In addition, the *Macquarie Point Development Corporation Act 2012* was amended in 2015 to enable the accreditation of a Contaminated Land Auditor, which for the first time in Tasmania allows for a statutory audit of contaminated land to be undertaken. The Corporation has engaged an independent Contaminated Land Auditor, Mr David Lam of Tetra Tech Coffey Pty Ltd (the Auditor) to provide confidence to key stakeholders that environmental investigations, remediation, and validation activities have been completed to a level compliant with required standards (discussed in **Section 2.4**).

2.0 The Precinct South – Area Details and Background

2.1 Area Details

For the purpose of assessment and completion of the Environmental Audit, the Site has been divided into seven sub-areas for assessment based on the nature of identified contamination, historic activity, and the intended future uses of each area. The sub-areas of the Site are shown on **Figure 1** below.

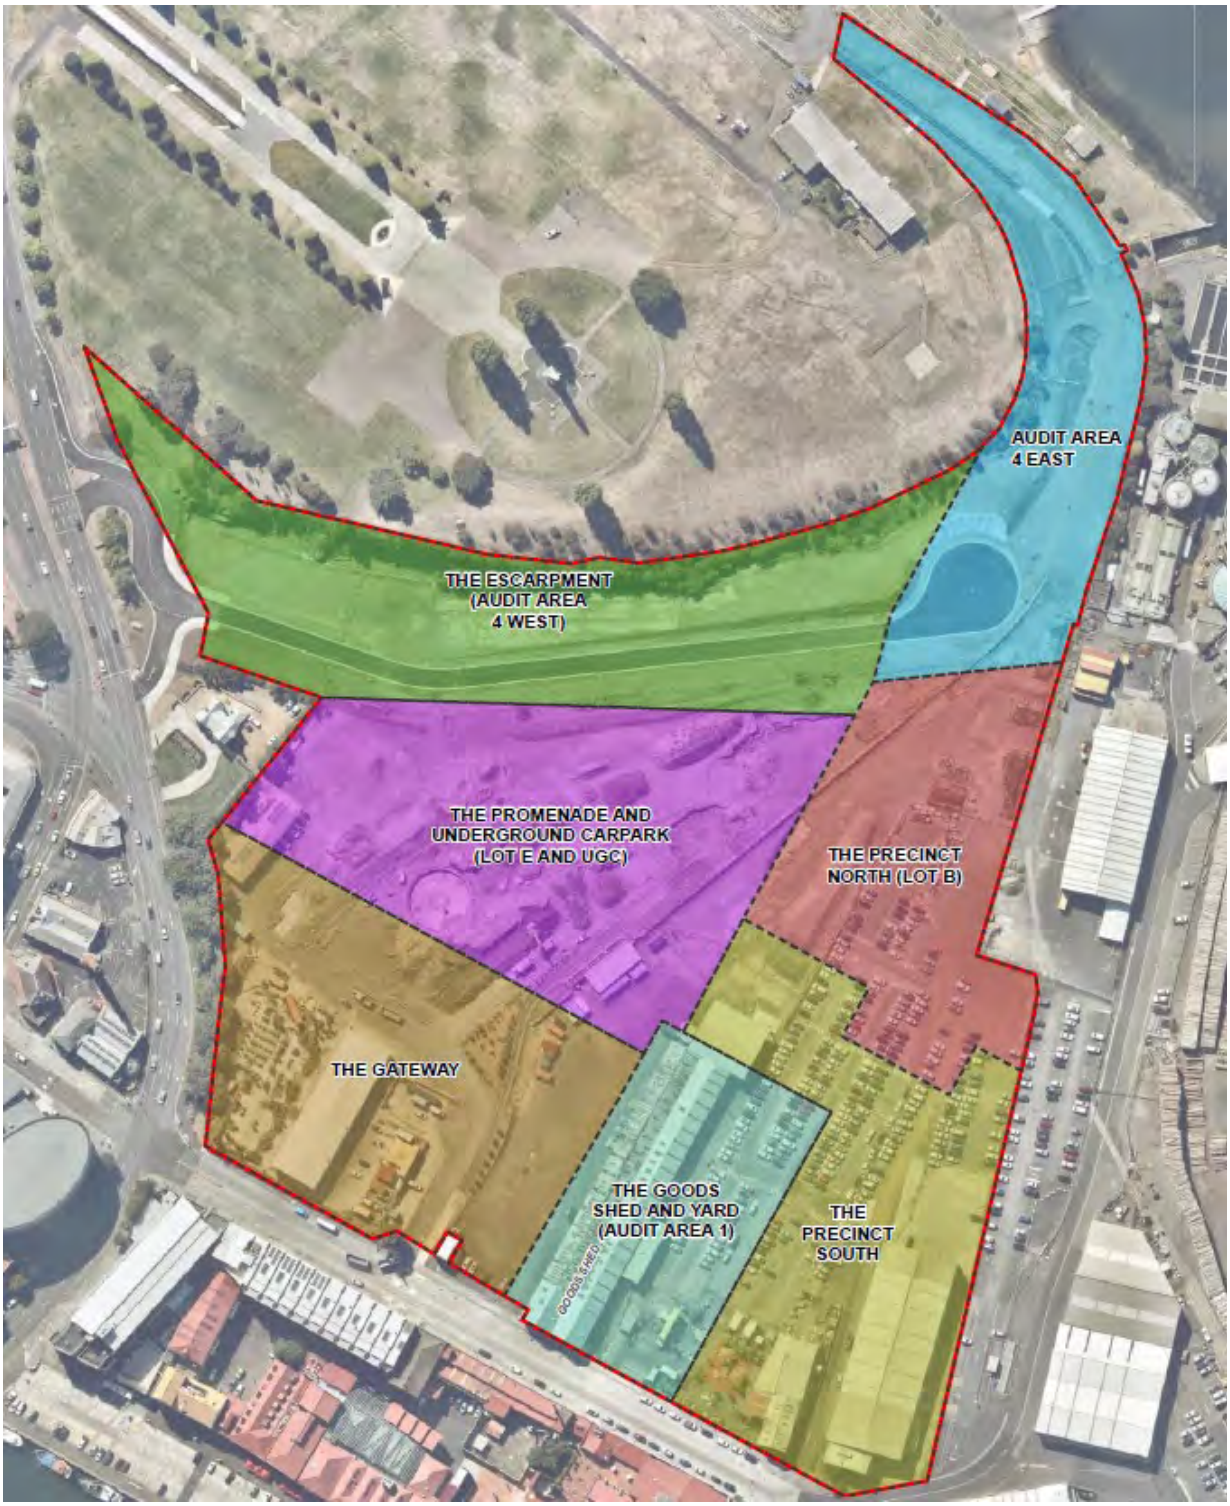

Figure 1 Site Areas

The details of the Precinct South, as a subsection of the Site, are provided in **Table 1** below.

Table 1 Precinct South Details

Item	Details
Area Identification	The Precinct South
Address	10 Evans Street, Hobart, Tasmania, 7000 (see **Figure F1**)
Area	Approximately 1.4 hectares (ha)
Title Details	The Precinct comprises a portion of land title 113521/1 (formerly CT 114462/1) which makes the overall Site area.
Current Owner	State of Tasmania (Crown Land)
Local Government Authority	Hobart City Council
Current Zoning	Mixed Use (*Sullivans Cove Planning Scheme 1997* [amended on 30 October 2019])
Layout and Current Usage	The Precinct South is relatively flat, with a slight rise to the northern edge. The surface is sealed with bitumen, concrete, and gravel. One building currently occupies the central southern area of the Precinct South area: • The Red Shed, currently occupied by a microbrewery (Hobart Brewing Company). A slab is present to the east of the Red Shed, which was formerly occupied by the SeaRoad Shed, which was demolished in late 2022. Red Square, to the west of the Red Shed, is currently used as an intermittent public events space, and is used as a market place for small mobile vendors (e.g., coffee and food vendors, hairdressers). The current layout of the Precinct South is shown on **Figure F2**.
Surrounding Land Uses	• North – Unoccupied area of the Site (referred to as the Precinct North), used as parking space. A Waste Water Treatment Plan (WWTP) is located to the north and east beyond the Site boundary. • East –TasPorts owned land including carparking and port facilities. • South – Evans Street, with commercial properties beyond (including TasPorts), which extend towards Hunter Street and Sullivans Cove. • West – The Goods Shed and Yard portion of the Site, which is used for office space and temporary events works.
Geology	The Precinct South has been subject to significant filling since the early 1800s and is located on reclaimed land. Fill material across the Precinct South, and the greater Macquarie Point Site, consists of clays, sands, gravels, cobbles and bricks. Deeper fill material consists of silty sands, similar to the underlaying natural material, and may be associated with reworked natural material or dredged material. Natural soils encountered below the Precinct South consists of estuarine/marine deposits (silty sands) and weathered dolerite including clays, gravels, cobbles. Dolerite bedrock is present below the Precinct South and is noted to generally increase in depth and decrease in elevation to the south and east.

Item	Details
	The known lithology is summarised below: • Fill material: 0 to 12 m below ground level (bgl) • Estuarine/marine deposits: 3.7 to 15 m bgl • Weathered dolerite: 11.2 to 19 m bgl • Dolerite bedrock: 5 to 25+ m bgl
Hydrogeology	Regional groundwater flow is inferred to be in a general easterly direction toward the River Derwent. The Site is underlain by a single aquifer unit (within multiple lithological units). Groundwater flow beneath the Precinct South is in a generally southerly direction towards Sullivan's Cove. Groundwater below the Precinct South is generally encountered between 1.9 to 4 m bgl. Groundwater modelling completed by GHD (2016) indicates groundwater flow to the south of the Site is in an easterly direction between the southern boundary of the Site and the location of Hunter Island. The easterly groundwater flow direction is considered to be influenced by Hunter Island, which is likely to be relatively low permeability when compared to the surrounding sediment, and the higher permeability sediment located in the former Hobart Rivulet (i.e., beneath Evans Street). The former Hobart Rivulet is considered to be a likely preferential pathway for groundwater flow. There are a number of former sea walls located beneath and surrounding the Site. The sea walls were used the progressive stages of land reclamation and are likely to influence localised groundwater flow direction. Evidence of tidal influence on groundwater levels has been identified to the south of the Site within the inferred groundwater flow path at MW151, where tidal variation of approximately 0.1 m has been noted. Tidal influence (i.e., increasing Standing Water Level (SWL) variations) has been noted to increase toward Sullivans Cove.

It is noted that, for the purposes of assessment and the Site Environmental Audit, the Site was divided into seven audit areas (referred to as Audit Area 1 to Audit Area 7) when planning future works in 2015. Due to changes in the remediation and development approach and refinement of the process by which the Corporation has planned to engage and develop the Site, these boundaries were redefined in 2021 to better reflect the overall planned development of the Site.

For the purposes of reference to earlier reports, the Precinct South covers:

- Audit Area 3 in its entirety
- A portion of Audit Area 5.

2.1.1 Proposed Future Land Use

Based on the *New Territory from Old Ground – Macquarie Point Strategic Framework and Masterplan 2015-2030* (the Masterplan) (MPDC, 2015), the Precinct South was intended for development for a mixture of future uses comprising:

- Commercial (including visitor accommodation, retail, arts and institutional); and
- Public open space.

In September 2022, it was announced by the Tasmanian Government Department of State Growth that the Macquarie Point Site is the preferred location for a future sports stadium and multipurpose area. In October 2023, the *Mac Point Draft Precinct Plan* (the Draft Precinct Plan) (MPDC, 2023) was released for the redevelopment of the Site, which sets out a mixed-use precinct comprised of interconnected discrete Zones. The Draft Precinct Plan is presented in **Plate 1**.

Based on the Draft Precinct Plan (MPDC, 2023), the Precinct South area is proposed to comprise a combination of Commercial and Open Space use areas, specifically:

- The Complementary Integrated Mixed Use Zone; and
- The 'Multipurpose Stadium and Associated Concourse Zone'

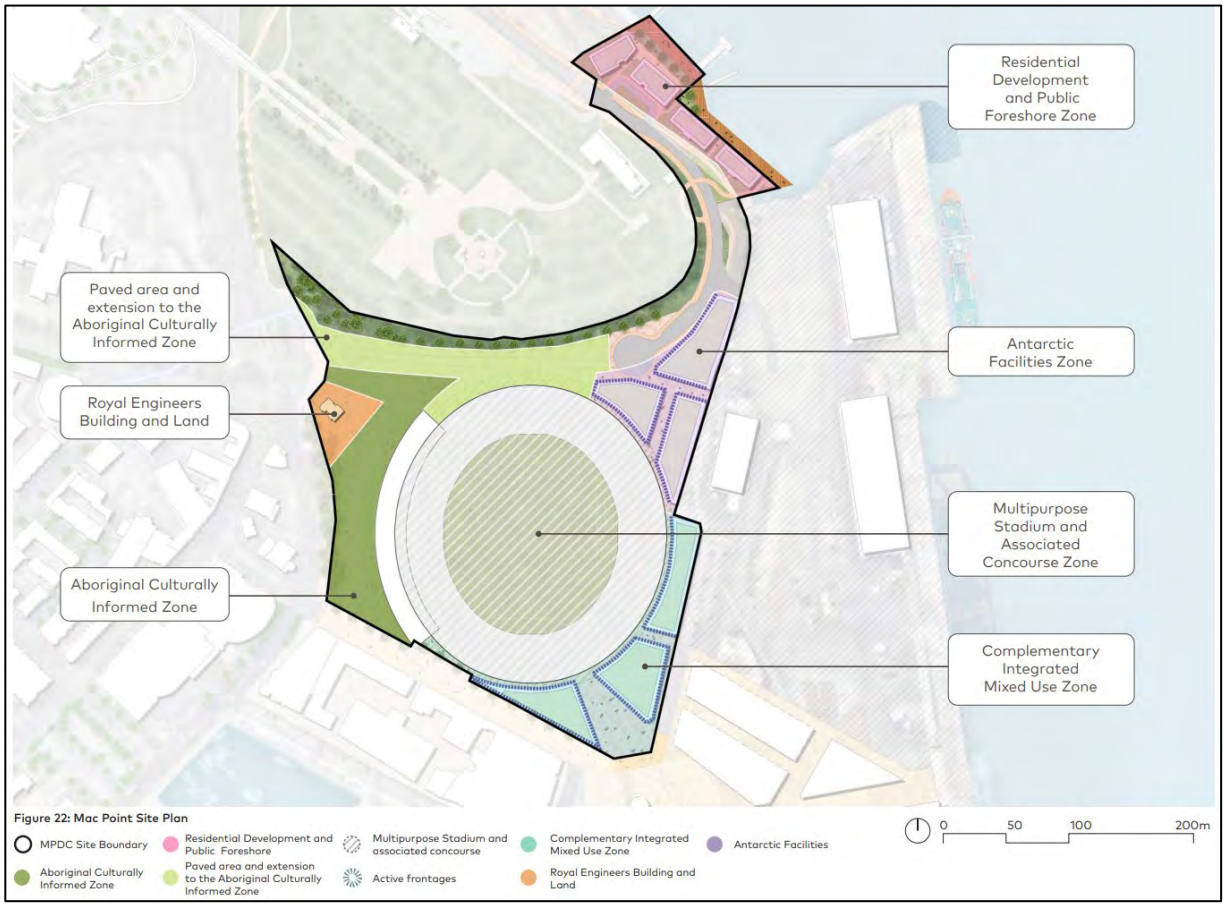

Plate 1 Draft Future Land Uses (MPDC, 2023)

As the Draft Plan is not yet confirmed and may change in future, assessment of the Precinct South has been undertaken with reference to the future land uses in the Masterplan (MPDC, 2015) with the following exceptions:

- It has been assumed that the future site use for the entire area will be potentially Commercial / Light Industrial and that the surface level will not be changed as part of future development.
- The entire area of the Precinct South will be covered in hardstand.
- Basement carparking is not currently planned for this area and is considered unlikely to occur based on the shallow depth to groundwater, and potential management issues associated with residual Light Non-Aqueous Phase Liquid (LNAPL) present in the south eastern portion of the Site. Additional remediation and/or mitigation controls will be required if basement parking is considered in future.

