventilation; correlates generally with HIL D and BS 8485:2015+A1:2019 Type C
Large commercial and industrial buildings	Includes warehouses, most factories, big-box retail stores, large showrooms, and hardware or garden centres; characterised by large, open, high-volume buildings; often single-storey; may have basement, roof or exterior parking; corporate ownership, owner-occupied or leased; generally easy evacuation; may involve ground-bearing or piled foundations; correlates well with HIL D and BS 8485:2015+A1:2019 Type D

Table 13 Building Categories Reference Standards

Category	Description
ASC NEPM Land Use Scenarios	
HIL A	Residential with a garden or accessible soil; childcare centres and primary schools
HIL B	Residential with minimal opportunities for soil access; secondary schools
HIL C	Public open spaces and recreation areas
HIL D	Commercial and industrial premises.
BS8485 Building Types	
Type A	Private ownership with no building management controls on alterations to the internal structure, the use of rooms, the ventilation of rooms or the structural fabric of the building; some small rooms present.
Type B	Private or commercial properties with central building management control of any alterations to the building or its uses but limited or no central building management control of building maintenance, including the gas protection measures; multiple occupancy; small- to medium-sized rooms with passive ventilation of rooms and other internal spaces throughout ground floor and basement areas.
Type C	Commercial buildings with central building management control of any alterations to the building or its uses and central building management control of building maintenance, including the gas protection measures; single occupancy of ground floor and basement areas; small- to large-sized rooms with active ventilation or good passive ventilation of all rooms and other internal spaces throughout ground floor and basement areas.
Type D	Industrial-style buildings having large volume internal space(s) that are well ventilated; corporate ownership with building management controls on alterations to the ground floor and basement areas of the building and on maintenance of ground gas protective measures.

Future buildings in the Complementary Integrated Mixed Use Zone and the Antarctic Facilities Zone, including the proposed underground carpark, are considered suitable to consider as standard commercial buildings, based on the proposed uses and development.

The following has been considered for the proposed Multipurpose Stadium:

- The Multipurpose Stadium will be a commercial space without residential use or long term occupancy by sensitive receptors (i.e., children), and is considered to correlate with ASC NEPM HIL D.
- The central covered playing area, a key part of the Multipurpose Stadium, will form a large well-ventilated internal volume, with central building control on alterations to the ground floor and maintenance of ground gas protective measures, and considered to correspond most closely with BS8485 Building Type D.
- Smaller rooms such as shops, offices, changing rooms or viewing boxes etc which may be present in the Multipurpose Stadium are considered commercial spaces and will have central building control on alterations to the ground floor and maintenance of ground gas protective measures, and are considered to correspond with BS8485 Building Type C.

While public buildings, schools, hospitals, and shopping centres was considered for the Multipurpose Stadium, this was considered overly conservative. The higher protection level required for this type of structure is driven by additional risks associated with:

- Continuous or longer term occupancy of more sensitive receptors (children) associated with schools and other public buildings (i.e. HIL A). Daily or continuous occupation of the Multipurpose Stadium by children is not expected, with attendance only during events such as sporting events or concerts, rather than the longer and more frequent occupancy which would be expected for schools or hospitals.

- Particular constraints regarding building evacuation during emergency. The Multipurpose Stadium is not anticipated to have particular constraints as stadium design should anticipate large numbers of people entering and exiting simultaneously as part of standard operation (i.e., the start and end of events) and will have dedicated crowd control staff during events, and the central building management would be expected to have a prepared and practised evacuation plan for events and for non-event periods where there would typically be low numbers of people within the building.
- The playing field and stands of the Multipurpose Stadium will not be a fully enclosed structure, unlike the example buildings (hospitals, schools, shopping centres. The 70% design includes open spaces on each side of the structure to allow natural ventilation and airflow, as part of the temperature control within the stadium to prevent overheating/greenhouse effects during use.

On the basis of this assessment, the Multipurpose Stadium is considered a mixture of the standard commercial building and large commercial and industrial building categories. The standard commercial building category has been conservatively adopted as under some Characteristic Situations, a higher level of protection is required (refer to **Plate 3**).

5.2.2.3 Required Protection Level

Plate 3 below provides a matrix (EPA NSW, 2020) used to assess the level of gas protection required, based on these factors.

CS	Required gas protection guidance value				
	Low-density residential	Medium-to high-density residential (strata title)	Public buildings, schools, hospitals and shopping centres	Standard commercial buildings (offices, etc.)	Large commercial (warehousing) and industrial buildings
1	0	0	0	0	0
2	3	3	3	2	1[a]
3	4	3	3	2	2
4	6[b]	5[b]	5	4	3
5	-[b]	6[b]	6[c]	5	4
6	-[d]	-[d]	6[c]	6	6

(a) If maximum measured methane concentration exceeds 20% v/v, increase to CS 3.
(b) Residential development is not recommended at CS 4 and above without pathway intervention (for example, source depressurisation or control of lateral migration) external to the buildings and a high level of management. These requirements necessarily preclude low-density residential (NEPM HIL A residential) development.
(c) Evacuation issues and social risks must be considered.
(d) Level 3 risk assessment is required.

Plate 3 Guidance Values for Gas Protection (EPA NSW, 2020)

Based on an assessed rating of CS3, and proposed buildings in the assessment areas considered to correspond to standard commercial buildings, a gas protection guidance value of 2 is considered required for future buildings and structures for the Site based on the matrix provided on **Plate 3**. It is noted that the required gas protection guidance values for CS2 and CS3 are the same for the proposed Site land use, and further soil vapour assessment is not considered required to refine assessment of risks or identification of mitigation/management controls.

The change in land use and proposed development includes large continuous structures, such as the Multipurpose Stadium, which cover and extend from areas where methane or other potentially hazardous vapours have been detected. The potential exists for vapour to migrate along the base of any such large structures, and as such any requirement for vapour protection must extend to the entirety of any structure which covers areas of potential intrusion.

In addition, due to the potential risks, and high level of cost likely required to rectify any fault in vapour intrusion measures, independent verification of design and installation of vapour intrusion prevention

measures should be undertaken for the current proposed, and any future proposed, structures at the Site.

On this basis, the following information and management measures are required and should be included in the SEMP:

- The existing requirements for gas protection are to be incorporated into any structures (such as buildings or service pits) which cover areas where methane or other potential hazardous vapours (TRH and BTEXN[1]) may migrate into structures.
- Conduits or services which pass through soil between or outside of structures and have air-space which vapour could potentially intrude into (for example, air space in protective conduits around buried cables) must be sealed and gas-impermeable, or have duct sealing at any points where air/vapour within the conduits could potentially vent into an enclosed space.
- Design and construction documentation must include a documented testing and verification method for vapour intrusion mitigation measures, with reference to Appendix 7 – Verification and construction quality assurance, of *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020). Any design and/or installation of ground gas protection measures will require independent oversight and sign-off by an Environmental Auditor, or other suitably qualified and independent verifier.

It is noted that, if the selected vapour protection system prevents potential groundwater seepage into any basement structures, the ventilation rate of ≥2 air exchange cycles per hour assumed in the RC (see **Section 3.2**) will not be required.

5.2.3 Updated Designs for Planting Deep Rooted Vegetation

The SEMP includes the following requirements for establishment of landscaped areas and gardens:

Landscaped areas and gardens should be established in above ground planter boxes on hardstand and not directly over exposed soil. In the event that gardens are proposed in-ground, the following barrier system shall be installed:

- *Layer 1: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users.*
- *Layer 2: Earthen cover (minimum 0.5 m) certified as 'Fill Material' in accordance with Tasmanian EPA Bulletin 105 (IB105).*
- *Layer 3: Surface coverage (comprising shallow rooted vegetation).*

Allowance may be made for the establishment of deep rooted vegetation; however, the barrier thickness may need to be increased, or the design modified. In-ground garden designs should be confirmed with a Contaminated Land Auditor.

These requirements have been included to minimise the potential for contact between potentially contaminated soil and future Site users, such as workers maintaining plant life or workers/visitors who may come into contact with garden spaces.

As part of development of the Site, updated designs for planting of trees and inground plants, including potentially deeper rooted plants, have been developed and are attached in **Appendix D**. These designs have been included in the SEMP (AECOM, 2025h), with the following additional controls:

- Soil imported for in-ground planting must be Level 1 – Fill Material, as defined in *Information Bulletin No 105 – Classification and Management of Contaminated Soil for Disposal* (IB105) (EPA, 2018).
- No plants intended for consumption are to be included in any in-ground planting on the Site.
- The potential size of plant root structures should be considered when selecting species for cultivation on the Site. Planting structures should have sufficient volume for the plants to develop

[1] Identification of other potentially hazardous soil vapours is discussed by assessment area in **Section 6.0**. The identified CoPC are included here to minimise the potential for error during future implementation of requirements.

without requiring root structures to penetrate the earthen liners and extend beyond the clean-fill soil.

- The earthen liner and barrier layers included in planting designs are to be installed above the Site water table.
- In-ground planting is only to occur in open space use areas. No in-ground planting is to occur within Site buildings (i.e., within atriums, foyers, or arboretums).
- Trees, or any other deep-rooted plants, which are cultivated on the Site should be excavated and removed as soon as possible if any of the following occurs:
  - Death or significant rot/reduction in size;
  - Toppling/knocking over by wind or impact.
- In the event that plant removal occurs:
  - Removal of all root structures must be included.
  - If root structures have extended and pierced the earthen liner and/or indicator barrier layer, these must be repaired and restored as part of removal of the plant(s).

The proposed designs are not considered to introduce any additional risk of environmental harm, with the additional controls described above, as:

- All designs maintain a barrier layer equal to or greater in thickness than requirements (0.5 m) in the previous Site Suitability Statements, and include the marker layer indicating where current, potentially contaminated Site soil begins.
- The proposed earthen liner will limit the potential for plant roots to come into contact with Site soil or groundwater. In the event that root structures do penetrate these barriers, it is not considered to create unacceptable risks to Site users or environment as:
  - Planting will only occur in open space use areas and will not be conducted above vapour protection systems.
  - No plants intended for consumption are to be planted on the Site, and any contamination which plants may accumulate if roots penetrate liners will not be consumed by humans. In addition, the primary CoPC in Site soil and groundwater are lead, PAHs, and TPHs.
    - Lead and PAHs both have relatively low bioavailablity in soil, and limited ability to translocate from root structures to above-ground biomass (Appendix B7 of the ASC NEPM). If plants were to penetrate the earthen liner and marker layer, any soil contamination taken up by the plant would predominantly be present in the skin or outer layers of root material, and would not be transported to the surface or come into contact with human receptors.
    - The majority of chemicals found in petroleum hydrocarbons are generally not taken up or absorbed by plants, and plant uptake and consumption is not included as a significant exposure pathway in the HSLs provided by CRC CARE, 2011.

    Other CoPC detected above the Tier 1 criteria adopted for human health (benzene, metals (arsenic, cadmium, copper, manganese, nickel, copper, vanadium and zinc), and cyanide) are not considered to have an additional risk pathway or to represent any new or increased risk to future Site users based on the planting designs attached, as these CoPC:
    - Are limited in extent and area in Site soil and groundwater.
    - Are noted in most cases in Appendix B7 of the ASC NEPM to have either limited update in plants, or be likely to adversely affect plant growth before reaching a level where human harm would occur.
    - Will have limited intake by humans via plant species, based on the proposed limitation on edible plants to be included in the SEMP.

5.3 Changes in Proposed Land Use and Final Surface Elevations

5.3.1 Land Use

The original development of the Site, provided in *Strategic Framework and Masterplan 2015 – 2030* (the former Masterplan) (MPDC, 2015) and presented on **Figure F3**, proposes the Site be developed for a mix of uses comprising:

- Residential, including medium to high density
- Commercial, including visitor accommodation, retail, arts and institutional
- Open space, including parks and recreations areas
- Transport, including roads, light rail, cycleway, and pedestrian access
- A single storey underground carpark proposed to be constructed in the Promenade and Underground Carpark Area.

Subsurface utilities and maintenance activities were also anticipated to occur in all Site areas.

Table 14 below summarises the changes for each area to be assessed when compared to the updated planned development of the Site, discussed in **Section 2.3** and presented on **Figure F2**.

Table 14 Changes in Land Use by Area

Assessment Area	Changes in Land Use
The Goods Shed and Yard (Audit Area 1)	• The Goods Shed will be removed from this area. • Proposed Open Space use to the west and north of the Goods Shed now forms park of the Multipurpose Stadium and Associated Concourse zone. • Sections of this area will be lowered to final surface elevations of between 2.9 to 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Escarpment (Audit Area 4 West)	• Land use of parts of this area has changed to Open Space. It is noted that the Goods Shed is likely to be moved to this area, and assessment for commercial/industrial uses is still considered required. • The south-eastern corner is included in the proposed footprint of the underground carpark. • High density residential use is no longer planned in this area. • Sections of this area will be lowered to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.

Assessment Area	Changes in Land Use
The Promenade and Underground Carpark (Lot E and UGC)	• Open Space land use in the southern portion of this area is now included in the Multipurpose Stadium and Associated Concourse zone. While, the majority of this space was assessed for a proposed underground carpark, which was assessed for commercial/industrial use, portions of in the eastern and western areas of this assessment area were only considered for Open Space use. • Land proposed for an "Access Link", or open transport corridor, in the eastern portion of this area was assessed for Open Space use, but is now considered for commercial/industrial use as part of the Multipurpose Stadium and Associated Concourse zone. • The north-eastern corner is included in the proposed footprint of the underground carpark. • High density residential (above the first floor) is no longer planned in this area. • Sections of this area will be lowered to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Precinct North (Lot B)	• Land use is still considered to be commercial / light industrial. • A single storey underground carpark is proposed in the northern portion of this assessment area. • Sections of this area will be lowered to final surface elevations of between 1.8 and 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.

The Precinct Plan proposes a mixture of Commercial/Industrial and Open Space uses across all four areas considered in this assessment, with Intrusive Maintenance Worker uses also likely to occur. An underground carpark is now proposed in the north-east portion of the Site within the Escarpment, Promenade and Underground Carpark, and Precinct North, as well as within Audit Area 4 East which has not had a Site Suitability Statement issued to date.

Residential use is no longer planned in any of the four areas with previously issued Site Suitability Statements, however this use has been assessed for consideration of potential risks to off-Site residential receptors (discussed in **Section 3.0**).

It is noted that as part of the updated development plans, buildings and structures which extend over the boundaries of previously established assessment areas are proposed. Assessment of environmental risks associated with buildings which cover multiple assessment areas is included in **Section 6.5.**

5.3.2 Surface Elevation

As part of the development of the Site and preparation of preliminary designs for the Multipurpose Stadium, modification of the final Site surface level is proposed, consisting of excavation and backfilling with engineered materials in some area of the Site, or installation of surface layers in others.

Increase in final surface elevation (i.e., building up areas) is not considered to increase environmental risks as:

- Vapour intrusion risks will be reduced by the additional pore space and travel time to the surface, allowing additional degradation or dilution of potentially hazardous vapours.
- Increase in surface elevation reduces potential contact with groundwater due to increased distance between the surface and the water table.
- A barrier layer between the surface and existing Site soil is required as part of the conditions which inform the Site Specific Remediation Criteria (discussed in **Sections 5.4** and **3.2**).

However, decreases in surface elevation may affect the environmental risks associated with Site contamination associated with soil vapour (generated from soil and groundwater) and with potential contact by intrusive maintenance workers with deeper soils previously not considered likely to be disturbed following development.

The extents of excavation and backfill proposed at the 50% detailed design of the Multipurpose Stadium are attached as **Appendix C**, and displayed in context of the current surface elevation of the Site (shown on based on surface surveys completed in 2024) on **Figure F5** and **Figure F6**. The proposed surface elevations have not changed in the 70% detailed design (recently completed).

Decreases in final surface elevation are proposed in the following locations:

- The playing surface of the Multipurpose Stadium, and the ground floor level of the surrounding stands, is proposed at 3.0 mAHD.
- The area to the south and east (the Complementary Integrated Mixed Use Zone) has a proposed final surface level of 2.9 mAHD.
- The surface of the practice wickets area north-west of the stadium is proposed at 4.8 mAHD.
- A single storey underground carpark to the north-east of the stadium (within the Antarctic Facilities Zone) is proposed to 1.8 mAHD.

In addition, there is an area to the south-west of the stadium with a proposed final surface elevation of 3.3 mAHD (reduction in elevation of approximately 0.7 m). This area is within the Gateway assessment area, and will be considered separately as part of the environmental audit of this area.

Areas where a decrease in surface elevation is proposed, and the elevation used for assessment of environmental risks, are summarised on **Table 15** below.

Table 15 Proposed Decreases in Surface Elevations

Proposed Decreased Surface Elevation Area	Final Proposed Elevation (mAHD)		Affected Assessment Area			
	Design	Assessment[1]	The Goods Shed and Yard	The Escarpment	The Promenade and Underground Carpark	The Precinct North
Multipurpose Stadium	3	2.5	✓	✓	✓	✓
Complementary Integrated Mixed Use Zone	2.9		✓	×	×	✓
Practise Wickets	4.8	4.3	×	✓	×	×
Underground Carpark (Antarctic Facilities Zone)	1.8	1.3	×	×	×	✓

Notes: ✓ - Change in elevation is within the boundaries of this assessment area; × - Change in elevation is not within the boundaries of this assessment area; 1. The Assessment Final Proposed Elevation, which incorporates a margin of safety of 0.4-0.5 m to allow for minor changes which may arise, has been used when considering changes in environmental risks.

For the purposes of assessing environmental risks associated with the change in design elevation:

- A safety margin of 0.4-0.5 m below the proposed final surface elevations has been included in assessment of Site data in **Section 6.0** to allow for any potential minor variations or changes which may occur as development design is finalised, or during construction.
- If final surface elevation in any area is less than the assessment elevation for that area listed on **Table 15**,

- No review of changes in precluded PEVs has been conducted as part of the assessment, and it has been assumed that any PEVs identified as precluded in existing Site Suitability Statements remain precluded.

  While the proposed excavation may remove some soil impacts which preclude PEVs, Site Suitability Statements must consider the conditions which exist at the time of assessment and cannot be predicated on the future planned actions (i.e., excavation of soil) being completed at the Site.

It is noted that the inferred elevation of groundwater is equal to or greater than the proposed final design level in some areas (see **Figure F15**). Assessment and management measures for groundwater in these areas are discussed in **Section 6.5.2**.

5.4 Review of Site Specific Remediation Criteria

As part of previous assessment of the Site, Site Specific Remediation Criteria (RC) were initially developed in 2016 (AECOM, 2016) and have been used as part of environmental investigations to identify remediation requirements to remove or mitigate any unacceptable risks to current and future users of the Site, including as part of the previously issued Site Suitability Statements.

The RC were reviewed in *Review of Site Specific Remediation Criteria 2025* (AECOM, 2025a) and have been updated to consider changes since the RC were initially derived, including changes in:

- Proposed Site development.
- Relevant Australian or international guidance used to assess potential risks and derive RC.

The review of RC concluded that the AECOM (2016) RC are overall appropriate for ongoing assessment of potential human health risks which may arise from the land uses proposed in the Precinct Plan, including stadium construction, in areas where groundwater will be 1 m below the final surface or deeper.

Minor updates to the RC were recommended, to align with the updated tolerable concentration in air (TC) adopted for ethylbenzene in the HSLs from the ASC NEPM and to clarify where RC based on the vapour inhalation pathway exceed theoretical soil saturation limits or water solubility limits and therefore this pathway is not limiting.

As all recommended changes increase adopted RC values, the results of previous assessments using the AECOM (2016) RC are considered conservative and applicable for assessment of potential risks for development under the Precinct Plan (MPDC, 2024). As such, re-review of existing assessments for updated criteria is not considered required.

However, the updated RC derived in AEOCM (2025b), described in **Section 3.2**, have been used to assess if any additional remediation or management measures are required for the proposed future development of the Site.

5.5 Collection of Additional Environmental Data

Since issue of the Site Suitability Statements between 2019 and 2021, the following investigations or assessments have been conducted which have collected additional data from soil, groundwater or soil vapour relevant to the areas considered in this review:

- Acid Sulfate Soil (ASS) investigations conducted between 2024 and 2025
- Groundwater Monitoring Events (GMEs) conducted involving wells in or adjacent to the areas of Site Suitability Statements between 2022 and 2025.
- *In Situ* Soil Characterisation Sampling - Stadium Footprint Stage 1 and Stage 2 Bulk Excavation conducted in 2024
- Soil, groundwater and soil vapour investigations.

Each investigation is summarised below. Data from these investigations has been included in the data assessed in **Section 6.0**.

5.5.1 Acid Sulfate Soil Investigations

Acid Sulfate Soils (ASS) are soils containing sulfides, most commonly iron sulfides, which have been generated by natural bacterial activity in anerobic, sulfate rich water (e.g. coastal swamps or wetlands) and remain buried generally beneath the water table. If ASS is oxidised, sulfuric acid may be produced, in potentially high quantities which may represent a risk to surrounding land and aquatic organism and ecosystems. Unoxidised ASS, for example ASS below the water table, is referred to as Potential Acid Sulfate Soil (PASS), while ASS which has oxidised is referred to as Actual Acid Sulfate Soil (AASS).

Prior to issue of the Precinct Plan, development below the Site surface where ASS (as either AASS or PASS) was not proposed. However, the updated development includes excavation of soil, and advancement of footings to dolerite below the water table. These activities were identified as potentially contacting and disturbing ASS, if present, as the Site:

- Is located at less than 20 mAHD in close proximity to surface water bodies.
- Has been subject to historic land reclamation, where river and sea beds have been covered in fill material, as demonstrated by estuarine sands identified in soil bores.
- Is mapped as a Low (6-70%) probability of PASS on the LISTMap Coastal Acid Sulfate Soils (0-20 mAHD) layer.

In order to identify if ASS (as either AASS or PASS) is present on the Site, and to quantify what management requirements may be needed for any future development activities which may disturb it, an assessment methodology and framework, derived from the *Tasmanian Acid Sulfate Management Guidelines* (TASSMG) (DPIPWE, 2009), was prepared and implemented on-Site between April 2024 and July 2025, and is described in *Acid Sulfate Soil Investigation* (AECOM, 2025e). The locations of ASS sample bores are shown on **Figure F7**.

Overall, assessment of ASS at the Site has concluded:

- No AASS has been detected at Macquarie Point, and no ASS (either AASS or PASS) has been detected at Regatta Point.
- Oxidisable sulfides have been detected at Macquarie Point, consisting generally of sands and clays consistent with estuarine materials, and it is considered likely that river- and lake-bed materials (either originally present on Site, or used as part of historic land reclamation) is the ultimate source of this material.

  Soil with a high potential to acidify due to the presence of reduced inorganic sulphur, which is considered PASS, has been identified in:

  - Saturated soil, and soil which may have been intermittently wet at the water table.
  - Pockets of unoxidised estuarine sands in fill, characterised as black sand and gravel, which has not oxidised prior or during land reclamation, or while *in situ* on the Site.

  Management will be required for any work which may disturb or dewater PASS.
- Review of historic data identified indicators that Site groundwater may have been affected by the oxidation of sulfides, but that acidification has not occurred. Site groundwater is assessed as reasonably adequate to maintain a neutral pH in future, noting that this does not constitute protection against environmental impact if widespread or uncontrolled acidification occurs due to Site activities.
- PASS management is not considered required for the remaining unsaturated soil at the Site based on the existing Acid Neutralising Capacity (ANC) of soil, which is an order of magnitude or greater than the potential acidity. While the reported ANC may be inflated by sample preparation, it is considered suitable for use in interpretation with the safety margin of 10x, following corroboration by chip tray analysis.
- Indicative dosage rates of to treat and neutralise PASS of between 28 and 73 kg/tonne with a generic agricultural lime (aglime) if disturbed have been calculated, based on the location and treatment scenario (*in situ* vs stockpiled PASS).

The estimated rates are based on a generic assumed aglime with an Stated Neutralisation Value (SNV) ≥ 85% calcium carbonate ($CaCO_3$), and in which ≥80% of aglime particles are < 0.3mm. These parameters have been assumed based on typical aglime available in eastern Australia.

Any neutralisation agent proposed for use on the Site should be compared to these properties. While alternatives may be suitable for PASS treatment, the suitability and dosage rate of any alternative should be reviewed and verified by a suitability qualified and experienced environmental practitioner with consideration of:

- SNV and particle size distribution
- Solubility and longevity
- Potential for other environmental effects.

Any neutralisation of PASS must be verified by post-treatment laboratory analytical results.

Based on the outcomes of this assessment, it is recommended that:

- Future activities at Macquarie Point should identify all activities which have the potential to disturb or expose (i.e., dewater) PASS at the Site, and:
  - The Site Environment Management Plan (SEMP) and Construction Environment Management Plans (CEMPs) should include overarching management obligations for disturbance of ASS and/or water table drawdown via dewatering.
  - A scope specific Acid Sulfate Soil Management Plan (ASSMP) and Dewatering Management Plan (DWMP) should be developed for each discrete works package involving civil and general earthworks activities, water table drawdown via dewatering, and any other significant soil disturbance activities or changes to natural groundwater and surface water systems.

    These documents should be prepared by those undertaking works which may disturb PASS, and must include:

    - Estimated volumes and action criteria for PASS which may be disturbed by the proposed works.
    - Procedures for the handling of disturbed PASS, including verification of neutralisation, groundwater generated by dewatering, and monitoring of Site environmental conditions in the vicinity of PASS disturbances.
    - Contingency measures which are specific, measurable, and attainable, and can be implemented in a timely manner in the event that action criteria or trigger values are exceeded.
- Future structures and infrastructure at the Site should consider the potential effects of sulfides and possible acidification in design and selection of materials, and adopt appropriate mitigation measures to prevent degradation of materials overtime.
- Any groundwater, or run-off which may have come into contact with PASS, should be considered as potentially contaminated. pH and the potential to acidify should be considered in assessment any such water prior to disposal

The above recommendations should be documented in the Site Environment Management Plan (SEMP; AECOM, 2025a).

5.5.2 Groundwater Monitoring Events (GMEs) and Gauging

Since 2021, when the most recent Site Suitability Statement (Coffey, 2021b) was issued, three Groundwater Monitoring Events (GMEs) have been conducted at the Site where wells within the areas with existing Site Suitability Statements have been sampled, as listed on **Table 16** below. An additional GME was conducted at Regatta Point in 2024, but did not include any groundwater wells in the vicinity of the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, or the Precinct North, and data from this GME have not been included in this assessment.

Groundwater well locations are shown on **Figure F10** and gauging and analytical data collected from these programs are attached on **Table T5** to **Table T9**, with exceedances of adopted criteria are shown

on **Figure F13a-c**,. Results of samples with reference to Site suitability are discussed by area in **Sections 6.0** to **6.4**.

Table 16 Groundwater Monitoring and Gauging Events Completed Since 2021

Description	Dates	Wells Gauged/Sampled	Report
Targeted GME – The Gateway	30 November to 2 December 2022	<u>The Goods Shed and Yard</u> • MW127A, MW127B <u>The Promenade and Underground Carpark</u> • MW36, MW174 <u>The Gateway</u> • MW100, MW102, MW122, MW173, RS6 <u>Off-Site</u> • MW123A, MW123B, MW130_GHD, MW131_GHD, MW132_GHD, MW133_GHD, MW150	*The Gateway – Data Gap Assessment* (AECOM, 2023a)

Notes: * Gauged only

5.5.2.1 Groundwater Hydraulic Contours and Flow Direction

At the time of issue of the Site Suitability Statements, the most recent Site-wide groundwater contours used to infer groundwater flow direction were collected in November 2019 (**Figure F12a**) (AECOM, 2020i).

At that time, it was assessed that:

- The Site is underlain by a single aquifer unit (within multiple lithological units) extending to depths greater than 25.0 m bgl (the maximum depth assessed).
- Groundwater has generally been encountered in dolerite in the northern portion of the Site, and in fill material in the central, southern and eastern portions, extending into the underlying natural material including estuarine/ marine deposits, weathered Dolerite and fractured Dolerite.

- The inferred groundwater flow direction in the central and eastern areas of the Site is in a generally south to southeast direction, with steeper gradients in the north and western portion of the Site likely influenced by shallow dolerite bedrock.

  The relatively flat hydraulic gradient in the central and eastern areas of the Site is likely due to the increased depth of low permeability bedrock, and greater cross-sectional area of relatively high permeability fill and estuarine sands, increasing the potential saturated thickness of soil profile.

- Buried seawalls are noted to be below the Site and likely to have localised influence on groundwater flow direction

- The majority of Site groundwater is inferred to discharge to Sullivans Cove to the south and east of the Site. Some groundwater in the north-east may discharge to River Derwent, potentially via discharge to the Hobart Rivulet which passes under the Cenotaph grounds to the north of the Site and is understood to be in contact with groundwater.

Inferred groundwater contours at the Site developed as part of GMEs or other monitoring events conducted between 2022 and 2025, are attached as **Figure F12b-d**. A review of these contours, in particular the most recent Site-wide gauging events in February and June 2025, notes that:

- The overall flow direction (south to southeast) is generally consistent with the 2019 contours. Westerly groundwater flow into the Site from TasPorts/TasWater land on the eastern boundary is not detected in the June 2025 contours, potentially as no access to off-Site wells to the east was granted by TasPorts for this monitoring event. Some inflow from TasWater land was detected at MW159 in February 20205, and at MW167 in June 2025.

  However, this inflow, which may be related to a buried seawall from historic land reclamation (shown on **Figure F12a**) was apparent in December 2023 and February 2025, and is considered likely to be present.

- The February 2025 contours display a potential northerly flow in the Escarpment area. This was attributed at the time to lack of access to wells in this area, and the contours in June 2025 do not display any flow from the northern boundary of the Site (other than in Regatta Point), and it is not considered that groundwater from the Escarpment is likely to discharge on the northern boundary.

- The depth to groundwater in dolerite in the Escarpment and other northern areas of the Site was >3.5 mAHD in June 2025, shallower than November 2019. Historic gauging (AECOM, 2022a) had recorded groundwater elevations in this area as high as 4 to 4.5 mAHD in June 2025, and it is considered that there may be seasonal fluctuations, with increased groundwater in the north of the Site during wetter winter months.

  The detected depth of groundwater in the central and eastern areas of the Site (approximately 0.5 to 1.5 mAHD) is consistent across GMEs.

- Following installation of five groundwater wells in or near Regatta Point in 2024 (MW177A, MW178, MW179, MW180 and MW181), groundwater in the north-east portion of the Site is inferred to discharge to the River Derwent.

Overall groundwater depths, and inferred contours and flow directions, are consistent with those considered in the Site Suitability Statements and the overall discharge points of groundwater are considered the same (i.e., to Sullivans Cove and the River Derwent).

It is noted that proposed construction may come into contact with groundwater, in particular in the northern portion of the Site by the Multipurpose Stadium and Associated Concourse, and in the northeast in the proposed underground carpark, and is discussed by area in **Section 6.0**.

5.5.3 *In Situ* Soil Characterisation Sampling - Stadium Footprint Stage 1 and Stage 2 Bulk Excavation

As part of the proposed development of the Site, bulk excavation of soil is proposed to lower the surface elevation in some areas of the Site, and improve the geotechnical properties of soil beneath structures, as discussed in **Section 5.3.**

In order to facilitate off-Site disposal of soil to be excavated, additional sampling was conducted between 25 November and 11 December 2024 across the stadium footprint to a depth of approximately

2.4 mAHD to collect data for *in situ* waste categorisation of approximately 104,000 m^3 *in situ* (138,000 m^3 *ex situ* with a bulking factor of 1.33 applied) of soil.

The waste characterisation process was conducted with reference to:

- Tasmanian waste categories provided in *Information Bulletin No. 105: Classification and Management of Contaminated Soil for Disposal, Revision* (IB105) (EPA, 2018), with additional classification categories for Level 1 – Fill material introduced by amendment of the *Environmental Management and Pollution Control Act 1994* (the EMPCA) and the *Environmental Management and Pollution Control (Waste Management) Regulations 2020* in 2021.
- Sample density and statistical assessment of waste categories provided in *Publication IWRG702 - Industrial Waste Resource Guidelines: Soil Sampling for Waste Soils* (IWRG702) (EPA Victoria, 2024).

The assessment of soil was reported in *In Situ Soil Characterisation and Waste Management Plan – Stage 1 and Stage 2 Bulk Excavation, Macquarie Point Development Project* (AECOM, 2025b), and consisted of:

- Advancement of 125 boreholes on an approximate 20 x 20 grid across the proposed Stage 1 and Stage 2 excavation areas, as shown on **Figure F8**. It is noted that some deviations from the grid occurred due to the existence of existing structures (the Goods Shed).

  IB105 notes that, in the event *in situ* classification of soil is conducted, *Australian Standard 4482.1 - Guide to the investigation and sampling of sites with potentially contaminated soil. Part 1: Non-volatile and semi-volatile compounds* (AS4482.1) should be consulted to obtain a representative number of samples. Table E1 in Appendix E of AS4482.1 suggests that the minimum of 55 sample points using a square grid are required to characterise an area of 5.0 ha, and that sites greater than this area should be subdivided into smaller areas. The proposed excavation extent is approximately 5.8 ha, and a greater number of sample points was required. The 125 boreholes advanced were considered sufficient to collect representative samples of the Site.
- Collection 518 primary soil samples. Samples were collected at 0.5 m bgl and every 0.5 m following until the target depth of the borehole (~2.4 mAHD) was reached. Additional samples were collected if a change in lithology was observed by field staff.

  Key field observations during advancement of boreholes were:

  - Anthropogenic material (such as fragments of brick, metal, plastic, glass, wood, bitumen, ceramics, concrete and coal noted in various locations) were noted in anthropogenic fill at the surface to between 1 and >3.5 m bgl, and is considered likely to be the material introduced to the Site during progressive historical land reclamation events.
  - Odours and elevated vapour levels (recorded by photo-ionisation detector [PID]) were detected in locations:
    - In the former gasworks area, and are attributed to gasworks operations. This area is outside the areas assessed in the report and will be considered as part of the Gateway assessment area for the purposes of the Environmental Audit.
    - At 3 m bgl in bore H10, located in the Promenade and Underground Carpark area. This reading was close the water table and in the vicinity of historic Light Non-Aqueous Phase Liquid (LNAPL) Plume A2, and is attributed to groundwater fluctuation.
  - One fragment of ACM was observed at 0.5 m bgl in borehole E13, located in the Gateway area, which is not considered in this report. However, the ACM was non-friable and no asbestos fibres were observed at the Limit of Reporting (LOR) of 0.01%$^{w}/_{w}$ in the soil surrounding the fragment, and this fragment is not considered to constitute a potential hazard to future development.
- Samples were analysed for the following suites:
  - 168 samples (33%) were analysed for Total Contaminant Concentrations (TCC) of the CoPC listed on Table 2 of IB105, excluding tributyltin (TBT) which has not been detected on Site or identified as a CoPC based on historic uses.

- 350 samples (67%) were analysed for TCC of a targeted CoPC suite, based on previous investigations of the Site, consisting of BTEXN, TPH/TRH, lead, arsenic, and PAHs
- 179 samples were further analysed for Leachate Contaminant Concentration (LCC) for waste classification purposes, consisting of:
  - 75 samples analysed for metals, primarily lead, but also including mercury, arsenic, cadmium, chromium and zinc in targeted locations.
  - 139 samples were analysed for PAH LCC.

- Analytical results were screened against the waste categorisation criteria provided in IB105, and against the HIL D – Commercial/Industrial Land Use provided in the ASC NEPM to assess for potential land fill disposal.

  The screening of results concluded that the soil to be excavated in the Stage 1 and Stage 2 areas was primarily suitable to classify as Level 2 – Low Level Contaminated Soil, with the exception of three areas of potential Level 3 – Contaminated Soil or Level 4 – Contaminated Soil Requiring Remediation soil, consisting of:

  - Potential hotspots of approximately 18 m radius centred on:
    - J06, located on the boundary of the Escarpment and the Promenade and Underground Carpark, where lead and benzo(a)pyrene toxicity equivalency quotient (TEQ) LCC exceeded the Level 2 criteria in IB105
    - M13, located in the Goods Shed and Yard, where lead LCC exceeded the Level 2 criteria in IB105
  - Soil to be excavated in the former gasworks area (the Gateway), surrounding soil bores E15-E16, F15-16, G15-G18 and H15-H18, which had elevated concentrations of naphthalene. The Gateway is outside the areas considered in this report and will be considered separately.

Section 6.0 presents the soil data collected by this program for each assessment area, considered against Site criteria in **Section 3.0**.

5.5.4 Soil, Groundwater and Soil Vapour Investigation 2025

In early 2025, an inspection at the Site (AECOM, 2025f) identified a number of the groundwater wells and soil vapour bores which informed the previous Site Suitability Statements were lost, destroyed, or otherwise unsuitable for monitoring to review and assess if any changes in the Site condition had occurred. In order to restore the monitoring network, and collect updated data on the Site condition, in June 2025, the following activities were conducted at the Site:

- Advancement of 45 locations via sonic core drill rig and hand augering, consisting of :
  - 19 new groundwater wells
  - 16 new soil vapour bores
  - 10 new soil bores for assessment of ASS
- Repair of 25 damaged groundwater wells.
- Development of 20 groundwater wells (19 new wells, and one well [MW128B], which had an obstruction removed)
- Completion of a Site-wide GME and soil vapour monitoring event, including LNAPL transmissivity testing at three locations.

The completed works and outcomes are discussed in *Soil, Groundwater and Soil Vapour Investigation 2025* (AECOM, 2025d). Data collected with regards to soil, groundwater and soil vapour contamination relevant to this report are discussed by assessment area in **Section 6.0**, with specific assessment of LNAPL Plumes, and risks of off-Site ecological receptors, are provided in **Section 5.5.4.1** and **Section 5.5.5** below respectively.

5.5.4.1 LNAPL Plume Assessment

As part of the 2025 assessment (AECOM, 2025d), specific activities undertaken to investigate/assess LNAPL Plumes A1 and A2, and former LNAPL Plume A3, were:

- Installation of replacement wells to assess and delineate the LNAPL Plumes.
- Where LNAPL was present, completion of LNAPL transmissivity testing or, if sufficient LNAPL for this test was not present, qualitative assessment of LNAPL recharge.
- Sampling of groundwater was conducted for CoPC associated with the LNAPL previously identified in this plumes (degraded diesel), consisting of TRH, BTEXN, and metals.
- Soil vapour bores were installed at each LNAPL plume to assess potential vapour concentrations.

Groundwater wells and soil vapour bores delineating and/or assessing LNAPL and former LNAPL plumes are listed on **Table 17** and **Table 18** below.

Table 17 LNAPL Plume A1 and A2, and Former LNAPL Plume A3, Groundwater Assessment Wells

Well ID	Purpose	Groundwater Sampled?
MW36	Delineate LNAPL Plume A2 to the west	Yes
MW146	Delineate LNAPL Plume A2 to the east	No
MW155	Delineate Former LNAPL Plume A3 to the east	Yes
MW176	Delineate LNAPL Plume A2 to the south-east	No
MW177	Delineate LNAPL Plume A1 to the east / Former LNAPL Plume A3 to the north-east	No
MW182	Delineate LNAPL Plume A1 to the north-east	Yes
MW183	Target LNAPL Plume A1 location	Yes
MW184	Delineate LNAPL Plume A1 to the south / LNAPL Plume A2 to the north	Yes
MW185	Target LNAPL Plume A2 location	No
MW186	Delineate LNAPL Plume A2 to the south	Yes
MW187	Target Former LNAPL Plume A3 location	No
MW190	Delineate LNAPL Plume A1 to the north-east	Yes
MW191	Delineate LNAPL Plume A1 to the west / LNAPL Plume A2 to the north-west	Yes

Table 18 LNAPL Plumes A1 and A2, and Former LNAPL Plume A3, Soil Vapour Assessment Bores

Soil Vapour Bore ID	LNAPL Plume
SV31	LNAPL Plume A1
SV32	LNAPL Plume A2
SV33	Former LNAPL Plume A3

The following was observed during investigation in 2025:

- LNAPL sheen and a hydrocarbon odour were noted on soil during installation of MW186, and hydrocarbon odours and/or staining were noted during installation of MW183, MW185, MW190, and SV31.
- LNAPL sheen was observed in MW185 (targeting LNAPL Plume A2) and MW187 (targeting Former LNAPL Plume A3), and LNAPL (5mm) was noted in groundwater removed from MW185 during development on 13 June 2025. However, no measurable LNAPL was present in these wells up to three weeks following installation.
- No LNAPL was observed in well MW183, which was targeting the historic location of LNAPL Plume A1, or in surrounding wells.

- No groundwater concentrations indicative of LNAPL (i.e., exceeding the ASC NEPM solubility limits) were detected in any sampled well in 2025 in the vicinity of LNAPL Plumes A1, A2 or Former LNAPL Plume A3.
- Methane in excess of the adopted criteria for soil vapour was detected in all three soil vapour bores. However, no hydrocarbons vapours indicative of potential risks to future Site uses were detected.

Remediation of LNAPL using a fixed TFE system was last conducted between 2015 and 2017, and further direct remediation was assessed as no longer practicable (AECOM, 2021i) as:

- LNAPL recovery by the TFE system was asymptotic and demonstrated marginal recovery rates.
- The residual LNAPL in plumes was stable or decreasing.
- No unacceptable risks to future human health or ecological receptors associated with the LNAPL plumes was identified if the procedures within the SEMP were adopted for current and future Site uses.

These end-points were assessed in June 2025 (AECOM, 2025d), and, based on field observations and soil vapour and groundwater data collected from replacement wells, were considered to be still valid. The historic LNAPL plumes are not considered represent a risk to future Site users, if the Site is managed as described in the SEMP, and further active remediation or clean-up is not likely be practicable or remove quantities of LNAPL for the Site which will meaningfully affect the environmental condition or risks to future users of the Site or surrounding areas.

While the replacement well and soil vapour bore network is not as extensive as previously present, and some residual LNAPL may be present between current bore locations, it is not considered that this would represent a risk to future development or Site use.

It is also noted that LNAPL Plume B, located in the Precinct South, was also assessed as part of the 2025 GME, and is not considered likely to be mobile. LNAPL Plume B is hydraulically down-gradient of the areas which have had issued Site Suitability Statements and is not considered to have potential to affect the environmental status of these areas. Assessment and management of environmental risks associated with LNAPL Plume B is included in the Precinct South CUTEP report (AECOM, 2025g).

5.5.5 Risks to Off-Site Ecological Receptors

While soil at the Site has reported CoPC concentrations which could present risk to ecological receptors, no ecological receptors are currently present on the Site, or are proposed to be present following development. Risks from soil to ecological receptors are managed by the SEMP, which removes pathways between soil and receptors by:

- Barrier layers (either at the surface, or as part of planting design for in-ground plants as discussed in **Section 5.2.3**) are required in the SEMP and will prevent contact with Site soil.
- No extractive use of groundwater will be permitted.

Contamination present in groundwater may impact off-Site ecological receptors at the point of discharge, which have been inferred (based on groundwater flow direction) as:

- Sullivan's Cove to the south and east of the Site
- The River Derwent to the north (potentially via the Hobart Rivulet, which is understood to be in contact with groundwater to the north-east of the Site)

The *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), conducted based on groundwater data available to 2019, concluded based on a weight of evidence approach that groundwater emanating from the Site was unlikely to represent an unacceptable risk to off-Site ecological receptors in either of these aquatic systems.

An addendum to this assessment was prepared in 2025 (AECOM, 2025i), and concluded that overall, based on the review of updated Site data and information, the outcomes of the AECOM (2020h) assessment remain valid and suitable for ongoing assessment of the Site. No material changes in the off-Site aquatic ecological risk profile have been identified, and ecological risk to receptors in the River Derwent and Sullivans Cove remains low.

5.6 Closure of the Macquarie Point Sewage Treatment Plant (STP) and Realignment of the Main Hobart Pipeline

At present, the Main Hobart Pipeline, a sewer line connected from metropolitan Hobart to the Macquarie Point Sewage Treatment Plan (the STP) to the east of the Site, enters the Site from Evans Street on the south boundary of the Site and passes north though the Goods Shed and Yard, the Promenade and Underground Carpark, and the Precinct North.

TasWater, who own and operate the Main Hobart Pipeline and the STP, are currently constructing a Sewage Pumping Station (SPS) and emergency storage basin to the east of Macquarie Point and south of the STP, and plan to shut down and decommission the STP once completed, with details of the proposed land use available in the Environmental Impact Statement (EIS) for the new pumping station (TasWater, 2023).

In addition, the Main Hobart Pipeline will also be shut down and either removed or filled with grout, with removal as the preferred option, and replaced by a new off-Site sewer line to the south and east of the Site.

Installation of the new sewer line will be undertaken by the Corporation, who currently plan to undertake installation using horizontal micro-tunnelling, a trenchless horizontal drilling process where a surface controlled boring machine advances the excavation and installs pipeline sections behind it as it goes. Groundwater and soil is removed behind the boring machine as a slurry, with bentonite introduced to provide support around the pipeline. The Corporation has undertaken an initial costing assessment and will engage a contractor to undertake sewer installation once approval for the work is received from the Tasmanian Government.

The Corporation's planned route for the new line is attached as **Appendix E**. While not currently contemplated, if the route was modified such that the pipeline was installed within the Site, additional assessment of Site Suitability would be required.

These changes are not anticipated to increase the overall environmental risk profile of the Site as:

- The existing Main Hobart Pipeline is likely to be removed as part of future construction work, although an option to seal and fill it with grout may be considered. No environmental risks associated with this pipeline have been previously identified while in operation, and it is not considered that either removal or decommissioning via grouting would introduce any additional risks to future Site users, and that risks associated with either option could be managed by a CEMP informed by the SEMP.

  Elevated lead concentrations, in excess of the RC protective of future Intrusive Maintenance Workers, were identified in soil in an exclusion zone around the pipeline during remediation work in 2020 (AECOM, 2021e). Excavation and validation of removal of these impacts is not considered to be required as:

  - The affected area will be below the future Multipurpose Stadium, and specifically below the playing surface and will not be frequently accessed by intrusive maintenance workers.
  - The typical minimal level of Personal Protective Equipment (PPE) within the SEMP includes measures to minimise potential ingestion or inhalation of soil, including neck to toe clothing, impervious gloves for contact with soil, and potential disposal coveralls/dust masks.
  - Potential risks associated with this soil are included in the SEMP, and are required to be managed during removal by a CEMP, or during Site maintenance activities.

  As an additional measure, the SEMP will be updated with:

  - A requirement that any subsurface lines or services beneath proposed buildings or structures be installed in conduits or clean soil corridors (as previously required for services in the Promenade and Underground Carpark [Coffey, 2021a]).
  - Explicit mention of inhalation/ingestion risks for existing Site soils in the section discussing PPE.

- The new sewer line will be located off Site and hydraulically down-gradient. While the new sewer line will be in contact with groundwater, the micro-tunnelling process does not require excavation of

a trench or introduction of potentially higher permeability materials around the pipeline (i.e., bedding sands) which could produce a preferential pathway for potentially contaminated groundwater transport.

The Environmental Impact Statement (EIS) for the new pumping station (TasWater, 2023) did not identify any new impacts or environmental risks arising from the pumping station. This EIS has been submitted to and accepted by EPA Tasmania.

It is noted that AECOM provided input into the EIS for TasWater, separate to our ongoing consulting role for the Corporation as part of the development of the Site.

In addition, soil excavated as part of the construction of the pumping station was temporarily stockpiled and treated on the Site in 2025, and consisted of:

- Mixing Area 1 - Saturated fill and estuarine sands, considered potential PASS, was stockpiled in the Escarpment and treated with:
  - Agricultural lime (aglime) to neutralise possible acidification of PASS
  - Triple Super Phosphate (TSP) and moisture to reduce potential lead and copper leachability.
- Mixing Area 2 - Unsaturated fill was stockpiled in the Promenade and Underground Carpark, and the Gateway, and treated with TSP to reduce potential lead and copper leachability.

Mixing Area 1 and 2 are shown on **Figure 2** below.

Figure 2 TasWater Stockpiling and Soil Treatment Areas, 2025 (TasWater, 2025)

TasWater's proposed soil handling and stockpile management methodologies were developed to prevent any contact between Site soil and the soil excavated off-Site. The treatment and disposal of up to 17,500 m^3 of soil was undertaken under Environmental Approval No. 11933_2 and waste disposal letters D234398 and D24-212896, issued by EPA Tasmania, and the proposed interim use, including TasWater soil handling and stockpile management methodologies, was reviewed and approved by the Environmental Auditor prior to commencing with key controls against contamination of the Site including:

- Stockpiling of materials on hardstand
- Bunding and run-off capture.

All TasWater stockpiles of soil generated by the excavation of the pumping station were removed from the Site as of October 2025. Two small stockpiles of fine crushed rock (road base) which were imported to the Site for stockpile manager remain in Mixing Area 1, but have not come into contact with excavated soil and are not considered a potential source of contamination.

No spills or releases of soil or treatment reagents were recorded by TasWater during the treatment process. No residual soil, or damage to the underlaying hardstand in the stockpiling areas which could indicate large scale release or impact to the Site, were present in the final condition report photographs provided by TasWater. All stockpiles temporarily stored on the Site were categorised and disposed of as either Level 1 – Fill Material, or Level 2 – Low Level Contaminated Soil (IB105).

6.0 Area Specific Data Assessment

Summaries of the currently existing Site Suitability Statements are provided in **Section 4.0**. In addition, general changes, applicable to all areas, have been identified and are discussed in **Section 5.0** regarding:

- Changes to SEMP(s) issued at the time of Site Suitability Statements, including:
  - Issue of a Site-wide SEMP, superseding the initial area-specific SEMPs previously issued.
  - Extension of vapour intrusion mitigation requirements
  - Updated designs for in-ground planting
- Review and update of the Site Specific RC
- Collection of additional environmental data relating to ASS,, and other soil, groundwater and soil vapour
- Closure of the Macquarie Point Sewerage Treatment Plan and removal of the Main Hobart Pipeline sewer line.

Specific additional environmental data, and the area specific implications of the updated land uses and surface elevations proposed, are discussed by assessment area in **Sections 6.1** to **6.4** below.

6.1 The Goods Shed and Yard

6.1.1 Additional Environmental Data

6.1.1.1 Soil

Additional soil data for the Goods Shed and Yard collected since issue of the Site Suitability Statement consists of:

- 54 samples collected during *in situ* sampling to categorise soil to be excavated from this area (AECOM, 2025b), from 18 locations at *in situ* categorisation grid based sample bores K13 to K18, L13 to L18, and M13 to M18.
- One sample collected during installation of soil vapour bore SV36 in 2025 (AECOM, 2025d).

Locations of soil samples which have provided new data are shown on **Figure F8** and **Figure F10**. Results of soil sampling are screened against the Tier 1 criteria in **Table T1** to **Table T3**, and against the RC in **Table T4**.

Soil locations with exceedances of adopted criteria collected since issue of the Site Suitability Statements are shown screened against criteria in **Figure F11a-e**.

Due to the number and density of sample locations, visual display of exceedances of Tier 1criteria for the *in situ* characterisation samples (AECOM, 2025b) on a figure is not practicable, and review of these samples against Tier 1 criteria are discussed below. Exceedances of the RC in the *in situ* characterisation samples is shown on **Figure F11e**.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in soil samples collected after issue of the Site Suitability Statement:

- Low / Medium to High Density Residential – TRH >C16-C34; metals (lead); PAHs (benzo(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3)pyrene)
- Commercial/Industrial – lead, PAHs (benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3)pyrene)
- Recreation / Open Space - TRH >C16-C34; lead; PAHs (benzo(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3)pyrene)

- Modified / Highly Modified Ecosystems – TRH >C16-C34, metals (copper, lead[2], nickel, zinc), PAHs (benzo(a)pyrene)
- Vapour Intrusion (Residential) – TRH >C10-C16 (excluding naphthalene).

Residential use is not proposed in this area, or in any structures which have footprints which included this area, and thus the detected exceedance of the vapour intrusion criteria for residential use is not considered to represent an unacceptable risk to human health for the proposed development. The required vapour mitigation measures provided in the SEMP and discussed in **Section 5.2.2** provide additional mitigation against vapour intrusion.

The other PEVs which are precluded, based on exceedances of criteria detected in soil in the new data considered in this assessment, are consistent with the level of residual contamination described in the existing Site Suitability Statement. The Site is considered suitable for the new development if the mitigation and management measures detailed in the SEMP are implemented to prevent a complete exposure pathway from being established between future Site users and residual soil contamination.

Exceedances of the RC were detected for Intrusive Maintenance Workers for lead in *in situ* categorisation grids K14, K18, L13, M13 and M14, shown on **Figure F11e**.

Appendix B7 of the ASC NEPM notes that, in a situation where contamination concentrations in some samples exceed the nominated criteria, a statistical appraisal may be undertaken to assess the significance of the exceedance(s).

The Site may be considered suitable for the intended use if:

- The 95% upper confidence limit (UCL) of the arithmetic mean concentration of the contaminant is less than the criteria.
- No individual sample concentration exceeds 250% of the criteria value.
- The standard deviation of the sample concentrations does not exceed 50% of the criteria value.
- A sufficient number of samples has been collected using a spatially representative sample design.

While Appendix B7 of the ASC NEPM specifically references HILs, this statistical approach is considered suitable for application to other adopted criteria, as it assessed the likely overall exposure to contaminants a Site user may experience.

Statistical characteristics of lead concentrations from new samples in the Goods Shed and Yard, including 95%UCL and standard deviation, has been calculated using *ProUCL 5.1.001 – Statistical Software for Environmental Data Sets with and without Nondetect Observations* (ProUCL) (US EPA, 2016). Inputs and outputs generated and used in ProUCL are attached in **Appendix F**, and are assessed in **Table 19** below

It is noted that:

- For sample points where multiple samples were collected and submitted for analysis (i.e., laboratory duplicate samples), the higher reported CoPC concentration was used when calculating statistical values.
- Statistical assessment of lead in soil was conducted for both all new samples collected, and for all new samples excluding one sample, M13_1.0. The rational for exclusion of this sample is discussed below **Table 19**.

[2] It is noted the only lead exceedance of Tier 1 criteria for ecosystems occurred in sample M13_1.0, which is considered an outlier as discussed below **Table 19.**

Table 19 Statistical Appraisal of New Soil Data (Lead) - The Goods Shed and Yard

Requirement	Criteria (Lead)	Assessed Data Points	
		All Data Points	M13_1.0 Excluded
The 95% UCL of the arithmetic mean concentration is less than the criteria	95%UCL < 620 mg/kg	537.7 mg/kg - PASS	251.4 mg/kg – PASS
No individual sample concentration exceeds 250% of the criteria value	Maximum concentration < 1,550 mg/kg	9,220 mg/kg - FAIL	1,100 mg/kg – PASS
The standard deviation of the sample concentrations does not exceed 50% of the criteria value	Standard Deviation < 310 mg/kg	1,195 mg/kg - FAIL	229.8 mg/kg - PASS
A sufficient number of samples has been collected using a spatially representative design	As discussed in **Section 5.5.3**, the number of boreholes advanced in a grid pattern (within the practicable limitations of existing Site structures) for this assessment exceeded the density recommended by AS4482.1, and soil samples were collected every 0.5 m of depth. This sampling density and volume are considered to be sufficient and spatially representative of the volume of soil considered.		

From this assessment, the lead concentration in soil in one sample, collected at 1 m bgl in bore M13, was significantly elevated. If data from this sample is excluded in statistical assessment, the standard deviation and individual maximum concentration criteria from the ASC NEPM are passed.

However, it is considered that this detection represents an outlier and is not characteristic of the bulk soil in the area, as the detected concentration (9,220 mg/kg), is approximately 838% of the next highest detected lead in soil concentration in this data set (1,100 mg/kg at 1.5 m bgl in bore K14), and 560% of the highest lead concentration detected in soil (1,640 mg/kg at 1.9 m bgl in bore BH39) in the data which informed the Site Suitability Statement for this area (Coffey, 2019).

If excluded from the statistical assessment, the remaining lead detections in soil in this area pass the statistical appraisal requirements of the ASC NEPM and are not considered to represent a risk to future intrusive maintenance.

Remediation via excavation of this area is not currently practicable due to the active Site use as a carpark and transport corridor for Site tenants. It is noted that the soil at M13, and all the locations where additional new soil data considered in assessment of this area was collected, is planned for excavation and removal as part of the proposed Site development. The detection at M13_1.0 is delineated vertically (by M13_1.5) and laterally (by M11, M12, L13, and N13) and is not considered likely to indicate an extensive area of impact.

In order to prevent unacceptable risk during removal, or in the event that excavation does not occur, the SEMP should be updated with the following information and requirements:

- The elevated lead detection at M13 should be noted as a potential area of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.
- Any subsurface services in this area should be installed in sealed conduits or clean soil corridors to minimise any ongoing contact with existing Site soil by future maintenance workers.

Based on the soil data collected since the Site Suitability Statement, no new unacceptable risks to future Site users are considered to be present if these mitigations are incorporated into the SEMP.

6.1.1.2 Groundwater

The groundwater wells, in or adjacent to the Goods Shed and Yard, which have had groundwater samples collected and analysed since the Site Suitability Statement for this area was issued are listed on **Table 20** below.

Table 20 Groundwater Wells in and adjacent to the Goods Shed and Yard

Well ID	Description	Included in Existing Site Suitability Statement?	Recent GME Data		
			Targeted GME – The Gateway (2022)	Targeted GME – The Precinct South (2023)	Site-Wide GME (2025
Within the Goods Shed and Yard

MW133_GHD	Shallow (<10 m bgl) aquifer well, south-west and down-gradient off-Site	✓	✓	×	✓
MW150	Shallow (<10 m bgl) aquifer well, south-east and down-gradient off-Site	×	✓	✓	✓
MW129	Deep (<10 m bgl) aquifer well, south-west and cross-gradient in the Gateway	✓	×	×	×
RS6	Shallow (<10 m bgl) aquifer well, south-west and cross-gradient in the Gateway	✓	✓	×	✓

Notes: ✓: Analytical data available; ×: Analytical data not available

Sampling has been undertaken with good spatial and temporal distribution around the Goods Shed and Yard since issue of the existing Site Suitability Statement, and is considered sufficient to identify if any changes in groundwater contamination which could affect risk status have occurred.

Groundwater well locations are shown on **Figure F10**. Results of groundwater sampling are screened against the Tier 1 criteria in **Table T6** to **Table T8**, and against the RC on **Table T9**, with exceedances of adopted criteria are shown on **Figure F13a-c**. Groundwater samples have typically been assessed for key CoPC with exceedances detected in previous GMEs, including TRH/TPH, PAHs, and metals.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in groundwater samples collected after issue of the Site Suitability Statement:

- Drinking Water (Human Health) – Metals (arsenic, manganese); PAHs (naphthalene, benz(a)anthracene, benzo(a)pyrene); Cyanide (total)
- Drinking Water (Aesthetics) – Major Ions (chloride, sodium); Total Dissolved Solids (TDS)
- Recreation (Primary/Secondary Contact) – Metals (manganese); PAHs (naphthalene, benz(a)anthracene, benzo(a)pyrene)
- Eco-system protection – TRH (>C10-C40 (sum)); metals (aluminium, copper, manganese); PAHs (anthracene, phenanthrene, fluoranthene, benzo(a)pyrene); Nutrients (ammonia (as N))
- Vapour Intrusion (Structures) – Methane.

These CoPC and concentrations are consistent with the data considered in the existing Site Suitability Statement, with the exception of the methane in groundwater, It is noted that:

- Groundwater is not considered likely to be extracted for drinking purposes, based on the available urban reticulated water supply at the Site and surrounding areas and the high TDS concentrations, and extraction of groundwater for drinking purposes is restricted by the SEMP.
- Exceedances of recreation criteria are delineated and below criteria in MW153, located down-gradient of the Site prior to the inferred point of discharge (Sullivan's Cove to the south), and are not considered likely to be above criteria at the point of discharge or where contact with receptors may potentially occur.
- Assessment of vapour intrusion based on methane concentrations in groundwater was not assessed in the existing Site Suitability Statement, where vapour intrusion risks in existing structures were assessed via soil vapour and indoor air sampling. Methane intrusion was not considered to represent an unacceptable risk to users of the existing structure in area (the Goods Shed), based on the previous sampling.

  However, the concentrations of methane detected in new groundwater data represent a potential risk of methane infiltration for future development which will require mitigation as described in **Section 5.2.2** and documented in the SEMP.
- As discussed in **Section 5.5.5,** the *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), including the 2025 addendum (AECOM, 2025i) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).

LNAPL Plumes A1 and A2 are inferred upgradient of the Goods Shed and Yard. However, LNAPL was not detected in intervening wells MW175, MW176, or MW146 in the 2025 GME (AECOM, 2025d).

Based on assessment of LNAPL Plumes in 2025 (refer to **Section 5.5.4.1**), detectable LNAPL was not present in or adjacent to this assessment area, although sheen was reported in well MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3). No groundwater concentrations indicative of free-phase LNAPL were detected, and LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development, provided the controls in the SEMP (AECOM, 2025h) are implemented.

LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development.

No exceedances of groundwater RC have been detected in or adjacent to the Goods Shed and Yard in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in the Site Suitability Statement for this area, and no requirement for groundwater remediation is considered to be present.

Additional management of risks of potential future methane infiltration are considered to be required for the Goods Shed and Yard to be suitable for future development, with management measures documented in the SEMP and described in **Section 5.2.2**.

Based on the distribution (temporal and spatial) of groundwater sampling, the consistency of results with previous monitoring, and no exceedances of RC detected, there have been no other changes in groundwater conditions which would indicate an unacceptable risk to future Site users since issue of the Site Suitability Statement for this area, if the management controls within the SEMP are implemented.

6.1.1.3 Soil Vapour

One soil vapour sampling event, conducted in 2025 (AECOM, 2025d), has occurred involving locations in the Promenade and Underground Carpark since the issue of the Site Suitability Statement. Soil vapour sampling locations and results are shown on **Figure F14**, and results of sampling are presented in **Table T10**.

No exceedances of the adopted soil vapour criteria have been detected in the one soil vapour bore within the Goods Shed and Yard (SV36) which has been sampled after the Site Suitability Statement was issued.

However, it is considered that there are potential risks of soil vapour intrusion under the proposed development of the Site as:

- Methane concentrations in groundwater, which exceed the adopted criteria for potential risk near foundations (**Section 6.1.1.2**).

  Methane in groundwater was not considered in the existing Site Suitability Statement, as potential risks of methane (and other vapour) intrusion into existing buildings was assessed on the basis of direct sampling of sub-slab vapour and indoor air and did not identify any risks. However, new buildings and structures will have different interaction with soil vapour and may have different migration pathways and potential concentrations.

- Soil vapour from other parts of the Site has the potential to laterally migrate along the base of proposed structures (i.e., the Multipurpose Stadium) which extend beyond the boundaries of this area, and may have a risk of infiltration in this area (**Section 6.5**). Concentrations of methane, BTEXN, and TPH/TRH have been detected in soil vapour in areas of the Site which share a building footprint with this area.

On this basis, it is considered that there are potential risks of vapour intrusion into new structures in this area by methane, and by BTEXN and TPH/TRH vapours if development continues as proposed.

Mitigation and management measures, as discussed in **Section 5.2.2**, will be required for future development.

6.1.2 Change in Land Use and Elevation

The current Site Suitability Statement for the Goods Shed and Yard allows for *retail / commercial / recreational / public open space use and other less sensitive uses*, subject to specific conditions which are detailed in Site Suitability Statement. The updated uses of this assessment area, consisting of the Multipurpose Stadium and Associated Concourse, are considered commercial/industrial uses, and the existing Site Suitability Statement is considered applicable for the current surface elevation.

The proposed final surface elevation of the majority of the area is between 2.9 to 3.0 mAHD, which would require a reduction of 0.5 to 1.5 m below the current grade, as shown on **Figure F5**. Deeper excavations may be required for installation of:

- Footings or foundations, which are likely to extent to bedrock.
- A layer of imported engineered fill and concrete slab, at least 1 m thick (**Figure F6** and **Appendix C**), noting that this additional excavation and rebuild of surface level is not yet confirmed as part of Multipurpose Stadium design.

The existing Site Suitability Statement and supporting assessments did not allow for any change in the existing surface elevation, and further included an assumption that intrusive maintenance works would be unlikely to take place at more than 2 m below current surface level. Additional risks may exist during construction or ongoing Site use from contact with deeper soil, or from increased risks of vapour intrusion as less vertical distance between potential vapour sources is present.

In addition, a proposed structure (the multipurpose stadium) extends beyond the assessment area boundaries, and must be considered in assessment of the suitability of development.

It is noted that groundwater beneath the Goods Shed and Yard has been historically detected at between 0 and 1 mAHD (see **Figure F12a-d**), and no contact with groundwater is expected or should occur during long term Site use. Any potential contact with groundwater should be managed in accordance with the SEMP, and by a CEMP during construction.

In order to manage and mitigate risks to future Site users from changes to elevation, the next update to the SEMP will include the following requirements:

- Any engineered fill or other materials used to increase the surface level to 3 mAHD must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.
- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Vapour protection for CS3, as discussed in **Section 5.2.2**, with independently verified design and installation is to be included in any structures to be established in this area. Any selected protection measure must be suitable to prevent vapour intrusion from TPH, BTEXN, and methane.
- While not currently proposed as part of the development of this area, the SEMP should be updated to include the following planning control for any future structures where groundwater may be at or within 1 m of the surface:
  - Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, design and construction must include measures to prevent:
    - Potential vapour intrusion into buildings and structures as discussed in **Section 5.2.2**.
    - Groundwater intrusion into buildings and structures such as drainage or tanking. Any drained groundwater must be considered potentially contaminated waste and be removed by a licenced waste transporter or discharged under a trade waste agreement.
    - Any dewatering must also consider and include measures to prevent potential exposure and oxidation of PASS in any previously saturated soil which is drained.
- Prior to development of this area, Site Suitability Statements must be issued for portions of the land beyond the assessment area boundaries which proposed building structures extend to. The structures which are currently proposed across multiple assessment areas are listed in **Table 27** in **Section 5.3**. The updates and management measures relating to ASS described in **Section 5.5.1** must also be implemented.

If the above mitigations and management measures are implemented, no unacceptable risks to future users are considered to be introduced by the proposed change in land use and elevation.

6.2 The Escarpment (Audit Area 4 West)

6.2.1 Additional Environmental Data

6.2.1.1 Soil

Additional soil data for the Escarpment collected since issue of the Site Suitability Statement for this area consists of:

- 25 primary samples collected during *in situ* sampling to categorise soil to be excavated from this area (AECOM, 2025b), from 9 locations at *in situ* categorisation grid based sample bores E7, E8, F7, F8, G6, G7, H6, H7, and I6.
- Four primary samples collected during installation of groundwater wells MW120A and MW194 in 2025 (AECOM, 2025d).

Locations of soil samples which have provided new data are shown on **Figure F8** and **Figure F10**. Results of soil sampling are screened against the Tier 1 criteria in **Table T1** to **Table T3**, and against the RC on **Table T4**.

Soil locations with exceedances of adopted criteria collected since issue of the Site Suitability Statements are shown screened against criteria in **Figure F11a-e**.

Due to the number and density of sample locations, visual display of exceedances of Tier 1criteria for the *in situ* characterisation samples (AECOM, 2025b) on a figure is not practicable, and review of these samples against Tier 1 criteria are discussed below. Exceedances of the RC in the *in situ* characterisation samples is shown on **Figure F11e**.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in soil samples collected after issue of the Site Suitability Statement:

- Low / Medium to High Density Residential – metals (lead); PAHs (benzo(a)anthracene, benzo(a)pyrene, dibenz(a,h)anthracene)
- Commercial/Industrial – PAHs (benzo(a)pyrene)
- Recreation / Open Space - PAHs (benzo(a)anthracene, benzo(a)pyrene, dibenz(a,h)anthracene)
- Modified / Highly Modified Ecosystems – TRH >C16-C34, metals (copper, lead, nickel, zinc), PAHs (benzo(a)pyrene).

The other PEVs which are precluded, based on exceedances of criteria detected in soil in the new data considered in this assessment, are consistent with the level of residual contamination described in the existing Site Suitability Statement. The Site is considered suitable for the new development if the mitigation and management measures detailed in the SEMP are implemented to prevent a complete exposure pathway from being established between future Site users and residual soil contamination.

No exceedances of soil RC have been detected in or adjacent to the Escarpment in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in that assessment. In addition, exceedance of the RC in soil to the south of the Precinct North (in the Precinct South) were excavated and removed in 2023 (AECOM, 2024f), noting that while the report on this remediation has not yet been finalised, all impacted soil within the Precinct North was considered removed in the Site Suitability Statement.

No change in precluded PEVs, and no requirement for further soil remediation, is considered to be identified based on the additional data collected in the Escarpment since issue of the Site Suitability Statement.

6.2.1.2 Groundwater

The groundwater wells, in or adjacent to the Escarpment, which have had groundwater samples collected and analysed since the Site Suitability Statement for this area was issued are listed in **Table 21** below.

Table 21 Groundwater Wells in and adjacent to the Escarpment

Well ID	Description	Included in Existing Site Suitability Statement?	Recent GME Data		
			Targeted GME – The Gateway (2022)	Targeted GME – The Precinct South (2023)	Site-Wide GME (2025
Within the Escarpment					
BG1	Shallow (<10 m bgl) aquifer well, central area. Previously treated as background well – potentially screened across fill and dolerite. MW194 installed adjacent screened in dolerite	✓	×	×	✓
M3	Shallow (<10 m bgl) aquifer well, central area. Considered lost/destroyed under new roadway	✓	×	×	×
MW103	Shallow (<10 m bgl) aquifer well, south central area. Lost/destroyed.	✓	×	×	×
MW120	Shallow (<10 m bgl) aquifer well, north-west corner. Previously treated as background well – considered lost/destroyed by installation of an access stairway (the StairLink) in the area	✓	×	×	×
MW120A	Shallow (<10 m bgl) aquifer well, north-west corner. Replacement for MW120	×	×	×	✓
NR3	Shallow (<10 m bgl) aquifer well, eastern boundary. Appears to be filled with gravel / not considered suitable for sampling.	✓	×	×	×
MW194	Shallow (<10 m bgl) aquifer well, central area. Adjacent to BG1 and screened in dolerite aquifer only.	×	×	×	✓
Adjacent Areas					
MW145	Shallow (<10 m bgl) aquifer well, cross-gradient over eastern boundary in Audit Area 4 East. Casing filled with concrete – considered destroyed	✓	×	×	×
NR1	Shallow (<10 m bgl) aquifer well, cross-gradient over eastern boundary in Audit Area 4 East.	✓	×	×	×
MW121	Shallow (<10 m bgl) aquifer well, cross gradient and south-west in the Promenade and Underground Carpark.	×	×	×	✓
MW131	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
MW132	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
MW133	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
MW134	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
R1	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×

Well ID	Description	Included in Existing Site Suitability Statement?	Recent GME Data		
			Targeted GME – The Gateway (2022)	Targeted GME – The Precinct South (2023)	Site-Wide GME (2025
BH1_PS	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
MW177	Shallow (<10 m bgl) aquifer well, south-east and down-gradient in the Promenade and Underground Carpark.	×	×	×	✓
MW182	Shallow (<10 m bgl) aquifer well, south-east and down-gradient in the Promenade and Underground Carpark. Delineates LNAPL Plume A1	×	×	×	✓
MW183	Shallow (<10 m bgl) aquifer well, south-east and down-gradient in the Promenade and Underground Carpark. Installed in LNAPL Plume A1	×	×	×	✓
MW184	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Installed between LNAPL Plumes A1 and A2.	×	×	×	✓
MW190	Shallow (<10 m bgl) aquifer well, south-west and down-gradient in the Precinct North.	×	×	×	✓
MW191	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Delineates LNAPL Plume A2	×	×	×	✓

Notes: ✓: Analytical data available; ×: Analytical data not available

The following is noted on the spatial and temporal distribution of monitoring of groundwater at and around the Escarpment since the Site Suitability Statement was issued:

- No off-Site background wells are present. However, BG1, MW120A, and MW194 are upgradient of historic land contaminating activities and are considered to represent background conditions.
- A number of wells downgradient have been lost/destroyed by Site activities undertaken since issue of the Site Suitability Statement. However, replacement wells (as discussed in AECOM, 2024d) have been installed and sampled to fulfil the purposes of these wells.
- Only one GME, which included sampling of groundwater in or adjacent to the Escarpment, has been conducted since issue of the Site Suitability Statement. However, no potentially contaminating activities are considered to have occurred in this area, and no requirement for future or ongoing monitoring was identified as part of the Site Suitability Statement. The GME conducted in 2025 was undertaken to confirm past results.

Groundwater well locations are shown on **Figure F10**. Results of groundwater sampling are screened against the Tier 1 criteria in **Table T6** to **Table T8**, and against the RC in **Table T9**, with exceedances of adopted criteria are shown on **Figure F13a-c**. Groundwater samples have typically been assessed for key CoPC with exceedances detected in previous GMEs, including TRH/TPH, PAHs, and metals.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in groundwater samples collected after issue of the Site Suitability Statement:

- Drinking Water (Human Health) – benzene, toluene, naphthalene, metals (manganese); cyanide (total)
- Drinking Water (Aesthetics) – metals (manganese); Major Ions (chloride, sodium, sulfate (as SO_4)); TDS

- Recreation (Primary/Secondary Contact) – benzene, naphthalene
- Eco-system protection – TRH (>C10-C40 (sum)); TPH (C10-C36 (sum)); metals (copper, manganese, zinc); Phenolic compounds (2,4-dimethylphenol)
- Vapour Intrusion (Residential) – TRH (>C10-C16).

These CoPC and concentrations are consistent with the data considered in the existing Site Suitability Statement. It is noted that:

- Groundwater is not considered likely to be extracted for drinking purposes, based on the available urban reticulated water supply at the Site and surrounding areas, and the high TDS concentrations. Extraction of groundwater for drinking purposes is restricted by the SEMP.
- Exceedances of recreation criteria are delineated and below criteria in MW153, located down-gradient of the Site prior to the inferred point of discharge (Sullivan's Cove to the south), and are not considered likely to be above criteria at the point of discharge or where contact with receptors may potentially occur.
- As discussed in **Section 5.5.5,** the *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), including the 2025 addendum (AECOM, 2025i) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).
- Residential use is not proposed for this area and the exceedances of vapour intrusion criteria is not considered to represent an unacceptable risk to the proposed development.

LNAPL Plumes A1 and A2 are inferred down-gradient of the Escarpment, and while groundwater contours from February 2025 (**Figure F12c**) indicate there is potential for northerly flow from LNAPL plumes areas, it was noted at the time these contours were derived that this was likely to be an artifact as no wells along the northern boundary of the Site were accessible for gauging at that time (AECOM, 2025f). The updated contours from gauging in June 2025 (**Figure F12d**, AECOM, 2025d) do not show a northerly component of groundwater flow.

Based on assessment of LNAPL Plumes in 2025 (see **Section 5.5.4.1**), detectable LNAPL was not present in or adjacent to this assessment area, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (Former LNAPL Plume A3). No groundwater concentrations indicative of free-phase LNAPL was detected, and LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development, provided the controls in the SEMP (AECOM, 2025h) are implemented.

No exceedances of groundwater RC have been detected in or adjacent to the Escarpment in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in that assessment, and no requirement for groundwater remediation is considered to be present.

Based on the distribution (temporal and spatial) of groundwater sampling, the consistency of results with previous monitoring, and no exceedances of RC detected, there have been no changes in groundwater conditions which would indicate an unacceptable risk to future Site users since issue of the Site Suitability Statement for this area, if the management controls within the SEMP are implemented.

6.2.1.3 Soil Vapour

No soil vapour sampling events has occurred involving locations in the Escarpment since the issue of the Site Suitability Statement. Soil vapour intrusion has not been identified as a risk within this area based on soil or groundwater samples collected and analysed and the proposed future uses of the area, and no vapour protection system is considered required for any structures contained entirely within this assessment area, such as if the existing Goods Shed is moved to the Escarpment, as proposed.

However, it is considered that there are potential risks of soil vapour intrusion under the proposed development of the Site as:

- Soil vapour from other parts of the Site has the potential to laterally migrate along the base of proposed structures (i.e., the Multipurpose Stadium) which extend beyond the boundaries of this area, and may have a risk of infiltration in this area (**Section 6.5**). Concentrations of methane,

BTEXN, and TPH/TRH have been detected in soil vapour in areas of the Site which share a building footprint with this area.

On this basis, it is considered that there are potential risks of vapour intrusion into new structures in this area by methane, BTEXN and TPH/TRH vapours if development continues as proposed.

Mitigation and management measures, as discussed in **Section 5.2.2**, will be required for future development.

6.2.2 Change in Land Use and Elevation

The current Site Suitability Statement for the Escarpment states that *the site is suitable for the site uses as follows: residential, including medium to high density, retail, commercial, recreational/public open space use, transport (roads etc) and other less sensitive uses,* subject to specific conditions which are detailed in Site Suitability Statement.

The updated uses of this assessment area, consisting of the Multipurpose Stadium and Associated Concourse and relocation of the Goods Shed, which are considered commercial uses, and open spaces are included in the existing Site Suitability Statement, which is considered applicable for the current surface elevation.

In addition, proposed structures (the Multipurpose Stadium and underground carpark) extend beyond the assessment area boundaries, and must be considered in assessment of the suitability of development.

As part of development, it is proposed that the surface of this area be reduced as follows (see **Section 5.3.2** and **Figure F5**):

- 3 mAHD within the footprint of the Multipurpose Stadium, which would require reduction of the current Site surface elevation by between approximately 2 to 3.5 m.
- 4.8 mAHD in the practice wickets area, which would require reduction of the current Site surface elevation by between approximately 2.5 to 3 m.
- 1.7 mAHD in a proposed basement carpark area, which would require reduction of the current Site surface elevation by between approximately 3 to 4 m.

The proposed final surface elevation is shown on **Figure F5**. Deeper excavations may be required for installation of:

- Footings or foundations, which are likely to extend to bedrock. While dolerite is relatively shallow (<2 m bgl) in the northern portion of the Escarpment, deeper areas exist to in the southern and eastern portions of the area.
- A layer of imported engineered fill and concrete slab, at least 1 m thick (**Figure F6** and **Appendix C**), noting that this additional excavation and rebuild of surface level is not yet confirmed as part of Multipurpose Stadium design.

The existing Site Suitability Statement and supporting assessments did not allow for any change in the existing surface elevation, and further included an assumption that intrusive maintenance works would be unlikely to take place at more than 2 m below current surface level. Additional risks may exist during construction or ongoing Site use from contact with deeper soil, or from increased risks of vapour intrusion as less vertical distance between potential vapour sources is present.

It is also noted that groundwater beneath the Escarpment has been historically detected at between 2 and 5 mAHD. The potential exists for groundwater to come into contact with deeper excavations and potentially the surface elevation based on the current development, and to infiltrate the proposed underground carpark. Assessment of risks and mitigations associated with the intersection of groundwater and proposed final surface elevations is provided in **Section 6.5.2**. However, based on this assessment, no unacceptable risks to future users have been identified based on the 70% complete stadium design.

In order to manage and mitigate risks to future Site users from changes to elevation, the next update to the SEMP will include the following requirements:

- Any engineered fill or other materials used to increase the surface level must either:

  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.
- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Vapour protection for CS3, as discussed in **Section 5.2.2**, with independently verified design and installation is to be included in any structures to be established in this area. Any selected protection measure must be suitable to prevent vapour intrusion from TPH, BTEXN, and methane.
- Groundwater drainage in the north, west and north-west of the stadium must include:
  - Capture and disposal as potentially contaminated waste of any drained groundwater.
  - No intersection between drainage layers and the locations of LNAPL plumes.
  - A vapour mitigation layer is present above the drainage layer, which the same performance requirements as described in **Section 5.2.2**
  - Assessment of any soil to be dewatered and management of potential PASS as described in **Section 5.5.1**.
- The SEMP should be updated to include the following planning control for any future structures where groundwater may be at or within 1 m of the surface:
  - Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, design and construction must include measures to prevent:
    - Potential vapour intrusion into buildings and structures as discussed in **Section 5.2.2**.
    - Groundwater intrusion into buildings and structures such as drainage or tanking. Any drained groundwater must be considered potentially contaminated waste and be removed by a licenced waste transporter or discharged under a trade waste agreement.
    - Any dewatering must also consider and include measures to prevent potential exposure and oxidation of PASS in any previously saturated soil which is drained.
- Prior to development of this area, Site Suitability Statements must be issued for portions of the land beyond the assessment area boundaries which proposed building structures extent to. The structures which are currently proposed across multiple assessment areas are listed in **Table 27** in **Section 5.3**.
- The updates and management measures relating to ASS described in **Section 5.5.1** must also be implemented.

If the above mitigations and management measures are implemented and documented in the SEMP, no unacceptable risks to future users are considered to be introduced by the proposed change in land use and elevation.

6.3 The Promenade and Underground Carpark (Lot E and UGC)

6.3.1 Additional Environmental Data

6.3.1.1 Soil

Additional soil data for the Escarpment collected since issue of the Site Suitability Statement for this area consists of:

- 247 primary samples collected during *in situ* sampling to categorise soil to be excavated from this area (AECOM, 2025b), from 41 locations at *in situ* categorisation grid based sample bores C12, D11 to D13, E9 to E13, F8 to F13, G8 to G13, I7 to I13, and J6 to J13.
- 14 primary samples collected during installation of groundwater wells MW182 to MW186, and MW191, and soil vapour bores SV31 and SV32 in 2025 (AECOM, 2025d).

Locations of soil samples which have provided new data are shown on **Figure F8** and **Figure F10**. Results of soil sampling are screened against the Tier 1 criteria on **Table T1** to **Table T3**, and against the RC on **Table T4**.

Soil locations with exceedances of adopted criteria collected since issue of the Site Suitability Statements are shown screened against criteria in **Figure F11a-e**.

Due to the number and density of sample locations, visual display of exceedances of Tier 1 criteria for the *in situ* characterisation samples (AECOM, 2025b) on a figure is not practicable, and review of these samples against Tier 1 criteria are discussed below. Exceedances of the RC in the *in situ* characterisation samples are shown on **Figure F11e**.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in soil samples collected after issue of the Site Suitability Statement:

- Low / Medium to High Density Residential – TRH (>C10-C16(minus naphthalene), >C16-C34, >C34-C40), metals (arsenic, cadmium, lead, zinc); PAHs (benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs)
- Commercial/Industrial – metals (lead); PAHs (benz(a)anthracene, benzo(b)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene)
- Recreation / Open Space - TRH ((>C10-C16(minus naphthalene, >C16-C34, >C34-C40), metals (lead), PAHs (benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs)
- Modified / Highly Modified Ecosystems – TRH (>C16-C34), metals (copper, lead, nickel, zinc), PAHs (benzo(a)pyrene)
- Vapour Intrusion (Residential) – TRH (>C10-C16 (excluding naphthalene)); PAHs (naphthalene)
- Vapour Intrusion (Commercial/Industrial) – TRH (>C10-C16 (excluding naphthalene)); PAHs (Naphthalene).

Residential use is not proposed in this area, or in any structures which have footprints which included this area, and thus the detected exceedance of the vapour intrusion criteria for residential use is not considered to represent an unacceptable risk to human health for the proposed development. The required vapour mitigation measures provided in the SEMP and discussed in **Section 5.2.2** provide additional mitigation against vapour intrusion.

The other PEVs which are precluded, based on exceedances of criteria detected in soil in the new data considered in this assessment, are consistent with the level of residual contamination described in the existing Site Suitability Statement. The Site is considered suitable for the new development if the mitigation and management measures detailed in the SEMP are implemented to prevent a complete exposure pathway from being established between future Site users and residual soil contamination.

Exceedances of the RC in this area are presented in **Table 22** below.

Table 22 Soil RC Exceedances - The Promenade and Underground Carpark

Land Use	CoPC	RC	Exceedance Locations
Potential Future Commercial (unknown construction or multi-storey building)	TRH >C10-C16 (minus naphthalene)	140 mg/kg	• E10, F10, G10, G11, H09, H10, H11, I10, I11, J10 • MW183, MW184, MW185, MW186, SV32
	Naphthalene	12 mg/kg	• G10
Potential Future Commercial/Light Industrial Workers (working within a basement)	TRH >C10-C16 (minus naphthalene)	770 mg/kg	• E10, F10, G10, G11, H09, H10, H11, I11 • MW183, MW184, MW185
	Naphthalene	97 mg/kg	• G10
Potential Future Maintenance Worker	Lead	620 mg/kg	• F11, G11, G13, H10, H12, H13, I13, J06, J08, J10, J12

These exceedances of the RC are not considered to represent unacceptable risks to the future development of the Site or a requirement for future remediation as:

- Exceedances of RC for TRH >C10-C16 and naphthalene in soil may represent a risk of potential vapour intrusion into future structures. However, soil and groundwater concentrations are indirect measures and, where available, actual soil vapour or air samples should be considered to determine the level of risk from soil vapour.

  On this basis, the following has been considered for assessment of risks of vapour intrusion from soil to future commercial/light industrial workers:

  - The samples with exceedances of the commercial/light industrial worker RC collected from groundwater monitoring wells are all from locations in the vicinity of soil vapour bores tested as part of the same event (2025d), as listed below in **Table 23**.

Table 23 The Promenade and Underground Carpark - Distance between Groundwater Wells and Soil Vapour Bores

Groundwater Well	Nearby Soil Vapour Bore(s)	Approximate Distance (m)
MW183	SV31	4.2
MW184	SV31	24
	SV32	30
MW185	SV32	2.5
MW186	SV32	30

  No soil vapour concentrations in either soil vapour bore in the proximity to these locations, or any other soil vapour bores installed currently (see **Section 6.3.1.3**) or historically (Coffey, 2021a), have reported soil vapour concentrations of TRH or naphthalene which would indicate a potential risk to future Commercial/Industrial use. The sources of hydrocarbons in soil in this location are LNAPL Plumes A1 and A2, which have been identified as diesel ultimately sourced from historic fuel storage for rail refuelling in this area, and while there is some distance between the exceedances in MW184 and MW186 and the soil vapour bores, it is considered probable that the fuel impacts in these locations would have similar properties and concentrations of vapour generation.