Due to the exceptions noted above, remediation of the Precinct South has been conducted to a more conservative level of protection than required under the current Masterplan.

It is noted that if and when further details of the changes in future development of the area are made available, review of the remediation and approved future Site uses may be required to confirm that no unacceptable risks remain.

2.2 The Precinct South History

2.2.1 Previous Land Uses

A summary of the previous potentially contaminating land uses undertaken within or adjacent to the Precinct South is provided on **Table 2** below.

Table 2 The Precinct South Historical Land Uses

Historical Land Use	Details
The Precinct South	
Land Reclamation	The Precinct South has been subject to land reclamation activities from circa 1830s to the 1900s. It is unclear what was used to backfill the Site; however, it is suggested that material used to fill the Site consisted of rubble, waste and dredged material from the adjacent former Hobart Rivulet and River Derwent (Austral, *Macquarie Point Development Project, Historical Summary* [Austral, 2013]). The *Draft Precinct Plan* (MPDC, 2023) includes Figure 17, which is a layout of progressive changes in the Site shoreline between 1827 and present day, and indicates that land reclamation in the Precinct South occurred primarily between 1891 and 1937. Austral, 2013, notes that between the 1920s and 1937, an area of 6.5 acres off Macquarie Point had been reclaimed for oil storage use, which may have included the Precinct South. Investigations completed beneath the Precinct South have generally characterised the fill material as consisting of sands with dolerite gravels and cobbles with occasional rubble, glass and metal fragments, coal, coke and ash. This is consistent with the material suggested to be used for land reclamation.
Bulk Fuel Terminals	The eastern portion of the Precinct South was part of the former bulk fuel terminal that operated from the 1920s to the early 1970s. A series of aboveground storage tanks (ASTs) of varying size were located in the various fuel terminals. These contained oil/petroleum products including light kerosene, dieseline, fuel oil, motor spirit, diesel fuel, white spirit, and motor spirit. A review of available information indicates caustic soda was also stored. In addition to ASTs, products were also stored in 205 L drums.
Fuel and Oil Transfer	Two fuel (diesel) and oil pipelines were present on the western side of the SeaRoad Shed Slab. The pipelines were used for the transfer of petroleum products to the Ocean Pier, located in the position of the current WWTP and to other locations to the north of the Site. Sections of the pipelines to the north of the SeaRoad Shed Slab were removed as part of remediation works in 2020 (AECOM, 2021b) (discussed in **Section 2.2.5.2**), but and the remaining sections of the pipelines were removed in 2023 as discussed in this report.

Historical Land Use	Details
Freight Handling	Historic freight handled within the Precinct South consisted of general freight (i.e., domestic consumables, etc.) and industrial chemicals (i.e., paints, oils, degreasers, etc). The SeaRoads Shed (also referred to as the Holyman Building) used for freight storage and handling was previously located in the south-east corner of the Precinct South was demolished in late 2022, leaving a slab behind. Two underground storage tanks (USTs) (15 kL diesel and 5.4 kL unleaded petrol [ULP]) were located adjacent to the south-west corner of the SeaRoad Shed. It is understood this infrastructure was owned and operated by BP and has since been removed from Site (prior to occupation and management of the Site by the Corporation). A UST removal and validation report has not been made available for review.
Waste Paper Depot	When the Red Shed was erected circa 1953, it was used by the Boy Scouts as a waste paper depot where collected paper was received and pressed into bundles.
Mechanics Workshop	The Red Shed was leased out as a truck repair and maintenance workshop in the 1990s for a short period (i.e., < 5 years). Whilst detail on activities undertaken is not available, small quantities of chemicals, including paints, solvents, welding gas, fuels and oils were stored in the area, and it is likely that activities such as spray painting, welding and high pressure water cleaning was undertaken.
Goods Shed Annexe	The former Goods Shed Annexe adjoined the northern extent of the Good Shed. Remediation of this area was undertaken in early 2020 and is discussed in **Section 2.2.5.3**.
Surrounding the Precinct South	
Land Reclamation	The area surrounding the Precinct South (in all directions) has been subject to land reclamation activities as previously described.
Rail Activities	The former Roundhouse for freight and rail transport was located to the west of the Precinct South. The Roundhouse consisted of a locomotive maintenance facility featuring a large turntable in the centre. Supplementary facilities included a workshop, offices, stores, amenities, an electrical and boiler shop, and a blacksmith. Rail tracks entered the Roundhouse from the north east via the former Roundhouse Refuelling Area (discussed below). Dismantling of the Roundhouse began in the early 1980s. Anecdotal information indicates that pits and service trenches were backfilled with building rubble including potential asbestos. Five small, isolated fragments of ACM were encountered during investigation in 2020, but no areas of bulk asbestos in trenches have been located by investigations to date. Intact corrugated ACM used as formwork was uncovered as part of an archaeological dig to the west of the Roundhouse in 2023, and was removed entirely from the Site following discovery.
Bulk Fuel Terminals	The area to the east of the Precinct South has been subject to use for bulk fuel terminals as previously described. In addition, the Roundhouse Refuelling area (associated with the former rail Roundhouse) was located to the north west of the Precinct South and consisted of four large ASTs which serviced locomotive and tanker refuelling operations until the late 1908s. Two smaller ASTs were also located in this area and may have also been used for refuelling activities.

Historical Land Use	Details
Port Operations	Tasports' port operations currently located to east of the Precinct South occupies the former bulk fuel terminals footprint. It is understood that TasPorts gained possession of the former bulk fuel terminal area following decommissioning in the early 1970s.
Freight Handling	Freight handling occurred across the broader Site between 1915 and 2014. Freight handled consisted of general freight (i.e., domestic consumables, mail etc.) and industrial chemicals (such as fuels, oils, degreasers, etc).
Former Hobart Rivulet	The Hobart Rivulet was formerly located south of the Precinct beneath the existing Evans Street but was backfilled. Prior to the backfilling the former Hobart Rivulet, the channel which consisted of timber and stone walls, was regularly dredged to remove contaminated material associated with nearby industrial activities (e.g., gasworks, slaughter yard, soap manufacturing, tannery).

2.2.2 Chemical Storage

The Precinct South and surrounding areas have been subject to a history of industrial activities including locomotive activities, freight handling and distribution, and bulk fuel storage which have included the storage of a range of potentially dangerous substances.

The following is noted with regards to chemical storage and handling known to have occurred on or near the Precinct South:

- Bulk Fuel Terminals: Historical fuel releases from handling and storage activities undertaken as part of bulk fuel terminal operations (formerly located in the eastern portion of the Precinct South and extending further east) are likely to have been a source of hydrocarbon impact to soils and groundwater.
- USTs: Two USTs were previously located on the western side of the SeaRoad Shed. The report *Environmental Audit of the AN Tasrail Facilities* (PPK, 1996) identified tanks inferred to be a 15 kL diesel (distillate) and a 5.4 kL ULP (based on a review of licensing) tank off the south-west corner of the SeaRoad Shed (formerly known as the "Holymans Building"). It is understood that these were installed circa 1972, and the USTs have since been removed from Site (prior to occupation and management of the Site by the Corporation). A UST removal and validation report has not been made available for review.
- Based on the Site history and the UST storage capacity, it is considered likely that the USTs were used for fuel storage for supply to vehicles (i.e., to refuel trucks transporting freight) rather than for bulk storage for distribution. Historical fuel releases from USTs (and associated transfer infrastructure) have the potential to have been a source of hydrocarbon impact to soils and groundwater.
- Mechanics Workshops: The Red Shed has been previously used as a mechanics workshop for truck repair and maintenance work. Rust PPK, 1996 identified a number of fuels stored in the building for vehicle maintenance, including oil drums, 20 L containers of paint, welding gases, waste oil and potential solvents.
- Rust PPK, 1996 also reported 360 containers (20 L) of paint, 56 drums (205 L) of motor oil and 144 containers (20 L) of lubricating oil were observed to be stored in the "Holymans Building" (later known as the SeaRoad Shed), which was demolished in late 2022.

2.2.3 Subsurface Features

Table 3 below provides a summary of the known current and former subsurface features which may be present contamination source risks or influence subsurface hydrogeology/contaminant transport mechanisms within or adjacent to the Precinct South.

Table 3 Subsurface Feature Summary

Feature	Comment
Within the Precinct South	
Sewer pipelines	The Sewer (Main Hobart Pipeline) traverses the western portion of the Precinct South. AECOM, 2017a identified that the Sewer (Main Hobart Pipeline) is likely to be in contact with the water table for the entire section in which the sewer line traverses the Site. The invert depth of the Sewer (Main Hobart Pipeline) ranges from 0.15 m Australian Height Datum (AHD) to 0.88 m Australian Height Datum (m AHD). Another sewer pipeline enters the Site near SeaRoad Shed Slab at the southern boundary. Construction details are not known. Based on the depth of pipelines at the Site, it is likely to be buried between 0.6 – 1.2 m bgl, and likely to be above the water table.
Oil/Diesel Pipeline	Two former fuel pipelines (diesel and oil) constructed out of steel were located west of the SeaRoad Shed Slab and south of the Red Shed in the Precinct South. The northern sections of these pipelines were removed in 2020 (AECOM, 2021b), and the remaining sections (within the Precinct South) were removed as part of the remediation work described in this report. Some sections are known to remain in the northern portion of the Site (outside the Precinct South). Details of these pipelines, as encountered during this work, and their removal can be found in **Section 5.1**.
Naval Oil Pipeline	A former naval oil pipeline was reported previously on the southern boundary of the Precinct South. Based on the findings of the remediation work described in this report, the Naval Oil Pipeline is believed to potentially be an extension of the Oil Line which was removed as part of this project
USTs	PPK 1996 identified a 15 kL diesel and a 5.4 kL ULP tank off the south-west corner of the SeaRoad Shed (formerly known as the “Holymans Building”). These USTs have been removed from Site (prior to occupation and management of the Site by the Corporation); however, a UST removal and validation report has not been made available for review. Further investigations were undertaken by GHD in 2014 where these USTs were previously located. Excavations at location RS3 revealed a fabric covering bedding sands with a strong hydrocarbon odour. Soil samples collected from the excavation identified detectable concentrations of hydrocarbons above the water table indicating soil impacts associated with the former USTs are present. The soil in this area was removed as part of the remediation described in this this report. Details of this process can be found in **Section 5.2**.
Water/ Stormwater Pipeline	AECOM, 2017a identified water and stormwater infrastructure located on the south and eastern boundary, and in the western portion, of the Precinct South. A stormwater pit was identified in the south-eastern portion of the Site adjacent to groundwater well MW6 (refer **Figure F2** in the **Figures** section). The depth of the pit and the discharge location could not be determined. The depth is inferred to be 0.7 m bgl based on the measured depth of the base of a stormwater inspection point connected to the identified stormwater pit (~20 m south).

Feature	Comment
Sea Walls	Sea walls were historically used during land reclamation, and a review of historical information has informed the location of sea walls across the Site. In August 2015, GHD completed further investigations to gain supplementary information regarding the location, construction and integrity of sea walls. The following is noted: • A sea wall comprising horizontal timber boards was encountered at approximately 2.0 m bgl in the south-western portion of the Precinct South. • GHD noted that anecdotal information indicated the retaining wall that bisects the Site to the west of the Precinct South could be a former sea wall. The retaining wall was observed to terminate at ~0.8 m bgl, which indicates the retaining wall is unlikely to be a historic sea wall. • During construction of the car park in the northern portion of the Precinct South in 2018, a potential sea wall comprising cemented dolerite cobbles was encountered at a depth of approximately 0.5 m bgl to the east of the Goods Shed.
Good Shed Annexe (Mechanics Workshop and Truck Wash	The Goods Shed Annexe contained a mechanics workshop (which was used for painting and repairs of shipping containers), truck wash, mechanics pit and triple interceptor trap (TIT). This infrastructure was removed in 2020 as discussed in **Section 2.2.5.3**.
Telecommunications Services	Telecommunication services enter the Precinct South to the south. The depths of services are typically between 0.6 m bgl – 1.2 m bgl.
Adjacent to the Precinct South	
Former Hobart Rivulet	The former Hobart Rivulet was located directly down inferred hydraulic gradient to the south of the Precinct South, beneath the existing Evans Street. Prior to filling of the former Hobart Rivulet after 1918, the channel which consisted of timber and stone walls, was regularly dredged to remove contaminated material associated with nearby industrial activities (e.g., gasworks, slaughter yard, soap manufacturing, tannery). The former Hobart Rivulet is inferred to be a preferential flow pathway for groundwater migration. In addition, the presence of waste materials within the former rivulet is a potential source of impact to soils and groundwater.
TasGas Pipeline	A TasGas pipeline is known to run along Evans Street to the south of the Precinct South.

2.2.4 Contamination Source Zones

Environmental investigations completed at the Site to date have identified the following key contaminant source zones across the Site consisting of Non-Aqueous Phase Liquid (NAPL), namely, LNAPL Plume A1, LNAPL Plume A2, LNAPL Plume B and Gasworks Dense Non-Aqueous Phase Liquid (DNAPL).

LNAPL Plume B is within the boundaries of the Precinct South and is shown on **Figure F2** in the **Figures** section.

In addition to the four key contaminant source zones, LNAPL Plume A3, understood to have been present in the Promenade and Underground Carpark Area (also referred to as Lot E and the Underground Carpark) to the north and west of the Precinct South, has also previously been identified as a historical source zone.