  - Soil vapour sampling was conducted in SV32, where an exceedance in soil was detected, and did not report potentially hazardous levels of soil vapour (see **Section 6.3.1.3**).
  - The samples with exceedances collected from *in situ* characterisation bores (E10, F10, G10, G11, H09, H10, H11, I10, I11, J10) are located in the same areas of historic railyard activities

(see **Figure F4**) and typically downgradient of the LNAPL plumes and historic refuelling activities, or of the former Roundhouse where maintenance and refuelling of rail engines was conducted in this area and ended in the 1980s, and the source of hydrocarbons is inferred to be primarily diesel fuel used for rail work. It is noted that:

- All soil with identified hydrocarbon exceedances from these bores is intended for excavation as part of development and will not remain on-Site.
- It is considered likely that, based on the source and age of impacts, the hydrocarbons present in soil are likely to be of low volatility and have had long periods to generate and release more hazardous volatile constituents. Similar to the samples from groundwater wells and soil vapour bores in this area discussed above, it is not considered likely that hazardous vapour concentrations will be generated by these impacts.

Based on the above, it is considered that, based on CoPC concentrations in soil vapour, that there is a low risk of vapour intrusion from soil impacts, although it cannot be completely discounted as some locations with soil concentrations indicative of vapour risk are not in the vicinity of soil vapour bores. To mitigate and manage potential risks, future structures in this area are considered to require a vapour protection system with an independently verified design and installation, as described in **Section 5.2.2**.

- All exceedances of the future maintenance worker RC for lead are within the volume of soil proposed for excavation as part of development (AECOM, 2025b), with locations shown on **Figure F11e**. The exceedances detected in samples F11_2.5, G11_1.5, H10_2.5, H12_2.5, H13_1.5, H13_2.0, J06_2.0, J06_2.5, J08_1.5, J10_1.0, J12_1.0 are delineated vertically by shallower and deeper samples (**Table T4**), and will be removed by excavation as part of development. However, the remaining samples (G13_2.5, G13_3.0, and I13_1.5), were collected from the bottom of boreholes, and may remain on Site following development.

  Direct remediation of the detected impacts is not practicable at this time due to tenant leases in the areas of detected impact.

  For development of the Site, the following should be undertaken to mitigate risks of potential exposure to lead in soil by future intrusive maintenance workers:

  - The elevated lead detections listed above must be noted in the SEMP as potential area(s) of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.
  - The soil with elevated lead concentrations should be remediated if accessible, and if bulk excavation for development does not occur.
  - Any subsurface services in this area should be installed in sealed conduits or clean soil corridors to minimise any ongoing contact with existing Site soil, including any lead-impacted soil which is not removed as part of Site development, by future maintenance workers.

No change in precluded PEVs, and no requirement for further soil remediation, is considered to be identified based on the additional soil data collected in the Promenade and Underground Carpark since issue of the Site Suitability Statement.

6.3.1.2 Groundwater

The groundwater wells, in or adjacent to the Promenade and Underground Carpark, which have had groundwater samples collected and analysed since the Site Suitability Statement for this area was issued are listed in **Table 24** below.

BG1	Shallow (<10 m bgl) aquifer well, north and up-gradient in the Escarpment	×	×	×	✓

Notes: ✓: Analytical data available; ×: Analytical data not available

The following is noted on the spatial and temporal distribution of monitoring of groundwater at and around the Promenade and Underground Carpark since the Site Suitability Statement was issued:

- No off-Site background wells are present. However, BG1, MW121, and MW194 are upgradient of historic land contaminating activities and are considered to represent background conditions.
- A number of wells downgradient have been lost/destroyed by Site activities undertaken since issue of the Site Suitability Statement. However, replacement wells (as discussed in AECOM, 2024d) have been installed and sampled to fulfil the purposes of these wells.
- Sampling has been undertaken in former areas of potential concern within this area near LNAPL plumes, and up-, cross- and down-gradient, since issue of the Site Suitability Statement, and is considered suitable for detection of any changes in the risk profile or groundwater conditions.

Groundwater well locations are shown on **Figure F10**. Results of groundwater sampling are screened against the Tier 1 criteria in **Table T6** to **Table T8**, and against the RC in **Table T9**, with exceedances of adopted criteria are shown on **Figure F13a-c**. Groundwater samples have typically been assessed for key CoPC with exceedances detected in previous GMEs, including TRH/TPH, PAHs, and metals.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in groundwater samples collected after issue of the Site Suitability Statement:

- Drinking Water (Human Health) – metals (manganese), cyanide (total)
- Drinking Water (Aesthetics) – metals (manganese); Major Ions (chloride, sodium, sulfate (as SO_4)); TDS
- Ecosystem protection – TRH (>C10-C40 (sum)); TPH (C10-C36 (sum)), metals (aluminium, copper, manganese, zinc); PAHs (phenanthrene, fluoranthene); Nutrients (ammonia (as N))
- Vapour Intrusion (Structures) – methane.

These CoPC and concentrations are consistent with the data considered in the existing Site Suitability Statement, noting that methane in groundwater was not considered in that assessment. It is noted that:

- Groundwater is not considered likely to be extracted for drinking purposes, based on the available urban reticulated water supply at the Site and surrounding areas, and the high TDS concentrations. Extraction of groundwater for drinking is restricted by the SEMP.
- As discussed in **Section 5.5.5,** the *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), including the 2025 addendum (AECOM, 2025i) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).
- Residential use is not proposed for this area and the exceedances of vapour intrusion criteria is not considered to represent an unacceptable risk to the proposed development.
- Protection against methane intrusion was considered in the Site Suitability Statement for this area, and the requirements within **Section 5.2.2** are consistent with the controls adopted as part of the previous assessment of Site Suitability.

LNAPL Plumes A1 and A2 are within the Promenade and Underground Carpark, and former LNAPL Plume A3 is inferred down-gradient. Based on assessment of LNAPL Plumes in 2025 (refer to **Section 5.5.4.1**), measurable LNAPL was not present in or adjacent to this assessment area, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3). No groundwater concentrations indicative of free-phase LNAPL were detected, and LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development, provided the controls in the SEMP (AECOM, 2025h) are implemented.

No exceedances of groundwater RC have been detected in or adjacent to the Promenade and Underground Carpark in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in that assessment, and no requirement for groundwater remediation is considered to be present.

Based on the distribution (temporal and spatial) of groundwater sampling, the consistency of results with previous monitoring, and no exceedances of RC detected, there have been no changes in groundwater conditions which would indicate an unacceptable risk to future Site users since issue of the Site Suitability Statement for this area, if the management controls in the SEMP are implemented.

6.3.1.3 Soil Vapour

One soil vapour sampling event, conducted in 2025 (AECOM, 2025d), has occurred, involving two locations (SV31 and SV32) in the Promenade and Underground Carpark since the issue of the Site Suitability Statement.

New soil vapour date from both bores reported concentrations of methane which indicate a potential risk of vapour intrusion. In addition:

- Vapour management and mitigation for potential methane and TRH/TPH vapour intrusion was required for this area under the existing Site Suitability Statement, and none of the new data received or in the changes in proposed development is considered to change these requirements.
- Soil vapour from other parts of the Site has the potential to laterally migrate along the base of proposed structures (i.e., the Multipurpose Stadium) which extend beyond the boundaries of this area, and may have a risk of infiltration in this area (**Section 6.5**). Concentrations of methane, BTEXN, and TPH/TRH have been detected in soil vapour in areas of the Site which share a building footprint with this area.

On this basis, it is considered that there are potential risks of vapour intrusion into new structures in this area by methane, BTEXN and TPH/TRH vapours if development continues as proposed.

Mitigation and management measures, as discussed in **Section 5.2.2**, will be required for future development.

6.3.2 Change in Land Use and Elevation

The current Site Suitability Statement for the Promenade and Underground Carpark states that *the site is suitable for the site uses as follows: residential (including medium to high density), commercial/*

industrial, recreational/public open space use, access way and transport (roads etc) and other less sensitive uses, subject to specific conditions which are detailed in Site Suitability Statement.

The updated use of this assessment area, consisting of the Multipurpose Stadium and Associated Concourse, is considered a commercial/industrial land use. The following areas of the Promenade and Underground Carpark area were not assessed as suitable for commercial/industrial land use in the existing Site Suitability Statement:

- The Access Link area, a proposed open air transport corridor, and a section of the Open Space area, along the eastern boundary of the assessment area, which were assessed and considered suitable for Open Space use in the Site Suitability Statement (see **Figure F3**), are now proposed as part of the Multipurpose Stadium. The north-east corner of the Access Link is also now proposed to form part of the new underground carpark in the north-east of the Site.

  Potential vapour intrusion risks for commercial use (the new proposed land use) from hydrocarbons in soil were identified in this area in the Site Suitability Statement.

In addition, proposed structures (the Multipurpose Stadium and underground carpark) extend beyond the assessment area boundaries, and must be considered in assessment of the suitability of development.

As part of development, it is proposed that the surface of this area be reduced as follows (see **Section 5.3.2** and **Figure F5**):

- 3 mAHD within the footprint of the Multipurpose Stadium, which would require reduction of the current Site surface elevation by between approximately 2 to 3.5 m.
- 4.8 mAHD in the practice wickets area, which would require reduction of the current Site surface elevation by between approximately 1.5 to 2.5 m.
- 1.7 mAHD in a proposed basement carpark area, which would require reduction of the current Site surface elevation by between approximately 3 m (noting that only a relatively minor portion of the Promenade and Underground Carpark is proposed for the basement carpark).

The proposed final surface elevation is shown on. Deeper excavations may be required for installation of:

- Footings or foundations, which are likely to extent to bedrock. While dolerite is relatively shallow (<2 m bgl) in the north-west portion of the Promenade and Underground Carpark, deeper areas exist to in the southern and eastern portions of the area.
- A layer of imported engineered fill and concrete slab, at least 1 m thick (**Figure F6** and **Appendix C**), noting that this additional excavation and rebuild of surface level is not yet confirmed as part of Multipurpose Stadium design.

It is also noted that groundwater beneath the Promenade and Underground Carpark has been historically detected at between ~1 and 4 mAHD. The potential exists for groundwater to come into contact with deeper excavations and potentially the surface elevation based on the current development, and to infiltrate the proposed underground carpark. Assessment of risks and mitigations associated with the intersection of groundwater and proposed final surface elevations is provided in **Section 6.5.2**. However, based on this assessment, no unacceptable risks to future users have been identified based on the 70% complete stadium design.

In order to manage and mitigate risks to future Site users from changes to elevation, the next update to the SEMP will include the following requirements:

- Any engineered fill or other materials used to increase the surface level must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.

- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Vapour protection for CS3, as discussed in **Section 5.2.2**, with independently verified design and installation is to be included in any structures to be established in this area. Any selected protection measure must be suitable to prevent vapour intrusion from TPH, BTEXN, and methane.
- Groundwater drainage in the north, west and north-west of the stadium must include:
  - Capture and disposal as potentially contaminated waste of any drained groundwater.
  - No intersection between drainage layers and the locations of LNAPL plumes.
  - A vapour mitigation layer is present above the drainage layer, which the same performance requirements as described in **Section 5.2.2**
  - Assessment of any soil to be dewatered and management of potential PASS as described in **Section 5.5.1**.
- The SEMP should be updated to include the following planning control for any future structures where groundwater may be at or within 1 m of the surface:
  - Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, design and construction must include measures to prevent:
    - Potential vapour intrusion into buildings and structures as discussed in **Section 5.2.2**.
    - Groundwater intrusion into buildings and structures such as drainage or tanking. Any drained groundwater must be considered potentially contaminated waste and be removed by a licenced waste transporter or discharged under a trade waste agreement.
    - Any dewatering must also consider and include measures to prevent potential exposure and oxidation of PASS in any previously saturated soil which is drained.
- Prior to development of this area, Site Suitability Statements must be issued for portions of the land beyond the assessment area boundaries which proposed building structures extend to. The structures which are currently proposed across multiple assessment areas are listed on **Table 27** in **Section 5.3**.
- The updates and management measures relating to ASS described in **Section 5.5.1** must also be implemented.

If the above mitigations and management measures are implemented and documented in the SEMP, no unacceptable risks to future users are considered to be introduced by the proposed change in land use and elevation.

6.4 The Precinct North (Lot B)

6.4.1 Additional Environmental Data

6.4.1.1 Soil

Additional soil data for the Precinct North collected since issue of the Site Suitability Statement for this area consists of:

- 51 primary samples collected during *in situ* sampling to categorise soil to be excavated from this area (AECOM, 2025b), from 11 locations at *in situ* categorisation grid based sample bores K06 to K10, L08 to L10, M09 to M11, and N09 to N11.
- 8 primary samples collected during installation of groundwater wells MW187, MW190 and MW192, and soil vapour bores SV33, SV34 and SV35 in 2025 (AECOM, 2025d).

Locations of soil samples which have provided new data are shown on **Figure F8** and **Figure F10**. Results of soil sampling are screened against the Tier 1 criteria in **Table T1** to **Table T3**, and against the RC in **Table T4**.

Soil locations with exceedances of adopted criteria collected since issue of the Site Suitability Statements are shown screened against criteria in **Figure F11a-e**.

Due to the number and density of sample locations, visual display of exceedances of Tier 1 criteria for the *in situ* characterisation samples (AECOM, 2025b) on a figure is not practicable, and review of these samples against Tier 1 criteria are discussed below. Exceedances of the RC in the *in situ* characterisation samples is shown on **Figure F11e**.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in soil samples collected after issue of the Site Suitability Statement:

- Low / Medium to High Density Residential – TRH (>C16-C34), metals (arsenic, chromium, lead); PAHs (benz(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs)
- Commercial/Industrial – metals (lead), PAHs (benz(a)anthracene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene)
- Recreation / Open Space - TRH (>C10-C16, >C16-C34), metals (arsenic, chromium, lead), PAHs (benz(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs)
- Modified / Highly Modified Ecosystems – TRH (>C16-C34), metals (arsenic, copper, lead, nickel, zinc), PAHs (benzo(a)pyrene)
- Vapour Intrusion (Residential) – TRH (C6-C10 (excluding BTEX), >C10-C16(excluding naphthalene), PAHs (naphthalene)
- Vapour Intrusion (Commercial/Industrial) – TRH (>C10-C16 (excluding naphthalene)).

Residential use is not proposed in this area, or in any structures which have footprints which included this area, and thus the detected exceedance of the vapour intrusion criteria for residential use is not considered to represent an unacceptable risk to human health for the proposed development. The required vapour mitigation measures provided in the SEMP, and discussed in **Section 5.2.2**, provide additional mitigation against vapour intrusion.

The other PEVs which are precluded, based on exceedances of criteria detected in soil in the new data considered in this assessment, are consistent with the level of residual contamination described in the existing Site Suitability Statement. The Site is considered suitable for the new development if the mitigation and management measures detailed in the SEMP are implemented to prevent a complete exposure pathway from being established between future Site users and residual soil contamination.

Exceedances of the RC in this area are presented in **Table 25** below.

Table 25 Soil RC Exceedances - The Promenade and Underground Carpark

Land Use	CoPC	RC	Exceedance Locations
Potential Future Commercial (unknown construction or multi-storey building)	TRH >C10-C16 (minus naphthalene)	140 mg/kg	• L08, M09, M10, M11, N11 • MW190
	Naphthalene	12 mg/kg	• M10
Potential Future Maintenance Worker	Lead	620 mg/kg	• K06, L08, M09, N10

These exceedances of the RC are not considered to represent unacceptable risks to the future development of the Site or a requirement for future remediation as:

- As noted in **Section 5.2.2**, future structures in this area will require a vapour protection system with an independently verified design and installation, which includes TRH and naphthalene in the CoPC which will be mitigated by it. Any residual vapour generation will be protected against by this barrier.
- All exceedances of the future maintenance worker RC for lead are within the volume of soil proposed for excavation as part of development. The exceedances detected in samples K06_1.0, L08_1.5, and M09_1.0 are delineated vertically by shallower and deeper samples, and will be removed entirely by excavation. However, the remaining detected, exceedance, N10_1.5, was collected at the base of a bore and lead impacted soil may remain following excavation.

  Direct remediation of the detected impacts is not practicable at this time due to tenant leases in the areas of detected impact.

  For development of the Site, the following should be undertaken to mitigate risks of potential exposure to lead in soil by future intrusive maintenance workers:

  - The elevated lead detections should be noted in the SEMP as potential area(s) of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.
  - Any subsurface services in this area should be installed in sealed conduits or clean soil corridors to minimise any ongoing contact with existing Site soil by future maintenance workers.

No change in precluded PEVs, and no requirement for further soil remediation, is considered to be identified based on the additional soil data collected in the Promenade and Underground Carpark since issue of the Site Suitability Statement.

6.4.1.2 Groundwater

The groundwater wells, in or adjacent to the Precinct North, which have had groundwater samples collected and analysed since the Site Suitability Statement for this area was issued are listed in **Table 26** below.

Notes: ✓: Analytical data available; ×: Analytical data not available

The following is noted on the spatial and temporal distribution of monitoring of groundwater at and around the Precinct North since the Site Suitability Statement of was issued:

- A number of wells downgradient have been lost/destroyed by Site activities undertaken since issue of the Site Suitability Statement. However, replacement wells (as discussed in AECOM, 2024d) have been installed and sampled to fulfil the purposes of these wells.
- Sampling has been undertaken in former areas of potential concern within this area near LNAPL plumes, and up-, cross- and down-gradient, since issue of the Site Suitability Statement, and is considered suitable for detection of any changes in the risk profile or groundwater conditions.

Groundwater well locations are shown on **Figure F10**. Results of groundwater sampling are screened against the Tier 1 criteria in **Table T6** to **Table T8**, and against the RC in **Table T9**, with exceedances of adopted criteria are shown on **Figure F13a-c**. Groundwater samples have typically been assessed for key CoPC with exceedances detected in previous GMEs, including TRH/TPH, PAHs, and metals.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in groundwater samples collected after issue of the Site Suitability Statement:

- Drinking Water (Human Health) – metals (manganese), PAHs (naphthalene), cyanide (cyanide total)
- Drinking Water (Aesthetics) – metals (manganese), Major Ions (chloride, sodium); TDS
- Recreation (Primary/Secondary Contact) - PAHs (naphthalene)
- Eco-system protection – TRH (>C10-C40 (sum)); TPH (C10-C36 (sum)), metals (aluminium, copper, manganese, zinc); PAHs (anthracene, phenanthrene, fluoranthene), Nutrients (ammonia (as N))

- Vapour Intrusion (Residential) – TRH (>C10-C16 (minus naphthalene))
- Vapour Intrusion (Structures) – methane.

These CoPC and concentrations are consistent with the data considered in the existing Site Suitability Statement, noting that methane in groundwater was not considered in that assessment. It is noted that:

- Groundwater is not considered likely to be extracted for drinking purposes, based on the available urban reticulated water supply at the Site and surrounding areas, and the high TDS concentrations. Extraction of groundwater for drinking purposes is restricted by the SEMP.
- As discussed in **Section 5.5.5,** the *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), including the 2025 addendum (AECOM, 2025i) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).
- Residential use is not proposed for this area and the exceedances of vapour intrusion criteria is not considered to represent an unacceptable risk to the proposed development.
- Protection against methane intrusion was considered in the Site Suitability Statement for this area, and the requirements within **Section 5.2.2** are consistent with the controls adopted as part of the previous assessment of Site Suitability.

LNAPL Plumes A1 and A2 are inferred up-gradient within the Promenade and Underground Carpark, and former LNAPL Plume A3 was within the Precinct North.

Based on assessment of LNAPL Plumes in 2025 (see **Section 5.5.4.1**), measurable LNAPL was not present in or adjacent to this assessment area, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3). No groundwater concentrations indicative of free-phase LNAPL were detected, and LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development, provided the controls in the SEMP (AECOM, 2025h) are implemented.

No exceedances of groundwater RC have been detected in or adjacent to the Precinct North in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in that assessment, and no requirement for groundwater remediation is considered to be present.

Based on the distribution (temporal and spatial) of groundwater sampling, the consistency of results with previous monitoring, and no exceedances of RC detected, there have been no changes in groundwater conditions which would indicate an unacceptable risk to future Site users since issue of the Site Suitability Statement for this area. Update to the assessment of risks to off-Site ecological receptors is underway and will be required prior to any change to the Site Suitability Statement.

6.4.1.3 Soil Vapour

One soil vapour sampling event, conducted in 2025 (AECOM, 2025d), has occurred involving four locations in the Precinct North (SV18, SV33, SV34 and SV35) since the issue of the Site Suitability Statement.

New soil vapour date from all bores reported concentrations of methane which indicate a potential risk of vapour intrusion. Soil vapour collected from bore SV18 also reported concentrations of naphthalene above the adopted criteria for residential land use.

In addition:

- Vapour management and mitigation for potential methane and TRH/TPH vapour intrusion was required for this area under the existing Site Suitability Statement, and none of the new data received or in the changes in proposed development is considered to change these requirements.
- Residential land use is not proposed for this area, and the detected naphthalene is not considered to indicate a potential risk to future users under the current development plan. However, it is noted that a risk naphthalene intrusion may be introduced by the proposed development as discussed in the next bullet point below.

- Soil vapour from other parts of the Site has the potential to laterally migrate along the base of proposed structures (i.e., the Multipurpose Stadium) which extend beyond the boundaries of this area, and may have a risk of infiltration in this area (**Section 6.5**). Concentrations of methane, BTEXN, and TPH/TRH have been detected in soil vapour in areas of the Site which share a building footprint with this area.

On this basis, it is considered that there are potential risks of vapour intrusion into new structures in this area by methane, BTEXN and TPH/TRH vapours if development continues as proposed.

Mitigation and management measures, as discussed in **Section 5.2.2**, will be required for future development.

6.4.2 Change in Land Use and Elevation

The current Site Suitability Statement for the Precinct North states that *site is suitable for the proposed site use of 'Arts and Institutional Area', which is considered to be a 'Commercial' use setting, involving commercial and cultural uses, including retail, (the site would also be suitable for high density residential uses above – but not on - the ground floor, and other less sensitive uses such as industrial use),* subject to specific conditions which are detailed in Site Suitability Statement.

The updated uses of this assessment area, consisting of the Multipurpose Stadium and Associated Concourse, the underground carpark, and buildings associated with the Antarctic Facilities Precinct and the Complementary Integrated Mixed Use Zone, which are considered commercial uses, and open spaces are included in the existing Site Suitability Statement, which is considered applicable for the current surface elevation, with the exception of underground carparking which was not considered for this assessment area in the Site Suitability Statement.

In addition, proposed structures (the Multipurpose Stadium and underground carpark) extend beyond the assessment area boundaries, and must be considered in assessment of the suitability of development.

As part of development, it is proposed that the surface of this area be reduced to:

- 3 mAHD within the footprint of the Multipurpose Stadium and concourse, or reduction of the Site surface elevation by between approximately 2.5 to 3.5 m.
- 2.9 mAHD in the Complementary Integrated Mixed Use Zone, or reduction of the Site surface elevation by between approximately 0.3 to 1 m.
- 1.7 mAHD in a proposed basement carpark area, or reduction of the Site surface elevation by between approximately 3 to 4 m.

The proposed final surface elevation is shown on **Figure F5**. Deeper excavations may be required for installation of:

- Footings or foundations, which are likely to extend to bedrock. While dolerite is relatively shallow (<2 m bgl) in the northern portion of the Precinct North, deeper areas exist to in the southern and eastern portions of the area.
- A layer of imported engineered fill and concrete slab, at least 1 m thick (**Figure F6** and **Appendix C**), noting that this additional excavation and rebuild of surface level is not yet confirmed as part of Multipurpose Stadium design.

The existing Site Suitability Statement and supporting assessments did not allow for any change in the existing surface elevation, or installation of basement structures, and further included an assumption that intrusive maintenance works would be unlikely to take place at more than 2 m below current surface level. Additional risks may exist during construction or ongoing Site use from contact with deeper soil, or from increased risks of vapour intrusion as less vertical distance between potential vapour sources is present.

It is also noted that groundwater beneath the Precinct North has been historically detected at between 0.5 and 1.5 mAHD. The potential exists for groundwater to come into contact with deeper excavations and potentially the surface elevation based on the current development, and to infiltrate the proposed underground carpark. Assessment of risks and mitigations associated with the intersection of groundwater and proposed final surface elevations is provided in **Section 6.5.2**. However, based on

this assessment, no unacceptable risks to future users have been identified based on the 70% complete stadium design.

In order to manage and mitigate risks to future Site users from changes to elevation, the next update to the SEMP will include the following requirements:

- Any engineered fill or other materials used to increase the surface level must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.
- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Vapour protection for CS3, as discussed in **Section 5.2.2**, with independently verified design and installation is to be included in any structures to be established in this area. Any selected protection measure must be suitable to prevent vapour intrusion from TPH, BTEXN, and methane.
- Groundwater drainage in the north, west and north-west of the stadium must include:
  - Capture and disposal as potentially contaminated waste of any drained groundwater.
  - No intersection between drainage layers and the locations of LNAPL plumes.
  - A vapour mitigation layer is present above the drainage layer, which the same performance requirements as described in **Section 5.2.2**
  - Assessment of any soil to be dewatered and management of potential PASS as described in **Section 5.5.1**.
- The SEMP should be updated to include the following planning control for any future structures where groundwater may be at or within 1 m of the surface:
  - Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, design and construction must include measures to prevent:
    - Potential vapour intrusion into buildings and structures as discussed in **Section 5.2.2**.
    - Groundwater intrusion into buildings and structures such as drainage or tanking. Any drained groundwater must be considered potentially contaminated waste and be removed by a licenced waste transporter or discharged under a trade waste agreement.
    - Any dewatering must also consider and include measures to prevent potential exposure and oxidation of PASS in any previously saturated soil which is drained.
- Prior to development of this area, Site Suitability Statements must be issued for portions of the land beyond the assessment area boundaries which proposed building structures extent to. The structures which are currently proposed across multiple assessment areas are listed on **Table 27** in **Section 5.3**.
- The updates and management measures relating to ASS described in **Section 5.5.1** must also be implemented.

If the above mitigations and management measures are implemented and documented in the SEMP, no unacceptable risks to future users are considered to be introduced by the proposed change in land use and elevation.

6.5 Changes Affecting Multiple Assessment Areas

6.5.1 Building Footprints and Structures Which Extent Across Multiple Areas

As noted in **Section 5.3.1**, the updated development plan of the Site includes proposed structures which extent across two or more of the assessment areas used in the Environmental Audit. As such, no construction of any structure should be commenced unless all areas within the proposed footprint have had Site Suitability Statements for the proposed use issued. **Table 27** below lists proposed structures which cover multiple assessment areas (see **Figure F2**).

Table 27 Proposed Structures which extend beyond assessment area boundaries

Structure	Assessment Areas
Multipurpose Stadium and Associated Concourse	• The Goods Shed and Yard • The Escarpment • The Promenade and Underground Carpark • The Precinct North • The Precinct South • The Gateway
The Antarctic Facilities Zone (buildings and underground carpark)	• The Escarpment • The Promenade and Underground Carpark • The Precinct North • Audit Area 4 East
Complementary Integrated Mixed Use Zone (building footprints)	• The Goods Shed and Yard • The Precinct North • The Precinct South

The potential for soil vapour intrusion has been identified at the Site (**Section 5.2.2**, and the sub-sections discussion soil vapour in **Sections 6.1** to **6.4**). Soil vapour can migrate laterally along the base of structures and infiltrate into other areas of the Site.

The proposed areas for the Multipurpose Stadium and underground carpark are adjacent to each other, and the underground carpark underlays the Antarctic Facilities Zone buildings. While the design has not been finalised, the features overlap each other and form a continuous structure.

As such, the following soil vapour locations, which are located beneath the future stadium or underground carpark, have been considered when assessing soil vapour risks for the proposed development:

- The Goods Shed and Yard: SV36
- The Promenade and Underground Carpark: SV33, SV32
- The Precinct North: SV18, SB33, SV34
- The Precinct South: SV46
- The Gateway: SV45.

Soil vapour data from bores SV41 and SV43, outside the proposed stadium footprint, have also been considered.

Exceedances of adopted soil vapour concentration (**Section 3.1.3**) have been detected in these bores for:

- All structures - Methane
- Residential – Benzene, Naphthalene, TPH (aliphatic >C8-C10, aromatic >C8-C10)
- Commercial / Industrial – Benzene, Naphthalene, TPH (aromatic >C8-C10) (within the Gateway only)

Soil vapour sampling locations are shown on **Figure F10**, and results of sampling are presented in **Table T10**.

While residential use is not proposed for any area considered in this report and detected exceedances of criteria are not considered to represent a risk to future Site use, methane concentrations represent a potential vapour intrusion risk. Methane is considered likely to be sourced from the anerobic digestion of either residual fuel impacts from Site use, or organic material in former river- or sea-bed buried during land reclamation. Methane in groundwater above the adopted criteria is widespread on the Site, and if sourced from buried materials under reclaimed land, there are likely to be multiple discontinuous areas where potentially hazardous concentrations are generated.

In addition, exceedances of Commercial / Industrial criteria adopted for benzene, naphthalene, and/or TRH (aliphatic >C8-C10) were also identified in the soil bores SV41 and SV43, located in the Gateway area to the south-west of the proposed stadium footprint, and are considered likely to be due to contamination from former gasworks operations in this area. While exceedances of criteria for this land use have not been identified in samples collected from soil vapour within the stadium footprint, previous investigations of the Gateway area have identified that the fill is highly heterogenous and that minor pockets of gasworks contamination which have not been detected during previous investigations may be present.

As discussed in **Section 5.2.2**, the existing Site Suitability Statement for the Promenade and Underground Carpark included a requirement for vapour mitigations against TPH and methane to be included in future structures. Based on the additional data collected since issue of the Site Suitability Statement, and with consideration of the detected soil vapour concentrations in soil vapour in and adjacent to the proposed building structure for this area, for Site Suitability, the vapour protection system should be designed and verified as preventing vapour intrusion from benzene, naphthalene, TPH, and methane.

6.5.2 Groundwater and Surface Elevation

As part of development of the Site, lowering of surface is proposed, and may introduce potential environmental risks if:

- The final design surface is lowered below the surface of groundwater. If this occurs, groundwater may potentially reach the surface and either:
  - Come into contact with Site users; or
  - Migrate along the surface and potentially impact stormwater, other portions of the Site, or off-Site locations.
- Groundwater is less than 1 m below the surface. The Site Specific RC (**Section 3.2**) included an assumption that groundwater will be ≥1 m below the surface when deriving criteria values for potential vapour intrusion from groundwater. If groundwater is shallower than this, the RC are not applicable and unquantified risks of vapour intrusion may be present.
- PASS is dewatered and may potential oxidise and acidify.

As such, any future development of the Site which involved modification of the surface elevation must assess the proposed change against groundwater elevations. If groundwater will be or is likely to be ≤1 m below the final surface, the proposed development must include measures and/or mitigations to:

- Prevent groundwater from reaching the surface or structures, such as drainage or tanking. Any such measures:
  - Must capture any drained groundwater for assessment and disposal as potential contaminated waste.
  - Must not transport or potentially increase the migration of groundwater or other contaminants on groundwater (such as LNAPL or DNAPL) to sensitive receptors (such as stormwater or the River Derwent/Sullivans Cove).
- Assess and prevent unacceptable risks from groundwater-derived vapour via either:
  - Additional assessment of vapour risks from shallow groundwater which demonstrates that no unacceptable risks are present; or
  - A vapour protection system suitable for potential vapour risks from groundwater.

- Identify if PASS may be dewatered and, if so, include measures to neutralise potential oxidation and prevent acidification as required by the assessment of acid sulfate soil at the Site (see **Section 5.5.1**).

These requirements must be documented in the SEMP.

Based on the proposed final surface elevations of the Site (**Section 5.3.2**), and the most recent inferred groundwater contours from July 2025 (**Figure F12d**), an area of the Site with three proposed future uses has identified under the proposed future development where potential interactions with groundwater may introduce risks to future Site users. The area is shown on **Figure F15**, and the three land uses, with proposed final surface elevations and inferred groundwater depths, are listed on **Table 28** below.

Table 28 Areas of Potential Shallow Groundwater

Area	Location	Elevation (mAHD)	
		Final Surface	Groundwater
Multipurpose Stadium	North, west and north-west of stadium footprint	3	2 to 3.7
Practice Wickets	North-west corner of Site	4.8	3.4 to 4+
Underground Carpark	North-east corner of Site	1.7	0.6 to 1.7

The Multipurpose Stadium 70% design includes installation of a drainage layer and capture of groundwater as shown on **Plate 4** below. Captured groundwater from the drainage layer will be diverted to sumps for further disposal.

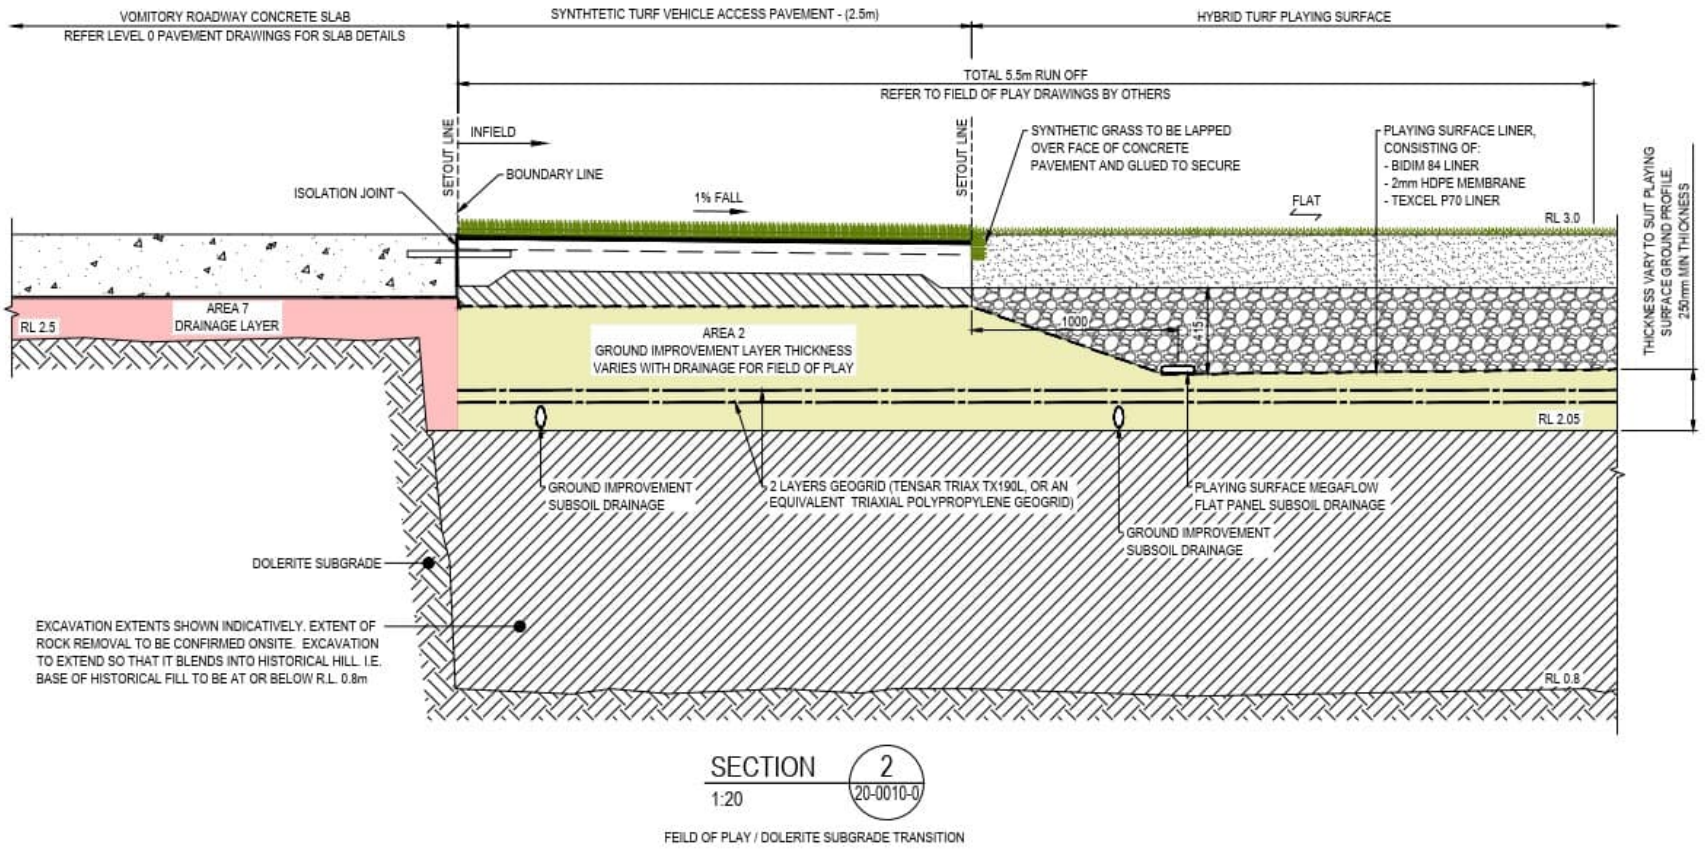

Plate 4 Multipurpose Stadium - Groundwater Drainage Layer Design

The proposed design is considered to appropriately mitigate potential environmental risks from shallow or surface groundwater as:

- The drainage design includes a HDPE liner which will prevent physical migration of groundwater to the surface, and potential contact with Site users or migration along the surface to other areas or stormwater.
- Groundwater in the drainage layer will be captured and is currently proposed for disposal under a Trade Waste Agreement (TWA). Discharge of the captured groundwater under a TWA is an appropriate disposal method to prevent groundwater from discharging to
- The drainage layer is upgradient and above the elevation of known LNAPL and DNAPL, and does not include active pumping/extraction which could encourage migration from these areas into the drainage layer. As such, groundwater with impacts relating to LNAPL or DNAPL are unlikely to be captured, and would be disposed of as potentially contaminated waste, and would not have the potential to discharge to stormwater or sensitive receptors near the Site (i.e., River Derwent or Sullivans Cove).
- While groundwater may be present at less than 1 m below the surface in the drainage layer, and represents a potential vapour intrusion risk. Mitigation and management is required and included in the design, consisting of the vapour intrusion mitigation barrier (**Section 5.2.2**) required for the stadium, which is present above the drainage layer.

  This barrier will mitigate potential vapour intrusion into the Multipurpose Stadium and playing field.
- A dewatering management plan (DWMP) is required for works which may drain saturated soils (**Section 5.5.1**). Under this document, procedures for the management and neutralisation of any dewatered PASS will be documented and implemented.

For the other two areas with potential risks from shallow groundwater:

- In the Practice Wickets area, groundwater is inferred to still be approximately 0.8 m below the design surface, based on surrounding wells, and is not considered at risk of surface infiltration by physical groundwater. Based on the open space/recreational use of this area, vapour intrusion and accumulation is not considered to represent an unacceptable risk as the Practice Wickets area is:
  - Not in an area of high risk from volatile impacts, based on historic uses, and is hydraulically up-gradient of areas which may have volatile impacts (i.e., LNAPL Plume A2 is ~75m south-east of this area, and the former gasworks area is ~85 m south), and historic soil and groundwater sampling in this area of the Site has typically reported potential volatiles, such as TRH/TPH, as low or below LOR in groundwater.
  - Proposed for open space / recreation use, and will have limited to no capacity for capture and accumulation of vapours which may represent hazardous levels (noting that such vapours are considered unlikely based on the history and available environmental data for this area). Vapours which migrate from groundwater to open air typically attenuates and dissipates swiftly due to atmospheric wind and pressure changes.
- The underground carpark design and final elevations are not yet finalised. However, Section 4.4 – Planning Controls of the SEMP (AECOM, 2025h) states that:
  - *Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, additional assessment of the potential vapour intrusion risk to building users, based on data representative of that part of the Site, will be required.*

  Such assessment by a suitably qualified and experienced environmental professional will be required as part of design and construction of the underground carpark and should be a condition of suitability.

  It is recommended that the requirement in the SEMP be updated to include consideration and mitigation of potential groundwater infiltration in structures, such as the proposed underground carpark.

Based on the above, potential shallow groundwater interactions are not considered to introduce unacceptable risks or make the Site unsuitable for the proposed development as:

- In the 70% detailed design of the Multipurpose Stadium:
  - Any drained groundwater is captured and disposed of as potentially contaminated waste under a TWA or similar, and should not be discharged to sensitive receptors.
  - The drainage layer does not intersect and capture LNAPL , which may render groundwater unable to be discharged under TWA.
  - A vapour mitigation layer is present above the drainage layer, as required in **Section 5.2.2**, and will act as mitigation against potential vapour intrusion risks from shallow groundwater.
  - Any potential soil which may be dewatered by the drainage layer is assessed and managed by a DWMP, as required by the acid sulfate soil investigation (**Section 5.5.1**).

  Any changes to these features in future design requires review and reassessment of environmental risks.
- Potential shallow groundwater below the Practice Wickets is not considered to represent an unacceptable risk, as groundwater is not considered likely to infiltrate to the proposed surface elevation of 4.8 mAHD, and vapour intrusion from groundwater is not considered to represent a risk in consideration of the open space use of the area and the Site history and environmental data in this area.
- The design of the underground water carpark, including the final surface elevation within the carpark (i.e., the level of the lowest floor) is not yet finalised and risks and mitigations from shallow groundwater cannot be assessed. However, the SEMP contains requirements to assess vapour intrusion for structures within 1 m of groundwater, prohibits contact between Site users and groundwater.

  The SEMP will need to be referenced and complied with during the design of the underground carpark in the future.

7.0 Conclusions and Recommendations

7.1 Conclusions

Prior to the development of Macquarie Point, Division 2, Section 39F(1) of the *Macquarie Point Development Act 2012* (the Act) requires that an accredited site auditor certifies that remediation of each part of the Site has occurred to a standard that is satisfactory for the purposes of the proposed redevelopment.

Auditor certification has been recorded in Site Suitability Statements, with the overall aim of the Site's Environmental Audit being issue of Site Suitability Statements for all areas.

To date, four Site Suitability Statements have been issued by the EPA-accredited Site Auditor, as part of contaminated land audit reports, consisting of:

- The Goods Shed and Yard - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1* (Coffey, 2019a)
- The Escarpment (Audit Area 4 West) - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West* (Coffey, 2020)
- The Promenade and Underground Carpark (Lot E and UGC) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark* (Coffey, 2021a)
- The Precinct North (Lot B) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot B* (Coffey, 2021b).

The Site Suitability Statements should be read in conjunction with the contaminated land audit reports, which form part of the assessment of and requirements for the Site's suitability for the proposed development.

However, in 2024, the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024), was released by the Corporation, which updated and modified the vision for development of the Site. As a result, the Site Suitability Statements issued prior to the Precinct Plan (listed above) are no longer accurate to the proposed future uses of the Site and require review and update for the changes in Site uses and proposed development.