Table 4 below provides an overview of these identified contaminant source zones.

Table 4 Contaminant Source Zones

ID	Location	Contaminants Identified	Inferred Contamination Source
LNAPL Plume A1	Former Roundhouse Refuelling Area, central portion of the Site.	Metals, TRH, PAH	LNAPL (likely diesel) has been identified at the water table and is likely associated with locomotive refuelling activities in the Roundhouse Refuelling Area. Plume A1 appears to be a localised LNAPL source correlating with historical information indicating the presence of an AST in this location.
LNAPL Plume A2	Former Roundhouse Area and Roundhouse Refuelling Area, central portion of the Site.		Similar to Plume A1, LNAPL has been identified at the water table and is likely associated with locomotive refuelling activities in the Roundhouse Refuelling Area. The LNAPL is understood to comprise predominantly diesel fuel, as well as fuel oils associated with diesel engine operation (e.g., lubricants, engine oils etc.).
LNAPL Plume A3	Former Roundhouse Refuelling Area and Central Eastern Area central portion of the Site.		Historical documents reference localised LNAPL at this location. Similar to Plume A1, LNAPL is likely associated with locomotive refuelling activities in the Roundhouse Refuelling Area. The LNAPL is understood to comprise predominantly diesel fuel, as well as fuel oils associated with diesel engine operation (e.g., lubricants, engine oils etc.). Measurable LNAPL not been identified since July 2017. On this basis, LNAPL Plume A3 is not considered to be a key ongoing contaminant source at the Site.
LNAPL Plume B	Beneath and inferred to extend off Site to the east of the SeaRoad Shed Slab), south eastern portion of the Site and eastern portion of the Precinct South.		LNAPL (comprising predominantly diesel with some petrol) has been identified at the water table and is understood to be associated with historical fuel handling and storage activities in proximity to the SeaRoad Shed (AECOM, 2017e).
Gasworks DNAPL	The Gateway Area, south western portion of the Site.	Metals, TRH, PAH, BTEX, phenols, ammonia, cyanide	Comprising tar and gross tar impacts, DNAPL has been observed to depth up to 7.6 m below ground level (bgl) beneath the former Cold Store. The DNAPL is associated with tar from the production of coal gas which was previously undertaken on the footprint of the Cold Store.

Notes: TRH – Total Recoverable Hydrocarbon; PAH – Polycyclic Aromatic Hydrocarbon; BTEX – Benzene, Toluene, Ethylbenzene and Xylenes; AECOM, 2017e – Macquarie Point Development Project - LNAPL Remediation Action Plan, 30 May 2017

2.2.5 Previous Remediation Works

2.2.5.1 LNAPL Remediation

LNAPL delineation and remediation (including LNAPL Plume B within the Precinct South) was conducted by AECOM between 2015 and 2017. Prior to AECOM conducting works, remediation of LNAPL Plume B was previously undertaken by Sinclair Knight Merz (SKM) and reported:

- An active skimmer system was deployed in 2000 and reported removal of approximately 5,000 L of LNAPL.
- After one year, a passive system was installed and recovered approximately 25 L of LNAPL.

An assessment of potential remediation options for LNAPL associated with the LNAPL Plumes A1, A2, A3 and B was prepared by AECOM as part of the *LNAPL Remediation Action Plan* (the RAP) (AECOM, 2017b) and selected Total Fluids Extraction (TFE) as the most practicable LNAPL remediation method for the Site.

A detailed assessment of LNAPL impacts and remediation conducted on Site has been reported in *Assessment of LNAPL Remediation Endpoints* (AECOM, 2021c), and is summarised below.

- TFE trial events were undertaken by AECOM between November 2015 and February 2016. Fluid extraction was induced by deploying submersible top-loading pneumatic pumps in groundwater wells containing LNAPL, or at locations considered likely to release LNAPL from the aquifer matrix after a period of localised groundwater drawdown.
- A fixed TFE system was installed at the Site in 2015/16 and TFE activities were undertaken at the Site over the period August 2016 – November 2017. TFE activities have included a combination of continuous TFE operations on LNAPL Plumes A1, A2 and B and periodic TFE (LNAPL Plume A3). The AECOM document titled *Total Fluid Extraction System, Operation and Performance Overview, May 2017* (AECOM, 2017e) includes operational data collected between August 2016 and May 2017, and the following conclusions were provided as part of AECOM, 2017e:
    - A total of 445 L of LNAPL was extracted over a total of 4,190 hours of TFE system operation and 13 Mobile LNAPL Recovery Unit (MLRU) events.
    - LNAPL was detected in two non-TFE wells where it was previously absent (MW131 and MW138); both wells are located in the immediate vicinity of LNAPL Plume A1 (MW131) and Plume A2 (MW138).
    - Overall, the TFE data indicated a steady reduction in LNAPL extracted by the TFE system and LNAPL recovery thicknesses in the wells.
- Rebound of LNAPL was not observed in groundwater wells and LNAPL Plume B appeared to be stable and not increasing.

During a Groundwater Monitoring Event (GME) between 29 November and 6 December 2023 (AECOM, 2024a), LNAPL was detected at four wells in the Precinct South – MW03, MW05, PW02 and S8. The thickness of LNAPL in PW02 and S8 exceeded historically recorded maximums, and as result, an additional LNAPL gauging and transmissivity (Tn) test event was conducted between 20 and 21 March 2024 (AECOM, 2024b) and reported that:

- LNAPL thicknesses in March 2024 were consistent with the 2023 GME in PW02 and S8. LNAPL thickness in MW05 had decreased by an order of magnitude, and LNAPL was no longer present (confirmed by bailer) in MW03 or detectable in other accessible wells in the Precinct South. Based on these results, the LNAPL Tn values discussed below, and the lack of any identified source of further LNAPL impact in the Precinct South, it was considered that Plume B remains apparently stable and is unlikely to be mobilised.
- LNAPL Tn values were calculated for PW02 (0.002 to 0.020 m^2/day) and S8 (0.004 to 0.009 m^2/day). Insufficient LNAPL rebound occurred in MW05 for a LNAPL Tn value to be determined. All calculated LNAPL Tn values were within or below range (0.009 to 0.074 m^2/day) which *Evaluation of LNAPL Remediation Technologies for Achieving Project Goals* (ITRC, 2009) notes as the point at which there has been assessed further LNAPL recovery will generally be inefficient, will

take long periods to marginally affect LNAPL transmissivity, and will have little benefit in terms of reduction of LNAPL mass, migration potential, or longevity of the plume.

Based on this assessment, it was concluded that further active remediation of Plume B was not considered likely to have a practicable effect on Site condition, or achieve significant LNAPL recovery or reduction in the volume of Plume B.

Soil vapour assessment conducted in the SeaRoad Shed in 2018 and 2019 did not identify an unacceptable risk to human health from potential vapour intrusion from LNAPL Plume B which would represent a potential risk to potential future commercial use of the area.

The *Assessment of LNAPL Remediation End-Points* (AECOM, 2021c) concluded that further LNAPL remediation is not practicable or required for the proposed future uses, and the additional LNAPL Tn assessment conducted in 2024 (AECOM, 2024b) did not provide any information which is considered to alter this conclusion. While residual LNAPL is present, on-Site groundwater management is required as documented in the SEMP.

2.2.5.2 Remnant Pipeline and Impacted Soil Removal

Between February and November 2020, soil impacts and remnant fuel and oil pipelines were excavated and removed from the north eastern section of the Precinct South and adjacent areas the Precinct North and the Promenade and Underground Carpark Area (shown on **Figure F2**). Details of the remediation and validations works completed have been detailed in AECOM, 2021b and are summarised below:

- Two sections of unused pipelines from former Site uses within the Precinct South were excavated and removed:
  - The Oil Line which entered the Site from the north of Audit Area 4 East and extended south along the eastern boundary, through Audit Area 4 East, the Precinct North, and the Precinct South, before exiting the Site in the south east corner of the Precinct.
  - The Diesel Line which runs parallel to the Oil Line in the Precinct North and the Precinct South.

  Excavation of the pipelines was stopped at the northwest corner of the SeaRoad Shed Slab, with the sections remaining on-Site removed in 2023, as discussed in the body of this report.

  Each pipeline consisted of 8” diameter steel piping. Both the Oil and Diesel Lines had a bituminous cladding present. No asbestos was detected in samples collected from the Oil Line. However, asbestos fibres were detected in the cladding of the Diesel Line. The Diesel Line and the surrounding soil were excavated as ACM and the area of excavation validated by an asbestos hygienist following excavation.

  Excavated soil surrounding the pipeline sections was sampled and validated against the Site-specific Remediation Criteria (RC), discussed in **Section 3.1**.
- Soil surrounding the pipelines in the Precinct South was excavated as part of removal of identified soil impacts in those areas. The remediation extents were validated against the applicable RC for the areas of excavation. The following was recommended during assessment of validation samples with respect to the Precinct South:
  - Delineation, removal and validation of soil with lead concentrations above the Future Maintenance Worker RC.
- Excavations in the Precinct South were backfilled with Virgin Excavated Natural Material (VENM) or with material excavated from other areas of the Site which was approved for reuse by the Contaminated Land Auditor prior to placement. Details of assessment of materials which were reused and record of Auditor approval can be found in AECOM, 2021b.

2.2.5.3 The Goods Shed Annexe

Excavation and removal of three pieces of defunct infrastructure (the Mechanics Pit, TIT and Truck Wash) and surrounding soils from the Goods Shed Annexe, formerly a mechanics workshop located to the north of the Goods Shed, was conducted in 2020 and is reported in *Goods Shed Annexe Remediation Validation Report* (AECOM, 2021c).

The following remediation works were conducted:

- An estimated 210 m^3 of remnant infrastructure and surrounding soils were removed in three excavations within the Good Shed Annexe:
- 90 m^3 of soil and infrastructure was excavated to a maximum depth of 2.6 m bgl surrounding the former Mechanics Pit.
- 30 m^3 of soil and infrastructure was excavated to a maximum depth of 1.8 m bgl surrounding the former TIT.
- 90 m^3 of soil and infrastructure was excavated to a maximum depth of 1.8 m bgl surrounding the former Truck Wash.

All excavated soil and infrastructure have been disposed off-Site.

Where exceedances of the RC in excavation validation samples were detected, applicable to the planned future use of the Goods Shed Annexe, additional soil was removed, and further validation samples were collected to verify that soil with exceedances was removed.

A PVC pipe was located in the Truck Wash excavation with some sludge within it. A sample of the sludge was collected, and no exceedances of RC were detected within the material. The PVC pipe was removed to the boundary of the excavation and sealed with a PVC cap.

The excavations were backfilled with VENM sourced from a natural dolerite rock quarry at Leslie Vale, operated by Hazel Brothers. Three samples of the VENM were collected and reported no exceedances of any RC for the future Site use.

On the basis of the above and the currently available information, no further remediation of the Goods Shed Annexe for the proposed future Site use of Open Space was considered to be required.

2.3 Chemicals of Potential Concern

On the basis of the historical land uses of the Precinct South and the surrounding historic land uses, the chemicals of potential concern (CoPC) that have been identified are summarised in **Table 5** below.

Table 5 Chemicals of Potential Concern

Former Land Use/ Potential Contaminating Activity	Chemicals of Potential Concern	Potential Impacted Media
The Precinct South		
Land Reclamation	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs	• Soil • Groundwater • Soil Vapour
Freight Handling	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, pH	
Fuel Storage	Lead, TRH, PAH, BTEX, ACM	
Mechanics Workshop	Heavy metals[2], TRH, PAH, BTEX, phenolic compounds	
Adjacent Areas		
Land Reclamation	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs	• Soil • Groundwater • Soil Vapour
Roundhouse (Locomotive maintenance and refuelling)	TRH, BTEXN, PAHs, phenolic compounds, chlorinated hydrocarbons, SVOC, VOC	
Railyards (including fuel storage) and Freight Handling	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC	
Port Operations	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC	
Gasworks	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, cyanide, ammonia, ACM	
Fuel Storage and Bulk Fuel Terminals	Lead, TRH, PAH, BTEX, PFAS[3], ACM	
Former Hobart Rivulet	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, cyanide, ammonia, SVOC, VOC, OCPs	

Notes: SVOC: Semi-Volatile Organic Compounds; VOC: Volatile Organic Compounds; OCP: Organochlorine Pesticides; PFAS – Per and Poly-fluoroalkyl Substances; ACM – Asbestos Containing Material Heavy metals: 1 – aluminium, arsenic, cadmium, chromium, copper, lead, manganese, nickel and zinc; 2 - lead and arsenic; 3. A review of historical information has not identified the use of products containing PFAS, however there is potential for firefighting foams containing PFAS to have been applied as part of emergency response operations.

2.4 Regulatory Framework

Contaminated sites in Tasmania are regulated under the *Environmental Management and Pollution Control Act 1994* (EMPCA).

The National Environment Protection Council (1999) *National Environment Protection (Assessment of Site Contamination) Measure* (as amended in May 2013) [ASC NEPM] is the primary document referenced by EPA Tasmania for the assessment of contamination and risk to human health and/ or the environment. As such, the ASC NEPM has been adopted as the overarching project guidance.

Environmental related guidelines to be considered as part of future remedial planning works at the Site should include (but are not limited to):

- ASC NEPM.
- *Australian and New Zealand Guidelines for the Assessment and Management of Contaminated Sites*, Australian and New Zealand Environment and Conservation Council 1992 (ANZECC 1992).
- The *National Remediation Framework* (the NRF) (CRC CARE, 2020)
- *Environmental Management and Pollution Control (Waste Management) Regulations 2010*.
- EPA Tasmania *Information Bulletin No. 105 Classification and Management of Contaminated Soil for Disposal*, (IB105)

The ASC NEPM came into effect on 18 May 2013. There have been changes to health investigation levels (HILs) for various land use settings (e.g., residential, commercial/industrial); however, in many instances, the changes have resulted in less conservative criteria. The ASC NEPM notes that the HILs are not intended to be used as remediation criteria and that remediation of contaminated land is outside of the scope of the Measure, therefore the amended ASC NEPM has had no notable effect on the selection of potential remedial strategies for the Site.

The NRF was developed to support and complement the ASC NEPM and provide a nationally consistent approach to remediation of contaminated sites for Australian regulatory bodies and industries which clean up and manage sites across multiple jurisdictions. The NRF provides guidance in planning and implementing a range of approaches throughout the lifecycle of site remediation. In November 2019, the NRF was endorsed by the Heads of EPA (HEPA).

2.4.1 Environmental Audit

In conjunction with the amendment of the *Macquarie Point Development Corporation Act 2012*, the Corporation has engaged a Contaminated Land Auditor, David Lam of Tetra Tech Coffey Pty Ltd (the Auditor). David is included on the EPA Tasmania Register of Interstate Contaminated Land Auditors and is considered suitably qualified by EPA to undertake an Environmental Audit to review the progress of environmental assessment, remedial planning and execution works at the Site.

The role of the Auditor is to ensure that the works are carried out in compliance with local Tasmanian legislation and guidelines with consideration given to the requirements of the Victorian EPA Environmental Audit framework in the absence of an Audit scheme in Tasmania. It is noted that Victoria legislation which defines the Audit process was updated and superseded by the *Environment Protection Act 2017* (the EP Act), which came into effect on 1 July 2021, and contains significant changes to Audit methodology and terminology under the Victorian framework. Under Section 478 of the EP Act, existing Audits where an Auditor has been engaged prior to 1 July 2021, and the Audit has not been completed by 1 July 2021, can be conducted under either the EP Act or the previous framework. To maintain continuity with the portions of the Audit already completed, and due to elements of the EP Act which give powers and place requirements on EPA Victoria, which does not have authority to make decisions or give direction within Tasmania, the Site Audit will continue under the previous framework and terminology.

The overarching outcome required for the Environmental Audit is a Contaminated Land Audit Report (i.e., sign off) prepared by the Contaminated Land Auditor confirming that Clean Up to the Extent Practicable (CUTEP) has been achieved and that the Site is suitable for the intended future uses.

Auditor review and endorsement of the proposed methodology and overall outcomes of Site remediation will be required prior to future development of the Site.

2.4.2 Clean Up to the Extent Practicable

The Audit will include consideration of CUTEP, similar to that adopted by the Victorian audit scheme as discussed in **Section 2.4.1**. Section 1.0 of Victorian EPA Publication 840.2 (2016) *The cleanup and management of polluted groundwater* (EPA Publication 840.2) has been used as guidance for the CUTEP process in the absence of an equivalent Tasmanian document, and notes that:

> '*Where polluted groundwater has been identified, EPA Victoria's role is to require clean up. If it is impracticable to clean up groundwater to the level needed to restore beneficial uses, EPA may accept that cleanup to the extent practicable has occurred and that, subject to appropriate ongoing management, further cleanup is not required*'.

The CUTEP process recognises that polluted groundwater should be cleaned up such that the protection of beneficial uses is restored, and were considered acceptable (by the authority, in this case the independent Auditor in conjunction with the Tasmanian EPA), groundwater may be cleaned up to the extent practicable.

It is noted that a CUTEP determination needs to be made for the whole Site (i.e., each Audit Area), not just individual remediation areas. However, interim agreement will likely be sought from the Auditor that individual areas have reached remediation end-points, so that active remediation works can cease.

3.0 Assessment Criteria

3.1 Site Specific Remediation Criteria

3.1.1 Human Health

AECOM has prepared Site Derived Remediation Criteria (RC) for soil and groundwater to inform potential remediation/ management works required at the Site for the protection of human health (*Derivation of Remediation Criteria, Macquarie Point Development Project*, AECOM, 2016a). The following scenarios have been considered based on the potential future land uses:

- Recreational Open Space Users
- Residents:
  - Slab-on-grade unknown construction or multi-storey building
  - Low rise slab-on grade
  - Building with basement car park.
- Commercial:
  - Slab-on-grade unknown construction or multi-storey building.
- Commercial/ Light Industrial Workers:
  - Working within a basement car park
  - Low rise slab-on-grade.
- Maintenance Workers (including excavation to depths of up to 1 m bgl).

The RC is based on generic assumptions regarding future land use including:

- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of Intrusive Maintenance Workers [IMW]) to have direct contact with soils. Agreement with the Site Contaminated Land Auditor will likely be required when specifying an appropriate engineered break layer to mitigate potential direct contact with underlying soils. The engineered break layer may consist of, but not be limited to:
  - Paved surfaces (e.g., concrete, asphalt, etc.)
  - Building footings
  - Sufficient clean soil to mitigate potential direct access to underlying soil during incidental digging (e.g., 0.5 – 1.0 m topsoil)
  - Other suitable materials: e.g., geosynthetic materials that may provide a suitable physical barrier and may be able to be used as alternative to a thicker earthen layer.
- A Site Environment Management Plan (SEMP) will be in place in the future to maintain/manage the surface cover and to specify the requirement for a Work Health and Safety Plan (WHSP) for ground breaking activities, including Intrusive Maintenance Workers.
- Adjacent off-Site land uses include open space, commercial/industrial and residential areas. As these potential land uses have been considered on Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g., via groundwater migration beyond the Site boundary).
- Soil RC are not considered to be applicable to soil located within the saturated zone (i.e., beneath the water table). Where soil impacts are located beneath the water table, this impact is considered to be a factor for groundwater assessment and management as partitioning to vapour will be dominated by groundwater rather than soil in the saturated zone.

Concentrations of CoPC have been reported in excess of the RC within the Precinct South. The current Masterplan presents a mixture of Commercial/Industrial and Open Space uses for the Precinct South. However, as discussed in **Section 2.1.1**, the Site has recently been announced as a preferred location

for development of a future sports stadium, and under the Draft Precinct Plan (MPDC, 2023), portions of the Precinct South will be used for either stadium or mixed use. The existing Site Specific RC for Commercial / Light Industrial, Intrusive Maintenance Worker, and Public Open Space use have been applied for assessment of this area. Assessment against residential use criteria has also been conducted, however it is noted that this use is not considered likely to be realised for the Precinct South based on the Draft Precinct Plan and zoning regulations in the vicinity of TasPorts operations on the eastern boundary.

It is noted that a future risk assessment of site data and completed remediation against stadium requirements will be required in the future and additional remediation may be required if specific risk scenarios not considered by the existing RC are identified.

3.1.2 Ecological

The Site Derived RC discussed in **Section 3.1** are noted to have been developed to be protective of human health exposure scenarios and did not consider potential ecological receptors. The *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020a) was prepared to evaluate the potential risk to identified ecological receptors from groundwater impacts on the Site, primarily the nearby marine ecosystems of the River Derwent and Sullivans Cove, which contain the inferred points of discharge of Site groundwater. The ecological receptors were identified to be artificial, of low ecological value and considered to be within 'highly disturbed' environments. Specific ecological criteria were developed to be protective of this environment and assessed using data from the Site boundaries.

Based on the weight of evidence approach, which considered concentrations of Chemicals of Potential Ecological Concern (CoPEC), composition and stability of LNAPL impacts, and interaction between groundwater and seawater, including the effects of subsurface infrastructure and seawalls, it is considered that groundwater emanating from the Site boundary is unlikely to pose an unacceptable risk to off-Site aquatic ecological receptors within Sullivans Cove and the River Derwent.

3.2 Data Quality Objectives

Guidance regarding the development of Data Quality Objectives (DQOs) has been referenced from the following primary documents:

- National Environment Protection Council, National Environment Protection (*Assessment of Site Contamination*) Measure 1999, *Schedule B2: Guideline on Site Characterisation* (as amended in May 2013) [ASC NEPM].
- EPA New South Wales, *Sampling Design Part 1 – Application, Contaminated Land Guidelines* (EPA NSW, 2022a)
- EPA New South Wales, *Sampling Design Part 2 – Interpretation* (EPA NSW, 2022b)
- US EPA, 2006 *Guidance on Systematic Planning Using the Data Quality Objectives Process* (EPA QA/G-4).

The process of establishing appropriate DQOs is defined by the seven-step planning approach presented in the ASC NEPM and summarised in **Table 6** below.

Table 6 Data Quality Objectives

Step	Data Quality Objective Step Summary
1	***State the Problem*** – Summarise the problem that will require new environmental data, identify the resources available to resolve the problem and develop a Conceptual Site Model (CSM) based on available information prior to the commencement of the site investigation.
2	***Identify the Goal of the Study*** – Identify the decisions that need to be made and the new environmental data required to support the identified decisions. Develop a decision statement linking the principal project objective(s) to the possible actions that will address the problem.

Step	Data Quality Objective Step Summary
3	***Identify Information Inputs*** – Identify the information needed to support any decision and whether new environmental data will be needed.
4	***Define the Boundaries of the Study*** – Specify the spatial and temporal aspects of the environmental media that the data must represent to support decision(s).
5	***Develop the Analytical Approach*** – Define the parameter of interest, specify the action level, and integrate information from Steps 1–4 into a single statement that gives a logical basis for choosing between alternative actions.
6	***Specify Performance or Acceptance Criteria*** – Specify the decision-maker's acceptable limits on decision errors, which are used to establish performance goals for limiting uncertainties in the data.
7	***Develop the Plan for Obtaining Data*** – Identify the most resource-effective sampling and analysis design for generating the data that is required to satisfy the DQOs.

The methodology presents a sampling plan which is designed to meet the objectives for the investigation and to achieve the nominated DQOs. The approach to be adopted relative to the seven steps presented above is discussed in the following sections.

3.2.1 Step 1 – State the Problem

The overarching problem to be addressed is to remove contamination or potential contamination sources which may represent an unacceptable risk to current or future Site uses, or current or future uses of neighbouring sites.

The problem to be addressed as part of remediation is removal of infrastructure and impacted soil to the extent practicable and demonstrate that identified impacts have been removed to an appropriate extent to remove any unacceptable risks to future Site uses arising from these materials.

3.2.2 Step 2 – Identify the Goal of the Study

The overarching goals of remediation works were to:

- Remove unacceptable risks to future Site uses.

The goals of this remediation works are to:

- Assessment and validation the removal of impacted soil and remnant infrastructure.
- Support future CUTEP assessment of the Precinct South.

3.2.3 Step 3 – Identify Information Inputs

To allow assessment of the data against the issues listed in **Section 3.2.2**, various inputs will be considered as follows:

- Review of the existing Conceptual Site Model (CSM) and Site data, and planned future Site uses.
- Identification of existing areas of known or potential impacts which may present an unacceptable risk to future uses.
- Identification of criteria to assess the success of the remediation.
- Assessment of field records, analytical certificates, and records of remediation against adopted criteria to consider if unacceptable risks remain.

3.2.4 Step 4 – Define the Boundaries of the Study

The spatial boundaries (geographical limits) applied for data collection and decision making for remediation works are defined as follows:

- The area of the Site referred to as the Precinct South (as shown on **Figure F2**).
- The area of works is vertically delineated by the underlaying groundwater at a variable depth below the site. Groundwater is estimated to be at approximately 2 m bgl in the area of works, based on recorded historical groundwater levels of between 1.72 to 2.80 m bgl in the area of work (AECOM, 2021a, 2022a).

The assessment area is shown in **Figure F2** in the **Figures** section.

The temporal boundaries for decision making are:

- Available records of current and historic land use and investigation, including Site history as presented in **Section 2.2.1**.
- Field records from remediation between 27 February and 6 June 2023.

3.2.5 Step 5 – Develop the Analytical Approach

Environmental data collected for the purpose of the remediation validation must be of sufficient representativeness to further inform decision making regarding the status of contamination at the Site.

The RWP (AECOM, 2023a) and Technical Specification (AECOM, 2023b) were developed to provide a framework outlining the scope and methodologies for remediation of the Precinct South and contain details of the sample analytical suites, density, and collection methodology required to collect and assess the outcomes of the implemented remediation.

Laboratories for the analysis of collected soil samples will be National Association of Testing Authorities (NATA) accredited for the requested analysis and will be consistent with the following methodologies summarised in **Table 7** below.

Table 7 Laboratory Analytical Methods

Matrix	Analyte	Method Reference
Soil	Metals*	USEPA 200.2 /ICP-AES, CV/FIMS /ICPMS
	TRH and BTEXN	GC/FID, HS/P&T-GC/MS
	PAH and Phenols	GC/MS – SIM
	Cyanide	APHA 4500 CN- -C&N
	Ammonia	APHA 4500 NH3- - G
Water/ Leachate	Metals*	ICP/MS/CV/FIMS
	TRH and BTEXN	GC/FID, P&T/HS/MS
	PAH and Phenols	USEPA 3510/8270 SIM
	Cyanide	APHA 4500 CN- -C&N, APHA 4500 CN- -I&N
	Ammonia	APHA 4500 NH3 - - G

*Notes: *arsenic, barium, cadmium, chromium, copper, lead, nickel, manganese, zinc, mercury.*

The decision rule for remediation validation samples is to assess the laboratory data against the performance criteria outlined in **Section 3.1**

Where the performance criteria are not achieved, further assessment or remediation will be required.

3.2.6 Step 6 – Specify Performance or Acceptance Criteria

A decision error in the context of the decision rule presented in **Section 3.2.5** would lead to inadequate removal of impacted material, and failure to achieve the remediation objectives. Decision errors may include:

- Data constraints and uncertainties resultant from errors identified:
  - in the scope of work documented in the RWP (such as extent of excavation or density of validation sampling)
  - during the implementation and assessment of remediation
  - in the laboratory testing program.
- Limitations:
  - in understanding of the extent of the impacts
  - based on inaccurate/inadequate data from previous investigations
  - where aspects of the proposed work could not be implemented
  - in the ability to collect representative samples for laboratory testing.

The decision rules for acceptance of remediation validation samples are:

- Comparison and assessment of results against the remediation criteria for chemical concentrations outlined in **Section 3.1.**
- Assessment of the density of validation sampling against the criteria outlines in the RWP.
- Assessment of laboratory Data Quality Indicators (DQIs) outlines on **Table 5** below.

Table 8 Acceptance Criteria for Data Quality Indicators

Data Quality Indicator	Acceptance Criteria
Rinsate blanks	Less than the laboratory limit of reporting (LOR)
Intra and inter laboratory field duplicates (1) (2)	Relative Percentage Difference (RPD) less than ± 30%
Laboratory duplicates (2)	RPDs Less than: • 20% for high level laboratory duplicates (i.e., >20 x LOR) • 50% for medium level laboratory duplicates (i.e., 10 to 20 x LOR)
Matrix spikes (3) (4)	Recoveries between 70-130% of the theoretical recovery, or laboratory supplied limits
Method blanks	Less than the laboratory LOR
Laboratory control samples (5)	Recoveries between 70-130%, or laboratory supplied limits
Surrogate spikes	See Note 5

Notes:

1. *Potential exceptions to this criterion may occur where the results are close to the LOR. This typical RPD range is obtained from AS4482.1 and Schedule B2 of the ASC NEPM.*
2. *If the results are close to the LOR, then higher results will be accepted.*
3. *Assumes that samples are homogeneous, and the background analyte level is less than 20% of the spike level (refer to USEPA Method 8000B). Note that there is no requirement for matrix spikes to pass as certain matrices may preclude recovery of spiked compounds. In this case data will be accepted if laboratory control spike data meets the acceptance criteria.*
4. *80% of the compounds tested must fall within the control limits. Control limits are dynamic and vary for individual tests as per USEPA Method 8000B.*
5. *Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for individual tests but are within the criteria described in USEPA Method SW846.*

Where one or more of the identified decision errors is realised, or the QA/QC and data validation program identifies limitations in the dataset, a data review will be undertaken to ascertain the acceptability of the data with respect to the objectives of remediation.