This report has been prepared to describe the changes in proposed land use and to assess if any changes in mitigation or management measures are required to prevent any unacceptable risk to future users or ecological receptors on the Site or adjacent properties.

7.1.1 Changes in Land Use

Table 29 below summarises the changes in Site use proposed for each of the four assessment areas considered in this report

Table 29 Changes in Land Use by Area

Assessment Area	Changes in Land Use
The Goods Shed and Yard (Audit Area 1)	• The Goods Shed will be removed from this area. • Proposed Open Space use to the west and north of the Goods Shed now forms park of the Multipurpose Stadium and Associated Concourse zone. • Sections of this area will be lowered to final surface elevations of between 2.9 to 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Escarpment (Audit Area 4 West)	• Land use of parts of this area has changed to Open Space. It is noted that the Goods Shed, located in the Goods Shed and Yard (Audit Area 1) is likely to be moved to this area, and assessment for commercial/industrial uses is still considered required. • The south-eastern corner is included in the proposed footprint of the underground carpark. • High density residential use is no longer planned in this area. • Sections of this area will be lower to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Promenade and Underground Carpark (Lot E and UGC)	• Open Space land use in the southern portion of this area is now included in the Multipurpose Stadium and Associated Concourse zone. While, the majority of this space was assessed for a proposed underground carpark, which was assessed for commercial/industrial use, portions of in the eastern and western areas of this assessment area were only considered for Open Space use. • Land proposed for an “Access Link”, or open transport corridor, in the eastern portion of this area was assessed for Open Space use, but is now considered for commercial/industrial use as part of the Multipurpose Stadium and Associated Concourse zone. • High density residential (above the first floor) is no longer planned in this area. • Sections of this area will be lower to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Precinct North (Lot B)	• Land use is still considered to be commercial / light industrial. • A single storey underground carpark is proposed in the northern portion of this assessment area. • Sections of this area will be lower to final surface elevations of between 1.8 and 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.

7.1.2 Additional Environmental Data or Changes in Adjacent Property Uses

In addition to the changes in land use and surface elevation arising from the new proposed development of the Site, new environmental data, and proposed changes to surrounding land uses, have been identified in the period since issue of the Site Suitability Statements.

New information available since the previous Site Suitability Statements were issued, that potentially affects the validity of those statements, is summarised on **Table 30** below.

Table 30 Additional Assessments or Foreseen Changes in Site Condition Considered

New Information or Change	Description and Consequences
Issue of the *State Policies and Projects (Macquarie Point Precinct) Order 2025* (the Order)	The Order provides the approval conditions for development of the Multipurpose Stadium. However, the environmental requirements are consistent with those in the *Macquarie Point Development Corporation Act 2012*, which provided the legislative framework for previous Site Suitability Statements, and no change to the process of Site Suitability are considered to arise from this change.
Updates and consolidation of the SEMPs referenced in Site Suitability Statements	The initial area-specific SEMPs issued for each area have been updated and consolidated into a single Site-wide SEMP. Each iteration of the SEMP has retained the conditions and information from previous versions.
Building and structure footprints overlapping areas of potential vapour intrusion	The current SEMP includes areas specific requirements relating to vapour mitigation in future buildings and structures, with identified soil vapours consisting of methane, TRH and BTEXN. The new planned development includes proposed structures with footprints which extend across areas of elevated potential vapour intrusion.
Designs for in-ground plants, including deep-rooted plants	Additional designs for in-ground plants have been proposed, which required assessment for environmental risk and confirmation from the Environmental Auditor to meet the requirements of the SEMP.
Review of the Site-Specific RC	The RC, which have been used to assess and identify areas of soil and groundwater where remediation is considered required for future development, have been reviewed and updated.
Collection of new environmental data from soil, groundwater, and soil vapour	Additional monitoring and investigation events have been conducted since issue of the Site Suitability Statements and have been assessed for any information which could influence Site Suitability. The following assessments relevant to areas with issued Site Suitability Statements have been considered: • Investigations of ASS • GMEs and groundwater gauging conducted in 2023, 2024 and 2025. • *In situ* characterisation soil sampling conducted for Stage 1 and Stage 2 of the proposed excavation of the Site. • Installation and sampling of new groundwater wells and soil vapour bores in June 2025.
Off-Site land use changes	The Macquarie Point STP is planned for closure and replacement with an SPS and emergency storage facility. As part of these works, the Hobart Main Pipeline (sewer) beneath the Site will be decommissioned and removed, and a new sewer line installed off-Site to the south under Evans Street, and east under TasPorts land.

7.1.3 Outcomes of Review

Based on the review of proposed development changes to land use, and new environmental data, the following items require changes in management or mitigation approaches for the Site to be suitable for the intended future use:

- Development of structures across assessment area boundaries.

  The Precinct Plan includes the following proposed structures which extend across multiple assessment areas:

- The Multipurpose Stadium and Associated Concourse – The Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, the Precinct North, the Precinct South, and the Gateway.
- The underground carpark and building footprints within the Antarctic Facilities Zone – The Escarpment, the Promenade and Underground Carpark, the Precinct North, and Audit Area 4 East.
- Building footprints within the Complementary Integrated Mixed Use Zone – The Precinct North and the Precinct South.

Extension of structures across the assessment area boundaries introduces additional considerations for Site Suitability, and development of structures which extend beyond the boundaries of assessment areas should not be commenced until Site Suitability Statements have been issued for all areas within their footprints.

- Potential soil vapour intrusion into future structures from methane, TRH, and BTEXN.

  This risk has been identified due to:

  - Detections of methane, considered to arise from anaerobic degradation of either residual hydrocarbon contamination, or saturated soil from former river- and sea-bed buried by land degradation, both directly in soil vapour, and above the adopted criteria for vapour intrusion in groundwater, in multiple locations across the Site.
  - Exceedances of the Commercial/Industrial land use RC for TRH >C10-C16 and naphthalene, indicating potential vapour intrusion in soil or groundwater below or adjacent to proposed structures, in both new data collected since issue of the Site Suitability Statement, and in some areas (i.e., former Open Space and Access Link areas in the Promenade and Underground Carpark) which have been updated to a more sensitive use in the new proposed development.
  - Potential changes in risk profile from proposed excavation/changes in Site elevation, which decrease the distance between some impacts and may lead to increased concentrations in soil at the surface.

  Based on the current land uses and existing leases, and the widespread and likely discontinuous sources of methane in saturated buried soils, remediation of the source of these impacts is not considered practicable. Inclusion of a vapour protection system in future building design is considered required as part of Site Suitability for areas which include potential vapour intrusion risks, consisting of the following areas considered in this report:

  - The Goods Shed and Yard – the Multipurpose Stadium and Associated Concourse.
  - The Escarpment – the Multipurpose Stadium and Associated Concourse, and the underground carpark and building structures within the Antarctic Facilities Zone.

    (It is noted that vapour protection is not considered required for the proposed relocation of the Goods Shed to the northern portion of this area).
  - The Promenade and Underground Carpark – the Multipurpose Stadium and Associated Concourse, and the underground carpark and building structures withing the Antarctic Facilities Zone.
  - The Precinct North – the Multipurpose Stadium and Associated Concourse, the underground carpark and building structures withing the Antarctic Facilities Zone, and building structures within the Complementary Integrated Use Zone.

    The performance requirements for any vapour protection system, including recommendations for independent review of the design and construction, are provided in **Section 7.2**.

- Potential future contact between intrusive maintenance workers and areas of Site soil with lead concentrations exceeding the adopted RC for this land use:

- The existing Site Suitability Statements included an assumption that only minor or incidental changes to the surface elevation would occur, and assessed potential risks to intrusive maintenance workers to a maximum depth of 2 m below the current surface elevation.
- Concentrations of lead were reported in previous assessments in excess of the adopted RC for maintenance workers at depths below 2 m below current surface elevation, and additional soil concentrations in excess of the RC have been identified since issue of the Site Suitability Statements, noting that these exceedances have been detected in soil proposed for excavation.
- To minimise potential contact between future intrusive maintenance workers and existing Site soil with exceedances of RC:
  - Known locations of exceedances will be documented in the SEMP(s) for management during construction or development activities.
  - Subsurface services will be required to be installed within clean fill/soil corridors, or within protective conduits.
  - Additional PPE requirements will be required during future intrusive maintenance works where contact with current Site soil may occur, to minimise potential ingestion/inhalation of existing Site soil.

  The proposed additional controls and data to be added to the SEMP regarding lead impacts to soil are provided in **Section 7.2**.

- Disturbance of PASS:
  - Assessment of Site soils in 2024 and 2025 identified that, while no ASS is present on Site, PASS with the potential to acidify if disturbed/oxidised is present in saturated soils at the Site.
  - Future development activities on the Site must include management measures for PASS to prevent acidification and environmental impact on the Site, or at any receiving site if PASS is excavated and removed, as documented in *Acid Sulfate Soil Investigations* (AECOM, 2025e).
- Potential groundwater present at the surface, or shallow groundwater where risks may not be quantified by the RC, at the following locations based on the final design elevations for the Site, has been identified at:
  - The north, west, and north-west areas of the Multipurpose Stadium.
  - The Practice Wickets in the north-west corner of the Site.
  - The underground carpark in the north-east corner of the Site.

  Potential shallow groundwater interactions are not considered to introduce unacceptable risks, or risks are considered to be suitably managed or mitigated by development designs, as:
  - In the 70% detailed design of the Multipurpose Stadium:
    - Any drained groundwater is captured and disposed of as potentially contaminated waste under a TWA or similar, and should not be discharged to sensitive receptors.
    - The drainage layer does not intersect and capture LNAPL plumes, which may render groundwater unable to be discharged under TWA.
    - A vapour mitigation layer is present above the drainage layer, and will act as mitigation against potential vapour intrusion risks from shallow groundwater.
    - Any potential soil which may be dewatered by the drainage layer is assessed and managed by a DWMP, as required by the acid sulfate soil investigation.

    Any changes to these features in future design requires review and reassessment of environmental risks.
  - Potential shallow groundwater below the Practice Wickets is not considered to represent an unacceptable risk, as groundwater is not considered likely to infiltrate to the proposed surface elevation of 4.8 mAHD, and vapour intrusion from groundwater is not considered to represent

a risk in consideration of the open space use of the area and the Site history and environmental data in this area.

- The design of the underground water carpark, including the final surface elevation within the carpark (i.e., the level of the lowest floor) is not yet finalised and risks and mitigations from shallow groundwater cannot be assessed. However, the SEMP contains requirements to assess vapour intrusion for structures within 1 m of groundwater, prohibits contact between Site users and groundwater.

The SEMP should be updated to include the requirements relating to potential surface or shallow groundwater, as noted in **Section 7.2**.

- Review of potential off-Site ecological impacts:
  - The *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).

    An addendum to this assessment was prepared in 2025 (AECOM, 2025i), and concluded that overall, based on the review of updated Site data and information, the outcomes of the AECOM (2020h) assessment remain valid and suitable for ongoing assessment of the Site. No material changes in the off-Site aquatic ecological risk profile have been identified, and ecological risk to receptors in the River Derwent and Sullivans Cove remains low.

    Ongoing groundwater monitoring was recommended and is included in the SEMP (AECOM, 2025h).
- The upcoming closure and removal of the Macquarie Point STP, and realignment of the Main Hobart Pipeline (Sewer):
  - The replacement of the STP with a pumping station, and associated activities including realignment of the Main Hobart, are not considered to change the environment suitability of the Site for future development.

The following changes, or updated information, are not considered to affect the previously issued Site Suitability Statements:

- Approval of the *State Policies and Projects (Macquarie Point Precinct) Order 2025* (the Order)
  - The Order provides approved conditions for the development of the Site. However, the conditions and requirements relating to the Environmental Audit and Site Suitability Statements are consistent with, and reference, the *Macquarie Point Development Act 2012*, and approval of the Order does not affect the assessment or requirements of the suitability of the Site for future development.
- Updates or consolidation of SEMP(s):
  - While the existing Site Suitability Statements reference different SEMPs, issued at the time of the initial assessment of Site's environmental suitability for development, have been updated as new data has been received, each iteration of the SEMP has included the previous requirements from Site Suitability Statements and been reviewed and accepted by the Site Auditor.
  - Updates to the SEMP, recommended in **Section 7.2**, must also be submitted to and accepted by the Auditor.
- Review and update of Site Specific RC:
  - While modifications to the Site Specific RC were identified as part of review in the context of the Precinct Plan, in all cases the changes increased criteria values, and as a result the RC used at the time of issue of Site Suitability Statements are considered conservative and appropriate for detection of potential environmental risks. As such, re-review of the existing data sets with the updated RC is not considered required.

  - It is noted that some RC (i.e., vapour intrusion, intrusive maintenance worker RC) are depth dependent, and potential changes in risks from the proposed modifications to the Site surface elevation are discussed above.

- Precluded PEVs:
  - No changes in PEVs precluded since the Site Suitability Statements were initially issued have been identified in this review.
- LNAPL Plumes
  - Based on assessment of LNAPL Plumes in 2025 (refer to **Section 5.5.4.1**), LNAPL was not present at measurable thicknesses in any groundwater wells in or hydraulically up-gradient of the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, or the Precinct North, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3).
  - No groundwater concentrations indicative of free-phase LNAPL, or soil vapour concentrations indicating potentially hazardous vapour generation (other than methane) were detected at the LNAPL Plumes, and LNAPL migration is not considered likely to occur.
  - LNAPL is still considered stable, and further remediation is not considered practicable.

  On this basis, LNAPL Plumes are not considered to make the Site areas considered unsuitable for development, if the management measures within the SEMP are implemented.

Based on the review conducted, if the recommendations provided in **Section 7.2** are implemented, and on the basis of ongoing implementation of the SEMP to manage residual environmental impacts at the Site, the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, and the Precinct North are considered suitable for the proposed development.

7.2 Recommendations

The following additional controls and mitigations are required to be added to the SEMP in order to mitigate and manage any additional environmental risks identified in the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, and the Precinct North:

- Vapour mitigation is required as part of construction of the structures in the following areas:
  - The Goods Shed and Yard.
  - The Promenade and Underground Carpark.
  - The Precinct North
  - Any buildings which include these areas in their footprint, such as the portion of the Multipurpose Stadium and Associated Concourse in the Escarpment.

  Vapour mitigation must incorporate a minimum gas protection value of 2 (EPA NSW, 2020), and the selected method should be suitable for mitigation of methane, TRH and BTEXN vapours.

  Design and construction documentation must include a documented testing and verification method for vapour intrusion mitigation measures, with reference to Appendix 7 – Verification and construction quality assurance, of *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020). Any design and/or installation of ground gas protection measures will require independent oversight and sign-off by an Environmental Auditor, or other suitably qualified and independent verifier.
- Landscaped areas and gardens should be established in aboveground planter boxes on hardstand and not directly over exposed soil. In the event that gardens are proposed in-ground, the following barrier system shall be installed:
  - Layer 1: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users.
  - Layer 2: Earthen cover (minimum 0.5 m) certified as ‘Fill Material’ in accordance with IB105.

- Layer 3: Surface coverage (comprising shallow rooted vegetation).

Deeper-rooted vegetation may be established using the designs provide in **Appendix E**, with the following additional requirements:

- Soil imported for in-ground planting must be Level 1 – Fill Material.
- No plants intended for consumption are to be included in any in-ground planting on the Site.
- The potential size of plant root structures should be considered when selecting species for cultivation on the Site. Planting structures should have sufficient volume for the plants to develop without requiring root structures to penetrate the earthen liners and extend beyond the clean-fill soil.
- The earthen liner and barrier layers included in planting designs are to be installed above the Site water table.
- In-ground planting is only to occur in open space use areas. No in-ground planting is to occur within Site buildings (i.e., within atriums, foyers, or arboretums).
- Trees, or any other deep-rooted plants, which are cultivated on the Site should be excavated and removed as soon as possible if any of the following occurs:
  - Death or significant rot/reduction in size
  - Toppling/knocking over by wind or impact.
- In the event that plant removal occurs:
  - Removal of all root structures must be included.
  - If root structures have extended and pierced the earthen liner and/or indicator barrier layer, these must be repaired and restored as part of removal of the plant(s).

- PASS within saturated soils, strongly correlating with estuarine sands, has been identified beneath the Site and should be considered during future works.

  Future activities at Macquarie Point should identify all activities which have the potential to disturb or expose (i.e., dewater) PASS at the Site, as identified in *Acid Sulfate Soil Investigations* (AECOM, 2025b), and:

  - The SEMP should be updated with a description and locations of identified PASS.
  - The SEMP should include overarching management obligations for disturbance of ASS and/or water table drawdown via dewatering, include a requirement for scope specific Acid Sulfate Soil Management Plans (ASSMP) and/or Dewatering Management Plans (DWMP) to be developed for each discrete works package involving civil and general earthworks activities, water table drawdown via dewatering, and any other significant soil disturbance activities or changes to natural groundwater and surface water systems.

    These documents should be prepared by those undertaking works which may disturb PASS, and must include:

    - Estimated volumes and action criteria for PASS which may be disturbed by the proposed works.
    - Procedures for the handling of disturbed PASS, including verification of neutralisation, groundwater generated by dewatering, and monitoring of Site environmental conditions in the vicinity of PASS disturbances.
    - Contingency measures which are specific, measurable, and attainable, and can be implemented in a timely manner in the event that action criteria or trigger values are exceeded.
  - Future structures and infrastructure at the Site should consider the potential effects of sulfides and possible acidification in design and selection of materials, and adopt appropriate mitigation measures to prevent degradation of materials overtime.

  - Any groundwater, or run-off which may have come into contact with PASS, should be considered as potentially contaminated. pH and the potential to acidify should be considered in assessment any such water prior to disposal

- Any engineered fill or other materials used to increase the surface level to 3 mAHD must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.
- The areas of soil listed below, where lead in soil has been identified as exceeding the intrusive maintenance worker RC:
  - Soil surrounding the Hobart Main Pipeline (sewer) (already noted in Section 3.2.3 of the SEMP.
  - Soil surrounding *in situ* sample points K14, K18, L13, M13, M14, K06, L08, M09, N10, F11, G11, G13, H10, H12, H13, I13, J06, J08, J10, J12

  These locations should be noted as a potential area of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.
- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Any future development of the Site which involved modification of the surface elevation must assess the proposed change against groundwater elevations. If groundwater will be or is likely to be ≤1 m below the final surface, the proposed development must include measures and/or mitigations to:
  - Prevent groundwater from reaching the surface or structures, such as drainage or tanking. Any such measures:
    - Must capture any drained groundwater for assessment and disposal as potential contaminated waste.
    - Must not transport or potentially increase the migration of groundwater or other contaminants on groundwater (such as LNAPL or DNAPL) to sensitive receptors (such as stormwater or the River Derwent/Sullivans Cove).
  - Assess and prevent unacceptable risks from groundwater-derived vapour via either:
    - Additional assessment of vapour risks from shallow groundwater which demonstrates that no unacceptable risks are present; or
    - A vapour protection system suitable for potential vapour risks from groundwater.
  - Identify if PASS may be dewatered and, if so, include measures to neutralise potential oxidation and prevent acidification as required by the assessment of acid sulfate soil at the Site.

Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract *Macquarie Point Development Project – Review of Site Specific Remediation Criteria and of issued Site Suitability Statements* dated 18 February 2025.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 20-May-2025 and 01-Feb-2026, and is based on the reports and information referenced within the report text which was available at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

								Maximum	0.3	0.3	
								Minimum	0.0001	0.00001	

Notes:

1. Field methane readings were recorded prior to and following sampling. The higher value is presented on this table.
2. Flow rate and field methane concentrations were measured using GA5000 landfill gas meter with a limit of resolution (LOR) of 0.1 %v/v and 0.1 L/hr.
3. Where methane concentration or flow rate has been recorded as below LOR, the LOR has been used for the calculation of GSV
4. GSV has been calculated using the maximum recorded flow rate.
5. 2 minute average flow rates were not recorded for all soil vapour bores.
6. Positive - Air flow from subsurface to surface; Static - no differential pressure difference recorded between bore and surface, limited soil vapour flow anticipated; Negative - Air flow from surface to subsurface, potential barometric pumping.

GENERAL NOTES:

A. SIDES OF EXCAVATION TO BE KEPT VERTICAL TO AT LEAST 150 ABOVE THE PIPE.
B. ALL ROCK INTRUSIONS OUT OF TRENCH WALL MUST BE REMOVED PRIOR TO ANY PIPE LAYING OPERATIONS.
C. ANY FOREIGN MATTER SUCH AS VEGETATION OR LITTER SHALL BE REMOVED FROM THE TRENCH PRIOR TO PIPE LAYING AND BACKFILL.
D. MARKER TAPE IS REQUIRED WHERE THE SEWER IS NOT THE DEEPEST SERVICE.
E. PLACE MARKER TAPE AT 1.5M DEEP OR ON FIRST BACKFILL LAYER, WHICHEVER IS SHALLOWER.

TABLE 201-D: TRENCH DIMENSIONS

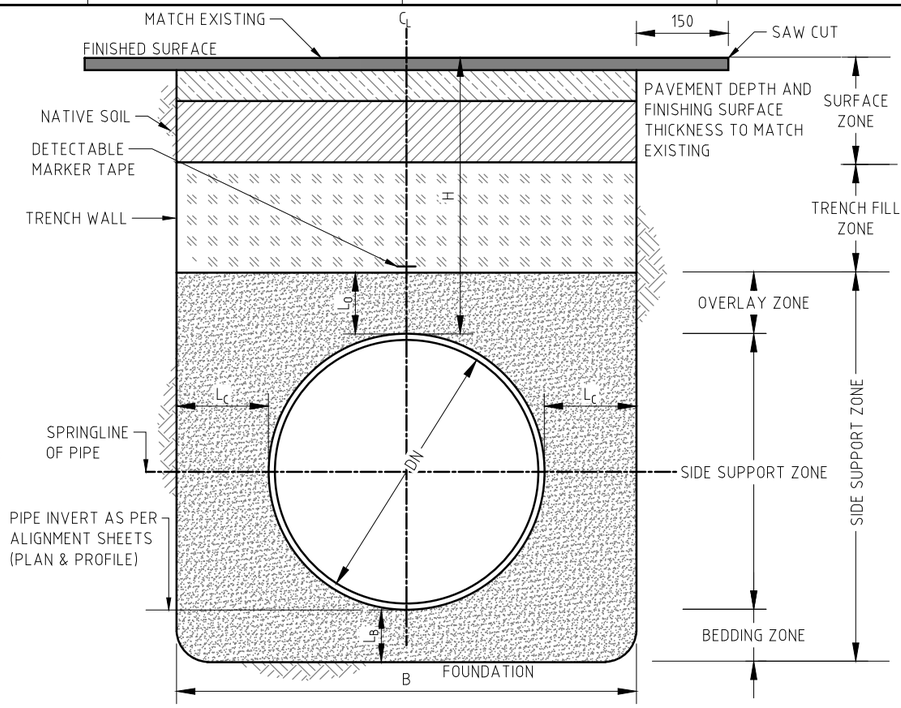
SEWER SIZE (DN)	L b :BEDDING DEPTH		L c :OVERLAY	L c :SIDE SUPPORT	
	MINIMUM	MAXIMUM	(MINIMUM)	MINIMUM	MAXIMUM
> 900	150	250	200²/ 300³	300	550

TRENCH DIMENSION NOTES:

1. IF MAXIMUM BEDDING DEPTH IS EXCEEDED, FILL OVER EXCAVATION WITH SPECIAL EMBEDMENT AS PER MRWA-S-202
2. THE FIRST MINIMUM OVERLAY FIGURE IS THE MINIMUM OVERLAY REQUIRED WHEN WALK BEHIND TRENCH BACKFILL COMPACTION EQUIPMENT IS TO USED.
3. THE SECOND MINIMUM OVERLAY FIGURE IS THE MINIMUM REQUIRED WHEN:
   a. RIDE ON TRENCH BACKFILL EQUIPMENT IS USED; OR
   b. THE SEWERAGE PIPE IS IN A ROAD CARRIAGEWAY. THIS ASSUMES THAT THE FIRST BACKFILL LAYER WILL BE AT LEAST 200 THICK (WHEN COMPACTED) SO THAT THERE IS A TOTAL COVER >500 DURING MECHANICAL COMPACTION.

TABLE 201-C: MINIMUM COVER (H)

LOCATION	MINIMUM COVER
MAJOR & ARTERIAL TYPE R TRAFFICABLE ROADS	1200
ALL OTHER SEWERS	900



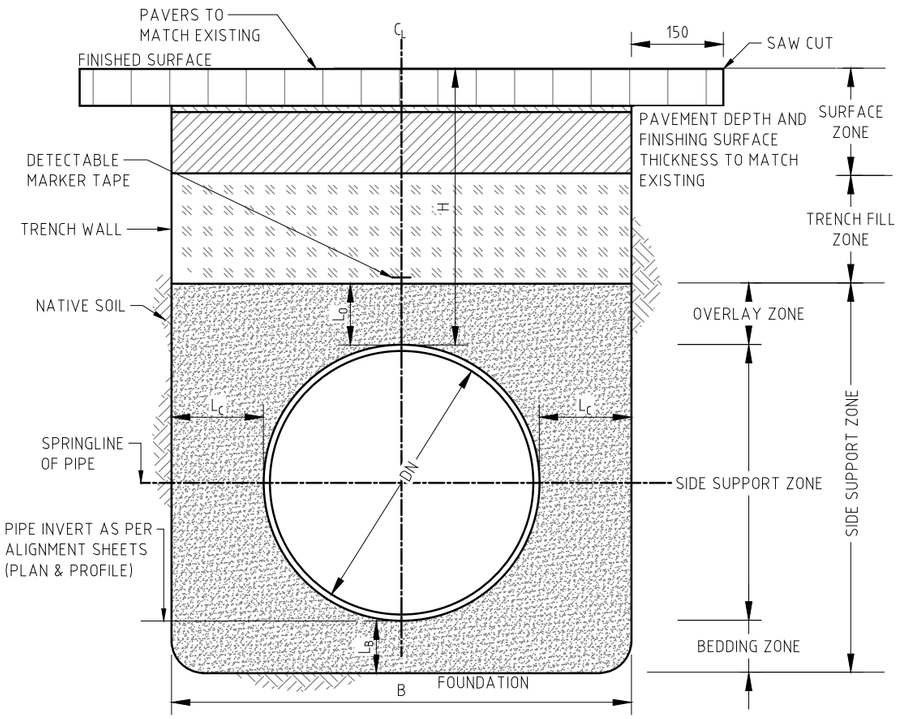


TABLE 201-A: TRAFFICABLE AREAS (TYPE R1)

TRENCH ZONE		PREFERRED MATERIALS	PRODUCT SPEC No.	METHOD OF PLACEMENT	MIN. COMPACTION REQUIREMENT
SURFACE ZONE	DSG	REPLACE WITH NEW PAVEMENT TO MATCH EXISTING PAVEMENT DETAIL, TO BE DETERMINED ON-SITE (ASSUME AC14 40MM MIN SURFACE). MINIMUM 450MM DEPTH OF PAVEMENT. CONSTRUCTION AS PER DSG SPECIFICATION 304.			95% R D
	HCC	REPLACE WITH NEW PAVEMENT TO MATCH EXISTING PAVEMENT DETAIL, TO BE DETERMINED ON-SITE (ASSUME AC10 35MM MIN. SURFACE). MINIMUM 300MM DEPTH OF PAVEMENT. CONSTRUCTION AS PER LGAT TSD-R06.			95% R D
TRENCH FILL ZONE		REFER TO ROAD OWNERS SPECIFICATION, IF NOT AVAILABLE: COMPLY WITH MRWA BACKFILL SPEC - MRWA SPEC 04.03, SUMMARISED AS FOLLOWS: A. FOR TRENCHES <1.5 M DEEP IN TYPE R SITUATION, THE BACKFILL SHALL BE 20MM CLASS 3 PLANT WET MIXED CRUSHED ROCK OR CRUSHED CONCRETE FOR THE FULL DEPTH. B. FOR TRENCHES > 1.5 M IN TYPE R SITUATION: - 20MM CLASS 3 PLANT WET MIXED CRUSHED ROCK OR CRUSHED CONCRETE ABOVE THE SUB-BASE LEVEL (NOMINALLY TO 600MM DEPTH BELOW THE FINISHED SURFACE LEVEL). - 20MM CLASS 4 (OR BETTER) CRUSHED ROCK OR CRUSHED CONCRETE FOR THE REMAINDER. C. IN TYPE F SITUATIONS: - THE BACKFILL SHALL BE 20MM CLASS 4 (OR BETTER) CRUSHED ROCK OR CRUSHED CONCRETE.	VICROADS SPEC 812 FOR CLASS 3 & 4 FCR. 818 FOR CLASS 4 CRUSHED SCORIA. RC500.22 FOR CLASS 4 CRUSHED CONCRETE.	BACKFILL MATERIAL SHALL BE PLACED AND COMPACTED IN LAYERS AND MOISTURE CONDITIONED AS REQUIRED TO ACHIEVE THE REQUIRED DENSITY. WHERE HAND HELD OR WALK BEHIND COMPACTION EQUIPMENT IS USED ON THE BACKFILL ZONE, AVOID COMPACTION WITHIN 300MM OF TOP OF PIPE. WHERE HEAVIER COMPACTION IS USED IN THE BACKFILL ZONE, AVOID COMPACTION WITHIN 500MM OF TOP OF PIPE.	95% R D
EMBEDMENT ZONE		- ALL NOMINATED EMBEDMENT IS SATISFACTORY IN TYPE R SITUATIONS, HOWEVER, IT IS CRITICAL THAT EMBEDMENT HAVE THE CORRECT MOISTURE CONTENT AND BE PROPERLY PLACED TO ACHIEVE ADEQUATE COMPACTION. - SELECTED MATERIALS SHALL BE WORKED AROUND THE PIPE TO ENSURE ALL VOIDS AT HAUNCHES ARE FILLED AND THE PIPE IS PROVIDED WITH GOOD SUPPORT ALONG ITS ENTIRE LENGTH. - EMBEDMENT TO BE PLACED UNDER THE HAUNCHES BY SHOVEL AND COMPACTED USING HAND TAMPERS OR VIBRATING PROBES OR PLATES. - RISK OF PIPELINE DEFLECTION MAY BE FURTHER REDUCED BY: - INCREASING THE DEPTH OF THE OVERLAY (TO UP TO 1M), OR - CEMENT STABILISING THE TOP SURFACE OF THE EMBEDMENT (HAND DISTRIBUTED CEMENT AT 2 KG PER SQUARE METRE, WORKED INTO THE TOP SURFACE BY SHOVEL).			70% i D

TABLE 201-A: TRAFFICABLE AREAS (TYPE R2)

TRENCH ZONE		PREFERRED MATERIALS	METHOD OF PLACEMENT	MIN. COMPACTION REQUIREMENT
SURFACE ZONE	HCC	REPLACE EXISTING PAVERS WITH 'LIKE FOR LIKE' IN ACCORDANCE WITH HCC AGREEMENT. ASSUME PREPARATION OF PAVERS, 30MM BEDDING SAND AND 450MM BASE PAVEMENT AS PER DSG SPECIFICATION 304		95% R D
TRENCH FILL ZONE		REFER TO BACKFILL SPECIFICATION - MRWA SPECIFICATION 04.03. - FOR BACKFILL < 1.5M DEEP, SELECTED OR ORDINARY FILL. A. SELECTED FILL. MATERIAL THAT IS FREE FROM ORGANIC OR OTHER DELETERIOUS MATERIAL, OBTAINED FROM EXCAVATION OR IMPORTED, WITH A PARTICLE SIZE OF ROCK NOT GREATER THAN 20MM, OR FOR OTHER THAN ROCK NOT GREATER THAN 75MM (REFER AS2566.2-2002). B. ORDINARY FILL. MATERIAL OBTAINED FROM EXCAVATION OR IMPORTED THAT CONTAINS NOT MORE THAN 20% BY MASS OF ROCK FRAGMENTS WITH SIZE BETWEEN 75MM AND 150MM, WITH NO ROCK OR CLAY FRAGMENTS GREATER THAN 150MM (REFER AS2566.2-2002). - FOR BACKFILL > 1.5M DEEP, AS PER PROJECT SPECIFIC BACKFILL SPECIFICATION.	REFER TO BACKFILL SPECIFICATION - MRWA SPECIFICATION 04.03. - FOR BACKFILL < 1.5M DEEP, SELECTED OR ORDINARY FILL PLACED AS REQUIRED TO MEET THE NOMINATED COMPACTION DENSITY. - FOR BACKFILL > 1.5M DEEP, PLACE AS SPECIFIED IN THE PROJECT SPECIFIC BACKFILL SPECIFICATION. PLACE AND COMPACT IN LAYERS AND MOISTURE CONDITION AS REQUIRED. WHERE HAND HELD OR WALK BEHIND COMPACTION EQUIPMENT IS USED IN THE BACKFILL ZONE, AVOID COMPACTION WITHIN 300MM OF TOP OF PIPE. WHERE HEAVIER COMPACTION IS USED IN THE BACKFILL ZONE, AVOID COMPACTION WITHIN 500MM FROM THE TOP OF PIPE.	95% R D TOP 600 mm 90% R D
EMBEDMENT ZONE		- THE EMBEDMENT PROPOSED IS SATISFACTORY IN NON TRAFFICABLE SITUATIONS, HOWEVER, IT IS CRITICAL THE EMBEDMENT HAVE THE CORRECT MOISTURE CONTENT AND BE PROPERLY PLACED TO ACHIEVE MAXIMUM COMPACTION. - SELECTED MATERIALS SHALL BE WORKED AROUND THE PIPE TO ENSURE ALL VOIDS AT HAUNCHES ARE FILLED AND THE PIPE IS PROVIDED WITH GOOD SUPPORT ALONG ITS ENTIRE LENGTH. - EMBEDMENT TO BE PLACED UNDER THE HAUNCHES BY SHOVEL OR FORK AND COMPACTED TO THE REQUIRED DENSITY.		60% i D

77												
78	**Suggested UCL to Use**											
79				95% H-UCL		537.7						
80												
81	Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.											
82	Recommendations are based upon data size, data distribution, and skewness.											
83	These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).											
84	However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.											
85												
86	**ProUCL computes and outputs H-statistic based UCLs for historical reasons only.**											
87	**H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.**											
88	**It is therefore recommended to avoid the use of H-statistic based 95% UCLs.**											
89	**Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.**											
90

Executive Summary

The Macquarie Point Development Corporation (MPDC) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of a remediation strategy for the Macquarie Point site in Hobart, Tasmania (the Site).

This report provides a factual overview of the outcomes of the Well Maintenance Program undertaken at the Site between 14 September – 6 December 2023, and the Targeted Groundwater Monitoring Event (GME) undertaken at and surrounding the area referred to as the Precinct South, in the south-eastern corner of the Site, between 29 November – 6 December 2023.

The outcomes of the Well Maintenance Program and Targeted GME are summarised below:

- A Well Maintenance Program consisting of inspection of the condition of 38 groundwater wells at and surrounding Precinct South identified a number of wells requiring location or repair. To ensure serviceability of the wells prior to undertaking the GME:
  - A licenced surveyor was engaged to locate buried or 'missing' groundwater wells (for which well gatics were not visible at the surface) using metal detection and Global Positioning System (GPS) survey based on previously reported coordinates were used.
  - A licenced driller was engaged to undertake maintenance and repair work on select wells (as required), including cutting of bitumen and clearing of fill to expose gatics (where well gatics were buried under the surface), replacement of gatic bolts (where bolts were damaged, sheared or missing), replacement of gatic covers (where gatic covers were damaged), extension of the polyvinyl chloride (PVC) well casing to surface where gatics were buried under fill in re-graded areas of the Site.

  Based on the Well Maintenance Program, seven wells, namely MW13, MW137, MW142, MW143, R4, S9, and TW03, are considered to be destroyed/lost. The loss of these groundwater wells is not considered to prevent fulfilment of the objectives of the GME based on available historic data and lack of changes in use or monitoring data from nearby groundwater wells.
- A total of 31 groundwater wells at and surrounding the Precinct South were selected for gauging and sampling via low flow techniques for the Targeted GME. The outcomes of the Targeted GME are summarised below:
  - Recorded depth to groundwater ranged from 1.582 metres below ground level (m bgl) (MW164) to 3.250 m bgl (MW176) in wells screened in the shallow aquifer, and from 2.281 m bgl (MW126B) to 3.056 m bgl (MW124B) for wells screened in the deeper aquifer (top of screened interval >9 m bgl). Shallow groundwater contours indicated a generally south-westerly groundwater flow direction, with some southerly components in the southern portion of Precinct South, and possible easterly flow components at the eastern boundary, although this may be an artefact of lack of gauging data in the TasPorts area.
  - Hydrocarbon odours were noted at monitoring wells MW03, MW05, PW02 and S8.
  - Measurable Light Non-Aqueous Phase Liquid (LNAPL) was observed at four groundwater monitoring wells (MW03, MW05, PW02 and S8) in the south-eastern corner of the Precinct South, with thickness ranging from 0.050 to 0.160 m. Recorded LNAPL thickness was within historic recorded ranges in MW03 and MW05, while above historical recorded thicknesses in PW02 and S8. While LNAPL Plume B is still considered delineated on Site and unlikely to be migrating further onto the Site, additional monitoring to confirm LNAPL thicknesses and assess mobility via LNAPL baildown testing is recommended.

    No LNAPL was encountered in wells where it had not previously been reported, and no groundwater samples were collected from wells with LNAPL present.

    LNAPL is not delineated at the eastern border of the Precinct South and is considered likely to extend to TasPorts land to the east.
  - Dense Non-Aqueous Phase Liquid (DNAPL) was not encountered at any of the groundwater wells monitored.

- Concentrations of the following Chemicals of Potential Concern (CoPC) were reported above the adopted assessment criteria for Protected Environmental Values (PEVs) in at least one sample, noting exceedances were reported for Tier 1 Screening criteria including Drinking Water (Health and Aesthetics), Recreation (Primary / Secondary Contact), Vapour Intrusion (Residential), Ecosystem Protection (90%), and Buildings and Structures):
  - Benzene
  - Total recoverable hydrocarbon (TRH) fractions including TRH >C10-C40 (sum), TRH C6-C10 [minus benzene, toluene, ethylbenzene and xylenes (BTEX)](F1), TRH >C10-C16 (minus Naphthalene)(F2)
  - Metals (aluminium, arsenic, copper, lead, manganese, zinc)
  - PAHs (naphthalene, anthracene, phenanthrene, fluoranthene, benz[a]anthracene, benzo[a]pyrene)
  - Inorganics (chloride, sodium, total cyanide, ammonia)

  It is noted that the presence of LNAPL also precludes all PEVs, and that concentrations of some CoPC listed above (PAHs [naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene] and aluminium) were reported with Limit of Report (LOR) above adopted criteria. Future assessment should consider if lower LORs should be requested for these CoPC if practical.
- Concentrations of the following CoPC were reported in excess of the Site-Derived Remediation Criteria (RC) for Potential Future Residents for slab-on-grade buildings with unknown construction or multi-storey building:
  - TRH (C6-C10) (minus BTEX)

  Residential use of the Precinct South is not planned for future development and is not considered likely to occur due to currently planning limitations on residential occupancy near an active port (i.e., TasPorts land to the east of the Precinct South).

Further assessment of groundwater PEVs and nature and extent of impacts will be undertaken separately, however, precluded PEVs are consistent with previous investigations of this area reported in existing Detailed Site Investigation (DSI) reports relevant to the Precinct South, i.e. *Audit Area 5 – Detailed Site Investigation* (AECOM, 2021a), and *Audit Area 3 – Detailed Site Investigation* (AECOM, 2022). The data collected as part of this investigation is considered to be adequate to inform future assessments of the Precinct South.

1.0 Introduction

The Macquarie Point Development Corporation (MPDC) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of a remediation strategy for the Macquarie Point site in Hobart, Tasmania (the Site). The Site location is presented on **Figure F1** in the **Figures** section.

This report has been prepared to provide a factual overview of the outcomes of the Well Maintenance Program undertaken at the Site between 14 September – 6 December 2023, and the Targeted Groundwater Monitoring Event (GME) undertaken at, and surrounding, the area referred to as the Precinct South area between 29 November – 6 December 2023.

The Site layout is presented on **Figure F2** in the **Figures** section. The Precinct South layout is presented on **Figure F3** in the **Figures** section.

1.1 Background

Historical activities undertaken at and in proximity to the Site have resulted in soil and groundwater impacts. The Site has been divided into seven sub-areas, as shown on **Plate 1**, for the purpose of assessment, remediation and completion of an Environmental Audit. Portions of the Site which have not yet received issue of a Site Suitability Statement (i.e., Auditor sign-off) include the Gateway, Precinct South, and Audit Area 4 East. Remediation work at the Precinct South was conducted in 2023, and remediation work at the Gateway has been conducted in 2024, although has not yet had results reported.

Plate 1 Site Sub-Areas

The Site was previously divided into Audit Areas (named Audit Area 1 to Audit Area 7) for environmental assessment purposes based on previous development plans. The Precinct South, the area considered in this report, covers previous Audit Area 3 and the south-east portion of previous Audit Area 5. Previous investigations undertaken in the Precinct South are summarised in existing Detailed Site Investigation (DSI) reports relevant to these areas, i.e. *Audit Area 5 – Detailed Site Investigation* (AECOM, 2021a), and *Audit Area 3 – Detailed Site Investigation* (AECOM, 2022).

As part of environmental assessments, AECOM has conducted a series of GMEs at the Site since 2015. The most recent Site-wide GMEs were conducted in August 2019 and November 2019, the outcomes of which were reported and summarised in the AECOM report titled *Groundwater Well Installation and Monitoring 2019* (AECOM, 2020a). Since then, a targeted GME has also been undertaken at the Gateway area in December 2022, the outcomes of which were reported in the AECOM report titled *The Gateway – Data Gap Assessment* (AECOM, 2023a).

A Well Maintenance Program was undertaken between 14 September – 6 December 2023, during which a number of wells, which were either damaged or buried by Site activities (such as excavation, spray sealing of surfaces, or vehicle movements on Site), were located and repaired.

Following the Well Maintenance Program, a Targeted GME was undertaken between 29 November – 6 December 2023 at and surrounding the Precinct South area to collect updated groundwater data to record current groundwater quality and conditions in this area. These data will inform detailed assessment of the condition at Precinct South, which will be undertaken as a separate phase of work.

This factual report consolidates and summarises the results of the Well Maintenance Program and the Targeted GME.

1.2 Objectives

The objectives of the Well Maintenance Program and Targeted GME were to:

- Assess the condition of groundwater wells in and surrounding the Precinct South (including wells off-Site to the south), and, where wells were not considered suitable to sample:
  - Locate any buried or ‘missing’ groundwater wells
  - Undertake well maintenance and repair activities (if possible) of damaged wells.

  It is noted that groundwater wells in other portions of the Site that were noted to be either lost or damaged during the December 2022 Targeted Gateway GME, were also included in this program.
- Collect updated groundwater data at and surrounding the Precinct South to record current groundwater quality and conditions. Detailed assessment of the groundwater data will be undertaken separately.

The objective of this report is to provide a clear and concise summary of the results to the Well Maintenance Program and the Targeted GME undertaken at and surrounding the Precinct South area.