3.2.7 Step 7 – Develop the Plan for Obtaining Data

The RWP (AECOM, 2023a) and Technical Specification (AECOM, 2023b) were developed to provide a framework outlining the scope and methodologies for remediation of the Precinct South.

4.0 Remediation Requirements

4.1 Identified Impacts

Sections 4.1.1 to **4.2** below describe impacts which were identified as requiring or potentially requiring remediation in the RWP or during remediation works.

4.1.1 Former Fuel Pipeline Removal

Two former fuel pipelines (referred to as the Diesel and the Oil Lines) were known to be present beneath the Site roadway between the Red Shed and the SeaRoad Shed Slab. Prior to the activities described in this report, each pipeline terminated at the north-west corner of the SeaRoad Shed following remediation in 2020 (AECOM, 2021b).

Each pipeline as encountered during the Precinct South remediation in 2023 is described below.

- The Diesel Line, located to the west of the Oil Line, consisted of approximately 200 mm diameter steel pipe with a bituminous, ACM cladding, and ran north-south at a depth of approximately 0.5 m bgl under the Site road before turning west and terminating in a sealed flange on Site in front of the Red Shed. ACM was also detected in the cladding of this pipeline during earlier removal of other sections (AECOM, 2021b).

  An additional pipeline, not connected but identical in appearance to the Diesel Line, was uncovered to the west of the termination point. This was inferred to be the extension of the Diesel Line, and potentially a historic “Naval Oil Line”, identified in previous assessments, and was removed and capped with concrete at the Site boundaries as part of this remediation program.

  Soil surrounding the Diesel Line was also removed as potentially containing ACM as described in **Section 5.1.1**, as it was assessed as possible that fragments of the cladding may have broken loose.

- The Oil Line, located to the east of the Diesel Line, consisted of approximately 200 mm diameter steel pipe with a bituminous cladding, which was sampled and did not have any ACM detected, consistent with previous remediation activities (AECOM, 2021b). The Oil Line ran north-south at approximately 0.5 m bgl until it reached the southern Site boundary of the Site, in front of the SeaRoad Shed Slab, prior to removal and capping as discussed in **Section 5.1.2**.

  Soil surrounding the Oil Line was assessed for re-use on Site as discussed in **Section 5.5.1**.

The location of the removed fuel lines is shown on **Figure F4**. Removal of the fuel pipelines is discussed in **Section 5.1** and analytical results and validation are discussed in **Section 6.1** below, and assessment of the cladding of the Diesel and Oil Lines for potential asbestos is attached as **Appendix G**.

4.1.2 Soil Requiring Remediation

The RWP identified soil impacts which could represent an unacceptable risk to potential future uses of the Site consisting of:

- The Northern Excavation Area (shown on **Figure F3**), where lead impacts in excess of the future Intrusive Maintenance Worker RC were detected in a continuous area in soil samples OL-EX-320, OL-EX-321, OL-EX-322 and OL-EX-334, indicative of a probable lead hot spot area, and were not removed or delineated at the conclusion of works in this area in 2020 (AECOM, 2021b), where soil excavation was not extended into what, at that time, was a separate Audit Area (as noted at the end of **Section 2.1**), which was not included in the planned scope of remediation completed in 2020.

  A former boiler was also uncovered and removed during excavation of this area.

- The Former UST Area and Pipeline Excavation Area (shown on **Figure F4**) consist of an excavation along the length of the pipelines to be removed, and includes the following components:

  - Soil surrounding the pipelines, which was considered to have the potential to be impacted by leaks from the pipeline or by ACM within the bituminous cladding of the Oil Line.

- Hydrocarbon concentrations in soil in the Former UST Area under the Site access road, where exceedances of the Commercial/Light Industrial RC were previously reported for speciated TRH at BH194. Excavation of materials at near BH193, BH195 and RS3 in this area was also required as, while speciation of TRH in these samples was completed at depths greater than 1 m bgl and indicated that soil vapour is not an unacceptable risk from soils at that depth, impacts were not delineated vertically, and it was considered possible that TRH impacted soil could be present in shallower material.
- A buried railway was also uncovered and removed during excavation of this area and is discussed in **Section 5.2.2.1**.

The areas of soil excavation are shown on **Figure F2** in context of the Site as a whole, and discussed in **Section 5.2**, **6.1.2** and **6.1.2** below.

4.2 Change in Use Investigation

As noted in **Section 2.1.1**, under the Masterplan (MPDC, 2015) a significant portion of the Precinct South is planned for future Open Space Use. However, changes proposed in the Draft Precinct Plan (MPDC, 2023) include a Complementary Integrated Mixed Use Zone and the Multipurpose Stadium and Associated Concourse Zone, which includes Open Space areas. Assessment for Commercial / Light Industrial use is considered more appropriate for these areas, and a more conservative level of remediation may be required.

As part of the RWP, soil data from previous investigations in the Precinct South was assessed against the Site Specific RC for Commercial and Commercial / Light Industrial use to assess potential remediation requirements beyond those previously identified for the future uses in the Masterplan. Two locations where a potential risk of vapour intrusion due to concentrations of TRH >C_{10}-C_{16} in excess of the Commercial/Light Industrial RC were identified:

- At 0.5 m bgl in soil bore BH62, located in the northeast corner of the Precinct South.
- At 9 m bgl from wall validation sample OL-EX-107 and 1.0 m bgl from wall validation sample OL-EX-110, collected from the trench excavated during the removal of a former pipeline route in the eastern section of the Precinct South.

The TRH ranges assessed against the RC at these locations considers a range of hydrocarbon components, each of which present a different level of risk to future Site users based on the chemical structure of the components. Shorter carbon chain hydrocarbons with aromatic ring structures present a higher risk to human health, and as a conservative measure, the RC adopted for TRH C_6-C_{10} and TRH C_{10}-C_{16} assume that all contaminants detected consist of the higher risk components. Speciation assessment of results can assess the composition of the detected hydrocarbons with more precision and determine the quantities present of aromatic or aliphatic hydrocarbons in samples collected, however this was not conducted at the time of sampling due to the proposed future Open Space use of each area.

Soil at location BH62 (where an exceedance of the RC was previously detected at 0.5 m bgl) was excavated until groundwater was encountered (approximately 2.2 m bgl) as part of removal of lead impacted soil in the Northern Excavation Area, and no further investigation was conducted as potentially impacted soil has been removed from the Site. However, a trench was excavated through previously placed backfill between locations OL-EX-107 and OL-EX-110.

The area of additional investigation is shown on **Figure F3** and discussed in **Sections 5.3** and **6.2**.

4.3 Buried Railway(s)

During excavation of the Site road between the SeaRoad Shed Slab and the Red Shed to remove the former fuel pipelines, a buried section of railway track was uncovered running north / south beneath the road. The rail section was visible on historic aerial photographs of the Site from 1946 onwards attached to the *Audit Area 3 Detailed Site Investigation* (the AA3 DSI) (AECOM, 2022b), which indicate that the railway was buried/covered in bitumen to a point north of the SeaRoad Shed at some point between 1984 and 1990.

Two other potential buried railways within the Precinct South from the same time period were also noted on aerial photographs:

- One running north from the north-east corner of the Red Shed beneath the carpark area.
- One running north-south beneath the carpark along the western boundary of the Precinct South.

Potential buried railways may also exist beneath the carpark in the adjacent Goods Shed and Yard area to the west. It was anecdotally reported by staff of the Corporation that no indications of buried railways were uncovered during installation of the carpark, although limited intrusive work was undertaken as part of this activity.

Railway sleepers potentially leach contaminants if treated with cresols/tar, which was a common to prevent rot/decay of the wood. However, old or exposed sleepers generally do not have detectable levels of leachate due to the impregnation of the treatment materials into the wood. Previous advice from EPA Tasmania in 2019 was that they consider creosote treated timbers to be general waste, although there is no specific Tasmanian legislation of this approach. EPA NSW Approval 2001/12 (EPA NSW, 2001) also considered creosote treated timbers as solid or inert waste. EPA Victoria does consider creosote treated timber as priority waste for the purpose of disposal (EPA Victoria, 2022).

As a precaution, a sample was collected and analysed from a timber removed from the buried railway and the uncovered railway was removed as part of the Precinct South remediation. Removal and assessment of the railway is discussed in **Section 5.2.2.1**

The uncovered railway is shown on **Plate 2** below, and the location of the buried railway is shown on **Figure F2.**

Plate 2 Uncovered Railway, 9 March 2023

4.4 Stockpile Remediation

Soil excavated as part of the Precinct South was considered for potential on-Site remediation based on initial results of categorisation samples. Remediation of contaminated soil is considered beneficial as it can:

- Reduce the concentration of contaminants, or availability of contaminants to migrate to receptors, reducing the risks of future disposal of the material.
- Potentially allow beneficial reuse of soil (on- or off-Site) which would not be possible otherwise.
- Lower the waste classification of soil and allow reduced costs in disposal if reuse is not possible.

Remediated soil was only considered for reuse on Site if, during post-remediation categorisation sampling:

- No exceedances of Site-Specific RC were detected.
- No signs of material organic impact were detected by field screening, including visual and olfactory assessment, and measurement of potential hydrocarbon vapours.
- No previous detection had reported any contaminants which would not be treated or reduced by the employed remediation technique.

Auditor approval was required prior to reuse of remediated soil on Site.

Two soil remediation techniques were employed as part of the Precinct South remediation:

- Chemical immobilisation to stabilise lead impacted soil and reduce lead leachability. Stockpiles treated by this methodology were not considered suitable for reuse on-Site, as the total concentration of lead is not reduced by treatment.
- A combination of biopiling and landfarming to volatilise and encourage aerobic digestion of TPH (hydrocarbon) impacts.

Remediation and reuse of stockpiles is discussed in **Section 5.6** and assessment of stockpile remediation, including summary of remediation technologies referenced from the CRC Care National Remediation Framework *Technology guide: Bioremediation* (CRC Care, 2018) and CRC Care National Remediation Framework *Technology Guide: Soil – Chemical immobilisation and stabilisation* (CRC Care, 2019), are attached as **Appendix F**.

5.0 Field Activities Completed

5.1 Removal of Pipelines

Excavation and removal of the Diesel and Oil Lines was undertaken between 20 February and 24 March 2023 by Blackcap using a 12 tonne mechanical excavator. Based on the survey data provided by BlackCap and the AECOM field assessment of soil stockpiles, the following material was excavated and removed as part of this phase of works:

- Approximately 110 m of the Diesel Line (including the disconnected extension noted in **Section 4.1.1**).
- Approximately 90 m of the Oil Line.

Both pipelines were removed from the sealed northern ends, adjacent to the northwest corner of the SeaRoad Shed, where previous remediation activities were concluded (AECOM, 2022a). The route of pipeline removal is shown on **Figure F2**, noting that the pipelines were in separate trenches north of the Former UST Area and in a single trench south of this area. Validation of the pipeline excavations based on samples collected by AECOM is discussed in **Section 6.1**.

The extent of excavation was determined by:

- Tracing and exposing of the pipelines by BlackCap.
- Field observations and analytical results from soil samples along the route of the pipelines.
- Restrictions on further excavation imposed by the Site boundary to the south.

Samples of the cladding of each pipeline were collected and assessed for ACM presence by AEGIS under the direction of BlackCap (**Appendix G**), with ACM detected in the Diesel Line cladding, but not surrounding the Oil Line, which was consistent with results from previous removal of sections of these fuel pipelines to the north (AECOM, 2022a).

5.1.1 Removal of Diesel Line

The Diesel Line ran south from the previous end of removal at a point near the northwest corner of the SeaRoad Shed Slab, at a depth of approximately 0.5 m bgl, before turning west just south of the SeaRoad Shed Slab and terminated at a 90° elbow, such that the pipeline was directed vertically up towards the surface, in front of the Red Shed. The termination point was sealed with a flange and cap, which was removed by BlackCap before a visual record (photograph) could be recorded. All remaining sections of this pipeline on the Site were removed as part of works. A removed section of the Diesel Line is shown on **Plate 3** below.

Plate 3 Section of Diesel Line following disconnection, 2 March 2023

A separate previously unknown section of pipeline was uncovered to the west of the termination point of the Diesel Line. This pipeline appeared identical to the Diesel Line, with same cladding and dimensions, and entered and exited the Site from the Southern Boundary due to a 45° elbow in the pipe and a slight bend in Evans Street in front of the Red Shed. This pipeline was removed by BlackCap before a photographic record could be captured.

AECOM field staff observed clear water without odour or PID readings in the section of the Diesel Line which ran north-south beneath the Site road, which was decanted and captured by BlackCap. AECOM field staff were not onsite when BlackCap tapped the previously unknown section of the Diesel Line in south-east corner (south of the Red Shed), but BlackCap reported a mixture of water and degraded diesel was present which was also captured and removed from Site.

Historic reports indicated a potential “Naval Oil Pipeline” was in the area, and that the Diesel Line may run west adjacent to or beneath Evans Street, and based on the similarity in appearance and age this was inferred to be the same pipeline. The section of this line on the Site was removed and capped with cement:

- At the Site boundary on the eastern end.

- Approximately 5 m from the Site boundary on the western end due to the presence of high risk services (power, gas) beneath Evans Street and access requirements by the Red Shed tenants.

Fragments of potential ACM cladding from the Diesel Line were noted by AECOM field staff when sampling the excavated soil from this stockpile, and it was not considered suitable for reuse on Site. The excavated soil was disposed of off Site as discussed in **Section 5.7**.

5.1.2 Removal of Oil Line

The Oil Line ran south at approximately 0.5 m bgl to the Site boundary without any change in direction. The Oil Line was removed to the southern boundary of the Site (Evans Street), where it was capped and sealed with concrete approximately 2 m from the Site boundary due to the presence of underground services and a fire hydrant on the corner of the Site (shown on **Plate 4**, below).

Plate 4 The Oil Line, in situ at Evans Street prior to removal, 20 March 2023

The soil surrounding the Oil Line was reused on Site as discussed in **Section 5.5**.

5.2 Soil Excavation

Excavation and removal of hydrocarbon impacted soil in the former UST Area and lead impacted soil in the Northern Excavation Area was undertaken between 13 March and 7 June 2023 by BlackCap using a 12 tonne mechanical excavator. Vertical excavation was limited to approximately 2 m bgl in each area, where groundwater was encountered, and lateral excavation was undertaken in stages based on the results of wall validation samples collected by AECOM during works.

Based on the survey data provided by BlackCap and the AECOM field assessment of soil stockpiles the following material was excavated and removed as part of this phase of works:

- Approximately 325 m^3 of soil surrounding the fuel pipelines (consisting of 120 m^3 surrounding the Oil Line north of the former UST Area, and 205 m^3 surrounding the Diesel Line, and surrounding the Oil Line south of the Former UST Area where the pipelines were within a single trench).

- Approximately 360 m^3 of soil was removed from the Former UST Area.
- Approximately 650 m^3 of soil was removed from the Northern Excavation Area.

The extent of excavation was determined by:

- The locations of two remnant pipelines (the Oil Line and Diesel Line), and two areas of soil impact (the Northern Excavation Area and the Former UST Area) identified in the RWP and Technical Specification.
- Field observations of soil encountered during excavations, by field staff from AECOM and BlackCap
- Results of validation sampling assessed against the RC by AECOM. Further excavation was undertaken where possible when exceedances of the RC for the proposed future Site uses were identified.
- Restrictions on further excavation including:
  - The Site boundary to the east (for the Northern Excavation Area) or the south (for the removal of pipelines).
  - LNAPL Plume B to the east (for the Former UST Area).
  - Groundwater at approximately 2 m bgl.

Each area of excavation is shown on **Figure F2**, and validation of the soil excavations based on samples collected by AECOM is discussed in **Section 6.1**. Each excavation was backfilled as described in **Section 5.5**.

5.2.1 The Northern Excavation Area (Lead Impacted Soil)

The Northern Excavation Area consisted of soil with concentrations of lead in excess of RC in the northeast corner of the Precinct South. Removal of lead impacted soil was conducted to the north of this area in 2020 (AECOM, 2021b), but validation samples collected during the 2020 works indicated that lead impacts extended to the south.

An estimated 650 m^3 of soil, consisting of fill material, was removed using a mechanical excavator to approximately 2 m bgl, where groundwater was encountered and acted as a vertical limit to excavation. Lateral excavation to the south, east and west, beyond the initial area estimated in the RWP and Technical Specification, was conducted based on the results of validation samples collected from the excavation wall, or if backfill material from the 2020 soil remediation program in this area (AECOM, 2021b) was encountered. Assessment of validation samples from this area is provided in **Section 6.1.2**.

Excavated soil was sampled and remediated to reduce lead leachate concentrations, prior to off-Site disposal, as discussed in **Section 6.2**.

The following features of interest were noted during excavation of this area:

- A water-filled boiler (see **Plate 5** below), initially noted by field staff as a potential pipe or UST, was uncovered in fill on the eastern wall of the Northern Excavation Area. The boiler was not connected to any pipelines and appeared to have been buried as a disposal method at some point in the past.

  The water in the boiler was sampled by AECOM and decanted by Cleanaway (under BlackCap supervision), prior to the boiler being removed and disposed off-Site by BlackCap. The location where the boiler was found is shown on **Figure F3**, and assessment of the boiler, the water within it, and surrounding soils is discussed in **Section 6.1.2.1**.

Plate 5 Boiler in Norther Excavation Area, 26 April 2023

- Two potential ACM fragments were noted by AECOM staff in stockpiled material (one in OL_EX_SP4 and one in OL_EX_SP5) from the south-east corner of the excavation (near sample locations OL_EX_415 to OL_EX_417). The presence of asbestos could not be verified by laboratory testing as the observed fragments were removed from the stockpiles and disposed of to an ACM waste container by field staff, and as such the stockpiled material from these areas was treated as potentially ACM containing, however no other fragments were observed. Assessment of the ACM is discussed in **Section 6.1.2**.

Plate 6 ACM Fragment in OL_EX_SP5, 23 May 2023

- Blue colouration (shown on **Plate 7** below) was noted in soil collected from stockpiled material (OL_EX_SP6) on the south west corner (near sample locations OL_EX_418 and OL_EX_419) and flagged, based on colour, by AECOM field staff as potential Prussian Blue, a blue material historical used in paints or associated with gasworks wastes with high levels of cyanide. No blue colouration was observed in soil in the excavation or at any other point. Assessment of the potential cyanide is discussed in **Section 6.1.2**.

Plate 7 Blue material located in OL_EX_SP6, 23 May 2023

5.2.2 The Former UST Area (Hydrocarbon Impacted Soil)

The Former UST Area consisted of soil with concentrations of fuel hydrocarbons in excess of RC beneath the SeaRoad Slab and the Site road to the west.

During excavation of the initial inferred extent of the Former UST Area, beneath the Site Road west of the SeaRoad Shed Slab to the edge of the slab, excavated soil was segregated into four stockpiles based on depth the soil was removed from and field observations:

- A stockpile of fine crushed rock / road base (approximately 90 m^3, based on reported depth and dimensions of road removed) between the surface (below bitumen) to approximately 0.5 m bgl which was stockpiled separately.
- Gravelly clay fill material between 0.5 and 1.3 m bgl, with noted gravels, cobbles, marine sands and shells, and trace anthropogenic fragments of bricks, glass, ceramics, wood, leather, metal and bones. This material was stockpiled in two stockpiles: UST_SP_0.5-1.0 (approximately 85 m^3), consisting of material from between 0.5 and 0.9 m bgl, and UST_SP_1.0-1.5 (approximately 65 m^3) consisting of material from between 0.9 and 1.3 m bgl.
- Similar clay material to the above was exposed from 1.3 to 2.0 m bgl, with a noted hydrocarbon odour and detectable PID readings. This material was stockpiled as UST_SP_1.5-2.0 (approximately 125 m^3) and included fill material from shallower than 1.3 m bgl (surrounding Oil Line validation sample point OL_77) from the southern end of the excavation where field screening detected potential hydrocarbon impacts.

Based on field screening during initial excavation, further excavation was undertaken (to 2 m bgl where groundwater was encountered):

- To the east below the SeaRoad Shed Slab, generating stockpile UST_SP_EXT (approximately 180 m^3). This stockpile was further extended based on validation sampling, generating stockpile UST_SP_Ext_59SP (approximately 10 m^3).
- To the south and east of Oil Line validation sample point OL_77, generating stockpile UST_SP_Ch77-80 (approximately 30 m^3).

An estimated 360 m^3 of soil, consisting of fill material, was removed using a mechanical excavator. Groundwater was encountered at approximately 2 m bgl in the area to the east of the roadway beneath the SeaRoad Shed Slab, and acted as a vertical limit to excavation. The initial excavation was undertaken in 0.5 m lifts, with the top 0.5 m consisting of road base which was stockpiled for reinstatement at the surface and sealing following completion of remediation, and the remaining material separated into three stockpiles (from 0.5 to 1.0 m bgl, 1 to 1.5 m bgl, and 1.5 to 2.0 m bgl) based on field observations of staining and odours occurring only deeper in the material. Some material from the southern end of the excavation at depths shallower than 1.5 m bgl was included in the 1.5 to 2.0 m bgl stockpile based on field screening indicating potential hydrocarbon impacts.

Based on validation samples from the south and east walls of the excavation, the excavation was extended laterally in these directions and further validation samples collected.

Where excavation was assessed as required under the SeaRoad Shed Slab, the ~300 mm thick concrete slab was cut and removed to allow access to underlying soil. Approximately 175 m^2 of slab surface, or ~50 m^3 of concrete in total, was inspected by field staff following removal, and was reused as fill as discussed in **Section 5.5**. The area where concrete was cut, and fresh concrete reinstated to restore the SeaRoad Shed Slab at the completion of works, is shown on **Figure F3**.

Lateral excavation of the Former UST Area was limited to the east where concerns of contact with LNAPL on the surface of groundwater (LNAPL Plume B) were raised as a safety concern for site staff. Assessment of validation samples from this area, and discussion regarding extent of excavation, is provided in **Section 6.1.2**.

Excavated soil was sampled and either remediated for use as fill or disposed off-Site as discussed in **Section 5.5** to **5.7** .

5.2.2.1 Removal of Buried Railway

A buried railway, uncovered during exposure of the Diesel and Oil Lines, was located just below the bitumen surface of the road to the west of the SeaRoad Shed Slab as described in **Section 4.3**. The railway was present to a maximum depth of 0.2 to 0.4 m bgl. BlackCap excavated and removed the railway, including sleepers and metal rails, which were disposed off-Site as waste. The area of removal was bought back to level using imported fill for re-sealing at the end of works to reinstate the Site road.

Assessment of the railway is provided in **Section 6.1.3.1**.

5.3 Change in Use Investigation

As discussed in **Section 4.2**, the RWP and Technical Specification identified two areas where further investigation to assess if potential vapour risks to future Commercial or Light Industrial users could exist under the possible future development as proposed in the Draft Precinct Plan, and as a result, a more conservative level of remediation than required by the Masterplan should be implemented:

- At 0.5 m bgl in soil bore BH62, located in the northeast corner of the Precinct South.
- At.9 m bgl from wall validation sample OL-EX-107 and 1.0 m bgl from wall validation sample OL-EX-110, collected from the trench excavated during the removal of a former pipeline route in the eastern section of the Precinct South.

Due to chase-out of lead impacted soil, BH62 was included in the overall Northern Excavation Area and no further investigation was conducted or is considered required as potentially impacted soil was removed as part of the soil excavation in this area to a depth of approximately 2 m bgl on average.

On 3 May 2023, a trench between the recorded locations of OL-EX-107 and OL-EX-110 was advanced by excavator to a depth of 1.1 m bgl. Field staff noted that the backfill from the previous remediation was clearly identifiable and distinct from the existing fill material at the limit of the previous remediation. The investigation trench was advanced into the material which predated the 2020 remediation by 200 mm to avoid sampling backfill placed in 2020. No odours or staining was noted in the trench during advancement. Two soil samples were collected from the trench wall at 1.1 m bgl, at the previous locations of OL-EX-107 and OL-EX-110, for analysis, and are discussed in **Section 6.2**.

5.4 Field Screening and Sampling

Soil validation sampling and screening was undertaken by AECOM staff in accordance with the RWP and the Technical Specification in order to characterise the excavation during the removal of pipelines and impacted soil and assess if contamination has been removed or if further excavation is required.

Two stockpiles (PS-PB-SP1 and PS-PB-SP2), which consisted of soil treated to reduce lead leachate prior to removal from Site, were sampled by a suitability qualified environmental scientist from Elgin Associates (Elgin), a Hobart-based environmental consultancy, as suitably qualified AECOM field staff were not available. AECOM provided technical advice during sampling and review and assessed sample results for the purposes of categorising these stockpiles for off-Site disposal, with results of this assessment attached in **Appendix F**.

Validation samples were collected from the mid-point of walls and the base of excavations at a minimum rate of one sample per 25 m^2 of excavation face, and from a depth of at least 300 mm below any surface to minimise the potential for volatilisation of contaminants to occur. Where excavations reached groundwater, base samples were not collected as further excavation below the water table was not considered required or practicable for remediation as:

- As noted in **Section 3.1**, the rate of partitioning of contaminants to the vapour phase will be dominated by groundwater concentrations rather than soil impacts, and assessment and management of risks below the water table is considered a groundwater issue rather than a soil issue.
- The SEMP includes restrictions and limitations on contact with or extraction of groundwater.
- Excavation of saturated soil decreases the stability of excavation walls and increases the risk of collapse, and potential risk to occupied adjacent buildings.

Groundwater was encountered at the base of the Northern Excavation Area, and in the eastern portion of Former UST Area, where excavation was extended beneath the SeaRoad Shed Slab based on initial validation samples.

All validation samples were analysed for:

- Lead

- TRH C_6 – C_{40} fractions
- BTEXN
- PAHs and phenols.

Stockpile categorisation samples were collected at a density of at least 1 primary sample per 25 m^3 of material, using the same methodology as validation samples.

Stockpile categorisation samples were analysed for:

- At least 30% of samples per stockpile for *Information Bulletin No. 105 – Classification and Management of Contaminated Soil for Disposal* (IB105) (EPA Tasmania, 2018).
- Remaining samples for the analytical suites used for validation samples, above.

Some validation and categorisation samples were assessed for additional analytical suites based on observations by AECOM or BlackCap, or results of initial samples, and are discussed in **Section 6.0**.

AECOM and Elgin field staff inspected excavations and stockpiles for any sign of impact (staining, hydrocarbon odour, miscoloured soils, or other indicators) following excavation and provided advice to BlackCap as to whether further excavation was recommended. Soil at all samples points was screened for the presence of volatile gases using a Photo Ionisation Detector (PID). The locations of samples were recorded on field notes based on excavation extent, stockpile configuration, and surrounding Site features.

A total of 110 primary samples were collected to validate excavations, and as part of other investigations during the Precinct South remediation. **Table 9** below provides the source area and sample name nomenclature used by field staff.

A further 152 primary samples were collected as part of stockpile assessment (including stockpile remediation assessment), included in **Appendix F.**

Locations of validation samples are shown on **Figure F3** and **Figure F4**, and assessment of analytical results is presented in **Section 6.0**.

Field staff recorded the location of validation samples along the pipeline trench and in the Former UST Area excavation with reference to estimated chainage length, or the length along the trench from the commencement point of the pipeline removal without reference to direction or turns distance (i.e., the estimated length of a chain extended along the base of the trench).

Table 9 Validation and Stockpile Categorisation Sample Nomenclature and Sources

Source Area	Number of Primary Samples	Sample Name Nomenclature	
		Example Sample Name	Sample Name Explanation
Excavations			
Diesel Line Excavation[1]	20	DL_00_0.6E	Sample collected at chainage[2] 0 m, at 0.6 m bgl, on the east wall of the Diesel Line excavation.
Oil Line Excavation[1]	14	OL_05_0.6W	Sample collected at chainage 5 m, at 0.6 m bgl, on the west wall of the Oil Line excavation.
Former UST Area	18	UST_73_59E_1.6	Sample collected form chainage 63, location 59, east wall, at 1.6 m bgl in the Former UST Area excavation.

Source Area	Number of Primary Samples	Sample Name Nomenclature	
		Example Sample Name	Sample Name Explanation
	3	UST_EXT_59E_1.6	Sample collected form chainage 63, location 59, east wall, at 1.6 m bgl in the extension of the Former UST Area excavation beneath the SeaRoad Shed Slab to the east.
Northern Excavation Area	47	OL_EX_413_0.8	Sample collected at location OL_EX_413 at 0.8 m bgl.
Investigations			
Change in Use Investigation Trench	2	OL_EX_107_1.1	Sample collected at location OL_EX_107 at a depth of 1.1 m bgl.
Investigation of Boiler	1	OL_EX_UST[3]	Sample of water collected form boiler uncovered in Northern Excavation Area.
Buried Railway	1	Rail Timber 1	Sample collected of rail timber.
Imported Backfill	1	UST_OL_DL_BF	Sample of imported backfill to verify consistency with previous assessment.