Detailed assessment of protected environmental values (PEV), nature and extent of impacts, historical data and trends at the Precinct South is not presented in this factual report and will be undertaken separately.

1.3 Scope of Work

The scope of work undertaken at and surrounding the Precinct South are summarised in **Table 1**.

Table 1 Scope of Work

Task	Description	Details
1	Well Maintenance Program (14 September – 6 December 2023)	• *Walkover and well inspection* (14 September 2023): A walkover and targeted well inspection was undertaken to assess the accessibility and condition of groundwater wells at and surrounding the Precinct South, to identify wells that may require to be located (due to well gatics not being visible at the surface), as well as those that may require maintenance (due to being damaged) to ensure serviceability of the wells prior to undertaking a GME. • *Well surveying and metal detection* (1 November 2023): A licenced surveyor was engaged to locate up to 25 potentially buried or 'missing' groundwater wells (for which well gatics were not visible at the surface during the inspection undertaken on 14 September 2023). A combination of methods including metal detection and Global Positioning System (GPS) survey based on previously reported coordinates were used. Of the 25 wells, 18 were relevant to the Targeted Precinct South GME scope, and seven wells were from other portions of the Site which were not locatable during the Targeted Gateway GME (AECOM, 2023a). • *Well maintenance and repair* (13 November 2023): Maintenance and repair work was undertaken on select wells (as required), including cutting of bitumen and clearing of fill to expose gatics (where well gatics were buried under the surface), replacement of gatic bolts (where bolts were damaged, sheared or missing), replacement of gatic covers (where gatic covers were damaged), extension of the polyvinyl chloride (PVC) well casing to surface where gatics were buried under fill in re-graded areas of the Site. • *Re-survey of wells* (6 December 2023): A licenced surveyor was engaged to survey the updated heights [metres Australian Height Datum (m AHD)] of the top of the PVC casing for two groundwater wells (MW146 and RN4), which were uncovered from approximately 0.5 m bgl and extended to current ground surface level during the 13 November 2023 well maintenance and repair work. Further GPS survey and metal detection was undertaken to locate three additional wells (MW142, MW143 and MW155).
2	Targeted GME (29 November – 6 December 2023)	• *Gauging event* (4 December 2023): Gauging of the groundwater Standing Water Level (SWL) and Light Non-Aqueous Phase Liquid (LNAPL) thickness, where present, was conducted at a total of 31 groundwater wells located at and surrounding the Precinct South. • *Sampling event* (29 November – 6 December 2023): Collection of 27 primary groundwater samples over a six-day sampling period, from abovementioned groundwater wells, noting no samples were collected at four wells where measurable LNAPL was observed. Quality Assurance/Quality Control (QA/QC) samples were also collected. • Laboratory analysis of collected groundwater samples and QA/QC samples by National Association of Testing Authorities (NATA) accredited laboratories.
3	Reporting	• Preparation of this report summarising the results of the activities undertaken.

Further details regarding the field methodology adopted are provided in **Section 3.0** and **Section 4.0**.

2.0 Precinct South Details

The overall Macquarie Point Site, located at 10 Evans Street, Hobart, Tasmania, is approximately 9.3 hectares (ha) and is currently zoned as '*Macquarie Point Mixed Use Zone (Activity Area 3.0)*' for mixed use under the *Sullivans Cove Planning Scheme 1997* [(Hobart City Council (HCC, 2021)].

The Precinct South is a sub-area located in the south-eastern portion of the broader Site (refer **Plate 1** and **Figure F2** in the **Figures** section). For the purpose of reference to earlier reports, the Precinct South is comprised of the historic Audit Area 3 in its entirety, and a portion of historic Audit Area 5.

Site investigations have identified impacts at the Precinct South area, located in the south-eastern portion of the Site, which are associated with a history of industrial activities including rail/locomotive operations, freight handling and distribution, fuel and oil transfer, and bulk fuel storage.

2.1 Description

The Precinct South area is described below in **Table 2**.

Table 2 The Precinct South Details

Item	Details
Identification	The Precinct South, Macquarie Point
Address	10 Evans Street, Hobart, Tasmania, 7001 (see **Figure F1** in the **Figures** section)
Precinct South Area	Approximately 1.4 ha
Title Details	The Precinct comprises a portion of land title 113521/1 (formerly CT 114462/1) which make the overall Site area.
Current Owner	State of Tasmania (Crown Land)
Local Government Authority	Hobart City Council
Current Zoning	'*Macquarie Point Mixed Use Zone (Activity Area 3.0)*' (HCC, 2021)
Layout	The Precinct South is relatively flat, with a slight rise to the northern edge. The surface is sealed with bitumen, concrete, and gravel. One building currently occupies the central southern portion of the Precinct South area: • The Red Shed, currently occupied by a microbrewery (Hobart Brewing Company). A slab is present to the east of the Red Shed which was formerly occupied by the SeaRoads Shed, which was demolished in late 2022. Red Square, to the west of the Red Shed, is currently used as an intermittent public events space, and is used as a market place for small mobile vendors (e.g. coffee and food vendors, and hairdressers). The northern and central portion of the Precinct South is currently used as public carparking. The layout of the Precinct South is shown on **Figure F3** in the **Figures** section.
Surrounding Land Uses	• North – Unoccupied area of the Site (referred to as the Precinct North), temporarily being used for carparking and storage of shipping containers. A Waste Water Treatment Plant (WWTP) is located to the north and east beyond the Site boundary.

Item	Details
	• East –TasPorts owned land including carparking and port facilities. • South – Evans Street, with commercial properties (including TasPorts and University of Tasmania) and residential properties (apartments) beyond, which extend towards Hunter Street and Sullivans Cove. • West – The Goods Shed and Yard portion of the Site, which is used as office space and for temporary events, with commercial and residential properties beyond.
Geology	The Precinct South has been subject to significant filling since the early 1800s and is located on reclaimed land. Fill material across the Precinct South, and the greater Macquarie Point site, consists of clays, sands, gravels, cobbles and bricks. Deeper fill material consists of silty sands, similar to the underlaying natural material, and may be associated with reworked natural material or dredged material. Natural soils encountered below the Precinct South consists of estuarine/marine deposits (silty sands) and weathered dolerite including clays, gravels, cobbles. Dolerite bedrock is present below the Precinct South and is noted to generally decrease in depth to the south and east. The known lithology is summarised below: • Fill material: 0 to 12 m below ground level (bgl) • Estuarine/marine deposits: 3.7 to 15 m bgl • Weathered dolerite: 11.2 to 19 m bgl • Dolerite bedrock: 5 to 25+ m bgl
Hydrogeology	Regional groundwater flow is inferred to be in a general easterly direction toward the River Derwent. The Site is underlain by a single aquifer unit (within multiple lithological units). Groundwater modelling completed by GHD Group Pty Ltd (GHD, 2014) indicates groundwater flow to the south of the Site is in an easterly direction between the southern boundary of the Site and the location of Hunter Island. The easterly groundwater flow direction is considered to be influenced by Hunter Island, which is likely to be relatively low permeability when compared to the surrounding sediment, and the higher permeability sediment located in the former Hobart Rivulet (i.e. beneath Evans Street). The former Hobart Rivulet is considered to be a likely preferential pathway for groundwater flow. There are a number of former sea walls located beneath and surrounding the Site. The sea walls were used in the progressive stages of land reclamation and are likely to influence localised groundwater flow direction. Evidence of tidal influence on groundwater levels has been previously identified to the south of the Site within the inferred groundwater flow path at MW151, where tidal variation of approximately 0.1 m has been noted. Tidal influence [i.e. increasing SWL variations] has been noted to increase toward Sullivans Cove. The inferred potentiometric contours for shallow groundwater (refer **Figure F5**the **Figures** section) based on the SWL data collected during the gauging event undertaken on 4 December 2023, at and surrounding the Precinct South, indicate that groundwater beneath the Precinct South is in a generally south-westerly direction, with some southerly components in the southern portion of Precinct South. Some possible easterly flow components are noted at the eastern boundary, although this may be an artefact of lack of gauging data in the TasPorts area. Groundwater below the Precinct South is generally encountered between 1.9 to 4 m bgl.

2.1.1 Proposed Future Land Use

Based on the *New Territory from Old Ground – Macquarie Point Strategic Framework and Masterplan 2015-2030* (the Masterplan) (MPDC, 2015), the Precinct South was intended for development for a mixture of future uses, as shown on **Figure F2** in the **Figures** section, comprising:

- Commercial (including visitor accommodation, retail, arts and institutional); and
- Public open space.

In September 2022, it was announced by the Tasmanian Government Department of State Growth that the Macquarie Point site is the preferred location for a future sports stadium and multipurpose area. In October 2023, the *Mac Point Draft Precinct Plan* (the Precinct Plan) (MPDC, 2023) was released for the redevelopment of the Site, which sets out a mixed-use precinct comprised of interconnected discrete Zones. The Precinct Plan is presented in **Plate 2**, as well as in context with the boundaries of the Precinct South on **Figure F4** in the **Figures** section.

Based on the Precinct Plan (MPDC, 2023), the Precinct South area is proposed to comprise a combination of Commercial and Open Space use areas, specifically:

- The Complementary Integrated Mixed Use Zone; and
- The ‘Multipurpose Stadium and Associated Concourse Zone’.

Basement carparking is not currently planned for this area and is considered unlikely to occur based on the shallow depth to groundwater, and potential management issues associated with residual LNAPL present in the south-eastern portion of the Site. Additional remediation and/or mitigation controls will be required if basement parking is considered in future.

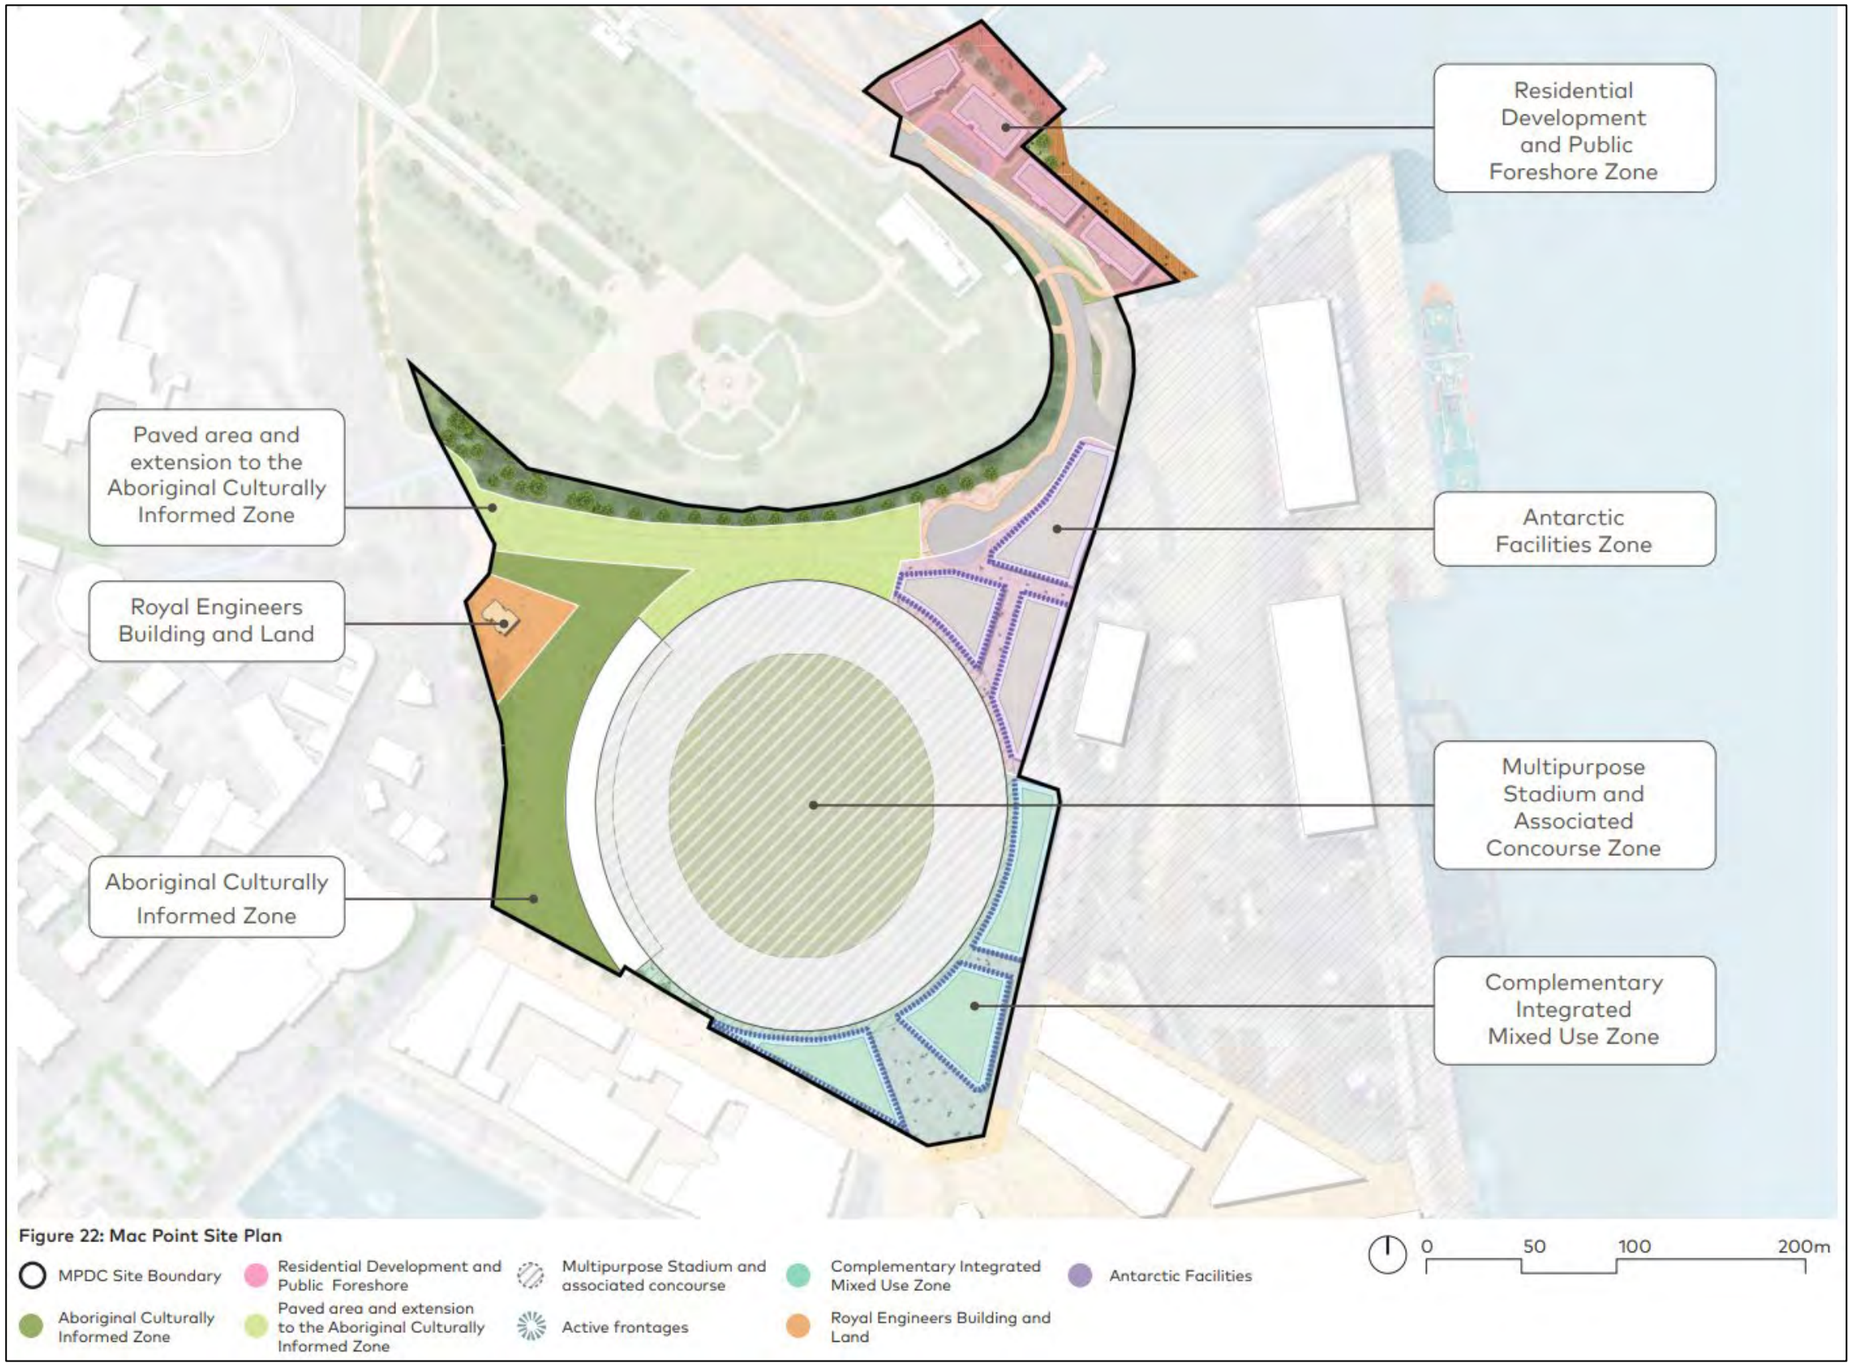

Plate 2 Precinct Plan and Future Land Uses (MPDC, 2023)

2.2 Chemicals of Potential Concern

On the basis of the historical land uses of the Precinct South and surrounding areas, and previous environmental investigations that have been undertaken at and surrounding Precinct South, the following chemicals of potential concern (CoPC), summarised in **Table 3** below, may be present in the Precinct South.

Table 3 Chemicals of Potential Concern

Former Land Use/ Potential Contaminating Activity	Chemicals of Potential Concern	Potential Impacted Media
The Precinct South		
Land Reclamation	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs	• Soil • Groundwater • Soil Vapour
Freight Handling	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, pH	
Fuel Storage	Lead, TRH, PAH, BTEX, ACM	
Mechanics Workshop	Heavy metals[2], TRH, PAH, BTEX, phenolic compounds	
Adjacent Areas		
Land Reclamation	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs	• Soil • Groundwater • Soil Vapour
Roundhouse (Locomotive maintenance and refuelling)	TRH, BTEX, PAH, phenolic compounds, chlorinated hydrocarbons, SVOC, VOC	
Railyards (including fuel storage) and Freight Handling	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC	
Gasworks	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, cyanide, ammonia, ACM	
Fuel Storage and Bulk Fuel Terminals	Lead, TRH, PAH, BTEX, PFAS[3], ACM	
Port Operations	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC	
Former Hobart Rivulet	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, cyanide, ammonia, SVOC, VOC, OCPs	

Notes: TRH – Total Recoverable Hydrocarbons; PAH – Polycyclic Aromatic Hydrocarbons; BTEX – Benzene, Toluene, Ethylbenzene and Xylenes; SVOC: Semi-Volatile Organic Compounds; VOC: Volatile Organic Compounds; OCP: Organochlorine Pesticides; PFAS – Per and Poly-fluoroalkyl Substances; ACM – Asbestos Containing Material; 1 – aluminium, arsenic, cadmium, chromium, copper, lead, manganese, nickel and zinc; 2 – lead and arsenic; 3. A review of historical information has not identified the use of products containing PFAS, however there is potential for firefighting foams containing PFAS to have been used historically as part of emergency response operations at the former Bulk Fuel Terminals.

3.0 Data Quality

3.1 Data Quality Objectives

The *National Environment Protection (Assessment of Site Contamination) Amendment Measure 2013*, (ASC NEPM, 2013) *Schedule B2: Guideline on Site Characterisation* specifies that the nature and quality of the data produced in an investigation are determined by the Data Quality Objectives (DQOs). As referenced by the ASC NEPM (2013), the DQO process is detailed in the United States Environmental Protection Agency (US EPA) *Guidance on Systematic Planning Using the Data Quality Objectives Process* (2006), EPA QA/G-4 (EPA/240/B-06/001).

The process of establishing appropriate DQOs is defined by a seven-step planning approach as presented by ASC NEPM (2013) and US EPA (2006). The DQOs for the Targeted Precinct South GME project were established during the development of the field program and presented in the Sampling, Analysis and Quality Plan (SAQP) [AECOM, 2023b] previously prepared for the work. For reference, the DQOs are presented in **Appendix A**.

3.2 Data Quality Indicators

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the data include:

- Assessment of the reproducibility of the data by calculation of the Relative Percent Difference (RPD) for laboratory and field duplicate samples. This provides an indication of the precision of the data. The RPD is calculated from the absolute difference between results of the duplicate pair divided by the mean value of the duplicate pair as presented below:

  RPD (%) = 100 x (D1-D2) / ((D1+D2) / 2)

  Where: D1 = primary sample analysis; D2 = duplicate sample analysis
- Assessment of the analytical results for laboratory QC samples. This provides an indication of the accuracy of the data.
- Collection of rinsate blanks (at a rate of one per day of sampling) to provide an indication of accuracy related to potential for cross contamination of samples during sampling.
- Collection of field blanks (at a rate of one per day of sampling) to assess ambient conditions during sampling.
- Analysis of trip blanks (at a rate of one per esky) to provide an indication of accuracy related to potential for cross contamination of samples during transport.

Assessment criteria for DQI for the sampling work undertaken are listed below in **Table 4**.

Table 4 Acceptance Criteria for Data Quality Indicators

Data Quality Indicator	Acceptance Criteria
Rinsate blanks	Less than the laboratory limit of reporting (LOR)
Intra and inter laboratory field duplicates (1)	RPDs less than: • 30% for high level laboratory duplicates (i.e. >20 x LOR) • 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR) • 200% for low level laboratory duplicates (i.e. 1 to 10 x LOR)
Trip blanks	Less than the laboratory LOR
Field blanks	Less than the laboratory LOR

Data Quality Indicator	Acceptance Criteria
Laboratory duplicates (2)	RPDs Less than: • 20% for high level laboratory duplicates (i.e. >20 x LOR) • 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR)
Matrix spikes (3, 4)	Recoveries between 70-130% of the theoretical recovery
Method blanks	Less than the laboratory LOR
Laboratory control samples (4)	Recoveries between 70-130%.
Surrogate spikes	See Note 5

Notes:

1. *This RPD range is based on typical RPDs recommended in AS 4482.1-2005 (Standards Australia, 2005). Higher variations can be expected for organic analyses compared to inorganics, and for samples with low analyte concentrations or non-homogeneous samples (ASC NEPM, 2013). It is noted that AS4482.1-2005 was recently withdrawn by Standards Australia in 2022, although, it is still considered acceptable for this withdrawn standard to be used, considering the absence of replacement technical documents, and on the basis that soil sampling guidelines from other states including from EPA Victoria (2009) and Queensland Government (2018) adopt typical RPD acceptance criteria recommended in AS4482.1-2005.*
2. *If the concentrations are close to the LOR, then higher RPDs may be accepted. Variation can be expected to be higher for organic analysis than for inorganics (AS 4482.1-2005).*
3. *Assumes that samples are homogeneous and the background analyte level is less than 20% of the spike level (refer to USEPA Method 8000B). Note that there is no requirement for matrix spikes to pass as certain matrices may preclude recovery of spiked compounds. In this case data will be accepted if LCS data meets the acceptance criteria.*
4. *80% of the compounds tested must fall within the control limits. Control limits are dynamic and vary for individual tests as per USEPA Method 8000B.*
5. *Recoveries for surrogates are test dependent and are based on US EPA Method SW846. Control limits are dynamic and vary for individual tests but are within the criteria described in US EPA Method SW846.*

3.3 Assessment of Data Quality

A detailed assessment of data quality is provided in **Appendix A** which encompasses appraisal of field and laboratory QA/QC for groundwater data collected across the Precinct South and surrounding areas between 29 November – 6 December 2023.

Based on the outcomes of the DQO process, the quality of the data collected was assessed on a range of factors including:

- Documentation and data completeness; and
- Data quality, comparability, representativeness, and precision and accuracy for sampling and analysis.

The relevant evaluation criteria for each of these issues are presented in below in **Table 5** below.

Table 5 DQO Evaluation and Criteria

DQO	Evaluation Criteria	Comments
Documentation Completeness	Site properly described	**Section 1.1** and **Figure F2**
	Investigation area properly described	**Section 2.0** and **Figure F3**
	Understanding of Site history and chemicals of interest presented	DSI reports (AECOM, 2021a and 2022) and **Section 2.2**
	Sampling locations properly and accurately located	SAQP (AECOM, 2023b), **Figure F3** and **Table T2**.

DQO	Evaluation Criteria	Comments
Data Completeness	Completion of calibration records, field records, chain of custody (CoC) forms, laboratory sample receipt and test certificates from NATA accredited laboratories	**Appendix B**, **Appendix C**, **Appendix D** and **Appendix E**
	Samples tested for appropriate chemicals of interest	SAQP (AECOM, 2023b), **Section 2.2**, **Table T3** to **Table T6**, **Appendix A**, **Appendix D** and **Appendix E**
	Consideration of key receptors of interest	DSI reports (AECOM, 2021a and 2022), **Section 2.1** and **Appendix F**
	Appropriate sampling techniques, sample storage and transportation of samples	SAQP (AECOM, 2023b), **Section 4.0**, **Appendix A** and **Appendix D**
Data Comparability	Selection of NATA certified laboratory using NEPM testing procedures	SAQP (AECOM, 2023b), **Appendix A** and **Appendix E**
	Intra-laboratory and inter-laboratory duplicate samples	SAQP (AECOM, 2023b), **Appendix A**, and **Appendix C**
Data Representativeness	Collection and analysis of adequate number of representative samples from each location	SAQP (AECOM, 2023b), **Appendix A** and **Figure F3**
	Use of properly trained and qualified field personnel	SAQP (AECOM, 2023b), **Appendix A** and **Section 4.0**
Precision and Accuracy	Assessment of RPD for laboratory and field duplicate samples	**Section 3.2** and **Appendix A**
	Assessment of suitability of LORs	**Appendix A** and **Table T3** to **Table T6**
	Assessment of the analytical results for laboratory QC samples	**Section 3.2** and **Appendix A**
	Collection and assessment of rinsate and blank samples	**Section 3.2** and **Appendix A**

The Targeted Precinct South GME was undertaken in accordance with the SAQP (AECOM, 2023b). The SAQP provided detail on sampling methodologies, the rationale for sample location selection, analytical schedule and DQOs.

Detailed assessment of field and laboratory QA/QC for the groundwater data collected has been undertaken in **Appendix A**. The data validation procedure employed indicate that the following should be considered when assessing the data provided in the report:

- During the six-day groundwater sampling period, no rinsate blank sample was collected on the first day of sampling (29 November 2023), hence assessment of potential cross-contamination during sampling undertaken on this day is limited. Wells sampled on this day (RN4 and MW146) did not report any exceedances of adopted criteria which affect the overall conclusions and outcomes of assessment, and no detections which are considered likely to indicate cross-contamination were reported in the five rinsate samples collected on each other day of sampling, thus it is considered unlikely that cross-contamination may have occurred to an extent which affects assessment of groundwater condition in the Precinct South.

- LORs for select PAHs, including naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene, were reported above the adopted Ecosystem Protection (90%), Drinking Water (Health), and/or Recreation (Primary / Secondary Contact) criteria. Exceedances of the adopted criteria for either these CoPC, and other CoPC, have been detected in groundwater during this sampling event and previous investigations, and these uses are considered precluded for groundwater within the Precinct South.

  As a results, the LORs of these CoPC which exceed adopted criteria are not considered significant or to affect the overall assessment of precluded uses of groundwater in the Precinct South. However, future sampling events should consider if lower LORs for this CoPC should be requested if practical.

- The LOR for aluminium was reported above the adopted Ecosystem Protection (90%) screening value. However, concentrations in excess of this criteria were reported in approximately 85% of the samples analysed, and this LOR discrepancy is not considered to affect the overall assessment of groundwater condition or precluded groundwater uses in the Precinct South, as detected concentrations of aluminium above LOR already preclude this use . However, future sampling events should consider if lower LORs for this CoPC should be requested if practical.

- Recovery of the surrogate 2-Bromonaphthalene (for TPH – semi-volatile speciation) was marginally greater than the upper DQO limits, which may indicate potential for minor over-estimation of reported concentrations of semi-volatile speciated TPH fractions in MW146. This may result a minor level of conservatism in the interpretive use of the data but does not impact the reliability of the data.

- The rate of laboratory QC testing of laboratory duplicates and matrix spikes were below the expected frequency for some analytes due to insufficient sample volume, however this is not considered to impact the reliability of the data as:

  - Results are consistent with historic assessments.
  - No new sources of impact are known to have been introduced since previous investigations have been conducted.

Where there have been non-compliance from data quality indicators identified, the following conservative measures have been adopted:

- Adopted criteria lower than reported LORs have been conservatively considered precluded.
- Results have been compared to data from this event and historic assessments, and existing Site knowledge, to assess if discrepancies are consisted likely to represent meaningful gaps or effects on interpretation.

On the basis of the known contamination status of the Site, the analytical data validation procedure employed, and the field procedures adopted during the field investigations, the overall quality of the analytical data is considered to be of an acceptable standard for interpretative use.

4.0 Field Methodology

4.1 Well Maintenance Program

As described in **Table 1**, the Well Maintenance Program included the following activities:

- Walkover and well inspection (14 September 2023)
- Well surveying and metal detection (1 November 2023)
- Well maintenance and repair (13 November 2023)
- Re-survey of wells (6 December 2023)

The walkover and well inspection were undertaken by properly trained and qualified AECOM field personnel. A licenced surveyor was engaged for GPS survey work and a licenced driller was engaged for well repair work, which consisted of cutting asphalt where wells were suspected covered, hydro-excavation where wells were suspected to be buried, minor repairs with hand tools to replace bolts or gatics, and/or extension of stand-pipes and installation of new gatics if required.

The work was undertaken in accordance with a Safety Health and Environment Management Plan (SHEMP) for the project, including task-specific safe work method statements (SWMS).

4.2 Targeted GME – Gauging and Sampling

Groundwater gauging and sampling for the Targeted GME were undertaken properly trained and qualified AECOM field personnel, in accordance with the SAQP for the work, as well as guidance provided in the following documents:

- ASC NEPM (2013), *Schedule B2: Guideline on Site Characterisation*.
- Documents in the absence of relevant Tasmanian guidelines, including:
  - EPA Victoria Publication IWRG701, *Sampling and Analysis of Waters, Wastewaters, Soils and Wastes*, June 2009.
  - EPA Victoria Publication 669.1, *Groundwater Sampling Guidelines*, February 2022.
  - EPA Victoria Publication 668.1 *Hydrogeological Assessment (Groundwater Quality) Guidelines*, October 2022.

Specific details regarding the field methodology are summarised in **Table 6** below.

Table 6 Methods

Activity	Methodology
Groundwater Monitoring Well Gauging	• Monitoring wells were gauged using an Interface Meter and SWLs and total well depths were measured as m below top of casing (BTOC). • Where LNAPL was present, the bottom depth of the well was not gauged.
Groundwater Monitoring Well Sampling	• Groundwater samples were collected via low flow sampling techniques. • Water quality parameters (including pH, electrical conductivity [EC], dissolved oxygen [DO], oxidation reduction potential [ORP] and temperature) were measured during purging using a calibrated water quality meter. Sampling was undertaken following the stabilisation of the water quality parameters (i.e. DO ±10%; EC ±3%; pH ±0.05; ORP ±10mV; temperature ±0.2°C) and water level (<0.1 m). • Samples were field-filtered (using 45µm in-line filters) for analysis of dissolved metals and ferrous iron.

Activity	Methodology
Groundwater QC Sampling	• Intra-laboratory and inter-laboratory duplicate groundwater samples, rinsate blanks, trip blanks and field blanks were collected as described in **Section 3.2**.
Sample Nomenclature	All samples were clearly labelled with unique sample identification numbers consisting of the date, sample location and sampler's initials. In the case of intra and inter-duplicate samples, sample containers were labelled so as to not reveal their purpose or sample location to the laboratory.
Sample Preservation	• Samples were stored on ice, in a darkened esky whilst at the Site, and in transit to the laboratory. • As required, groundwater samples were placed in appropriately preserved laboratory-supplied containers for the analyses performed by NATA-accredited laboratories.
Equipment Decontaminatio n	• Reusable groundwater sampling equipment was decontaminated between each sample location using a Decon 90 solution and subsequently rinsed in potable water. • Clean, disposable nitrile gloves were worn during gauging and sample collection. Gloves were changed between each gauging and sampling location.
Management of Purged Groundwater	• Purged groundwater from sampling activities was placed into labelled drums and stored on-Site for future disposal by a licenced waste contractor.

Equipment calibration certificates are attached in **Appendix B**.

Field records are attached in **Appendix C**.

The CoC forms and Sample Receipt Notification (SRN) documentation are attached in **Appendix D**, and laboratory certificates are attached in **Appendix E**.

5.0 Field Observations

5.1 Well Maintenance Program

As described in **Section 1.3** and **Section 4.1**, in preparation for the Targeted GME, a Well Maintenance Program was undertaken between 14 September – 6 December 2023, which included an inspection to assess the accessibility and condition of groundwater wells at and surrounding the Precinct South, followed by survey-location and repair of a number of wells which were either damaged or buried as a result of Site activities (such as excavation, spray sealing of surfaces, or vehicle movements on Site).

The outcomes of the work were presented in the SAQP (AECOM, 2023b) and are summarised in **Table T1** in the **Tables** section.

It is noted that:

- Two wells, namely MW146 and RN4 were buried 0.5 – 0.6 m deep under fill placed in the area for regrading of the surface for the Dark MOFO event in June 2023. Hydro-excavation (non-destructive digging) was used to expose the gatics for these wells buried under fill, following which the well casings were extended and gatics raised to the surface level. The top of casing of these wells were resurveyed on 6 December 2023 to record the changed elevation resulting from the repair work.
- Seven wells, namely MW13, MW137, MW142, MW143, R4, S9, and TW03, are destroyed/lost. The loss of these groundwater wells is not considered to prevent fulfilment of the objectives of the GME as:
    - MW137 and R4 have not been previously sampled, and they have been monitored as part of delineation of LNAPL in the Promenade and Underground Carpark area (referred to in reports as LNAPL Plume A2). Nearby wells MW146 (located between the historic location of LNAPL Plume A2 and Precinct South) and RN4 (located in the north-western portion of Precinct South) are down-hydraulic gradient of the inferred LNAPL Plume A2 and are suitable for assessment of potential migration of LNAPL or dissolved hydrocarbons to the Precinct South.
    - At S9, historical groundwater data are available from 2015, 2016, 2017, 2018 and 2019, with no exceedances of Site-Derived RC reported. Updated groundwater data has been collected from monitoring wells up- and down- inferred hydraulic gradient which enables assessment of groundwater quality in this area.
    - At MW13:
        - Historical groundwater data are available from 2015 and 2019. No exceedances of Site-Derived RC have been reported.
        - MW13 is inferred to have been located up- or cross-hydraulic gradient of historical fuel-related sources of contamination identified within this portion of the Site. Based on aerial images, the area surrounding and up-gradient of MW13 has predominantly been used for freight storage & as open-space since the mid 1970s until 2014, and for carparking & open space since 2016, without any new sources of potential impact to groundwater known to be introduced since the previous monitoring event.
        - Updated groundwater data has been collected from up-hydraulic gradient (MW127A/B and MW55) as well as down-hydraulic gradient (several wells).
        - MW13 previously delineated LNAPL to the west of Plume B. Excavation to the water table was conducted 9.5 m to the west of MW13 in 2023 and no LNAPL or sheen was apparent on the groundwater, as show on **Plate 3** in **Section 5.2**, and is considered suitable to delineate LNAPL in this direction.

      As MW13 does not have historical impact to groundwater reported, has not had contaminant sources of impact between the previous monitoring events introduced, and the Targeted GME included assessment of groundwater up, down, and cross-gradient, replacement of this well is not proposed.

- At TW03:
  - Historical groundwater data are available from 2016, 2017, 2018 and 2019. No exceedances of Site-Derived RC have been reported.
  - No new contaminant sources have been identified in this area since the previous monitoring. Potential sources of contamination (oil and diesel pipelines and lead impacted soil) in this area have been removed (AECOM, 2021b).
  - Previous groundwater gauging has reported potential off-Site mounding and localised westerly groundwater flow from TasPorts land to the east. The off-Site area potentially hydraulically upgradient currently consists of a sealed bitumen surface and apparent warehouse space, and review of aerial photographs on NearMap[1] between at least 6 March 2011 (the point at which NearMap images are available) and when the Targeted GME was undertaken does not indicate any change in use. As noted above, multiple GMEs conducted in this period have not reported any contamination in groundwater in TW03 which may indicate an off-Site source.

    While the presence/absence of groundwater mounding and potential off-Site impacts entering Site groundwater could not be assessed as part of this GME with the loss of TW03, it is considered unlikely that groundwater conditions have altered in a manner which may introduce new contamination based on no apparent changes in off-Ste use, and removal of on-Site sources of potential impact.

  As TW03 does not have historical impact to groundwater reported, and is not considered likely to have had any new source of potential impact between the previous monitoring events introduced, replacement of this well is not proposed.
- MW142 and MW143 are buried under fill placed in the area for regrading of the surface for the Dark MOFO event and were unable to be accessed. These wells, located within and immediately down-gradient of the extent of the historic LNAPL Plume A3, were last monitored as part of the November 2019 GME (AECOM, (2020a).

  The exclusion of these groundwater wells is not considered to prevent fulfilment of the objectives of the GME as:
  - LNAPL has not been measured at MW142 during any GMEs or during monitoring as part of LNAPL remediation (AECOM, 2021c) undertaken between 2016 – 2019 since installation of the well in October 2015, although LNAPL droplets were noted on the interface probe during gauging in October 2016.
  - LNAPL remediation, including at MW143, was undertaken between 2015 and 2017, and LNAPL was not detected in the well between July 2017 and November 2019. LNAPL is not considered to remain in this well (AECOM, 2021c).
  - The Targeted GME included gauging and assessment of groundwater from nearby wells, including MW146 (down-hydraulic gradient and between these wells and the border of the Precinct South) and RN4 (down-hydraulic gradient and located at the border of the Precinct South closest to these wells) and MW155 (which is cross-hydraulic gradient of MW142 and MW143). No LNAPL or hydrocarbon concentrations indicative of LNAPL were detected in these wells, and it is considered unlikely that LNAPL is migrating into the Precinct South.

Following completion of the Well Maintenance Program, a total of 31 groundwater wells at and surrounding the Precinct South were selected for the Targeted GME.

5.2 Groundwater and LNAPL Gauging

A groundwater gauging event was undertaken on 4 December 2023 to measure groundwater SWLs and LNAPL thickness (where present) at a total of 31 groundwater wells located at and surrounding the Precinct South.

[1] Nearmap.com, accessed 30 January 2024

Based on the SWL data collected during the gauging event, the inferred potentiometric contours for shallow groundwater are presented in **Figure F5** the **Figures** section, noting that:

- SWLs from deep groundwater monitoring wells, i.e. wells installed to depth of >10 m bgl, namely, MW124B, MW125B, MW126B and MW127B, are not considered in the potentiometric contours.
- Two wells, MW150 and MW155, were unable to be gauged as part of the gauging event on 4 December 2023. MW150, which is located in the middle of Evans Street, was unable to be safely accessed due to traffic, and MW155, which was initially buried under fill, was uncovered and accessed on 6 December 2023. Thus, SWL records collected at the time of sampling of these wells, from 1 December 2023 for MW150 (i.e. three days before the gauging event), from and 6 December 2023 for MW155 (i.e. two days after the gauging event) were used for the preparation of potentiometric contours. There is potential for some minor localised effects on the potentiometric contours based on this time gap, however, overall contours are consistent with previous gauging and inclusion of these SWL data are not expected to significantly impact interpretation of the contours.

The following are noted:

- Recorded depth to groundwater ranged from:
  - 1.582 m bgl (MW164) to 3.250 m bgl (MW176) in wells screened in the shallow aquifer
  - 2.281 m bgl (MW126B) to 3.056 m bgl (MW124B) for wells screened in the deeper aquifer (top of screened interval >9 m bgl).
- The inferred potentiometric contours for shallow groundwater indicate that groundwater at and surrounding the Precinct South has a generally south-westerly flow direction, with some southerly components in the southern portion of Precinct South, and possible easterly flow components at the eastern boundary, although this may be an artefact of lack of gauging data in the TasPorts area.
- Hydrocarbon odours were noted at monitoring wells MW03, MW05 and PW02. Although hydrocarbon odour at well S8 was not noted in the field records, the field staff has verified that LNAPL was confirmed at S8 (using an interface meter as well as a bailer) and that hydrocarbon odour was present at S8.
- Dense Non-Aqueous Phase Liquid (DNAPL) was not encountered at any of the groundwater wells monitored.
- Measurable LNAPL was observed at four groundwater monitoring well locations (MW03, MW05, PW02 and S8) as summarised in **Table 7**, with thickness ranging from 0.050 to 0.160 m. The historical reported range of LNAPL thickness from previous GMEs and monitoring at these wells (AECOM, 2021c) has also been included.

Table 7 LNAPL Measured in Groundwater Wells during Gauging Event (4 December 2023)

Well ID	Depth to Groundwater (m bgl)	Depth to LNAPL (m bgl)	LNAPL Thickness (m)	Historical Maximum LNAPL Thickness (m)	Thickness Within Historical Range?
MW03	1.97	1.92	0.050	0.091	Yes
MW05	2.17	2.1	0.070	0.096	Yes
PW02	2.25	2.09	0.160	0.080	No
S8	1.99	1.87	0.120	0.014	No

With regards to delineation of LNAPL, it is noted that:

- As well MW13 was destroyed (refer **Table T1**) during pipeline removal works in this area, there is a potential gap in LNAPL delineation to the west of groundwater well S8. However, excavation to groundwater was undertaken approximately 9.5 m west of groundwater well MW13 as part of soil remediation in the Precinct South in 2023, and no LNAPL or sheen was apparent on the surface of the groundwater exposed. A photograph of the groundwater encountered in this excavation is presented in **Plate 3**.
- Consistent with historic assessment, LNAPL is not delineated off-Site in TasPorts land to the east, however, repeated requests for access to gauge or monitor groundwater condition in this direction have not been granted by TasPorts. The LNAPL plume has been previously assessed as likely to be present on TasPorts land, and originate from historic activities (bulk fuels storage and handling) on both the Site and TasPorts land.

Plate 3 Groundwater in excavation approximately 9.5 m west of groundwater well S8 undertaken as part of soil remediation work in the Precinct South in 2023

The recorded LNAPL thickness in PW02 (0.160 m) and S8 (0.120 m) exceeded the historical maximum LNAPL thicknesses recorded for these wells and for Plume B as a whole (0.096 m, previously detected in MW05 in 2018) (AECOM, 2022). The cause of increase is not known, but as the inferred source of Plume B (historic fuel storage tanks in the area and on the TasPorts land to the east) have been removed, and no new sources, such as a fuel spill or installation of new storage tanks or lines, are known to have occurred in the area, it is considered likely that the recorded LNAPL thicknesses are localised changes to the existing plume and do not represent a change in plume mobility. Recent works, such as the removal of the SeaRoads Shed in late 2022, or remediation excavation conducted to the west in 2023, may have introduced vibrations in the ground or, in the case of the remediation excavation, created a temporary void, which has affected the LNAPL area.