Notes: 1. Note that Diesel Line and Oil Line were within a single trench to the south of the Former UST Area – Diesel Line validation samples (i.e., of the format DL_90_1.0) more than 80 m south of the point where removed of pipelines commenced (greater than chainage 80 m) are also applicable for the Oil Line Excavation; 2. Chainage was estimated by field staff from the northern end of the pipeline trenches. Field recorded values may not correspond to exact meterage along the trench; 3. Field staff initially suspected the boiler may be a UST and named the sample of water from this location as such.

5.5 Backfill of Excavations

Backfill of excavations was undertaken by BlackCap using an excavator to place and use the shovel to compact soil. Backfill was undertaken using either:

- Imported Virgin Excavated Natural Material (VENM)
- Reused and validated material excavated as part of the remediation work, including material which was remediated on Site.

Figure F5 shows where backfill material was used as part of the works, which is discussed by area below. Consideration and assessment of backfill material used is discussed in **Section 6.4**.

5.5.1 Pipeline Trenches and the Former UST Area

In order to restore direct access to the Site carpark to the north of the Red Shed, excavations beneath the Site road between the SeaRoad Shed Slab and the Red Shed were backfilled using material from the following sources:

- Imported VENM (approximately 600 m^3)
- Crushed concrete from the portion of the SeaRoad Shed Slab (approximately 50 m^3) removed to access underlying soil
- Reinstatement of road base (approximately 90 m^3) from the original Site road west of the SeaRoad Shed.
- A small stockpile of soil (approximately 20 m^3) from the Gateway area of the Site (assessed in *Soil Categorisation and Waste Management Plan – Stockpile RH_SP* [AECOM, 2023f])

Initial backfilling, which occurred in the pipeline trenches and the portion of the UST excavation under the Site road between the Red Shed and SeaRoad Shed Slab, was undertaken using VENM, with beneficial reuse of soil from stockpile RH_SP and crushed concrete from the portion of the SeaRoad Shed Slab removed as fill in the northern section of the pipeline trench. The original road base was reinstated on top prior to sealing with bitumen. The area of excavation under the SeaRoad Shed Slab was backfilled with VENM and a fresh concrete slab reinstated to edge of the Site road (to the initial boundary of the SeaRoad Shed Slab).

5.5.2 The Northern Excavation Area

The Northern Excavation Area was backfilled with as follows:

- Due to groundwater ingress into the excavation, and concerns about Site security and possible ingress to the excavation by unauthorised people looking for artifacts in the fill (such as buried bottles etc), a layer of imported VENM approximately 0.5 m thick was placed in the base of the excavation.
- To further discourage unauthorised entrance to the excavation, approximately 270 m^3 of soil excavated the Former UST Area and surrounding the northern portion of the Oil Line was used as fill material in the northern portion of the excavation while chase out of lead impacts in the southern portion continued. Additional assessment of the backfilled material, as discussed in **Section 6.4.2** below, was undertaken and provided to the Auditor for approval, as Auditor approval for reuse was not received prior to backfilling due to a communication error between BlackCap and AECOM field and office staff.
- The remaining portion of the excavation was backfilled with remediated soil from the Former UST Area and VENM.

The surface of the excavation was covered with a VENM layer of at least 300 mm thickness to prevent contact with soil by Site users.

5.5.3 Survey of Backfill Locations

At the completion of works, final dimensions of the Former UST Area and the Northern Excavation Area were surveyed by Walter Surveys Pty Ltd (Walters) under BlackCap supervision after backfilling was conducted. The extent of excavation areas was assessed based on surface indicators included cuts in concrete, changes in soil colour and characteristics, and comments from BlackCap field staff who had been present for soil works.

The following is noted regarding the survey extents provided from Walters:

- The width and extent of the pipeline trenches were not surveyed by Walters and have been estimated on the figures provided. The location of pipeline trenches was inferred using:
  - The previously surveyed end of pipeline removal in 2020 (AECOM, 2021b).
  - The surveyed extent of the UST Excavation Area.
  - AECOM field records including physical features visible on aerial photographs, such as the Red Shed and edge of the SeaRoad Shed, and field recorded length (chainage) of pipelines, and measured length along the excavation (chainage) during collection of validation samples.
- The surveyed extent of the Northern Excavation Area:
  - Did not include a section in the south-east corner where additional soil was removed to the north of validation sample location OL_EX_424 after survey of the excavation had been conducted. BlackCap reported that soil in this area was removed until a change in lithology (to the fill material previously imported as part of the 2020 remediation work (AECOM, 2021b) was reached.
  - May overestimate the extent of soil excavated on the northern boundary by approximately 4 m, as BlackCap reported that they excavated material from a clear change in lithology between the backfill material used as part of the 2020 remediation work in this area (AECOM, 2021b). Initial extent of excavation was marked out prior to breaking ground based on the previously surveyed extent of excavation in 2020 (AECOM, 2021b), however BlackCap

reported that survey of excavation extent was conducted after backfilling of this area, and that the northern edge may have been disturbed by heavy equipment movements.

The survey data from Walters is attached as **Appendix I**. Georeferenced survey data is shown on **Figure F2** to **Figure F5**.

5.6 Stockpile Remediation

Stockpile remediation was undertaken using the methodologies discussed in **Section 4.4**, prior to excavated soil being either reused as fill or disposed off-Site.

Assessment of stockpile remediation was conducted prior to reuse or disposal in the following documents, attached as **Appendix F**:

- *Soil Categorisation and Waste Management Plan – Precinct South Remediation – Former UST Area Excavation Stockpiles* (AECOM, 2023c)
- *Stockpile Remediation Validation and Waste Management Plan – PS-Pb-SP1 and PS-Pb-SP2* (AECOM, 2023d).

5.6.1 Biopiling / Landfarming

Excavated soil from the Former UST Area and soil surrounding the Oil Line within the southern section of the area, totalling approximately 210 m^3, were identified as potential candidates for biopiling/landfarming remediation based on initial categorisation samples collected from the soil, and field observations of odours or staining indicative of hydrocarbon impact.

Soil to be treated was stockpiled on the hardstand of the former SeaRoad Shed Slab and turned by BlackCap with inclusion of 100 L of a commercially available fertiliser, mixed with water, with a reported nitrogen / phosphorus / potassium (NPK) ratio of 14% / 7% / 3% to provide additional nutrients to the stockpiles to encourage microbial activity. The stockpiles were then allowed to sit for two weeks, before being inspected by AECOM field staff and assessed for potential hydrocarbon indicators such as staining, odours, or detectable readings on handheld PID.

As no indicators of impact were detected, the material was sampled and, following validation as discussed in **Section 6.3**, was reused as fill material in the Northern Excavation Area.

5.6.2 Lead Stabilisation

Soil from the Northern Excavation Areas (stockpiles OL_EX_SP1 to OL_EX_SP8; consisting of approximately 600 m^3 of soil) and, and from the Diesel Line Trench (stockpile DL_SP; consisting of approximately 200 m^3 of soil) reported lead leachate concentrations in excess of the maximum allowable IB105 Level 2 Leachable Contaminant Concentration (LCC). BlackCap was engaged by the Corporation to undertake lead immobilisation treatment of this material.

The soil being treated was spread at a uniform level across the intact area of the SeaRoad Shed Slab, and 40 tonnes of Single Super Phosphate (SSP) were spread using a computerised spreading truck and 60 tonnes of magnesium oxide (MgO) were placed on a grid layout in 20 kg paper bags, or in small volumes from 1 tonne bulk bags, for uniform spread.

Soil and reagents were then mixed using a rotary mixer shown on **Plate 8** below, before being re-established in windrows for testing and storage.

Plate 8 Soil mixing of remediation reagents through soil (photograph provided by BlackCap)

Following remediation, the material was validated as discussed in **Section 6.3**, and disposed off-Site to McRobies Gully Waste Management Facility under Environmental Approval 11649/1.

5.7 Disposal of Excavated Materials

Excavated materials (soil, pipelines, and other materials) were managed by BlackCap for on-Site reuse or off-Site disposal.

The excavated Oil Line and the uncovered boiler were disposed of to a recycler, with the water in the boiler decanted by Veolia and removed from Site. The buried railway was disposed of as solid waste, and the Diesel Line was disposed of as ACM due to the presence of asbestos in cladding.

Excavated soil and materials from the following areas were either reused on Site following remediation as discussed in **Section 5.5**, or removed from Site as waste. Approximately 850 m^3 of soil, sourced from the Northern Excavation Area and from soil surrounding the Diesel Line with potential ACM fragments present, was removed from the Site as Level 2 – Low Level Contaminated Soil. Assessment of soil prior to disposal is documented in *Stockpile Remediation Validation and Waste Management Plan – PS-Pb-SP1 and PS-Pb-SP2* (AECOM, 2023d), attached in **Appendix F**.

No waste from remediation remained on-Site following completion of works. Waste disposal documentation provided by the Corporation and BlackCap is attached as **Appendix H**.

6.0 Assessment of Analytical Results

In order to validate that remediation of soil had been sufficient to remove potentially unacceptable risks to future Site users, the analytical results of samples collected by AECOM have been assessed against the Site Specific RC detailed in Section **3.1** and the DQOs detailed in **Section 3.2**.

Laboratory reports for soil sample analyses are included as **Appendix C** and presented on **Table T1** to **Table T3**. Assessment of data quality is attached as **Appendix D** and is summarised in **Section 6.5**. The locations of validation samples are shown on **Figure F3** and **Figure F4**. Field notes collected by AECOM staff during works are attached in **Appendix E**.

Assessment of stockpiles, including remediation, reuse, and/or disposal, conducted over the course of the remediation work is attached as **Appendix F**.

6.1 Validation of Excavations

During remediation work, results of soil validation samples were reviewed against the RC by AECOM and advice was provided to BlackCap as to whether further excavation was recommended. The following approach was taken when considering soil sampling data:

- As discussed in **Section 2.1.1** and **Section 3.1.1**, the Site Specific RC for Commercial / Light Industrial, Intrusive Maintenance Worker, and Public Open Space uses are considered applicable for potential future uses of the Precinct South. Assessment against Residential use RC was also conducted; however, exceedances of Residential RC have not been considered as requiring further remediation if the RC for potential future uses have not been exceeded.
- Analytical suites for TRH C_6-C_{10} and TRH C_{10}-C_{16} consider a range of hydrocarbon components, each of which present a different level of risk to future Site users based on the chemical structure of the components. Shorter carbon chain hydrocarbons with aromatic ring structures present a higher risk to human health, and as a conservative measure, the RC adopted for TRH C_6-C_{10} and TRH C_{10}-C_{16} assume that all contaminants detected consist of the higher risk components.

  Speciation assessment of results can assess the composition of the detected hydrocarbons with more precision and determine the quantities present of aromatic or aliphatic hydrocarbons in samples collected. For samples where speciation analysis was conducted, the results of the speciated hydrocarbons was to assess the RC exceedances present and if there was an unacceptable risk to future Site users present in the material and has been considered to supersede exceedances reported for broader ranges of hydrocarbons.
- The Potential Future Maintenance Worker RC is considered applicable for the first 1 m bgl for non-volatile CoPC, as future intrusive works following development, such as installation or repair of conduits, are considered unlikely to occur below this depth. Where exceedances of this RC were reported for samples collected from the base of the excavation at a depth of greater than 1 m bgl, no further excavation was recommended.
- Where excavations encountered groundwater (i.e., at approximately 2 m bgl in both the Former UST Area and in the Northern Excavation Area), validation samples were not collected from the base of the excavation. As noted in **Section 3.1.1**, partitioning to vapour is considered to be dominated by groundwater concentrations rather than soil in the saturated zone. The SEMP (AECOM, 2021e) contains restrictions on access to groundwater.

  It is noted that, if the proposed future development of the Precinct South includes excavation or dewatering, contamination which may be present in deeper soil will need to be considered and assessed, and discussion of management of deeper impacts should be included in the next update of the SEMP.

Assessment of excavation validation samples are presented by excavation below.

6.1.1 Fuel Pipeline Excavations

Results of validation samples collected from the Diesel and Oil Lines are presented on **Table T1**, and sample locations are shown on **Figure F4**.

Pipelines and surrounding soil were removed in trenches approximately 1 m wide and 1 m deep, with the excavations merged into a single trench south of the Former UST Area. Validation samples were collected from the base (1.0 m bgl) and midpoint of walls (0.6 m bgl) at approximately 12 m intervals along the pipeline excavation trenches, which fulfils the validation sample frequency in the RWP (1 primary sample per 25 m^2 of excavation base or wall area).

The following exceedances of RC were detected in Diesel Line and Oil Line validation samples collected from material which remains *in situ*:

- Concentrations of TRH >C10-16 (minus naphthalene) exceeding the Potential Future Commercial (unknown construction or multi-storey building) RC were detected at:
  - DL_23_1.0, from the base of the Diesel Line excavation at chainage 23 m (i.e., 23 m from the northern end of the trench).
  - OL_17_0.6E, from the east wall of the Oil Line excavation at chainage 17 m.

  Speciation of the soil samples collected at these locations was conducted and, while concentrations of aliphatic TRH >C16-C21 and aliphatic TRH >C21-C35 in excess of Residential use RC were detected at DL_23_1.0, no exceedance of RC considered applicable to future Precinct South uses were detected.

  No further excavation is considered required at these locations.
- Concentrations of TRH >C10-C16 (minus naphthalene) and/or naphthalene in excess of Residential RC were detected at:
  - DL_11_1.0, DL_35_1.0, DL_47_0.6E, DL_47_1.0 and DL_100_1.0 on the Diesel Line excavation.

  This RC is not considered applicable to future Site uses and no further remediation is considered required at these locations.

Exceedances of Residential, Commercial/Light Industrial, and/or Intrusive Maintenance Worker RC were reported at DL_71_0.6E, DL_71_1.0, OL_77_0.6W and OL_77_1.0. However, soil at these locations was removed as part of the Former UST Area excavation.

During field assessment of the pipeline excavations:

- A slight odour described as “hydrocarbon with slight phenolic odour” was noted towards the southern portion of the Oil Line excavation. No ambient PID readings were recorded, however PID readings of 2.0 to 5.0 ppm were recorded at OL_77_0.6W and OL_77_1.0. Soil in this area was removed as part of the excavation of the former UST Area.
- AECOM field staff observed clear, non-odorous water in the section of the Diesel Line running north-south under the Site road, and BlackCap reported elevated fuel odours and a mixture of water and degraded diesel was present when tapping the section of the Diesel Line in the south-east corner of the pipeline trench, to the south of the Red Shed. Liquid was extracted from both sections of Diesel Line and removed from Site before cutting the line and did not come into contact with Site soil.

On the basis of the above, no further excavation is considered to be required of soil surrounding the former location of the Diesel and Oil Lines.