Remediation attempts at Plume B, conducted between 2000-2001 and 2015-2019, generally reported low recoverability and general impracticability of LNAPL remediation via extraction (AECOM, 2021c). In

order to assess if the recorded LNAPL thickness in this GME represents a change in plume conditions which may indicate further remediation could be considered, an additional LNAPL gauging and transmissivity testing event was conducted between 20-21 March 2024 (AECOM, 2024a) and reported that:

- Detected LNAPL thicknesses in wells in March 2024 were consistent with, or less than, the reported LNAPL thicknesses in December 2023. LNAPL was only detectable in three wells (MW05, PW02, and S8) and was no longer detectable in MW03.
- LNAPL transmissivity in PW02 and S8 was calculated following baildown testing and was at or below the range at which further LNAPL recovery was considered efficient. Insufficient LNAPL recovery occurred in MW05 to assess LNAPL transmissivity, and is considered indicative of overall low LNAPL transmissivity.

Based on these results, and on the lack of any identified source of ongoing LNAPL release which could be increasing the volume of LNAPL in Plume B, it is considered that LNAPL Plume B remains stable and is unlikely to have mobilised. Further remediation of LNAPL Plume B was considered unlikely to have a material impact on reducing the residual LNAPL volume.

During the Targeted GME, samples were collected from 27 groundwater wells, noting no samples were collected at four wells where measurable LNAPL was observed.

Table 8 below summarises the stabilised groundwater quality parameters measured during the Targeted GME, at the time of groundwater sampling via low-flow sampling method. The table summarises data from wells at and surrounding the Precinct South, including off-Site wells.

Table 8 Summary - Field Water Quality Parameters

Wells	Values	pH	EC (mS/cm)	ORP (mV) [1]	DO (mg/L)
Shallow Wells (i.e. wells installed to depths of ≤10 m bgl)	Minimum	6.58 (MW126A)	305 (MW163)	-1231.0 (RN4)	0.00 (MW60)
	Maximum	7.35 (MW163)	33,578 (MW153)	-20.4 (MW175)	0.16 (MW146)
	Average	NA	3125	-141.9	0.07
Deep Wells (i.e. wells installed to depth of >10 m bgl)	Minimum	6.38 (MW127B)	241 (MW127B)	-125.9 (MW124B)	0.02 (MW124B)
	Maximum	7.76 (MW124B)	1994 (MW126B)	-32.1 (MW127B)	0.10 (MW126B)
	Average	NA	1171	-78.4	0.06

Notes: mS/cm – millisiemens per centimetre; mv – millivolts; 1 –Field-collected ORP data has been presented herein, i.e. ORP data has not been corrected with reference to the electrode used in the field; NA – calculation of average is not applicable to pH values.

6.0 Analytical Results

Groundwater analytical data obtained from the laboratories were reviewed and screened against assessment criteria for comparison purposes only. The selected assessment criteria are detailed in **Appendix F**, including adopted Tier 1 Screening Criteria, and Site-Derived Remediation Criteria (RC) for groundwater (AECOM, 2016). These were also presented in the SAQP (AECOM, 2023b) previously prepared for the work.

Groundwater analytical data compared with adopted Tier 1 Screening Criteria are presented in **Table T3** to **Table T5**. Groundwater analytical data compared with Site-Derived RC are presented in **Table T6**. **Figure F6** - **Figure F9** in the **Figures** section shows locations with CoPC above the adopted assessment criteria in groundwater samples.

A summary of the exceedances of the adopted assessment criteria are presented on **Table 9** below.

Table 9 Summary of Exceedances of Assessment Criteria

PEV	CoPC	Criteria Exceeded [1]	Range of Reported Concentrations [1]	Number of Exceedances
Tier 1 Screening Criteria				
Drinking Water (Health)	Benzene	1	<1 - 2	1 of 27 primary results
	Arsenic	0.01	<0.001 - 0.011	1 of 27 primary results
	Lead	0.01	<0.001 - 0.025	2 of 27 primary results
	Manganese	0.5	0.079 - 3.47	17 of 27 primary results
	Naphthalene	0.17	<1 - 2.6	2 of 26 primary results
	Benz(a)anthracene	0.03	<1 - 1.2	1 of 26 primary results
	Benzo(a)pyrene	0.01	<0.5 - 1.3	1 of 26 primary results
	Cyanide Total	80	<4 - 186	2 of 26 primary results
Drinking Water (Aesthetics)	Aluminium	0.2	<0.01 - 0.32	2 of 27 primary results
	Manganese	0.1	0.079 - 3.47	26 of 27 primary results
	Total Dissolved Solids	600	189 - 22000	18 of 27 primary results
	Chloride	250	10 - 11600	7 of 27 primary results
	Sodium	180	7 - 5990	9 of 27 primary results
Recreation (Primary / Secondary Contact)	Naphthalene	1.7	<1 - 2.6	1 of 26 primary results
	Benz(a)anthracene	0.3	<1 - 1.2	1 of 26 primary results
	Benzo(a)pyrene	0.1	<0.5 - 1.3	1 of 26 primary results
Vapour Intrusion – Residential Health Screening Levels (HSLs)	>C10-C16 (minus Naphthalene)(F2)	760	<100 - 1140	2 of 26 primary results

PEV	CoPC	Criteria Exceeded [1]	Range of Reported Concentrations [1]	Number of Exceedances
Ecosystem Protection (90%)	Aluminium	0.0005	<0.01 - 0.32	23 of 27 primary samples
	Copper	0.003	<0.001 - 0.006	4 of 27 primary samples
	Lead	0.0066	<0.001 - 0.025	3 of 27 primary samples
	Manganese	0.08	0.079 - 3.47	26 of 27 primary samples
	Zinc	0.023	<0.005 - 0.077	4 of 27 primary samples
	Ammonia (as N)	1.2	<0.01 - 52	24 of 26 primary samples
	Anthracene	0.01	<1 - 3.7	4 of 26 primary samples
	Phenanthrene	0.6	<1 - 26.6	11 of 26 primary samples
	Fluoranthene	1	<1 - 5.4	7 of 26 primary samples
	Benzo(a)pyrene	0.1	<0.5 - 1.3	1 of 26 primary samples
	C10-C36 fraction (sum)	600	<50 - 1730	6 of 26 primary samples
	>C10-C40 fraction (sum)	600	<100 - 1710	6 of 26 primary samples
Buildings and Structures	Chloride	6000	10 - 11600	1 of 27 primary results
Aesthetics [2]	Hydrocarbon odours and measurable LNAPL were noted at monitoring wells MW03, MW05, PW02 and S8.			
Site-Derived Remediation Criteria				
Potential Future Residents (slab-on-grade buildings with unknown construction or multi-storey building)	TRH C6-C10 fraction (minus BTEX)(F1)	600	<20 - 600	1 of 27 primary results
	TRH >C10-C16 (minus Naphthalene)(F2)	800	<100 - 1140	1 of 26 primary results

Notes: *[1] Values are expressed as µg/L for organic CoPC and total cyanide, mg/L for other inorganic CoPC; [2] Aesthetic issues based on field observations.*

Concentrations of the following CoPC were reported above the adopted assessment criteria in at least one sample:

- Benzene
- TRH >C_{10}-C_{40} (sum), TRH C_6-C_{10} (minus BTEX)(F1), TRH >C_{10}-C_{16} (minus Naphthalene)(F2),
- Select metals (aluminium, arsenic, copper, lead, manganese, zinc)
- Select PAHs (naphthalene, anthracene, phenanthrene, fluoranthene, benz[a]anthracene, benzo[a]pyrene)
- Inorganics (chloride, sodium, total cyanide, ammonia)

Exceedances were reported for the following criteria:

- Tier 1 Screening Criteria:
  - Drinking Water (Health)
  - Drinking Water (Aesthetics)
  - Recreation (Primary / Secondary Contact)
  - Vapour Intrusion – Residential HSLs
  - Ecosystem Protection (90%)
  - Buildings and Structures
- Site-Derived RC:
  - Potential Future Residents (slab-on-grade buildings with unknown construction or multi-storey building)

No PEVs considered available in previous assessment (AECOM, 2021a and AECOM, 2022f) were reported precluded during the GME. No future residential use of the Precinct South is planned or considered likely, and no remediation of groundwater is considered required based on reported exceedances of RC.

As discussed in **Section 1.2**, further assessment of groundwater PEVs and nature and extent of impacts is not presented in this factual report and will be undertaken separately.

7.0 Conclusions

Based on the recent activities undertaken at and surrounding the Precinct South area, including the Well Maintenance Program and the Targeted GME, the following is noted:

- A Well Maintenance Program consisting of inspection of the condition of 38 groundwater wells at and surrounding Precinct South identified a number of wells requiring location or repair. To ensure serviceability of the wells prior to undertaking the GME:
  - A licenced surveyor was engaged to locate buried or 'missing' groundwater wells (for which well gatics were not visible at the surface) using metal detection and GPS survey based on previously reported coordinates were used.
  - A licenced driller was engaged to undertake maintenance and repair work on select wells (as required), including cutting of bitumen and clearing of fill to expose gatics (where well gatics were buried under the surface), replacement of gatic bolts (where bolts were damaged, sheared or missing), replacement of gatic covers (where gatic covers were damaged), extension of the polyvinyl chloride (PVC) well casing to surface where gatics were buried under fill in re-graded areas of the Site.
- Based on the Well Maintenance Program, seven wells, namely MW13, MW137, MW142, MW143, R4, S9, and TW03, are considered to be destroyed/lost. The loss of these groundwater wells is not considered to prevent fulfilment of the objectives of the GME based on available historic data and lack of changes in use, or monitoring data from nearby groundwater wells.
- A total of 31 groundwater wells at and surrounding the Precinct South were selected for gauging and sampling via low flow techniques for the Targeted GME. The outcomes of the Targeted GME are summarised below:
  - Recorded depth to groundwater ranged from 1.582 m bgl (MW164) to 3.250 m bgl (MW176) in wells screened in the shallow aquifer, and from 2.281 m bgl (MW126B) to 3.056 m bgl (MW124B) for wells screened in the deeper aquifer (top of screened interval >9 m bgl). Shallow groundwater contours indicated a generally south-westerly groundwater flow direction, with some southerly components in the southern portion of Precinct South, and possible easterly flow components at the eastern boundary, although this may be an artefact of lack of gauging data in the TasPorts area.
  - Hydrocarbon odours were noted at monitoring wells MW03, MW05, PW02 and S8.
  - Measurable LNAPL was observed at four groundwater monitoring wells (MW03, MW05, PW02 and S8) in the south-eastern corner of the Precinct South, with thickness ranging from 0.050 to 0.160 m. Recorded LNAPL thickness was within historic recorded ranges in MW03 and MW05, while above historical recorded thicknesses in PW02 and S8. While LNAPL Plume B is still considered delineated on Site and unlikely to be migrating further onto the Site, additional monitoring to confirm LNAPL thicknesses and assess mobility via LNAPL baildown testing is recommended.

    No LNAPL was encountered in wells where it had not previously reported, and no groundwater samples were collected from wells with LNAPL present.

    LNAPL is not delineated at the eastern border of the Precinct South and is considered likely to extend to TasPorts land to the east.
  - DNAPL was not encountered at any of the groundwater wells monitored.
  - Concentrations of the following CoPC were reported above the adopted assessment criteria for PEVs in at least one sample, noting exceedances were reported for Tier 1 Screening criteria including Drinking Water (Health and Aesthetics), Recreation (Primary / Secondary Contact), Vapour Intrusion (Residential), Ecosystem Protection (90%), and Buildings and Structures),
    - Benzene
    - TRH fractions including TRH >C10-C40 (sum), TRH C6-C10 [minus benzene, toluene, ethylbenzene and xylenes (BTEX)](F1), TRH >C10-C16 (minus Naphthalene)(F2)

- Metals (aluminium, arsenic, copper, lead, manganese, zinc)
- PAHs (naphthalene, anthracene, phenanthrene, fluoranthene, benz[a]anthracene, benzo[a]pyrene)
- Inorganics (chloride, sodium, total cyanide, ammonia)

It is noted that the presence of LNAPL also precludes all PEVs, and that concentrations of some CoPC listed above (PAHs [naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene] and aluminium) were reported with an LOR above adopted criteria. Future assessments should consider if lower LORs for assessment should be requested for these CoPC if practical.

- Concentrations of the following CoPC were reported in excess of the Site-Derived RC for Potential Future Residents for slab-on-grade buildings with unknown construction or multi-storey building:
  - TRH (C6-C10) (minus BTEX)

  Residential use of the Precinct South is not planned for future development and is not considered likely to occur due to currently planning limitations on residential occupancy near an active port (i.e., TasPorts land to the east of the Precinct South).

Further assessment of groundwater PEVs and nature and extent of impacts will be undertaken separately, however, precluded PEVs are consistent with previous investigations of this area reported in existing DSI reports (AECOM, 2021a and AECOM, 2022) relevant to the Precinct South. The data collected as part of this investigation is considered to be adequate to inform future assessments of the Precinct South.

9.0 Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract dated 20 December 2022.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 11 December 2023 and 8 October 2024 and is based on the conditions encountered and information reviewed and referenced in this document at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

Table T1 - Well Maintenance and Repair Activities – Summary

Area	Well ID	Inspected (Yes / No)	Well located? (Yes / No)	Maintenance / Repairs performed? (Yes / No)	Comments	Well Serviceable for monitoring? (Yes / No)
Precinct South	RN4	Yes	Yes	Yes	Gatic exposed 0.5 - 0.6 m under fill. Casing extended and gatic raised to surface level. Resurvey needed	Yes
	PW02	Yes	Yes	Yes	Bolts replaced. Well cap (100mm) missing. New well cap needed.	Yes
	MW03	Yes	Yes	No	Built-up sediment under gatic cover to be hand-cleared.	Yes
	MW05	Yes	Yes	No	Built-up sediment under gatic cover to be hand-cleared.	Yes
	MW6	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW13	Yes	No	-NA-	Destroyed during pipeline removal works	No - Lost/Destroyed
	MW16	Yes	Yes	No	Built-up sediment under gatic cover to be hand-cleared.	Yes
	MW60	Yes	Yes	Yes	New 180 mm gatic installed to replace missing lid and old 120 mm diameter base	Yes
	MW125A	Yes	Yes	Yes	Bolts replaced	Yes
	MW125B	Yes	Yes	Yes	Bolts replaced	Yes
	MW126A	Yes	Yes	Yes	Bolts replaced	Yes
	MW126B	Yes	Yes	Yes	Bolts replaced	Yes
	MW154	Yes	Yes	Yes	Bolts replaced	Yes
	MW162	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW163	Yes	Yes	No	Bolts need replacement	Yes - Bolts replacement pending
	MW164	Yes	Yes	No	No repair necessary, good condition	Yes
	S4	Yes	Yes	Yes	New 180 mm gatic installed to replace missing lid and damaged base	Yes
	S6	Yes	Yes	Yes	New 180 mm gatic installed to replace missing lid and damaged base	Yes
	S8	Yes	Yes	Yes	Bolts replaced	Yes
	MW137	Yes	No	-NA-	Hydro-excavation undertaken to 0.5 - 0.6 m bgl. Not found. Considered lost/destroyed	No - Lost/Destroyed
	MW142	Yes	-NA-	-NA-	GPS survey-location was undertaken on 6 December 2023. Well is likely buried under fill and was unable to be accessed.	No - Likely buried
	MW143	Yes	-NA-	-NA-	GPS survey-location was undertaken on 6 December 2023. Well is likely buried under fill and was unable to be accessed.	No - Likely buried
	MW146	Yes	Yes	Yes	Gatic exposed 0.5 - 0.6 m under fill. Casing extended and gatic raised to surface level. Resurvey needed	Yes
	MW150	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW175	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW176	Yes	Yes	Yes	Found under fill. Battered shallow surrounding fill. Bolts OK.	Yes
20 m Buffer Zone	R4	Yes	Yes	Yes	Casing found 0.5 - 0.6 m bgl beneath fill. Damaged casing, no gatic. Casing completely filled with fine-crushed-rock gravel. Not recoverable. Destroyed.	No - Lost/Destroyed
	S9	Yes	No	-NA-	Dug to 0.4 m bgl. Not found. Considered lost/destroyed	No - Lost/Destroyed
	TW03	Yes	No	-NA-	Hydro-excavation undertaken to 0.5 - 0.6 m bgl. Not found. Considered lost/destroyed	No - Lost/Destroyed
	MW155	Yes	Yes	No	GPS survey-location was undertaken on 6 December 2023. Well was located and serviceable.	Yes
	MW151	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW152	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW153	Yes	Yes	No	No repair ncessary, good condition	Yes
Further surrounding areas beyond the 20 m Buffer Zone	MW55	Yes	Yes	Yes	Bitumen cut to expose gatic. Bolts OK.	Yes
	MW127A	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW127B	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW124A	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW124B	Yes	Yes	No	No repair ncessary, good condition	Yes

Table T2 - Summary of Groundwater Monitoring Well Locations

Area	Well ID	Approximate Well Depth (m bgl)	Shallow / Deep Wells	Screened Interval (m bTOC)	Screen Lithology	Easting	Northing	Top of Casing (m AHD)	Date Sampled	Depth to Groundwater prior to purging (m bTOC)	LNAPL Observed ? (Yes / No)	Depth to LNAPL (m bTOC)	LNAPL Thickness (m)	DNAPL Observed ? (Yes / No)	SWL (m AHD) [2]	Stabilised Water Quality Parameters						Comments (Odour, Colour, Turbidity)	Rationale for inclusion in Targeted Precinct South GME
																Dissolved Oxygen (mg/L)	EC (mS/cm)	pH	Field ORP (mV) [3]	Corrected ORP (mV) [4]	Temperature (ºC)

20 m Buffer Zone	MW146	5.4	Shallow	2.5-5.5	Fill	527552.111	5252507.052	4.186	29-Nov-23	3.23	No	-	-	No	0.956	0.16	1.246	6.87	-104.1	94.9	16	No odor, clear, low turbidity, no sheen	Assess groundwater within an approximate distance of 20 m (buffer zone) from the Precinct South area.
	MW150	4.7	Shallow	1.0-5.0	Fill/Marine Deposits	527528.454	5252319.791	3.265	1-Dec-23	2.44	No	-	-	No	0.825	0.06	1.134	6.89	-120.6	78.4	16.5	No odor, clear, low turbidity, no sheen	
	MW175	4.5	Shallow	1.5-4.5	Fill	527517.102	5252456.438	3.904	30-Nov-23	3.003	No	-	-	No	0.901	0.08	1.152	6.79	-20.4	178.6	17.2	No odor, light brown, no sheen, low turbidity	
	MW176	4.5	Shallow	1.5-4.5	Fill	527537.901	5252479.305	4.036	30-Nov-23	3.25	No	-	-	No	0.786	0.13	1.192	6.85	-22.5	176.5	16.3	No odor, clear, low turbidity, no sheen	
Further surrounding areas beyond the 20 m Buffer Zone	MW55	6	Shallow	3.0-6.0	Fill	527548.733	5252422.331	3.929	30-Nov-23	2.956	No	-	-	No	0.973	0.10	3.247	6.80	-115.1	83.9	15.8	No odor, clear, low turbidity, no sheen	Assess groundwater in up-and cross-hydraulic gradient area to the west of the southern portion of Precinct South, as no wells are located within the 20 m buffer zone in this area.
	MW127A	4.8	Shallow	1.8-4.8	Fill	527529.64	5252393.95	3.896	30-Nov-23	3.105	No	-	-	No	0.791	0.05	3.76	6.80	-102.7	96.3	16.2	No odor, clear, low turbidity, no sheen	
	MW127B	16.8	Deep	15.6-16.6	Slope Deposits	527529.68	5252393.99	3.866	30-Nov-23	3.202	No	-	-	No	0.664	0.05	0.2413	6.38	-32.1	166.9	16.3	Low turbidity, light brown, slight urine odor	
	MW124A	5	Shallow	2.0-5.0	Fill	527507.73	5252350.79	3.767	5-Dec-23	3.043	No	-	-	No	0.724	0.05	0.713	7.05	-130.6	68.4	17.3	Low turbidity, brown, mud blocking pump inlet	
	MW124B	11.35	Deep	9.4-11.4	Marine Deposits	527507.67	5252350.79	3.738	5-Dec-23	3.056	No	-	-	No	0.682	0.02	1.721	7.76	-125.9	73.1	17.1	No odor, clear, low turbidity, no sheen	
	MW142*	4.5	Shallow	2.5-5.5	Fill	527581.4	5252528	4.165	-	-	-	-	-	-	-	-	-	-	-	-	-	Well not found - buried	Assess groundwater in up-and cross-hydraulic gradient area to the north of Precinct South, as no wells are located within the 20 m buffer zone in this
	MW143*	5.5	Shallow	2.5-5.5	Fill	527577.1	5252533	4.222	-	-	-	-	-	-	-	-	-	-	-	-	-	Well not found - buried	
	MW155	4.5	Shallow	1.5-4.5	Fill	527625.037	5252516.399	3.929	6-Dec-23	2.74	No	-	-	No	1.189	0.04	0.687	7.06	-97.1	101.9	16.3	-	
	MW151	5	Shallow	1.0-5.5	Fill/Marine Deposits	527567.708	5252282.43	2.553	1-Dec-23	2.25	No	-	-	No	0.303	0.13	2.634	6.65	-80.2	118.8	16.4	No odor, no sheen, clear, low turbidity	Assess groundwater further down-hydraulic gradient from the Precinct South, in the direction of groundwater flow towards Sullivans Cove.
	MW152	5	Shallow	1.0-5.5	Fill/Marine Deposits	527564.181	5252262.443	2.563	1-Dec-23	2.305	No	-	-	No	0.258	0.09	4.612	6.84	-131.6	67.4	16.4	No odor, no sheen, clear, low turbidity	
	MW153	4.5	Shallow	1.0-4.6	Fill/Marine Deposits	527557.54	5252240.934	2.449	1-Dec-23	2.142	No	-	-	No	0.307	0.06	33.578	7.15	-187.3	11.7	16.2	No odor, no sheen, high turbidity, black	

Notes:

m bgl - metres below ground level
TOC - top of casing
AHD - Australian Height Datum
SWL - Standing Water Level
EC - Electrical Conductivity (milliSiemens per centimetre)
ORP - Oxidation Reduction Potenial (milliVolts)

[1] *Wells installed to depths of >10 m bgl are considered herein as deep monitoring wells, and those installed to depths of <10 m bgl are considered as shallow monitoring wells*
[2] *SWL values in wells containing LNAPL have been corrected for the depression of the LNAPL/water interface in the well by multiplying the apparent LNAPL thickness in the well an LNAPL specific gravity of 0.85*
[3] *ORP as measured in the field*
[4] *Corrected ORP compared to the standard hydrogen electrode (calculated by adding 199 mV to the field-measured ORP value)*
^ Monitoring wells S8, MW03, MW05 and PW02 contained measurable LNAPL, thus sampling was not undertaken in these wells.
** Monitoring wells MW142 and MW143 are buried and inaccessible (as of 6 Dec 2023)*

Data Quality Objectives and Data Validation

DRAFT

Data Quality Objectives and Data Validation

1.0 Data Quality Objectives

The Data Quality Objectives (DQOs) for the Targeted Precinct South groundwater monitoring event (GME) project were established during the development of the field program and presented in the Sampling, Analysis and Quality Plan (SAQP) [AECOM, 2023b] previously prepared for the works. The DQOs are presented herein.

Guidance regarding the development of DQOs has been referenced from the following primary documents:

- *National Environment Protection (Assessment of Site Contamination) Amendment Measure 2013*, (ASC NEPM, 2013) *Schedule B2: Guideline on Site Characterisation*
- US EPA, 2006 *Guidance on Systematic Planning Using the Data Quality Objectives Process* (EPA QA/G-4).

The process of establishing appropriate DQOs is defined by the seven-step planning approach presented in the ASC NEPM and summarised in **Table 1** below.

Table 1 Data Quality Objectives

Step	Data Quality Objective Step Summary
1	***State the Problem*** – Summarise the problem that will require new environmental data and identify the resources available to resolve the problem based on a preliminary Conceptual Site Model (CSM) using available information prior to the commencement of the site investigation.
2	**Identify the Decision/Goal of the Study** – Identify the decisions that need to be made about the problem and the new environmental data required to make the decisions. Develop a decision statement linking the principal project objective(s) to the possible actions that will address the problem.
3	**Identify Information Inputs** – Identify the information needed to support any decision and whether new environmental data will be needed.
4	***Define the Boundaries of the Study*** – Specify the spatial and temporal aspects of the environmental media that the data must represent to support decision(s).
5	***Develop the Analytical Approach (or Decision Rule)*** – Define the parameter of interest, specify the action level, and integrate information from Steps 1–4 into a single statement that gives a logical basis for choosing between alternative actions.
6	***Specify Performance or Acceptance Criteria*** – Specify the decision-maker's acceptable limits on decision errors, which are used to establish performance goals for limiting uncertainties in the data.
7	***Develop the Plan for Obtaining Data*** – Identify the most resource-effective sampling and analysis design for generating the data that is required to satisfy the DQOs.

The approach adopted relative to the seven steps presented above in **Table 1** is discussed in the sections below.

1.1 Step 1 – State the Problem

The primary problem addressed as part of the works is the uncertainty regarding the current groundwater conditions at and surrounding the Precinct South, associated with the following:

- The current condition of groundwater, including the nature and extent of impacts, noting no groundwater assessments had been undertaken at the Precinct South since the Site-wide 2019 GMEs undertaken in August 2019 and November 2019.
- Temporal variations associated with groundwater quality.

Data collected as part of these investigations will inform future assessments, including the update of existing Detailed Site Investigation (DSI) reports and preparation of a Clean Up to the Extent Practicable (CUTEP) submission for Auditor assessment of the Precinct South.

1.2 Step 2 – Identify the Decision / Goal of the Study

As noted in **Section 1.1**, the investigation works were intended to collect data to enable assessment of current groundwater conditions associated with the Precinct South. The decision identification component of the DQO process represents the key issues that need to be reviewed and considered to resolve the problem identified in Step 1. These issues include:

- Obtaining representative physical and chemical groundwater data at and surrounding the Precinct South to address the objectives of the investigations (refer to **Section 1.2** of the main report text) and to further inform the Conceptual Site Model and future assessments.
- Comparing detected chemicals of potential concern (CoPC) concentrations against relevant screening criteria (refer to **Appendix F**) and historical data to assess the nature and extent of groundwater impacts, temporal trends, and potential risk posed to human and ecological receptors relevant to the proposed future uses and environmental values associated with Precinct South.

If the investigation results suggest potential risk, or if there remains insufficient information, recommendations shall be made on further assessment, management, or remediation measures.

1.3 Step 3 - Identify Information Inputs

To allow assessment of the data against the issues and decisions listed in **Section 1.2**, various information inputs are to be considered as follows:

- Field observations of aesthetic groundwater impacts (e.g. odours, sheen etc.) during gauging, purging and sampling of groundwater.
- Identification of the CoPC for each assessment location based on the Site-specific history, existing contamination issues, previously obtained groundwater quality data and associated objectives.
- Newly-collected groundwater data and concentrations of contaminants relative to relevant screening criteria and guidelines.
- Historical investigation data (where available) and information documented in previous Site reports including previous GMEs.

1.4 Step 4 – Define the Boundaries of the Study

The spatial boundaries (geographical limits) applied for data collection and decision making for the investigations are defined as follows:

- Evans Street and the University of Tasmania carpark to the south.
- The off-Site extent footprint of TasPorts area to the east
- The on-Site extent of the footprint of the Precinct North area to the north, the Promenade and Underground Carpark area to the northwest, and the Goods Shed and Yard area to the west.

- The area of works is vertically limited by the depths of the groundwater monitoring wells located within the investigation area, which range between approximately 4 m below ground level (bgl) and 18.9 bgl in this area.

The groundwater assessment locations are shown on **Figure F4** in the **Figures** section.

1.5 Step 5 – Develop the Analytical Approach (or Decision Rule)

Groundwater data collected as part of the investigations must be of sufficient representativeness address the primary problem (refer to **Section 1.1**) and decisions (refer to **Section 1.2**) identified as part of the DQO process.

Primary and secondary laboratories selected for the analysis of collected groundwater samples were accredited by National Association of Testing Authorities (NATA) for the requested analyses and were consistent with the following methodologies summarised in **Table 2** below.

Table 2 Laboratory Analytical Methods

Matrix	Sample Type	Analyte	Method Reference
Groundwater / Water	• Primary • QA/QC – Inter- and Intra-Laboratory Duplicate • QA/QC – Field Blank • QA/QC – Rinsate	Metals*	ICP/MS, CV/FIMS
		TRH and BTEXN	GC/FID, P&T/HS-GCMS
		PAH and phenols	GC/MS - SIM
		Free, WAD, and total cyanide	APHA 4500 CN-O, ASTM D7237
		Ammonia	APHA 4500 NH_3 - G
		Major cations (calcium, magnesium, sodium, potassium)	APHA 3120B or 3125B
		Major anions (chloride, sulfate, alkalinity)	APHA 2320B, APHA 4500-Cl - G, APHA 4500 SO_4-E
		Total Dissolved Solids (TDS)	APHA 2540C
	• Select Primary Samples ^	TRH speciation (aliphatic/aromatic)	CWG 1998
		Monitored Natural Attenuation (Nitrate, Ferrous Iron, Methane, Sulphate	APHA VCl3 reduction 4500 NO_3- + NO_2-B, APHA3500 Fe-B, HS/GC/FID, APHA 4500 SO4-E
		OCPs	USEPA SW 846-8270D
		VOC / SVOC	P&T/HS-GC/MS, GC/MS
		Chlorinated hydrocarbons	USEPA SW 846 - 8260B
	• QA/QC – Trip Blank	TRH (C_6-C_{10}) and BTEXN	USEPA SW 846-8260B

Notes: QA/QC – quality assurance/ quality control; Metals – 10 metals including aluminium, arsenic, cadmium, chromium, copper, lead, manganese, mercury, nickel and zinc; TRH – Total Recoverable Hydrocarbons; PAH – Polycyclic Aromatic Hydrocarbons; BTEXN – Benzene, Toluene, Ethylbenzene, Xylenes and Naphthalene; WAD – Weak Acid Dissociable; OCP: Organochlorine Pesticides; VOC: Volatile Organic Compounds; SVOC: Semi-Volatile Organic Compounds; ^ Approximately 25% of the samples were selected for analysis of TRH speciation and Monitored Natural Attenuation parameters, and approximately 10% of the samples were selected for analysis of OCPs, VOC/SVOC and chlorinated hydrocarbons.*

The decision for the investigation works is to obtain representative groundwater data and compare data against relevant screening or acceptance criteria. The decision rules are as follows:

- If comparison of groundwater chemical data to the relevant screening criteria (outlined in **Appendix F**) identifies exceedances, the exceedances will be subject to further investigation, assessment, remediation, or management; otherwise, groundwater will be deemed suitable for the proposed future uses and environmental values associated with the Precinct South area.
- If the investigation results suggest potential risk, or if there remains insufficient information, recommendations shall be made on further assessment, management, or remediation measures.
- If the QA/QC data meets the Data Quality Indicators (DQIs) adopted (outlined in **Section 3.2** of the main report text) to assess the precision and accuracy of the data, the data will be considered to be suitable for interpretive use. Data that fail to meet the DQIs will be managed using corrective actions (where possible) such as re-analysis of suspect samples, re-analysis of data and/or procedures, acceptance of data with acknowledged limitations/bias, or the data may be discarded.

1.6 Step 6 – Specify Performance or Acceptance Criteria

A decision error in the context of the decision rules presented in Step 5 would lead to either underestimation or overestimation of the risk level associated with particular investigations/ samples/data. Decision errors may include:

- Limitations in the available Site history information.
- Limitations based on inaccurate/inadequate data from previous investigations.
- Errors or limitations in this SAQP or proposed scope of works.
- Data not being adequately representative of Site conditions.
- Errors in the laboratory analytical reporting or procedures.
- Unnecessary implementation of remedial or management measures and controls.

Obtained field and laboratory data will be reviewed and screened against relevant assessment criteria (outlined in **Appendix F**) to make decisions regarding further assessment or management measures as part of as part of future assessments, including the update of existing DSI reports and preparation of a CUTEP submission for Auditor assessment of Precinct South.

A QA/QC and data validation program was developed as part of the SAQP (AECOM, 2023b) to ensure that data collected are sufficiently accurate and reliable for the purpose of this investigation. Data validation and assessment of QA/QC has been undertaken in **Section 2.0**.

1.7 Step 7 – Develop the Plan for Obtaining Data

The methodology presented in the SAQP (AECOM, 2023b) provided a sampling plan which was designed to meet the objectives for the investigation (refer to **Section 1.2** of the main report text), and also to achieve the nominated DQOs outlined in Steps 1 - 6. Optimisation of the data collection process has been achieved by targeting sampling based on historical information and previous assessment works undertaken at, and in the vicinity of, the Precinct South area.

The investigation was carried out to a level of accuracy and confidence required in accordance with the ASC NEPM (2013). The SAQP was reviewed by the Corporation and the Site Environmental Auditor.

2.0 Data Validation

Groundwater and QA/QC samples were collected by experienced AECOM field personnel in accordance with the SAQP (AECOM, 2023b) and with reference to the field methodology described in **Section 4.0** of the main report text. Samples were collected over a six-day field program (undertaken between 29 November 2023 – 6 December 2023) in laboratory supplied sample containers and placed in chilled eskies prior to transportation to the laboratories for analysis.

ALS Laboratories (ALS) was selected as the primary laboratory and Eurofins was selected as the secondary laboratory. Both laboratories are accredited by the National Association of Testing Authorities (NATA) for the analysis selected. All groundwater samples were analysed for metals, TRH, BTEX, PAHs, phenolic compounds, cyanide, ammonia, major ions and TDS.

Limited samples were also analysed for aliphatic/aromatic TRH speciation, Monitored Natural Attenuation (MNA) parameters (nitrate, ferrous iron, methane, sulphate), OCPs, VOC / SVOC and chlorinated hydrocarbons.

Copies of the laboratory documentation including chain of custody (CoC) documentation, sample receipt notification (SRN) reports, QC reports, and certificates of analysis are attached in **Appendix D** and **Appendix E**.

The assessment and validation of field and laboratory data quality are summarised in **Section 2.1** and **Section 2.2**, respectively.

2.1 Field Data Quality

2.1.1 Rinsate Blanks

Rinsate blanks were prepared by pouring laboratory-supplied rinsate water over non-dedicated sampling equipment to assess the potential for cross-contamination. Rinsate blank samples were analysed for a combination of analytes, including TPH/TRH, BTEXN, PAH, phenols, metals, ammonia, cyanide, ferrous iron, major ions, alkalinity and TDS. Rinsate blank results are provided in **Table A1** of this Appendix.

A total of five rinsate blank samples were collected as part of the six-day sampling program carried out at and surrounding the Precinct South. One rinsate blank sample was collected on each day of sampling, with the exception of the first day of groundwater sampling (i.e. 29 November 2023) during which no rinsate blank sample was collected due to field error. Hence, assessment of potential cross-contamination during sampling undertaken on this day is limited. Wells sampled on this day (RN4 and MW146) did not report any exceedances of Tier 1 criteria or Site-Derived RC which affect the overall outcomes of the GME. While the efficiency of equipment decontamination on 29 November 2023 cannot be assessed, based on the outcomes of rinsate assessment on the remaining five days of the GME (discussed below) and analytical results for samples from RN4 and MW146, it is considered unlikely that cross-contamination of samples occurred, or occurred at a level which affects overall results of assessment.

All samples had concentrations of target compounds reported below the laboratory LOR, with the exception of three rinsate samples, where concentrations of select analytes (i.e. total anions and alkalinity) were reported above the laboratory LOR, as outlined in **Table 3** below. Concentrations reported were either equal to the LOR, or in the same order of magnitude as the LOR.

Table 3 Rinsate Results

Work Order	Sample ID	Sample Date	Analyte	Conc. Reported in Rinsate Samples	LOR	Wells Sampled on these Dates	Conc. Reported in Groundwater Samples Collected on these Dates
EM2321824	QA303 and QA305	4/12/2023 and 6/12/2023	Total Anions	0.04 meq/L	0.01 meq/L	S6 MW6 MW16 MW125A MW125B MW154 MW155 MW164	Total Anions: 3.11 - 32.4 meq/L Bicarbonate Alkalinity: 131 - 1370 mg/L
			Bicarbonate Alkalinity as $CaCO_3$	2 mg/L	1 mg/L		
			Total Alkalinity as $CaCO_3$	2 mg/L	1 mg/L		

Work Order	Sample ID	Sample Date	Analyte	Conc. Reported in Rinsate Samples	LOR	Wells Sampled on these Dates	Conc. Reported in Groundwater Samples Collected on these Dates
	QA304	5/12/2023	Total Anions	0.02 meq/L	0.01 meq/L	S4 MW60 MW124A MW124B MW126A MW126B MW163	Total Alkalinity: 131 - 1370 mg/L
			Bicarbonate Alkalinity as $CaCO_3$	1 mg/L	1 m g/L		
			Total Alkalinity as $CaCO_3$	1 mg/L	1 mg/L		

Notes: 'Conc.' Refers to 'Concentrations'

Based on information provided by the laboratory, the laboratory-supplied inorganic rinsate water is monitored for metals and PFAS only, and not for alkalinity and other ions. It is understood that it is not uncommon to get detections of alkalinity close of LOR levels in laboratory-supplied water, depending on the caron dioxide levels in the air. Given concentrations of chloride, sulfate and free cyanide were reported below the laboratory LOR, it is unclear which anions may be present that may have resulted in detectable concentrations total anions; nonetheless, the concentrations reported are considered to be low.

The detections in these rinsate sample may be associated with potential cross-contamination during sampling or inadequate decontamination procedures. A total of 15 groundwater wells were sampled on these dates (4 – 6 December 2023). Concentrations of total anions and alkalinity reported in these samples were two to three orders of magnitude greater than those reported in the rinsate samples. On this basis, and because total anions and alkalinity are not considered to be the key risk-driving CoPC at the Site, the detections in the rinsate samples are not considered to impact the reliability of the data for interpretive use.

2.1.2 Field Blanks

Field blanks were collected at the rate of one per day of sampling, however, these sample were kept on hold and were not selected for analysis as the rinsate results did not report detections of key CoPC above the laboratory LOR (refer discussion in **Section 2.1.1** above).

2.1.3 Trip Blanks

One trip blank was submitted for each cooler box transported to the laboratory. A total of six trip blank samples were analysed as part of the field program. Trip blank results are provided in **Table A1** of this Appendix.

Trip blanks were analysed for select volatile compounds, including TPH C6-C9, TRH C6-C10, and BTEXN. All trip blank samples had concentrations of these target compounds reported below the LOR, indicating that cross contamination of samples occurring in transit is unlikely to have occurred.

2.1.4 Intra- and Inter-Laboratory Field Duplicate Samples

A total of three intra-laboratory duplicates and three inter-laboratory duplicate samples were collected (at groundwater wells MW146, MW127A and MW151) during the Targeted Precinct South GME program, compared to a total of 27 primary samples collected at and surrounding the Precinct South. The intra-laboratory and inter-laboratory duplicates were collected at a rate of one in nine primary samples analysed, which is greater than the DQO (one in 20 primary samples).

Groundwater RPD values reported outside the acceptable RPD limits are highlighted in **Table A2** of this Appendix.

A total of 1,369 RPD results were calculated for the field duplicate sample pairs. The RPDs between the primary and duplicate samples were within the acceptable ranges for the majority of the data, with the exception of 12 out of 1369 RPD results (i.e. approximately 0.88%). These are associated with a

combination of analytes including chloride, sulfate, ionic balance, total cyanide, ferrous iron, methane and TPH C10-C36 fraction (sum). Since >99% of the RPD results were reported within acceptable RPD limits, the groundwater dataset is considered suitable for interpretive use.

2.2 Laboratory Data Quality

Copies of the laboratory documentation including CoC, SRN reports, QC reports, and certificates of analysis are attached in **Appendix D** and **Appendix E**. ALS work orders include EM2321407, EM2321582 and EM2321824, and Eurofins work orders include 1049877and 1049962.

2.2.1 Sample Receipt Temperature

Groundwater samples were kept chilled during storage and transportation with ice in portable coolers (eskys) until received by the laboratory for analysis. The primary laboratory (ALS) reported that all sample batches were received within the recommended temperature range of 0 - 6°C, with ice present. The secondary laboratory (Eurofins) reported evidence to chill was noted for all samples batches received. Thus sample transport temperatures are considered appropriate and unacceptable sample degradation in transit is considered unlikely to have occurred.

Sample receipt temperatures can be found in the sample receipt notification reports in **Appendix D**.

2.2.2 Sample Holding Times

All samples were reported to be received by laboratories within the recommended holding times for the requested analyses, thus the results are considered suitable for interpretive use.

Proactive holding time assessments completed by the analytical laboratories are provided in **Appendix D**.

2.2.3 Limits of Reporting

The laboratory LOR and screening criteria values are detailed in **Tables T3 – T6** in the **Tables** section of the report.

All LOR values were either lower than or equal to the screening criteria applied to the samples analysed, to enable adequate assessment, with the exception of the following shown in **Table 4** below.

Table 4 Analytes with LORs greater than the adopted Screening Criteria

Screening Criteria	Analyte	LOR Value (µg/L) [a]	Screening Value (µg/L) [a]	Comment
Ecosystem Protection (90%)	Aluminium	0.01 mg/L	0.0005 mg/L	Detectable concentrations were reported. Refer further discussion below.
	Anthracene	1	0.01	
	Phenanthrene	1	0.6	
	Benzo(a)pyrene	0.5	0.1	
	1,2,3-Trichlorobenzene, Hexachlorobutadiene, Bis(2-ethylhexyl)phthalate, 2,6-Dinitrotoluene, Hexachlorocyclopentadiene, Pentachlorobenzene, Chlorpyrifos, Diazinon, Dimethoate, Malathion, Aldrin, Dieldrin, g-BHC (Lindane), DDE, DDT, Endosulfan 1, Endosulfan 2, Endrin, Heptachlor, Heptachlor epoxide, Hexachlorobenzene (HCB), Methoxychlor, 3,3-Dichlorobenzidine	Various	Various	Concentrations of these 23 analytes were reported below the LOR (i.e. not detectable) in all samples. Refer further discussion below.

DRAFT

Screening Criteria	Analyte	LOR Value (µg/L) [a]	Screening Value (µg/L) [a]	Comment
Drinking Water (Aesthetics)	Styrene, 2-Chlorophenol, 2,4-Dichlorophenol, 1,2-Dichlorobenzene, 1,4-Dichlorobenzene	Various	Various	Concentrations of these 5 analytes were reported below the LOR (i.e. not detectable) in all samples. Refer further discussion below.
Drinking Water (Health)	Naphthalene	1	0.17	Detectable concentrations were reported. Refer further discussion below.
	Benz(a)anthracene	1	0.03	
	Benzo(a)pyrene	0.5	0.01	
	N-2-Fluorenyl Acetamide, 7,12-Dimethylbenz(a)anthracene, 3-Methylcholanthrene, Dibenz(a,h)anthracene, Indeno(1,2,3-cd)pyrene, 1,2-Dibromoethane (EDB), 1,2-Dichloropropane, 1,2,4-Trichlorobenzene, Vinyl chloride, Bromomethane, 1,1-Dichloroethane, Carbon Tetrachloride, 1,2-Dichloroethane, 1,1,2-Trichloroethane, 1,1,1,2-Tetrachloroethane, trans-1,4-Dichloro-2-butene, cis-1,4-Dichloro-2-butene, 1,1,2,2-Tetrachloroethane, 1,2,3-Trichloropropane, Pentachloroethane, 1,2-Dibromo-3-chloropropane, Hexachlorobutadiene, 2-hexanone (MBK), N-Nitrosodibutylamine, N-Nitrosodiethylamine, N-Nitrosodipropylamine, N-Nitrosomethylethylamine, N-Nitrosomorpholine, N-Nitrosopiperidine, N-Nitrosopyrrolidine, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, 4-Aminobiphenyl, Azobenzene, Chlorobenzilate, Dimethylaminoazobenzene, Nitrobenzene, Bis(2-chloroethyl) ether, Hexachlorocyclopentadiene, Hexachloroethane, Pirimphos-ethyl, Aldrin, Dieldrin, Aldrin + Dieldrin, a-BHC, b-BHC, DDD, DDE, Heptachlor, Heptachlor epoxide, Hexachlorobenzene (HCB), 3,3-Dichlorobenzidine, 4-Chloroaniline	Various	Various	Concentrations of these 53 analytes were reported below the LOR (i.e. not detectable) in all samples. Refer further discussion below.

Screening Criteria	Analyte	LOR Value (µg/L) [a]	Screening Value (µg/L) [a]	Comment
Recreation (Primary / Secondary Contact)	Benz(a)anthracene	1	0.3	Detectable concentrations were reported. Refer further discussion below.
	Benzo(a)pyrene	0.5	0.1	
	N-2-Fluorenyl Acetamide, 7,12-Dimethylbenz(a)anthracene, 3-Methylcholanthrene, Dibenz(a,h)anthracene, Vinyl chloride, Bromomethane, 1,1,2-Trichloroethane, trans-1,4-Dichloro-2-butene, cis-1,4-Dichloro-2-butene, 1,1,2,2-Tetrachloroethane, 1,2,3-Trichloropropane, 1,2-Dibromo-3-chloropropane, 2-hexanone (MBK), N-Nitrosodibutylamine, N-Nitrosodiethylamine, N-Nitrosodipropylamine, N-Nitrosomethylethylamine, N-Nitrosomorpholine, N-Nitrosopiperidine, N-Nitrosopyrrolidine, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, 4-Aminobiphenyl, Azobenzene, Dimethylaminoazobenzene, Nitrobenzene, Bis(2-chloroethyl) ether, Hexachlorocyclopentadiene, Aldrin, Dieldrin, a-BHC, b-BHC, DDD, DDE, Heptachlor epoxide, Hexachlorobenzene (HCB), 3,3-Dichlorobenzidine	Various	Various	Concentrations of these 37 analytes were reported below the LOR (i.e. not detectable) in all samples. Refer further discussion below.

*Notes: a – Units of LOR and screening values presented are µg/L unless specified otherwise, with the values presented in **Tables T3 – T6** in the **Tables** section of the report.*

Analytes for which LOR values which were reported above adopted screening criteria are discussed below:

- LORs for up to 63 analytes, classified as a combination of fumigants, halogenated aromatic/aliphatic compounds, phthalate esters, nitrosamines, nitroaromatics, benzidine, anilines, haloethers, chlorinated hydrocarbons, organophosphorus and organochlorine pesticides, were reported above the adopted Ecosystem Protection (90%), Drinking Water (Aesthetics), Drinking Water (Health) and Recreation (Primary / Secondary Contact) criteria. These analytes have not typically been detected in soil and groundwater at the Site and are not considered key risk-driving CoPC for the Site. Thus, these are not considered to adversely impact the ability to adequately assess site data.
- LORs for select PAHs, including naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene, were reported above the adopted Ecosystem Protection (90%), Drinking Water (Health), and/or Recreation (Primary / Secondary Contact) criteria. Exceedances of the adopted criteria for either these CoPC or others have been detected in groundwater during this sampling event and previous investigations, and these uses are considered precluded for groundwater within the Precinct South.

  The LORs selected are not considered to affect the overall assessment of precluded uses of groundwater in the Precinct South. However, it is recommended that future sampling events consider the LORs adopted for these CoPC.

- The LOR for aluminium was reported above the adopted Ecosystem Protection (90%) screening value. However, concentrations in excess of this criteria were reported in the approximately 85% of the samples analysed, and this LOR discrepancy is not considered to affect the overall assessment of groundwater condition or precluded groundwater uses in the Precinct South. However, it is recommended that future sampling events consider the LORs adopted for this CoPC.

2.2.4 Laboratory Duplicates RPDs

The laboratory duplicate results are presented in the analytical laboratory QC reports provided in **Appendix E**.

The RPD between analytical results for field samples and their corresponding laboratory duplicates were all reported within acceptable limits, noting acceptable limits are dependent on the magnitude of results in comparison to the level of reporting, i.e. no limits where the result is less than 10 times the LOR; 0% - 50% where the result is between 10 and 20 times the LOR; and 0% - 20% where the result is greater than > 20 times the LOR.

2.2.5 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix E**.

Matrix spike recoveries were noted to be within the DQO range of 70% - 130%, or laboratory-derived limits for the methods used, with the exceptions of the outliers noted in **Table 5** below.

Table 5 Matrix Spike Outlier

Work Order	Sample ID	Analyte	Matrix Spike	Limits
Groundwater				
EM2321582	Anonymous	Sulfate as SO_4	ND	ND[1]
	Anonymous	Chloride	ND	ND[1]
	QA102	Methane	ND	ND[1]
	Anonymous	Manganese	ND	ND[1]
EM2321824	MW125B	Ammonia as N	ND	ND[1]

Notes: ND – Matrix spike recovery not determined; 1 – Background levels greater than or equal to 4 times the spike level.

Three of the five results above are from ‘Anonymous’ external samples, which are not specifically part of this project but formed part of the laboratory QC process and bact.

Matrix spike recoveries were only reported where background levels of CoPC were greater than or equal to 4x the spike level. Matrix spike recoveries were not determined for the above-mentioned outliers and are not considered to impact data quality.

2.2.6 Laboratory Method Blanks

All groundwater laboratory method blanks were reported within the acceptable range, i.e. below the laboratory LORs.

2.2.7 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory QC reports provided in **Appendix E**. All surrogate spike recoveries were within the surrogate control limits adopted, with the exception of the outlier noted in **Table 6** below.

Table 6 Matrix Spike Outliers

Work Order	Sample ID	Analyte	Matrix Spike	Limits
EM2321407	MW146	2-Bromonaphthalene	121%	71 – 117%

Recovery of the surrogate 2-Bromonaphthalene (for TPH - semivolatile speciation) was marginally greater than the upper DQO limits, which may indicate potential for minor over-estimation of reported concentrations of semi-volatile speciated TPH fractions in MW146. This may result a minor level of conservatism in the interpretive use of the data but does not impact the reliability of the data.

2.2.8 Laboratory Control Spikes

Laboratory control spike (LCS) recoveries, presented in **Appendix E**, were within the laboratory-derived control limits for the methods used, with the exception of the outliers reported in **Table 7** below.

Table 7 Laboratory Control Spike Recovery Outliers

Work Order	Analyte	Recovery	Limits
Matrix – Water			
EM2321407	Vinyl chloride	138%	58.1-135%
EM2321582		140%	

Recovery of the LCS for vinyl chloride was marginally greater than the DQO limits, indicating minor over-estimation of concentrations of this analyte. Vinyl chloride has not typically been detected in soil and groundwater at the Site and is not considered key risk-driving CoPC for the Site. It was analysed in three primary groundwater samples and concentrations were reported below the laboratory LOR in all three samples, hence the LCS recovery is not considered to impact the reliability of the data.

2.2.9 Frequency of Quality Control Spike

Frequency of QC spikes, presented in **Appendix E**, were at the rate expected by applicable QC specifications, with the exceptions of the outliers listed in **Table 8** below.

Table 8 Frequency of Quality Control Samples

Work Order	Type	Analyte	Rate (%)		Quality Control Specification
			Actual	Expected	
EM2321407	Laboratory Duplicates	• Pesticides • SVOC • TPH Speciation • TRH – Semivolatile fractions	0	10	NEPM 2013 B3 & ALS QC Standard
	Matrix Spikes		0	5	
EM2321582	Laboratory Duplicates	• PAH/Phenols • Pesticides • SVOC • TPH Speciation • TRH – Semivolatile fractions	0	10	NEPM 2013 B3 & ALS QC Standard
	Matrix Spikes		0	5	
EM2321824	Laboratory Duplicates	• PAH/Phenols • TRH – Semivolatile fractions	0	10	NEPM 2013 B3 & ALS QC Standard
	Matrix Spikes		0	5	

D R A F T

The actual rate of laboratory QC samples analysed for the above-mentioned analytes were below the expected frequency as there was insufficient sample volume to complete these analyses. These outliers are not considered to impact the reliability of the data.

3.0 Summary

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- During the six-day groundwater sampling program, no rinsate blank sample was collected on the first day of sampling (29 November 2023), hence assessment of potential cross-contamination during sampling undertaken on this day is limited. Wells sampled on this day (RN4 and MW146) did not report any exceedances of adopted criteria which affect the overall outcomes of the GME, and no detections which are considered likely to indicate cross-contamination were reported in the five rinsate samples collected on each other day of sampling, thus it is considered unlikely that cross-contamination may have occurred to an extent which affects assessment of groundwater condition in the Precinct South.
- LORs for select PAHs, including naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene, were reported above the adopted Ecosystem Protection (90%), Drinking Water (Health), and Recreation (Primary / Secondary Contact) criteria. These analytes have previously been identified as Site-related CoPC and will be considered as a CoPC for the purpose of informing the CSM for the Precinct South as part of the update of existing DSI reports.
- The LOR for aluminium was reported above the adopted Ecosystem Protection (90%) screening value, with concentrations in approximately 15% of the primary samples reported to be below the LOR. Concentrations reported in the remaining 85% of the samples exceeded screening value. As exceedances of adopted criteria are present in Site groundwater, the elevated LOR is not considered to affect conclusions regarding the nature and extent of dissolved aluminium.
- Recovery of the surrogate 2-Bromonaphthalene (for TPH - semivolatile speciation) was marginally greater than the upper DQO limits, which may indicate potential for minor over-estimation of reported concentrations of semi-volatile speciated TPH fractions in MW146. This may result a minor level of conservatism in the interpretive use of the data but does not impact the reliability of the data.
- The rate of laboratory QC testing of laboratory duplicates and matrix spikes were below the expected frequency for some analytes due to insufficient sample volume, however this is not considered to impact the reliability of the data as:
    - Results are consistent with historic assessments.
    - No new sources of impact are known to have been introduced since previous investigations have been conducted.

These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of the Precinct South and surrounding areas.

Notes:

**RPDs have only been considered where a concentration is greater than 1 times the EQL.*

***High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 200 (1-10 x EQL); 50 (10-20 x EQL); 30 (> 20 x EQL))*

****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory*

LOR: Limit of Reporting

Grey coloured text indicates concentration values were reported below the laboratory limits of reporting

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale and ALS Sydney.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Preliminary results will be available on the scheduled reporting date listed in this report. However the final report with methane analysis will be complete on 19/12.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Hi Farjad,
In this sample batch, could you please trip-blank sample off-hold, and analyse it for TRH (C_6-C_{10}) and BTEXN?
Thanks

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

EXTRA SAMPLE: TRIP BLANK (2VIALS). PLACED ON HOLD.

Hi Farjad,

For this sample batch (1049962):

1. Could you please update the SRN as follows:
   - Sample Date for **QA503** = 1 Dec 2023
   - For **QA202**, please **exclude** analysis of:
     - VOC, SVOC, OCP and chlorinated hydrocarbons
   - For **QA202** and **QA203**, please **include** analysis of:
     - Cyanide (Free, Total and WAD
     - TDS, Major cations, Major Ions, Ionic Balance

2. Sample receipt suggests some sample(s) exceeded holding time. Could you advise which these are?

Thanks,

Supriya Lath PhD

ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP070-CWG: EM2321407-001 Higher than expected surrogate recovery due to matrix interference. Confirmed by re-prep and re-analysis.
- ED041G: EM2321407 #1 and #6 has been confirmed for Sulfate by re-preparation and re-analysis.
- ED045G: EM2321407 #1 and #6 has been confirmed for Chloride by re-preparation and re-analysis.
- EG051G: EM2321407 #1-2 and #6 Results for Ferrous Iron have been confirmed by re-preparation and re-analysis.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075: Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EA015H: EM2321407 #5 TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- Ionic balances were calculated using: major anions - chloride, alkalinity and sulfate; and major cations - calcium, magnesium, potassium, sodium and ammonia for sample #5.
- EK057G: EM2321407 #1 Poor matrix spike recovery for NO2 due to sample matrix.
- EP075: Where reported, 'Sum of PAH' is the sum of the USEPA 16 priority PAHs
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Inter-Laboratory Testing

Analysis conducted by ALS Sydney, NATA accreditation no. 825, site no. 10911 (Chemistry) 14913 (Biology).

(WATER) EP033: C1 - C4 Hydrocarbon Gases

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2321407**	Page	: 1 of 14
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: 60693007/3	Date Samples Received	: 01-Dec-2023
Site	: Macquarie Point, 41 Evans St, Hobart	Issue Date	: 13-Dec-2023
Sampler	: C. Teller	No. of samples received	: 9
Order number	: Project: 60693007/3	No. of samples analysed	: 8

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP074E: Halogenated Aliphatic Compounds	QC-5478064-001	----	**Vinyl chloride**	75-01-4	138 %	58.1-135%	**Recovery greater than upper control limit**

Regular Sample Surrogates

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Ferrous Iron by Discrete Analyser	EG051G	WATER	In house: Referenced to APHA 3500 Fe-B. A colorimetric determination based on the reaction between phenanthroline and ferrous iron at pH 3.2-3.3 to form an orange-red complex that is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
Free CN by Segmented Flow Analyser	EK025SF	WATER	In house: Referenced to ASTM D7237, APHA 4500-CN-C&O and ISO 14403: Using an automated segmented flow analyser, a sample at high pH (sodium hydroxide preserved) is buffered to pH 6.0. The hydrogen cyanide present passes across a gas dialysis membrane into an acceptor stream consisting of 0.01 M sodium hydroxide. The acceptor stream mixes with a buffer at pH 5.2 and reacts with chloramine-T to form cyanogen chloride. Cyanogen chloride reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour, measured at 600nm. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	WATER	In house: Referenced to APHA 4500-CN C&O / ASTM D7511 / ISO 14403. Sodium hydroxide preserved samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Weak Acid Dissociable Cyanide by Segmented Flow Analyser	EK028SF	WATER	In house: Referenced to APHA 4500-CN C&O / ISO 14403. Samples preserved with sodium hydroxide are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN- The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4-pyridine carboxylic and 1,3-dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
C1 - C4 Gases	EP033	WATER	Technical Guidance for the Natural Attenuation Indicators: Methane, Ethane, and Ethene, US EPA - Region 1, EPA New England, July 2001. Automated static headspace, dual column GC/FID. A 12 mL sample is pipetted into a 20 mL headspace vial containing 3g of sodium chloride and sealed. Each sample is equilibrated with shaking at 40 degrees C for 10 minutes prior to analysis by GC/FID using a pair of PLOT columns of different polarity.
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	WATER	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Semivolatile Organic Compounds	EP075	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Volatile Hydrocarbon Speciation (TPH CWG & RIVM fractions)	EP079-CWG	WATER	In house: Conventional TPH and MAH data are determined by Purge and Trap GCMS analysis. TIC data (as fractions) and target aromatics (or groups of aromatics) are used to compute aliphatic and aromotic hydrocarbon fractions by addition or difference. Fractions conform to those outlined in TPHCWG,Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

CERTIFICATE OF ANALYSIS

Work Order	: **EM2321582**	Page	: 1 of 32
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007/3	Date Samples Received	: 04-Dec-2023 11:28
Order number	: 60693007/3	Date Analysis Commenced	: 06-Dec-2023
C-O-C number	: ----	Issue Date	: 13-Dec-2023 14:00
Sampler	: C. TELLER		
Site	: Macquarie Point, 41 Evans St, Hobart		
Quote number	: EN/004/23		
No. of samples received	: 12		
No. of samples analysed	: 11		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Sample MW 152 (Blue container) has been received empty. Bottle's cap was loose.
- ED041G: EM2321582-006 required dilution prior to Sulfate as SO4 2- analysis due to sample matrix interference. LOR values have been raised accordingly
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075: Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EG020F: EM2321582#7 has been diluted prior to metals analysis due to sample matrix. LOR values have been raised accordingly.
- EA015H: EM2321582 #3 TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- EP070-CWG: EM2321582-009 Insufficient sample remains for standard analysis. Where applicable LOR values have been adjusted accordingly.
- EP071: Sample EM2321582-009 was extracted using volatiles vials instead of unpreserved amber bottle.
- EP070-CWG: Sample EM2321582-009 was extracted using volatiles vials instead of unpreserved amber bottle.
- Ionic balances were calculated using: major anions - chloride, alkalinity and sulfate; and major cations - calcium, magnesium, potassium, sodium and ammonia for sample #1.
- EP075: Where reported, 'Sum of PAH' is the sum of the USEPA 16 priority PAHs
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Analytical Results

Inter-Laboratory Testing

Analysis conducted by ALS Sydney, NATA accreditation no. 825, site no. 10911 (Chemistry) 14913 (Biology).

(WATER) EP033: C1 - C4 Hydrocarbon Gases

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2321582**	Page	: 1 of 17
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: 60693007/3	Date Samples Received	: 04-Dec-2023
Site	: Macquarie Point, 41 Evans St, Hobart	Issue Date	: 13-Dec-2023
Sampler	: C. TELLER	No. of samples received	: 12
Order number	: 60693007/3	No. of samples analysed	: 11

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP074E: Halogenated Aliphatic Compounds	QC-5478109-001	----	**Vinyl chloride**	75-01-4	140 %	58.1-135%	**Recovery greater than upper control limit**
Matrix Spike (MS) Recoveries							
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA	EM2321390--001	Anonymous	**Sulfate as SO4 - Turbidimetric**	14808-79-8	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
ED045G: Chloride by Discrete Analyser	EM2321390--001	Anonymous	**Chloride**	16887-00-6	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EG020F: Dissolved Metals by ICP-MS	EM2321582--008	QA 102	**Manganese**	7439-96-5	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP033: C1 - C4 Hydrocarbon Gases	EB2338117--006	Anonymous	**Methane**	74-82-8	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER** Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Ferrous Iron by Discrete Analyser	EG051G	WATER	In house: Referenced to APHA 3500 Fe-B. A colorimetric determination based on the reaction between phenanthroline and ferrous iron at pH 3.2-3.3 to form an orange-red complex that is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
Free CN by Segmented Flow Analyser	EK025SF	WATER	In house: Referenced to ASTM D7237, APHA 4500-CN-C&O and ISO 14403: Using an automated segmented flow analyser, a sample at high pH (sodium hydroxide preserved) is buffered to pH 6.0. The hydrogen cyanide present passes across a gas dialysis membrane into an acceptor stream consisting of 0.01 M sodium hydroxide. The acceptor stream mixes with a buffer at pH 5.2 and reacts with chloramine-T to form cyanogen chloride. Cyanogen chloride reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour, measured at 600nm. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	WATER	In house: Referenced to APHA 4500-CN C&O / ASTM D7511 / ISO 14403. Sodium hydroxide preserved samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Weak Acid Dissociable Cyanide by Segmented Flow Analyser	EK028SF	WATER	In house: Referenced to APHA 4500-CN C&O / ISO 14403. Samples preserved with sodium hydroxide are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN- The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4-pyridine carboxylic and 1,3-dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
C1 - C4 Gases	EP033	WATER	Technical Guidance for the Natural Attenuation Indicators: Methane, Ethane, and Ethene, US EPA - Region 1, EPA New England, July 2001. Automated static headspace, dual column GC/FID. A 12 mL sample is pipetted into a 20 mL headspace vial containing 3g of sodium chloride and sealed. Each sample is equilibrated with shaking at 40 degrees C for 10 minutes prior to analysis by GC/FID using a pair of PLOT columns of different polarity.
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	WATER	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Semivolatile Organic Compounds	EP075	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Volatile Hydrocarbon Speciation (TPH CWG & RIVM fractions)	EP079-CWG	WATER	In house: Conventional TPH and MAH data are determined by Purge and Trap GCMS analysis. TIC data (as fractions) and target aromatics (or groups of aromatics) are used to compute aliphatic and aromotic hydrocarbon fractions by addition or difference. Fractions conform to those outlined in TPHCWG,Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

Quote number	: EN/004/23		
No. of samples received	: 12		
No. of samples analysed	: 11		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Project	: 60693007/3	Date Samples Received	: 07-Dec-2023 11:55
Order number	: 60693007/3	Date Analysis Commenced	: 08-Dec-2023
C-O-C number	: ----	Issue Date	: 14-Dec-2023 17:23
Sampler	: C. TELLER		
Site	: Macquarie Point, 41 Evans St, Hobart		
Quote number	: EN/004/23		
No. of samples received	: 24		
No. of samples analysed	: 20		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- ED041G/EK057G: EM2321824 #18 and #19 Samples required dilution prior Sulfate and Nitrite as N analysis due to matrix interferences. LOR values have been adjusted accordingly.
- ED041G: EM2321824 #11 Sample required dilution prior Sulfate analysis due to matrix interferences. LOR value has been adjusted accordingly.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Inter-Laboratory Testing

Analysis conducted by ALS Sydney, NATA accreditation no. 825, site no. 10911 (Chemistry) 14913 (Biology).

(WATER) EP033: C1 - C4 Hydrocarbon Gases

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2321824**	Page	: 1 of 14
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: 60693007/3	Date Samples Received	: 07-Dec-2023
Site	: Macquarie Point, 41 Evans St, Hobart	Issue Date	: 14-Dec-2023
Sampler	: C. TELLER	No. of samples received	: 24
Order number	: 60693007/3	No. of samples analysed	: 20

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EK055G: Ammonia as N by Discrete Analyser	EM2321824--002	MW125B	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected

TRH - Semivolatile Fraction	EP071	0	17	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	0	17	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	EP071	0	17	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Ferrous Iron by Discrete Analyser	EG051G	WATER	In house: Referenced to APHA 3500 Fe-B. A colorimetric determination based on the reaction between phenanthroline and ferrous iron at pH 3.2-3.3 to form an orange-red complex that is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
Free CN by Segmented Flow Analyser	EK025SF	WATER	In house: Referenced to ASTM D7237, APHA 4500-CN-C&O and ISO 14403: Using an automated segmented flow analyser, a sample at high pH (sodium hydroxide preserved) is buffered to pH 6.0. The hydrogen cyanide present passes across a gas dialysis membrane into an acceptor stream consisting of 0.01 M sodium hydroxide. The acceptor stream mixes with a buffer at pH 5.2 and reacts with chloramine-T to form cyanogen chloride. Cyanogen chloride reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour, measured at 600nm. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	WATER	In house: Referenced to APHA 4500-CN C&O / ASTM D7511 / ISO 14403. Sodium hydroxide preserved samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Weak Acid Dissociable Cyanide by Segmented Flow Analyser	EK028SF	WATER	In house: Referenced to APHA 4500-CN C&O / ISO 14403. Samples preserved with sodium hydroxide are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN- The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4-pyridine carboxylic and 1,3-dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
C1 - C4 Gases	EP033	WATER	Technical Guidance for the Natural Attenuation Indicators: Methane, Ethane, and Ethene, US EPA - Region 1, EPA New England, July 2001. Automated static headspace, dual column GC/FID. A 12 mL sample is pipetted into a 20 mL headspace vial containing 3g of sodium chloride and sealed. Each sample is equilibrated with shaking at 40 degrees C for 10 minutes prior to analysis by GC/FID using a pair of PLOT columns of different polarity.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Dec 04, 2023	7 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry weight basis unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion unless otherwise stated.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with blue colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is 7 days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit	**Colour:** Pt-Co Units	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 70 – 130%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 5.4, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Comments

V2 Amendments made to correct 'r' for NCP M23-De0001825 for Potassium.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference.
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Dec 04, 2023	7 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry weight basis unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion unless otherwise stated.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with blue colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is 7 days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit	**Colour:** Pt-Co Units	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 70 – 130%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 5.4, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference.

Appendix F

Assessment Criteria

DRAFT

Assessment Criteria

Groundwater analytical data obtained from the laboratories were reviewed and screened against assessment criteria for comparison purposes. The Assessment Criteria were presented in the Sampling, Analysis and Quality Plan (SAQP) [AECOM, 2023b] previously prepared for the works, and are described in the sections below.

1.0 Tier 1 Screening Criteria – Groundwater

The Protected Environmental Values (PEVs) for groundwater relevant under the Tasmanian Government *State Policy on Water Quality Management* (1997) [SPoWQM] include:

- Drinking Water
- Irrigation
- Industry
- Stock
- Ecosystem Protection

In addition to the above-mentioned PEVs, recreation (primary and secondary contact), aesthetics, buildings and structures, and human health (via the vapour intrusion pathway) have been included as PEVs to be considered.

A summary of the water quality objectives that have been adopted as Tier 1 Screening Criteria for each groundwater PEV is provided in **Table 1** below.

Table 1 Adopted Tier 1 Screening Criteria - Groundwater

Protected Environmental Value	Adopted Assessment Criteria	Rationale / Comment
Drinking Water	• NHMRC Australian Drinking Water Guidelines (Updated September 2022) Aesthetic • NHMRC Australian Drinking Water Guidelines (Updated September 2022) Human Health Where no NHMRC guideline values are available, screening values have been adopted from the following international sources: • WHO (2017) Guidelines for Drinking-Water Quality: Fourth Edition Incorporating the First Addendum • US EPA RSLs (2022) Tap Water Quality • Health Canada (2022) • NZMH (2018) Drinking Water Standards	• Whilst groundwater at the Site is unlikely to be extracted for drinking water purposes, these criteria have been conservatively adopted for the purpose of assessing this PEV.
Irrigation	• ANZECC (2000) Short Term Trigger Values (STV) for Irrigation Water	• STV have been adopted on the basis of the surrounding land use, where ongoing irrigation of plants and garden

DRAFT

Protected Environmental Value	Adopted Assessment Criteria	Rationale / Comment
		beds is unlikely to occur. STV can be tolerated for up to 20 years of irrigation.
Industry	• Due to the wide and varied potential industrial uses of groundwater, water quality requirements for use in industrial processes are assessed on an industry-specific basis.	• Groundwater at the Site is unlikely to be used for industrial purposes. In the absence of any standard or reliable criteria to apply for this PEV without a specific planned industrial use, this PEV has not been considered.
Stock	• ANZECC (2000) Livestock Drinking Water Quality	• Based on the Site setting, it is unlikely that groundwater would be used for stock watering purposes. However, for the purpose of assessing this PEV, the ANZECC (2000) guidance has been adopted.
Ecosystem Protection	• ANZG (2018) 90% level of ecosystem protection (marine water) Where no high reliability guideline values are available in ANZG (2018), screening values have been adopted from the following sources: • ANZG (2018) low to moderate reliability guideline values (marine) • US EPA (2013) Ambient Water Quality Criteria (chronic – Marine) • US EPA (2006b) Region 3 Mid-Atlantic Biological Technical Assistance Group (BTAG) Screening Benchmarks (marine). • RIVM (2001) Dutch Intervention Values (DIV) for TPH. • There are currently no relevant Australian guidelines for TRH in groundwater. Therefore, for the purpose of this assessment, the Netherlands Ministry of Housing - DIV (2000) for Mineral Oil has been adopted.	• The nearest surface water ecosystems that may receive groundwater discharge, i.e. River Derwent and Sullivans Cove, would be characterised as a moderately to highly disturbed (i.e. active port area) marine environment according to the ANZG (2018) definitions. As such, the assessment criteria based on 90% level of ecosystem protection (marine) have been adopted.
Recreation (Primary Contact) Recreation (Secondary contact)	• NHMRC (2008) Guidelines for Managing Risk in Recreational Water	• NHMRC (2008) recommends applying Australian Drinking Water Guidelines - Health (NHMRC, 2018), adjusted for a 10-fold decrease in ingestion of water. • Primary contact recreation activities (i.e. swimming, diving and water skiing) are considered unlikely at the inferred points of groundwater discharge (active

DRAFT

Protected Environmental Value	Adopted Assessment Criteria	Rationale / Comment
		port), however, these criteria have been conservatively adopted for the purpose of assessing this PEV.
Aesthetics	• NHMRC Australian Drinking Water Guidelines (amended 2018) Aesthetic	• This may relate to aesthetic issues associated with the presence of objectionable odours, colours, taints, visible floating material, foam, oil or grease or 'dirty' water.
Buildings and Structures	• AS 2159 – 2009	• Building and structures have been assessed on the basis of concrete piles in a mild exposure classification scenario in high permeability soils. • In addition to a pH of 5.5, sulphate and chloride concentrations of 1,000 mg/L and 6,000 mg/L respectively has been adopted to assess potential impacts to concrete piles.
Human Health*	CRC CARE (2011) Groundwater HSLs for vapour intrusion including: • Residential - HSL A/B (sand, depth to groundwater 2.0 – <4.0 m bgl) • Recreation/ Open Space - HSL C (sand, depth to groundwater 2.0 – <4.0 m bgl) • Commercial/ Industrial - HSL D (sand, depth to groundwater 2.0 – <4.0 m bgl) • Intrusive Maintenance Worker - HSL: (sand, depth to groundwater 2.0 – <4.0 m bgl)	• Groundwater HSLs for vapour intrusion for TRH fractions have been developed based on typical petroleum mixtures and consider the solubility limits of petroleum mixtures. HSLs cannot be applied to non-petroleum sources such as pure solvents or gasworks wastes, where solubility limits are much higher. The HSL (infinite) values presented in Appendix F of CRC CARE, 2011 have been adopted in accordance with CRC CARE guidance. The theoretical solubility of the pure compound in water was used instead to identify vapour limiting HSLs (i.e. chemicals where a vapour inhalation risk was calculated to be only present at concentrations exceeding the theoretical solubility). Whilst it is noted that petroleum products do exist at the Site, given the varying types of hydrocarbon impact (i.e. gasworks, diesel, and petrol) the HSL infinite values have been adopted as a conservative approach. • HSLs associated with depths to groundwater of between 2.0 and <4.0 m bgl in sand lithology are selected to assess groundwater analytical results on the basis of the expected depth to groundwater water at and surrounding the Precinct South area.

Notes: ANZG (2018) – Australian and New Zealand Guidelines for Fresh and Marine Water Quality; ANZECC (2000) – Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand (2000) Australian and New Zealand Guidelines for Fresh and Marine Water Quality; US EPA (2013) – United States Environmental Protection Agency, Ambient Water Quality Criteria (chronic – Marine); US EPA (2006b) –Region 3 Mid-Atlantic

*Biological Technical Assistance Group (BTAG) Screening Benchmarks; RSL – Regional Screening Levels; NHMRC (2022) – National Health and Medical research Council, Australian Drinking Water Guidelines 6, 2011 (Version 3.8, Updated September 2022); NHMRC (2008) – National Health and Medical Research Council, Guidelines for Managing Risks in Recreational Water; NZMH – New Zealand Ministry of Health Drinking Water Standards for New Zealand 2005 (Revised 2018); Health Canada (2022), Guidelines for Canadian Drinking Water Quality – Summary Tables; RIVM – Rijksinstituut voor Volksgezondheid en Milieu; WHO (2017) – World Health Organization, Guidelines for Drinking Water Quality: Fourth Edition Incorporating the First Addendum; CRC CARE – Cooperative Research Centre for Contamination Assessment and Remediation of the Environment; HSL – Health Screening Level; * While Residential use is not planned for the Precinct South area, groundwater results have been be compared to Residential criteria for completeness of Tier 1 screening assessment against all potential PEVs.*

Groundwater analytical data compared with the specific Tier 1 Screening Criteria values are shown in **Table T3** to **Table T5** in the **Tables** section.

2.0 Site-Derived Remediation Criteria

AECOM has prepared Site Derived Remediation Criteria (RC) to inform potential remediation/ management works required at the Site for the protection of human health (*Macquarie Point Development Project – Derivation of Remediation Criteria* [AECOM, 2016]). The RC are based on generic assumptions regarding future land use including:

- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of Maintenance Workers) to have direct contact with soils.
- A Site Environmental Management Plan (SEMP) will be in place to maintain/manage surface cover.
- Adjacent off-Site land uses include open space, commercial/industrial and residential areas. As these potential land uses have been considered on-Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g. via groundwater migration beyond the Site boundary).
- It is considered that potential exposure to workers undertaking remediation and/or development activities can effectively be mitigated through the implementation of an appropriate Construction Environmental Management Plan (CEMP).

Site-specific RC criteria are provided in AECOM, 2016 for the following potential future land use scenarios:

- Residential:
  - Slab-on-grade buildings with unknown construction or multi-storey building
  - Low rise slab-on-grade
  - Buildings with a basement.
- Commercial:
  - Slab-on-grade buildings with unknown construction or multi-storey building
  - Low rise slab-on-grade
  - Working within a basement car park.
- Recreation / Open Space Users
- Maintenance Workers (including excavation to depths of up to 1.0 m bgl).

Groundwater analytical data compared with Site-derived RC are presented on **Table T6** in the **Tables** section.

Mr James Puustinen
Senior Project Officer
Macquarie Point Development Corporation
GPO Box 51
Hobart, Tasmania, 7001

Dear James

The Precinct South - LNAPL Gauging and Transmissivity Testing, March 2024

1.0 Introduction

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of remediation at the Macquarie Point Site in Hobart, Tasmania (the Site). The Site location is shown on **Figure F1**.

The Site has historically been used for mixture of commercial and industrial purposes. As part of ongoing assessment undertaken at the Site, a Groundwater Monitoring Event (GME) was undertaken targeting the southeastern portion of the Site, referred to as the Precinct South, between 29 November and 6 December 2023. Results of the 2023 GME were reported in *The Precinct South – Well Maintenance and Targeted Groundwater Monitoring Event* (the GME Report) (AECOM, 2024a).

During the 2023 GME, measurable Light Non-Aqueous Phase Liquid (LNAPL) was recorded in four wells in the Precinct South (MW03, MW05, PW02, and S8). The thickness of LNAPL in PW02 and S8 exceeded historical recorded thicknesses measured between 2015 and 2019. As a result, the GME Report included a recommendation that additional testing be conducted to confirm LNAPL thicknesses and assess LNAPL mobility via baildown testing.

At the request of the Corporation, AECOM conducted a gauging round and LNAPL baildown testing in the Precinct South on 21 March 2024 in order to fulfil this recommendation from the GME Report. This report has been prepared to report the results of gauging and LNAPL transmissivity assessment.

1.1 Objectives

The objectives of the work were:

- To confirm LNAPL detections and thickness which were reported during the 2023 GME.
- To assess the LNAPL transmissivity for wells within the Precinct South where LNAPL has exceeded historic maximum thickness.
- To assess if further LNAPL remediation may be practicable.

1.2 Scope of Work

The following scope of work has been undertaken by AECOM:

- Gauging of 13 groundwater wells in the Precinct South. Two gauging rounds were conducted on 20 and 21 March 2024.
- Conducting field works and analysis associated with LNAPL baildown tests on groundwater wells PW02 and S8, in accordance with the guidance provided by the *Standard Guide for Estimation of LNAPL Transmissivity* (ASTM, 2013).
- Assessment of whether the further remediation of the detected LNAPL is likely to be practicable.

1.3 Background

The Site, and surrounding area, largely located on reclaimed land within the Hobart port, has a history of mixed industrial use including the former Hobart Gasworks, rail freight and bulk fuel storage. Former industrial activities have been ceased at the Site. The Site is currently undergoing an Environmental Audit by Mr David Lam of Tetra Tech Coffey, under the *Macquarie Point Development Act 2012*.

LNAPL, sourced from historic fuel storage prior to occupation of the Site by the Corporation, was known to exist on groundwater in four locations at the Site defined as LNAPL Plumes A1, A2, and A3 (located in the central portion of the Site), and LNAPL Plume B, located in the Precinct South.

LNAPL remediation has been undertaken at the Site, primarily during the periods 2000 to 2001 and 2015 to 2019.

In 2017, the *LNAPL Remediation Action Plan* (the RAP) (AECOM, 2017) was prepared to guide the LNAPL remediation activities and to clearly identify LNAPL remediation end-points, namely:

1. LNAPL recovery rates have reached asymptotic levels, and demonstrate marginal recovery rates, such as less than 5% of initial recovery volumes. Further recoverability of residual LNAPL is demonstrated to be impractical within the constraints of the adopted technology, reasonable timeframes and with consideration of the net environmental benefit.
2. The residual LNAPL plumes are shown to be stable or decreasing, including demonstration that LNAPL is not observed in wells where LNAPL has historically been absent.
3. No unacceptable risks to current and future human-health or environmental receptors based on the proposed future land uses.

Following cessation of LNAPL remediation in 2019, the *Assessment of LNAPL Endpoints* report (AECOM, 2021) assessed LNAPL remediation data against the endpoints identified in the RAP and concluded that the endpoints identified in the RAP had been met and that clean-up of LNAPL had been conducted to the extent practicable. No LNAPL remediation has been conducted since this period.

The LNAPL thicknesses in PW02 and S8, recorded during the December 2023 GME, were in excess of historic recorded maximum thickness for LNAPL Plume B and were assessed as representing a potential change in the stability which required further assessment of LNAPL recoverability.

2.0 Field Works and Assessment Methodology

The following field activities associated with LNAPL assessment are included in this report:

Table 1 Field Activities

Date	Activity
20 March 2024	Gauging of 13 groundwater wells in the Precinct South.
21 March 2024	Gauging of 13 groundwater wells in the Precinct South to assess any temporal changes in standing water levels (SWL), followed by LNAPL baildown tests on groundwater wells PW02 and S8, and extraction of LNAPL from well MW05.

Groundwater gauging and LNAPL baildown testing was undertaken by a suitably trained and qualified AECOM field engineer.

Specific details regarding field methodology are summarised in **Table 2** below, and records generated during the fieldwork are tabulated in **Attachment B**, with field records included as **Attachment C**. The location of wells is shown as **Figure F2**.

Table 2 Methodology

Activity	Methodology
Groundwater Monitoring Well Gauging	• Monitoring wells were gauged using an Interface Meter and standing water levels (SWLs) and total well depths were measured as metres below top of casing (mBTOC). • For wells which reported LNAPL presence during the 2023 GME, but did not report detectable LNAPL during gauging, a bailer was used to confirm LNAPL presence/absence.
LNAPL Baildown Testing	• LNAPL was removed using gravity-selective 38 mm bailers to remove LNAPL only. Field observations, including time of removal, and quantity of LNAPL and any groundwater removed, were recorded. • LNAPL rebound in groundwater wells was recorded at increasing intervals over 6 and 7 hours post LNAPL extraction. • Extracted LNAPL and/or groundwater was disposed off-Site following completion of works.

3.0 Results and Discussion

3.1 Gauging

Recorded gauging results are attached as **Table T1**, including the results of gauging during December 2023, recorded LNAPL maximum thicknesses (AECOM, 2021) and Standing Water Level (SWL) ranges (AECOM, 2022).

The following observations and assessments are made based on gauging results:

- LNAPL was still present in groundwater wells MW05, PW02, and S8. LNAPL thicknesses in PW02 and S8 were consistent with recorded values during the 2023 GME, while the LNAPL thickness in MW05 had decreased by approximately an order of magnitude.
- LNAPL was not present in well MW03 on 20 or 21 March 2024. This was confirmed via bailer on 21 March 2024.
- The recorded LNAPL thicknesses in PW02 and S8 were still above historic (2015 to 2019) recorded values. However, LNAPL thickness in MW03 and MW05 were below recorded maximum historical thicknesses in both December 2023 and March 2024.
- No LNAPL was detected in other wells on the Site in the vicinity of LNAPL Plume B. All wells with LNAPL detected have previously had LNAPL present.
- It is noted that groundwater wells on TasPorts land to the east of LNAPL Plume B were not accessible, and previous assessments have identified that LNAPL Plume B is likely to extend to the east.
- Bore logs for gauged wells are included as **Attachment E**, excluding MW60 which was installed by other parties and does not have a bore log available. The screened interval of MW60 was provided as part of data when AECOM commenced work on the project and is included in **Table T1**.

  All wells (excluding deep well MW126B) are screened in fill across the depth range where LNAPL was detected. It is considered unlikely that LNAPL is present in the formation at these locations which was not detected by monitoring based on screen depth, as the aquifer lithology consists of fill material, which is unlikely to have perching or confining conditions present which could lead to groundwater fluctuations isolating LNAPL from groundwater wells.
- Bureau of Meteorology daily weather observations[1] for Hobart in November and December 2023 (the period of and preceding the previous gauging round) and March 2024 (when gauging and baildown testing was conducted) are provided as **Attachment F**, with parameters which may affect gauging results summarised on **Table 3** below.

Table 3 Daily Weather Observations - Hobart

Date	Temperature (°C)	Pressure (hPa)			Activity/ Comments
		9am	3pm	Average	
4-Dec-23	11.8-24.8	1015.5	1011.6	1013.6	Gauging MW164. Minor rain (0.2 mm) recorded
5-Dec-23	13.0-22.3	1010.4	1005.6	1008.0	Gauging MW125A, MW125B, MW60 and S4
6-Dec-23	13.1-23.4	1014.6	1013.9	1014.3	Gauging MW03, MW05, PW02, S8, MW154, MW16, MW6, S6
20-Mar-24	10.6-16.8	1015.3	1019.2	1017.3	Gauging all wells. Minor rain (1.4mm) recorded
21-Mar-24	8.5-22.0	1026.3	1024.4	1025.4	Gauging all wells, baildown testing

[1] Accessed at http://www.bom.gov.au/climate/dwo/IDCJDW7021.latest.shtml on 16 April 2024

Temperature and weather conditions during gauging in December 2023 and March 2024 were relatively consistent, with slightly higher average pressure and slightly cooler minimum temperatures in March. Minor rainfall occurred in both periods, but no major rain events occurred during or in the seven days prior to either gauging round.

Weather conditions may have contributed between ~10 and 20 mm of decrease to corrected standing water level (SWL), based on an increase in approximately 10 to 20 hPa in average atmospheric pressure which can depress the water table. However, this fluctuation, and other weather differences, are considered minor and is not considered likely to have had any effects which could cause significant difference in the results of gauging in each period.

Based on the decrease or relative consistency of LNAPL thicknesses with the previous monitoring round and no new LNAPL detections during this period, it is considered unlikely that LNAPL Plume B is mobile or extending. No source of additional LNAPL to LNAPL Plume B is known as historic bulk fuel storage (the inferred initial source of this LNAPL) ceased in the early 1970s, and no potential sources of new LNAPL such as fuel storage or spills in the area of the plume have been identified in the period since. The use of the off-Site areas to the south and west have remained consistent in this period (as public roadways/carparking and TasPorts dock lands respectively) and are considered unlikely to have had any change in use which could lead or have led to additional fuel release in this area.

The cause of the increase above historical maxima in PW02 and S8 recorded in December 2023 is not known. Soil remediation was undertaken to the west of the SeaRoad Shed Slab in 2023 (AECOM, 2024b), which included excavation to the water table, and is a potential source of inducted LNAPL movement via either disturbance to groundwater during excavation or while excavations were open, , or from vibrations of heavy machinery moving over LNAPL Plume B.

3.2 LNAPL Removal, Rebound Monitoring and Baildown Testing

LNAPL was removed from wells PW02, S8, and MW05 using LNAPL selective bailers, with rebound monitoring for up to 6 hours 51 minutes following removal.

MW05 did not have any detectable LNAPL recharge until the final gauging at the end of monitoring and was not assessed for LNAPL transmissivity. The low recharge, and overall low absolute LNAPL thickness in the well (0.004 m), indicate that LNAPL remediation is unlikely to be practicable at this location.

Hydrographs of LNAPL recharge in PW02 and S8 are presented as **Plate 1** and **Plate 2** below. Calculated LNAPL volume and LNAPL gauging results prior to bailing, following initial recharge, and at the end of the day are presented on **Table 4** below.

Table 4 LNAPL Monitoring and Volume in Well

Time	Period	DTP (mBTOC)	DTW (mBTOC)	LNAPL Thickness (m)	Estimated LNAPL Volume in Well and Packing Sand (L)	% of initial volume
PW02						
9:10	Pre-Bailing	2.112	2.270	0.158	1.51	N/A
9:20	10 minutes after bailing	2.149	2.161	0.011	0.11	7.3%
15:41	End of Day	2.149	2.166	0.017	0.16	10.6%
S8						
9:26	Pre-Bailing	1.879	2.010	0.131	0.62	N/A
9:36	10 minutes after bailing	1.906	1.921	0.015	0.07	11.3%
15:44	End of Day	1.904	1.924	0.020	0.09	14.5%

Notes: DTP – Depth to product (LNAPL); DTW – Depth to water.; N/A – Not applicable; 1. LNAPL volume estimated by the American Petroleum Institute (API) LNAPL Transmissivity Workbook: A Tool for Baildown Test Analysis (2012).

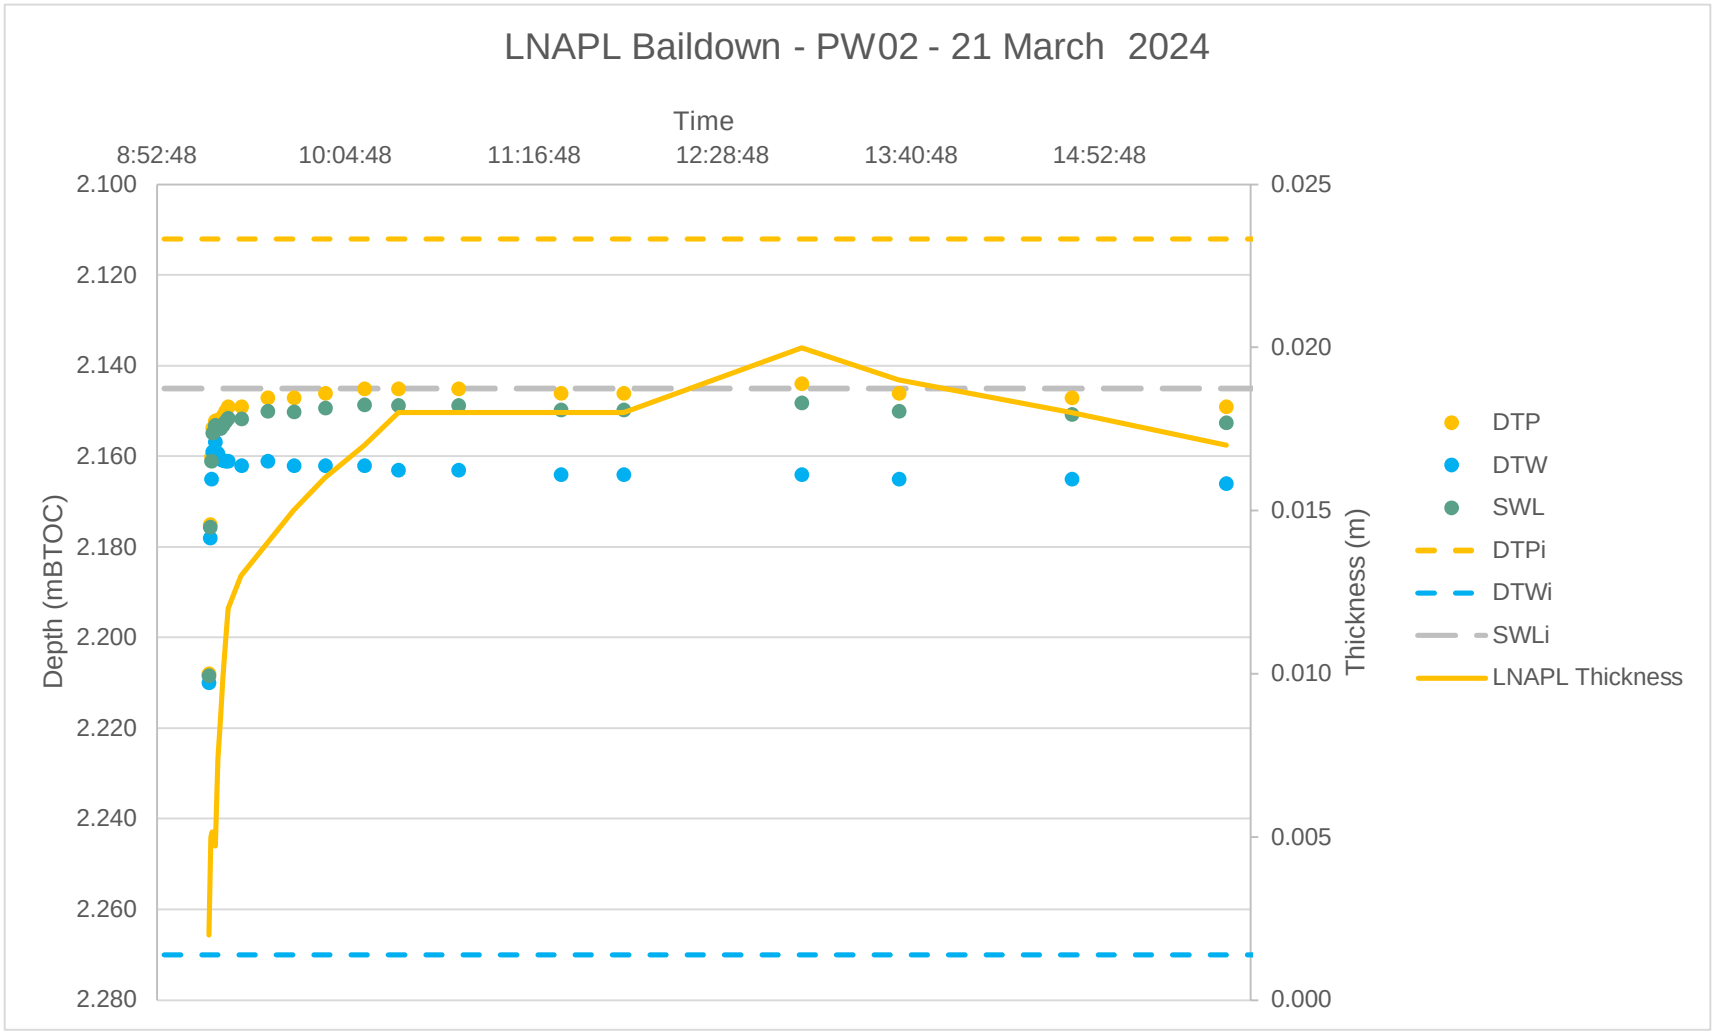

Plate 1 PW02 – LNAPL Recharge Monitoring

Notes: DTPi – Initial Depth to Product (before LNAPL removal); DTWi – Initial Depth to Water (before LNAPL removal); SWLi – Initial Standing Water Level (before LNAPL removal)

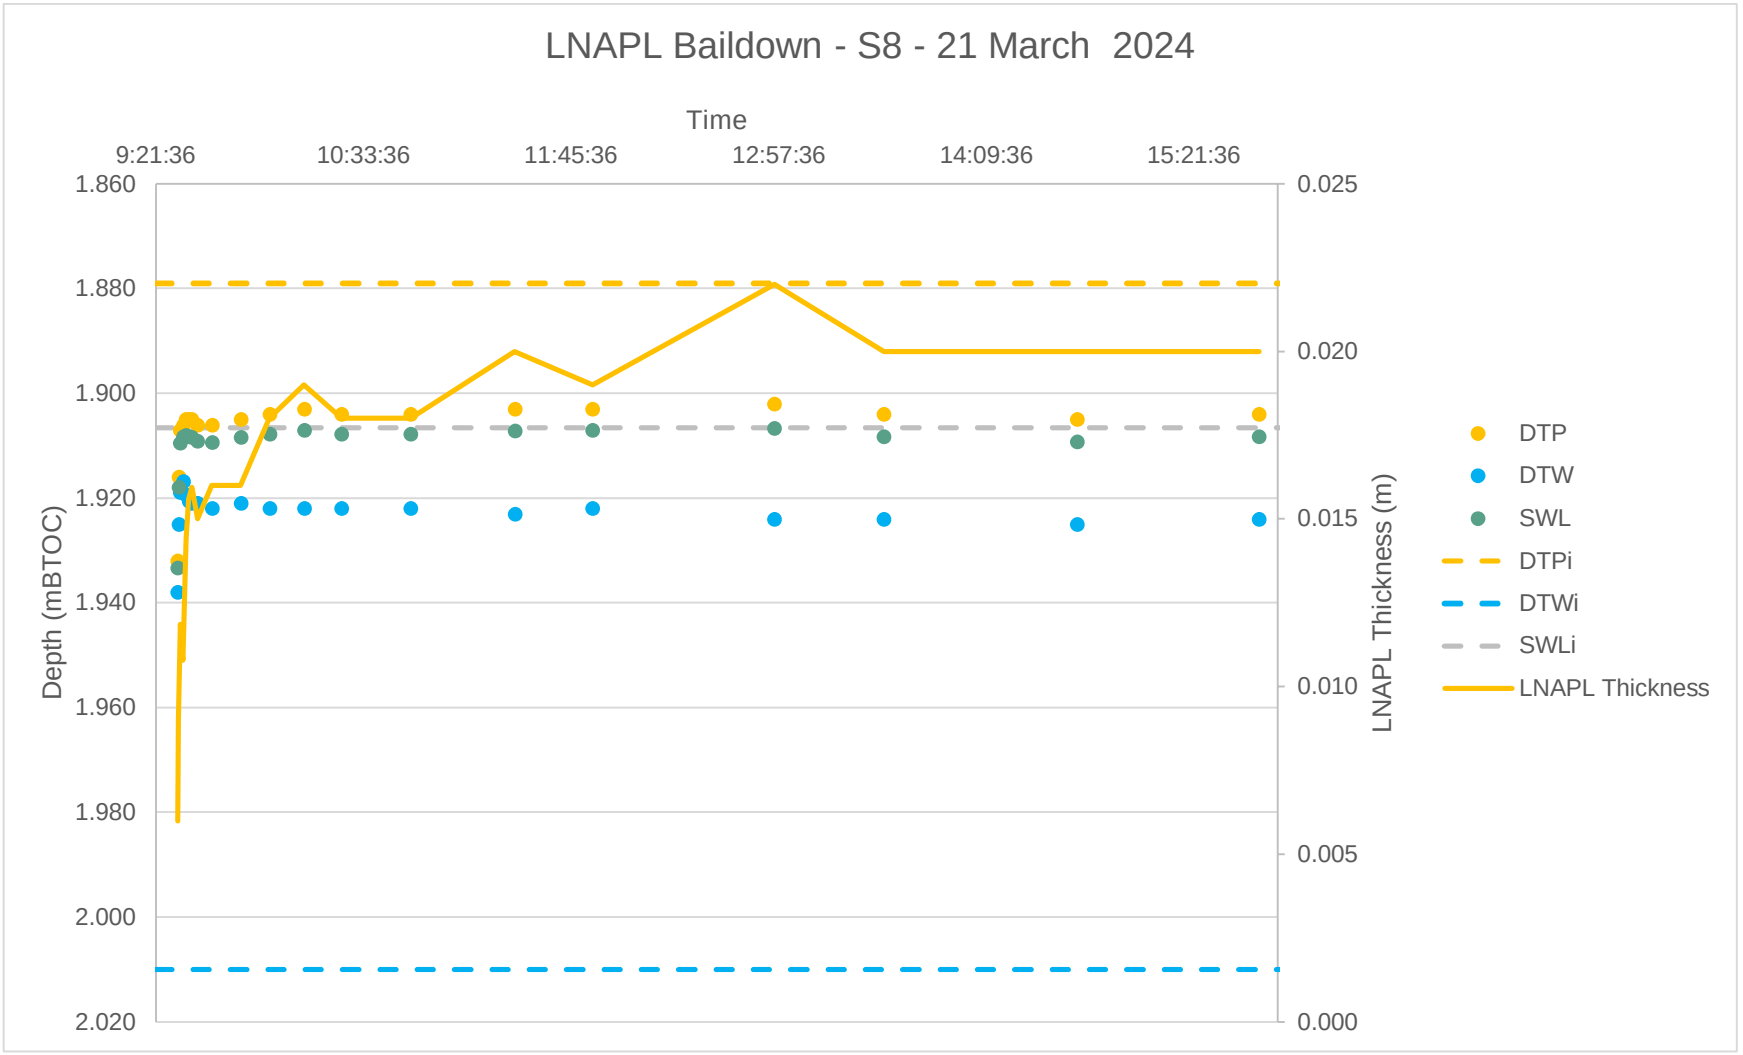

Plate 2 **S8 – LNAPL Recharge Monitoring**

LNAPL volume in each well was calculated by the American Petroleum Institute (API) *LNAPL Transmissivity Workbook: A Tool for Baildown Test Analysis* (2012) using the following formula:

$$V_{LNAPL} = \frac{T_{LNAPL} \times \pi \times \left[(r_{well}^2) + S_y \times (r_{bore}^2 - r_{well}^2)\right]}{1000}$$

Where:

V_{LNAPL} = volume of LNAPL in the well and bore (L)

T_{LNAPL} = thickness of LNAPL in the bore (m)

r_{well} = radius of the well (m)

r_{bore} = radius of the bore (m)

S_y = Specific yield (dimensionless). A specific yield of 0.175 was used as a typical value for well packed medium to coarse sand (i.e., packing sand around the screened interval of a groundwater well).

PW02 and S8 reported greater than 50% of the total recharge observed within the first 10 minutes, with groundwater also flowing into the well and returning the SWL to close to the pre-test value. Initial flow into the well is considered likely to be due to hydrostatic pressure from the surrounding aquifer, and to residual LNAPL entering the well from the surrounding packing sand.

Limited to no LNAPL is considered likely to have returned to either PW02 or S8 over the remaining monitoring period, as the estimated LNAPL volume in the wells at the end of monitoring was less than the volume estimated to remain in the well and packing sand following bailing, as shown on **Table 5** below.

Table 5 Estimated LNAPL Volumes

LNAPL Volume	Estimated LNAPL Volume (L)	
	PW02	S8
Prior to test	1.51	0.62
Removed by Bailing	1.20	0.50
Calculated Remaining after Bailing	0.31	0.11
End of Monitoring	0.16	0.09
Calculated Recharge from Formation	-0.15	-0.02

LNAPL transmissivity (Tn) values were calculated for PW02 and S8 using the *LNAPL Transmissivity Workbook: A Tool for Baildown Test Analysis* (API, 2012). This workbook employs the following three methods and worksheets to calculate LNAPL Tn in unconfined conditions:

- Bouwer and Rice (1976) (B&R)
- Cooper and Jacob (1946) (C&J)
- Cooper, Bredehoeft and Papadopulos (1967) (CB&J).

No Tn value could be calculated for MW05 as initial LNAPL thickness and rebound over the course of the day were too low.

The outputs of the API workbook for each well are included as **Attachment D** and summarised on **Table 6** below.

Table 6 Calculated LNAPL Transmissivity Values

Calculation Method	Calculated Value	PW02	S8
Bouwer and Rice	Tn (m^2/day)	0.002	0.0004
Cooper and Jacob	Tn (m^2/day)	0.018	0.009
Cooper, Bredehoeft and Papadopulos	Tn (m^2/day)	0.020	0.002
Average / Summary Result	**Tn (m^2/day)**	**0.013**	**0.004**
	Standard Deviation (m^2/day)	0.009	0.005
	Co-efficient of Variation	0.71	1.23

Evaluation of LNAPL Remediation Technologies for Achieving Project Goals (ITRC, 2009), notes that in previous observed operating hydraulic and pneumatic remediation systems, LNAPL transmissivity has generally been reduced to between 0.009 to 0.074 m^2/day at the point at which there has been assessed further LNAPL recovery will generally be inefficient, will take long periods to marginally affect LNAPL transmissivity, and will have little benefit in terms of reduction of LNAPL mass, migration potential, or longevity of the plume. The calculated and average LNAPL transmissivity values for both PW02 and S8 were within or below this range.

It is noted that the calculated co-efficient of variation, which assesses the level of difference between each calculation method, was greater than 0.5, which indicates there was a low level of agreement between the three calculated Tn values and thus the overall reliability of the average/summary Tn value should be considered low. This discrepancy between results is considered likely to be due to the relatively low Tn values calculated, and the limited or lacking LNAPL inflow from the formation, which would lead to discrepancies between the modelled and observed LNAPL recharge under each model. However, as even the highest modelled Tn value for each well (0.020 m^2/day for PW02, and 0.009 m^2/day for S8) is within the range where further LNAPL recovery would not be considered practicable, this level of uncertainty is not considered to affect the outcomes of this assessment.

On the basis of the limited recharge from the formation to all three wells with detectable LNAPL, and the low calculated LNAPL transmissivity values for PW02 and S8, further active LNAPL recovery from LNAPL Plume B is not considered likely to result in any practicable benefit or in material or significant LNAPL recovery .

4.0 Conclusions and Recommendations

Following detected LNAPL thickness in excess of historic maximums in two wells (S8 and PW02) located in LNAPL Plume B at the Macquarie Point site, a gauging and LNAPL baildown test round was conducted between 20 and 21 March 2024.

Based on the results of this assessment:

- Detected LNAPL thicknesses in wells were consistent with, or less than, the reported LNAPL thicknesses in December 2023, and no new LNAPL detections occurred between December 2023 and March 2024. Based on these results, the low Tn values calculated for PW02 and S8, and on the lack of any identified source of ongoing LNAPL release which could be increasing the volume of LNAPL Plume B, it is considered that LNAPL Plume B remains stable and is unlikely to have mobilised. The cause of the increases in LNAPL thickness observed in PW02 and S8 in December 2023 is unknown but may be due to disturbance of LNAPL induced by remediation activities undertaken in this area in 2023.
- Very limited LNAPL rebound was observed during monitoring following the removal of LNAPL from PW02, S8, and MW05 by LNAPL-selective bailers. Recorded rebound is considered likely to consist primarily of remaining LNAPL in the well or surrounding packing sand, and not from the surrounding formation, based on comparison of removed volumes to the estimated volumes in each well and packing sand before removal and at the end of rebound monitoring.
- LNAPL transmissivity (Tn) values were calculated for PW02 (0.002 to 0.020 m^2/day, with an average of 0.013 m^2/day) and S8 (0.0004 to 0.009 m^2/day, with an average of 0.004 m^2/day). While the calculated co-efficient of variation for each well exceeded 0.5, indicating a lower level of reliability for the average value, all calculated Tn values, including the highest for each well, were within or below the range (0.009 to 0.074 m^2/day) which *Evaluation of LNAPL Remediation Technologies for Achieving Project Goals* (ITRC, 2009) notes as the point at which there has been assessed further LNAPL recovery will generally be inefficient, will take long periods to marginally affect LNAPL transmissivity, and will have little benefit in terms of reduction of LNAPL mass, migration potential, or longevity of the plume.

On the basis of the above, further remediation of LNAPL Plume B is not considered likely to have a practicable effect on Site condition or achieve significant LNAPL recovery rates or reduction in LNAPL volume on the aquifer, and further remediation is not recommended.

Yours faithfully

Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation, and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the *Contract of Supply of Consultant Services Related to Construction – Mac Point Site Wide Environmental Remediation Consultancy Services*, dated 16 September 2022.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 21 and 26 March 2024 and is based on the conditions encountered and information reviewed at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

Temperature, humidity, wind, pressure and rainfall observations are from Hobart (Ellerslie Road) {station 094029}. Cloud, evaporation and sunshine observations are from Hobart Airport West {station 094008}

Hobart Airport West {station 94008} was originally called Hobart Airport. The name was changed with the opening of the new site Hobart Airport {station 94250}.

Temperature, humidity, wind, pressure and rainfall observations are from Hobart (Ellerslie Road) {station 094029}. Cloud, evaporation and sunshine observations are from Hobart Airport West {station 094008}

Hobart Airport West {station 94008} was originally called Hobart Airport. The name was changed with the opening of the new site Hobart Airport {station 94250}.

Executive Summary

The redevelopment of Macquarie Point aims to restore and energise a Site that has long been associated with industrial, freight and rail use into a significant hub for the people of Hobart. In order to realise the planned future Site uses, previous investigations of the Site have identified areas of impacted soil and remnant infrastructure associated with historic Site uses and activities which may preclude the planned future Site development.

To provide a framework for remediation of impacts within the areas of the Site referred to as the Precinct South, and for removal of fuel and oil pipelines, the following documentation was prepared:

- *The Precinct South – Remediation Work Plan* (AECOM, 2023a)
- *The Precinct South – Technical Specification* (AECOM, 2023b).

Excavation of the impacts and infrastructure identified in the above documents, has been conducted by BlackCap Group Pty Ltd (BlackCap), with excavation validation sampling conducted by AECOM between 27 February and 7 June 2023. As part of work to conduct remediation in the Precinct South, BlackCap and AECOM have completed the following scope of work:

- Excavation and removal of:
  - Two disused fuel pipelines (the Diesel Line and the Oil Line).
  - Two areas (the Northern Excavation Area and the Former Underground Storage Tank [UST] Area) where previous assessments had identified soil impacts which could represent unacceptable risks to future Site uses and development.
  - Features uncovered during excavation of soil, including a former boiler within the Northern Excavation Area, and a buried railway in the Former UST Area.
- Backfilling of excavations with Virgin Excavated Natural Material (VENM), reused Site soil (included remediated Site soil) and road base, and reinstatement of Site surfaces.
- Validation of excavation and removal of pipelines and impacted soil.
- Investigation of potential risks to future Site uses which may exist due to changes in the proposed future development of the Site.

Remediation and Validation Work

Soil and pipeline excavations were undertaken to remove remnant pipelines and soil impacts. Excavation works were undertaken with a mechanical excavator to a depth of between 1 metre below ground level (m bgl) in pipeline trenches, to approximately 2 m bgl in soil excavations, where groundwater was encountered. The extent of excavation in each area was determined by the following factors and field conditions:

- The initial estimates of excavation areas in *The Precinct South – Remediation Work Plan* (AECOM, 2023a) and *The Precinct South – Technical Specification* (AECOM, 2023b)
- Field observations of the locations and routes of pipelines, or indicators of soil impact (i.e., staining or odours) reported by AECOM and BlackCap
- Results of soil validation samples collected from the base or walls of excavations by AECOM compared against the Site Specific Remediation Criteria (RC) previously prepared for the Site (Draft *Derivation of Remediation Criteria, Macquarie Point Development Project*, AECOM, 2016a).
- Physical restrictions on further excavation, including:
  - The Site boundary to the east (for the Northern Excavation Area) or the south (for the removal of pipelines).
  - Light Non-Aqueous Phase Liquid (LNAPL) Plume B to the east (for the Former UST Area).
  - Groundwater at approximately 2 m bgl

The works undertaken to remove potential impacts and validate remediation are discussed below.

Removal of Pipelines

Removal of pipelines has been previously identified as required for Site development in order to remove any risk of residual liquids within the pipelines, or any contamination which may exist in the soil surrounding them from potential historic leaks or releases.

Two pipelines and surrounding soils were removed as part of these works:

- The Diesel Line, a 200 mm diameter steel pipeline with a bituminous cladding of Asbestos Containing Material (ACM). Approximately 110 m of this pipeline was excavated and removed from the Site as part of the work completed.

  Prior to removal, the Diesel Line ran north-south beneath a Site road from the termination point of previous remediation undertaken in 2020 (AECOM, 2021b), to the south-east corner of the Red Shed, where it turned west and terminated at a flanged cap. A separate section of the line with a 45° elbow was uncovered immediately to the west and removed within the Site boundary to the extent possible. A section of the pipeline approximately 5 m long remained on the Site where services under Evans Street rendered removal impractical. The pipeline was sealed with a concrete cap where disconnected.

  Clear, non-odorous water was encountered in the main section of the Diesel Line (running north/south), and a mixture of degraded diesel and water was encountered in the section in front of the Red Shed when tapped prior to cutting. Both liquids were decanted from the pipeline before cutting and removed from Site.

- The Oil Line, a 200 mm diameter pipe of steel construction with bituminous cladding. No ACM was detected within the cladding following testing undertaken as part of this program of work. Approximately 90 m of this pipeline was excavated and removed from the Site as part of the work completed.

  Prior to removal, the Oil Line ran north-south beneath a Site road from the termination point of previous remediation undertaken in 2020, to the Site boundary to the south. Removal of the pipeline was ceased approximately 2 m from the southern Site boundary due to the presence of services under Evans Street which prevent cutting or removal, and sealed with a concrete cap.

  No liquids were encountered within the Oil Line during removal.

- Approximately 325 m^3 of soil surrounding the fuel pipelines was excavated, consisting of 120 m^3 surrounding the Oil Line north of the former UST Area, and 205 m^3 surrounding the Diesel Line, and surrounding the Oil Line south of the Former UST Area where the pipelines were within a single trench.

  The 205 m^3 surrounding the Diesel Line was treated on Site to reduce lead leachate and removed from Site. The 120 m^3 was used as backfill in the Northern Excavation Area.

- No staining or indicators of leaks from either the Diesel or Oil Line were noted in soil surrounding the pipelines during removal. Potential indicators of hydrocarbon/fuel impact were observed in the soil surrounding the pipelines where they passed through the Former UST Area but is considered likely to be associated with the former UST impacts in this area.

- Contaminant concentrations with the potential to represent unacceptable risks to the proposed future uses of the Precinct were detected within the surrounding soil during validation of excavation consisting of:

  - Potential ACM fragments (cladding fragments) in the soil removed from around the Diesel Line. This soil, and fragments, were removed from Site.

  - Concentrations of Total Recoverable Hydrocarbon (TRH) >C10-16 (minus naphthalene) exceeding the Potential Future Commercial (unknown construction or multi-storey building) RC at DL_23_1.0 and OL_17_0.6E. Speciation of soil samples collected at these locations identified that no exceedance of RC applicable to future uses of the Precinct South were present.

- Exceedances of Commercial/Light Industrial, and/or Intrusive Maintenance Worker RC were reported at DL_71_0.6E, DL_71_1.0, OL_77_0.6W and OL_77_1.0. However, soil at these locations was removed as part of the Former UST Area excavation, or as soil surrounding the Diesel Line, and does not remain on-Site.

- The surface at the locations of pipeline excavation were covered with bitumen to reinstate the Site road following backfilling with a mixture of VENM, crushed concrete, and reinstated road base.

Based on the information above, no further remediation associated with the remnant pipelines is required for the proposed future uses of the Precinct South.

Soil Excavation

Approximately 1,320 m^3 of impacted or potentially impacted soil was excavated as part of the work completed and discussed in the report, consisting of:

- 325 m^3 of soil surrounding removed pipelines, discussed above.
- 650 m^3 of lead impacted soil from the Northern Excavation Area. This soil was treated on Site to reduce lead leachability and removed from Site.
- 360 m^3 of hydrocarbon impacted soil from the Former UST Area. This soil was reuses as fill material in the Northern Excavation Area, with a portion which reported hydrocarbon concentrations in excess of Site Specific RC remediated on Site before use as fill.

Soil remediation consisted of the following activities:

- Excavation of approximately 650 m^3 of soil was from the Northern Excavation Area to remove previously detected lead concentrations in excess of the future Maintenance Worker RC.

  Soil with concentrations of lead, TRH C6-C10 fraction (minus BTEX) and/or TRH >C10-16 (minus naphthalene) in excess of the Site Specific RC for Residential, Commercial/Light Industrial, and Maintenance Worker uses were excavated from the Northern Excavation Area and disposed off-Site.

  No exceedances of the Site Specific RC for the Commercial / Light Industrial, Intrusive Maintenance Worker, and Open Space uses, which are considered applicable to future uses of the Precinct South, were detected in validation samples collected from material which remains *in situ* in the Northern Excavation Area.

  The Northern Excavation Area was backfilled with a combination of VENM and with Site soil excavated from the Oil Line excavation and the Former UST Area. Where excavated soil had exceedances of RC, on-Site remediation was conducted to reduce hydrocarbon concentrations below a level assessed as representing unacceptable risks to future Site users. A surface layer of VENM was placed to act as a barrier to casual access to soil.

  In addition, the following features were noted in excavated soil:

  - Two isolated ACM fragments were observed in stockpiles excavated from the southern boundary of the Northern Excavation Area. No asbestos fibres were detected in soil samples, and no other fragments were observed in the excavation or in other stockpiles excavated from this area, and it is considered unlikely that the ACM observed represents an area of asbestos impact in excess of the ASC NEPM criteria of <0.05%$^{w}/_{w}$ for Commercial/Industrial land use. As no further fragments were observed, collection, sorting and weighing of a 20 kg sample of soil using the methodology described in the ASC NEPM could not be conducted.
  - Blue colouration/paint was noted in a small quantity (<100 g estimated) in a soil stockpile collected from the southern end of this area and identified by AECOM field staff as potential Prussian Blue, based on colour. Assessment of the soil from this stockpile did not identify elevated levels of cyanide, and no other blue colouration was observed in the stockpile or excavation wall, and it is not considered likely that the observation constituted a potential risk to future Site uses.

- A boiler, filled with water, was uncovered in the eastern portion of the Northern Excavation Area, near the Site boundary. The source of the boiler is not known. There were no pipes or other lines connected to it, and it is considered likely that it was buried as waste by a previous Site occupier at an unknown time.

  The water within the boiler was analysed and reported concentrations of TRH C6-C10 (minus Benzene, Toluene, Ethylbenzene and Xylenes [BTEX]) in excess of the RC for future Commercial / Light Industrial uses and was decanted and removed from the Site. No exceedances of Site Specific RC for hydrocarbons were detected in excavation validation samples to the north, east, south or below the boiler, or within soil excavated to west of the boiler. In addition, no hydrocarbon impacts which may represent an unacceptable risk to future Site uses have been detected in groundwater sampling from monitoring well MW163, approximately 10 m hydraulically downgradient, including in preliminary results from the most recent sampling event conducted on 5 December 2023, although it is noted that results of this event have not had data validation completed or confirmed.

  Based on currently available information, no unacceptable risks to future Site users have been identified associated with the former boiler, and no further remediation or management actions are recommended.

- Excavation of approximately 360 m^3 of soil was excavated from the Former UST Area to remove hydrocarbon impacts associate with historic USTs (removed during an earlier period).

  Concentrations of lead, TRH C6-C10 fraction (minus BTEX), TRH >C10-16 (minus naphthalene) and/or naphthalene in excess of Commercial/Light Industrial, and Maintenance Worker RC were reported in validation samples collected from soil removed from the Former UST Area and is no longer present on Site.

  The following exceedances of RC applicable to future uses of the Precinct South were detected in validation samples collected from material which remains *in situ*:

  - Concentrations of TRH C6-C10 fraction (minus BTEX) and/or TRH >C10-16 (minus naphthalene) were reported above Commercial / Light Industrial RC at the following locations:
    - UST_77_SE_1.6 and UST_80_1.2_S at the southern end of the excavation.

    Speciation of the soil samples collected at these locations was conducted and, while concentrations of aliphatic and aromatic TRH >C21-C35 in excess of Residential RC were detected, no exceedance of RC considered applicable to future Precinct South uses were detected.

    - UST_EXT_59E_1.6 and UST_EXT_59N_1.6 in the eastern portion of the excavation, under the area cut out from under the SeaRoad Shed Slab.

    The results of TRH speciation at UST_EXT_59E_1.6 reported an exceedance of the Commercial/Light Industrial (Working within a basement) RC for aliphatic TRH >C8-C10. It is also noted that samples were not collected at 0.8 m bgl at these locations, and the detected concentrations of aromatic TPH >C8-C10 at UST_EX_59N_1.6 are not delineated vertically would be considered to represent a potential vapour intrusion risk if present in soil <1 m bgl.

    Detected concentrations are not considered to represent an unacceptable risk to future development as:

    - Previous sub-slab soil vapour assessment conducted in 2019 included sample points within 5 to 13 m of the detected soil impacts and did not report potentially hazardous concentrations of hydrocarbon vapour.
    - The AA3 DSI (AECOM, 2022a) notes that further vapour assessment or protection is required for any future development which alters the Site surface. In the event that a change in Site surface occurs, further investigation or protection measures should be considered and prevent unacceptable risk from soil impacts at these locations.

  - The AA3 DSI also contains a requirement that mitigation methods for potential methane intrusion detected in parts of Audit Area 3, which are now contained in the Precinct South, are required to be incorporated into for future building designs. Suitable methane intrusion protection measures would also capture and prevent soil vapour intrusion from hydrocarbons in soil.

- The concentration of lead at 1.6 m bgl at UST_66_E_1.6 exceeded the Intrusive Maintenance Worker RC. This concentration is not considered to represent an unacceptable risk to future Site users as:
  - The Maintenance Worker RC is considered applicable for soil up to 1 m bgl. This exceedance of criteria was detected at 1.6 m bgl and is delineated vertically at 0.8 m bgl by UST_66_0.8_E, and this soil is not considered likely to come into contact with future Maintenance Workers.
  - The extent of lead above RC is considered likely to be limited in extent, as surrounding validation samples to the north, south, east and west did not report lead concentrations in excess of this RC.
  - The adopted RC for lead is 620 mg/kg. The reported result at UST_66_E_1.6 was 621 mg/kg, which is a minor exceedance of the criteria. The RWP and the AA3 DSI both contain statistical assessment of minor exceedances of criteria in accordance with the ASC NEMP, and similar isolated exceedances of RC are present within the Precinct South and are not considered to represent an unacceptable risk to future Maintenance Workers.

No other exceedances of the Site Specific RC for Commercial / Light Industrial, Intrusive Maintenance Worker, and Public Open Space uses were detected in validation samples collected from material which remains *in situ* in the Former UST Area.

The Former UST Area was backfilled with a combination of VENM, crushed concrete from the SeaRoad Shed Slab, and reinstated road base, and the surface was sealed with bitumen or concrete to reinstate the Site Road and SeaRoad Shed Slab.

In addition, the following feature was noted in excavated soil:

- A buried railway was uncovered in the western portion of the Former UST Area and was removed as a precautionary measure by BlackCap. Based on review of historic aerial photographs, the railway is believed to have been installed at some point prior to 1946 and buried between 1984 and 1990.

  Based on aerial photographs, the railway previously extended to the north into an area where soil excavation and remediation was conducted in 2020 (AECOM, 2021b). No railway sections were encountered during previous works, and it is inferred that the railway was removed at least partially at some point in the Site history.

  Assessment of a sample collected from a railway sleeper, and of Former UST Area or Pipeline Validation Samples collected beneath, or less than 2 m from, the railway line, indicate that it is considered unlikely that the sleepers were treated with creosote, and did not detect any indication of impact or contamination from the railway line, and is it considered unlikely that the railway line has acted as a historic or ongoing source of impact to the Site.

  It is noted that review of historical aerial photographs attached to the AA3 DSI identified that there may be other buried railway lines in the Precinct South. However, further investigation or remediation work is not considered to be required to locate or remove these railway lines as:
  - The railway lines are of a similar era and age as the buried railway line removed as part of this remediation program. It is considered likely that they would have similar properties and not represent ongoing sources of contamination or unacceptable risk to current or future Site uses.
  - At least a portion of the historic railway lines have been removed from the Site, prior to it being transferred to the Corporation, as no buried sections were encountered during remediation works in 2020 in areas where railways historically were present.

Change in Use Investigation

Previous assessment of the Precinct South had reported exceedances of the Commercial RC for TRH >C10-C16 (minus naphthalene) in samples collected from the following locations:

- Soil bore BH62.
- Remediation validation samples OL-EX-107 and OL-EX-110.

Previously, the proposed future use of this area in the *New Territory from Old Ground – Macquarie Point Strategic Framework and Masterplan 2015-2030* (MPDC, 2015) was Open Space, and the reported detections were not considered to represent an unacceptable risk to future Site uses. If Commercial/Light Industrial Use of this area occurs in accordance with the proposed *Mac Point Draft Precinct Plan* (MPDC, 2023), detected impacts at BH62, OL-EX-107 and OL-EX-110 had the potential to represent an unacceptable risk to future Site uses.

The location of BH62 was included in the excavation of the Northern Excavation Area during chase-out and removal of identified lead impacts, and as a result, the soil which was identified as potentially representing an unacceptable risk to future Site uses was excavated and removed from the Site as part of this remediation program. No further investigation at this location was conducted as a result.

A 1.1 m deep trench was excavated through backfilled material where a section of the Oil Line was removed in 2020, between sample locations OL-EX-107 and OL-EX-110, and soil samples were collected from existing site fill beneath the previous remediation area.

The samples collected from the base of the trench did not report TRH >C10-C16 (minus naphthalene) above the laboratory Limit of Reporting (LOR) and were generally lower for all TRH ranges than the 2020 samples from this location. The potential reasons for the lower results than previous detection considered are:

- The investigation trench may have been advanced in the incorrect location. However, this is considered unlikely, based on the available GPS data on previous locations and the visible differences between backfill placed at this location in 2020 and surrounding soils.
- The TRH concentrations detected in 2020 may have oxidised or volatilised during the period the trench was open between collection of validation samples and backfilling in 2020. This period may have been greater than 2 weeks (to allow laboratory turnaround of validation samples to determine if further excavation was recommended) and the exposure to ambient air would provide an opportunity a reduction in TRH concentrations.

Further assessment of available data from 2020 was conducted and concluded that:

- The TRH concentrations detected in 2020 in excess of Commercial / Light Industrial RC may have been limited in extent and could be considered delineated to the north, south and west, and delineated in shallow soil to the east.
- A level of vapour management for future buildings is required in the AA3 DSI (AECOM, 2022a) would also provide protection/mitigation of soil vapour from potential impacts in this area.

On the basis of the above, it is considered unlikely that the detected TRH >C10-C16 (minus naphthalene) detected at OL-EX-107 and OL-EX_110 in 2020 represent a source of unacceptable risk to future Site uses, and no further investigation or remediation is considered required.

Further Works and Recommendations

The following actions are recommended for future works prior to or during development of the Precinct of the Site:

- As part of the Contaminated Land Audit Report, a Site Environmental Management Plan (SEMP) will need to be developed to maintain the Site conditions associated with the assumptions which form the basis of the Site Specific RC adopted for assessment of this remediation, namely:
  - An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of Maintenance Workers) to have direct contact with soils. Agreement with the Environmental Auditor will likely be required when specifying an appropriate engineered break layer to mitigate potential direct contact with underlying soils. The engineered break layer may consist of, but not be limited to:
    - Paved surfaces (e.g., concrete, asphalt, etc.)
    - Building footings
    - Sufficient clean soil to mitigate potential direct access to underlying soil during incidental digging (e.g., 0.5 – 1.0 m topsoil)
    - Other suitable materials: e.g., geosynthetic materials that may provide a suitable physical barrier and may be able to be used as alternatives to a thicker earthen layer.

  The SEMP will need to be in place in the future to maintain/manage the surface cover and to specify the requirement for a Work Health and Safety Plan (WHSP) for ground-breaking activities, including IMWs.
- The SEMP should also contain considerations of the following potential impacts:
  - Saturated soil (>2 m bgl) in the Former UST Area and Northern Excavation Area excavations, which may represent a risk to future Site users if exposed, excavated, or dewatered.
  - Areas of potential vapour intrusion near OL-EX-107 and OL-EX-110, and on the eastern boundary of the Former UST Area excavation, which may require further mitigation or investigation if the vapour control measures in the AA3 DSI are not adopted.
  - If any changes to the assumptions of future use and conditions developed for the RC occur, for example a change in surface elevation, reassessment of identified impacts and exposure scenarios must be undertaken.

1.0 Introduction

1.1 Purpose

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of a remediation strategy for the Macquarie Point site in Hobart, Tasmania (the Site). The location of the Site is shown on **Figure F1**.

The redevelopment of Macquarie Point aims to restore and energise a Site that has long been associated with industrial, freight and rail use into a significant hub for the people of Hobart. Historic contamination at the Site is a legacy of past land uses, including gasworks, fuel handling and bulk storage, freight and rail transfer and locomotive servicing, and land reclamation across areas of the Site.

Previous investigations of the Site have identified areas of impacted soil and remnant infrastructure associated with historic Site uses and activities which may preclude the planned future Site development. To provide a framework for remediation of impacts within the areas of the Site referred to as the Precinct South, and for removal of fuel and oil pipelines, the following documentation was prepared:

- *The Precinct South – Remediation Work Plan* (the RWP) (AECOM, 2023a)
- *The Precinct South – Technical Specification* (the Technical Specification) (AECOM, 2023b).

Excavation of the impacts and infrastructure identified in the above documents, has been conducted by BlackCap Group Pty Ltd (BlackCap), with excavation validation sampling conducted by AECOM between 27 February and 7 June 2023.

This report provides details of the remediation and validation works conducted by BlackCap and AECOM in 2023 to remove identified impacts. The area of the Site considered in the report is shown on **Figure F2**.

1.2 Remediation Goals and Drivers

The Corporation has a series of overarching and interrelated remediation goals in relation to the Site. These include:

- Ensuring that there are no unacceptable risks to human health associated with the Site.
- Ensuring there are no unacceptable risks to the off-Site environment / ecology related to on-Site contamination.
- Remediating the Site to a suitable standard to allow for redevelopment for the intended future land uses.
- Remediating primary sources of contamination to the extent practicable as these represent an ongoing source of pollution to groundwater.

These objectives are generally consistent with those adopted by regulatory authorities around Australia. The Corporation has engaged an independent Site Contaminated Land Auditor to provide confidence to key stakeholders that environmental investigations and remedial planning activities have been completed to a level compliant with required standards.