6.1.2 Northern Excavation Area

Results of validation samples collected from the Northern Excavation Area are presented on **Table T1**, and sample locations are shown on **Figure F3**.

Soil was removed from the Northern Excavation Area in a series of stages based on the results of earlier validation sampling, where additional soil was removed if exceedances of RC applicable to future Site uses was detected.

Validation samples were collected from the walls of the excavation at 0.5-0.6 m bgl and at 1.5 – 1.6 m bgl at linear intervals of 5 m or less, which fulfils the validation sample frequency in the RWP (1 primary sample per 25 m^2 of floor or wall space). As groundwater was encountered at the bottom of the excavation (approximately 2 m bgl), no samples were collected or analysed from the base, with the

exception of OL_EX_411_2.0 which was collected from beneath the boiler (discussed in **Section 6.1.2.1**). Validation samples were not collected on the north or west boundary of the Northern Excavation Area if backfill from the 2020 remediation work (AECOM, 2021b) was encountered.

The following has been considered in assessing the remediation of the Northern Excavation Area:

- No exceedances of the Site Specific RC for Commercial / Light Industrial, Intrusive Maintenance Worker, and Public Open Space uses were detected in validation samples collected from material which remains *in situ* in the Northern Excavation Area.
- Concentrations of TRH C6-C10 fraction (minus BTEX) and/or TRH >C10-16 (minus naphthalene) in excess of Residential RC were reported at OL_EX_412_0.5, OL_EX_412_1.5, OL_EX414_1.5, and OL_EX_416_1.5, but this RC is not considered applicable to future Site uses and no further remediation is considered required at these locations.
- Concentrations of lead, TRH C6-C10 fraction (minus BTEX) and/or TRH >C10-16 (minus naphthalene) in excess of Residential, Commercial/Light Industrial, and Maintenance Worker RC were reported in validation samples collected from soil removed from the Northern Excavation Area and is no longer present on Site. It is noted that exceedances of applicable RCs could be present in soil beneath the water table and should be considered if excavation or dewatering/tanking is undertaken as part of any future land development.
- A water-filled boiler was uncovered in the south-west portion of the excavation and is discussed in **Section 6.1.2.1** below. Further excavation or remediation is not considered required due to the boiler.
- Blue colouration (shown on **Plate 7** in **Section 5.2.1**) was noted in soil collected from stockpiled material (OL_EX_SP6) on the south west corner (near sample locations OL_EX_418 and OL_EX_419) and flagged by AECOM field staff based on colour as potential Prussian Blue, a blue pigment historical associated with paints, or gasworks wastes, with high levels of cyanide.

  Assessment of the material from OL_EX_SP6 for cyanide was conducted and is discussed in *Stockpile Remediation Validation and Waste Management Plan – PS-Pb-SP1 and PS-Pb-SP2* (AECOM, 2023d), attached in **Appendix F**. Elevated cyanide concentrations indicative of Prussian Blue were not detected in OL_EX_SP6, and it was concluded that:

  - The observed blue colouration was not Prussian Blue; or
  - There was not sufficient material to impact the stockpile.

  No other blue colouration was observed in the excavation or stockpiles, and OL_EX_SP6 was disposed off-Site. Further excavation or assessment is not considered required.
- Two fragments of potential ACM were observed in stockpiles OL_EX_SP4 and OL_EX_SP5, consisting of soil excavated from the south-east corner of the excavation near sample locations OL_EX_415 to OL_EX_417.

  Assessment of the material from OL_EX_SP4 and OL_EX_SP5 is discussed in *Stockpile Remediation Validation and Waste Management Plan – PS-Pb-SP1 and PS-Pb-SP2* (AECOM, 2023d), attached in **Appendix F.**

  Observed fragments were removed from the stockpiles and the stockpiled material from these areas was treated as potentially ACM containing, however no other fragments were observed in the excavation or other stockpiled material from this area. Assessment of soil from OL_EX_SP4 for ACM was conducted as part of stockpile categorisation and no asbestos fibres were detected by the analytical laboratory.

  Isolated fragments of ACM can be common in industrial fill. No other fragments were observed in stockpiles from this area or in the excavation, and as only two fragments were observed in the approximate 90 m^3 volume of OL_EX_SP4 and OL_EX_SP5, it is considered unlikely that the ACM observed represents an area of asbestos impact in excess of the ASC NEPM criteria of <0.05%$^w/_w$ for Commercial/Industrial land use. As no further potential ACM fragments were observed, collection, sorting and weighing of a 20 kg sample of soil using the methodology described in the ASC NEPM could not be conducted.

On the basis of the above, no further excavation is considered to be required of soil in the Northern Excavation Area.

6.1.2.1 Buried Boiler

As discussed in **Section 5.2.1**, a buried, disconnected boiler (shown on **Plate 4**) was discovered in fill in the Northern Excavation Area. The boiler was filled with an estimated 2,000 L of water when uncovered.

The source and/or previous purpose of the boiler is not known. There were no pipes or other lines connected to it, and it is considered likely that it was buried as waste by a previous Site occupier at an unknown time.

The water in the boiler was sampled and analysed, with results presented on **Table T3**. Concentrations of TRH C6-C10 (minus BTEX) in excess of Commercial groundwater RC, and of TRH >C10-16 in excess of Residential groundwater RC were reported. This water was decanted by Veolia under BlackCap supervision and removed from the Site.

The following validation samples, with analytical results presented on **Table T1**, were collected from soil from a distance of 0 to approximately 3.6 m of the boiler:

- North – OL_EX_401, OL_EX_412 (remaining *in situ)*
- East – OL_EX_409 and OL_EX_413 (both later excavated), and OL_EX_420, OL_EX_421 (remaining *in situ*)
- South – OL_EX_410 (later excavated), and OL_EX_414 (remaining *in situ*)
- West – soil to the west of the boiler had previously been excavated and consolidated in stockpile OL_EX_SP2, which is discussed in *Stockpile Remediation Validation and Waste Management Plan – PS-Pb-SP1 and PS-Pb-SP2* (AECOM, 2023d), attached in **Appendix F**.
- Beneath – OL_EX_411 (collected from saturated soil at the base of the excavation immediately below the boiler and remaining *in situ*).

Of the surrounding soils considered:

- Concentrations of TRH C6-C10 (minus BTEX) and/or of TRH >C10-16 in excess of Residential RC were detected in samples from *in situ* soil collected at OL_EX_412_0.5, OL_EX_412_1.5, OL_EX_414_1.5, and in soil which was later removed collected at OL_EX_409_0.6, OL_EX_413_0.5, and OL_EX_413_1.5.

  The Residential RC is not considered applicable to future Site uses and no further remediation is considered required at these locations. The concentrations reported in excess of Residential RC (between 31 and 260 mg/kg) have been detected in other areas of the Site and are not considered to represent a potentially hazardous area of impact which may have come from the boiler.
- Concentrations of lead in excess of the Maintenance Worker RC were detected in samples from soil later excavated at OL_EX_409_0.6, OL_EX_409_1.6, OL_EX_410_1.6, OL_EX_413_0.5 and OL_EX_413_1.5. The detected lead concentrations are considered unlikely to be a result of the buried boiler, as the water sample collected reported a lead concentration of 0.001 mg/L and are attributed to the overall fill used in the area which was removed as part of remediation.
- Although the location from which soil was excavated in OL_EX_SP2 cannot be directly correlated to proximity to the boiler, and volatilisation of hydrocarbons is likely to have occurred during excavation and stockpiling, concentrations of TRH C6-C10 (minus BTEX) and/or of TRH >C10-16 in OL_EX_SP2 were reported below LOR (50 mg/kg) in all samples collected from this stockpile.
- The closest groundwater well to the buried boiler (MW163) is located approximately 10 m south and, based on the inferred groundwater contours (AECOM, 2022a) may be down hydraulic gradient from the buried boiler. No CoPC, including TRH, has been previous detected above Site RC in groundwater samples collected from this well, including in analytics of a sample collected on 5 December 2023 as part of a Groundwater Monitoring Event (GME) in this area (AECOM, 2024a).

On the basis of the above, it is not considered that further excavation of soil at the location the buried boiler was discovered is required.

6.1.3 Former UST Area

Results of validation samples collected from the Former UST Area are presented on **Table T1**, and sample locations are shown on **Figure F4**.

Soil was removed from the Former UST Area in a series of stages based on the results of earlier validation sampling, where additional soil was removed if exceedances of RC applicable to future Site uses was detected.

Validation samples were collected from the walls of the excavation at 0.6 m bgl and at 1.6 m bgl at linear intervals of 5 m or less, which fulfils the validation sample frequency in the RWP (1 primary sample per 25 m^2 of base or wall area). As groundwater was encountered at the bottom of the excavation (approximately 2 m bgl), no samples were collected or analysed from the base.

The following has been considered in assessing the remediation of the Former UST Area:

- Concentrations of TRH C6-C10 fraction (minus BTEX) and/or TRH >C10-16 (minus naphthalene) were reported above Commercial / Light Industrial RC at the following locations:
  - UST_77_SE_1.6 and UST_80_1.2_S at the southern end of the excavation.

  Speciation of the soil samples collected at these locations was conducted and, while concentrations of aliphatic and aromatic TRH >C21-C35 in excess of Residential RC were detected, no exceedance of RC considered applicable to future Precinct South uses were detected.
  - UST_EXT_59E_1.6 and UST_EXT_59N_1.6 in the eastern portion, under the area cut out from under the SeaRoad Shed Slab.

  The results of TRH speciation at UST_EXT_59E_1.6 reported an exceedance of the Commercial/Light Industrial (Working within a basement) RC for aliphatic TRH >C8-C10. It is also noted that samples were not collected at 0.8 m bgl at these locations, and the detected concentrations of aromatic TPH >C8-C10 at UST_EXT_59N_1.6 are not delineated vertically and would be considered to represent a potential vapour intrusion risk if present in soil less than 1 m bgl.

  However, detected concentrations are not considered to represent an unacceptable risk to current uses or future development as:
  - The planned use of this area until future development is Open Space, for which the reported concentrations do not represent a potential vapour risk.
  - Two rounds of soil vapour monitoring were conducted between August and November 2019 at sub-slab vapour pins SV05 (approximately 10 m north of UST_EXT_59N_1.6), SV06 (approximately 13 m north-east of UST_EXT_59N_1.6 and 15 m north-east of UST_EXT_59E_1.6), and SV30 (approximately 5 m east of UST_EXT_59S_1.6) in 2019 and did not report soil vapour concentrations in excess of adopted criteria (AECOM, 2020b). Based on the proximity of these monitoring points, it is considered unlikely that the TRH detected at these locations is generating soil vapours which may represent a risk to future Commercial/Industrial use.
  - The *Audit Area 3 Detailed Site Investigation* (the AA3 DSI) (AECOM, 2022a) notes that further vapour assessment or protection is required for any future development which alters the Site surface. In the event that a change in Site surface occurs, further investigation or protection measures should be considered to prevent unacceptable risk from soil impacts at these locations.
  - The AA3 DSI also contains a requirement that mitigation methods for potential methane intrusion detected in parts of AA3, which are now contained in the Precinct South, are required to be incorporated into for future building designs. Suitable methane intrusion protection measures would also capture and prevent soil vapour intrusion from hydrocarbons in soil.

  No further excavation is considered required at these locations based on the above considerations.

- The concentration of lead at 1.6 m bgl at UST_66_E_1.6 exceeded the Intrusive Maintenance Worker RC. This concentration is not considered to represent an unacceptable risk to future Site users as:
  - The Maintenance Worker RC is considered applicable for soil up to 1 m bgl. This exceedance of criteria was detected at 1.6 m bgl and is delineated vertically at 0.8 m bgl by UST_66_0.8_E, and this soil is not considered likely to come into contact with future Maintenance Workers.
  - The extent of lead above RC is considered likely to be limited in extent, as surrounding validation samples to the north (UST_59_0.8_E and UST_59_1.6_E), east (UST_EXT_59S_1.6), south (UST_74_E_0.8 and UST_74_E_1.6), and west (OL_65) did not report exceedances of this RC for lead.
  - The adopted RC for lead is 620 mg/kg. The reported result at UST_66_E_1.6 was 621 mg/kg, which is a minor exceedance of the criteria. The RWP and the AA3 DSI both contain statistical assessment of minor exceedances of criteria in accordance with the ASC NEMP, and similar isolated exceedances of RC are present within the Precinct South and not considered to represent an unacceptable risk to future Maintenance Workers.
  - The presence of the concrete slab (the original SeaRoad Shed Slab and the reinstated portion in the area of remediation) above UST_66_E_1.6 will further act to limit any potential future contact with this soil. If the concrete layer is removed as part of future Site development, the SEMP requires reinstatement of a barrier layer.

  No further excavation is considered required at these locations based on the above considerations.
- No other exceedances of the Site-Specific RC for Commercial / Light Industrial, Intrusive Maintenance Worker, and Public Open Space uses were detected in validation samples collected from material which remains *in situ* in the Northern Excavation Area.
- Concentrations of TRH >C10-16 (minus naphthalene) and naphthalene in excess of Residential RC were reported at UST_66_E_1.6, but this RC is not considered applicable to future Site uses and impacts are delineated vertically. No further remediation is considered required at this location.
- Concentrations of lead, TRH C6-C10 fraction (minus BTEX) and/or TRH >C10-16 (minus naphthalene) were reported in validation samples of soil removed from the Former UST Area and no longer present on Site.
- A buried railway was uncovered and removed to the west of the Former UST Area and Fuel Pipeline Excavations and is discussed in **Section 6.1.3.1**. However, no further excavation or remediation of soil in this area is considered required based on the outcomes of assessment of this railway.

On the basis of the above, no further excavation is considered to be required of soil surrounding the former location of the Diesel and Oil Lines.

6.1.3.1 Buried Railway

As discussed in **Section 4.3**, a buried railway (shown on **Plate 2**) was uncovered to the west of the Former UST Area and the Fuel Pipeline Excavations. The location of the buried railway is shown on **Figure F4**.

The buried railway was removed by BlackCap and disposed off-Site. The following was considered in assessing if the railway was a potential source of impact to the Precinct South:

- An indicative sample of railway timber (Rail Timber 01) was collected from a rail sleeper following excavation and prior to disposal off-Site. The timber sample was analysed for total concentrations of BTEXN, TRH, PAHs, and metals, and leachable concentrations of PAHs, with results attached on **Table T1** and **Table T2**.

  The sleepers reported detectable concentrations of TRH >C16-C34 and TRH >C34-C40, which do not have adopted RC. Shorter chain TRH, BTEXN, and PAH concentrations (total and leachate) were reported below LOR, and it considered likely that:

  - Review of assessments conducted by Environment Canada in 1992 (Environment Canada, 1992) reported that creosote used on railway sleepers is typically around 80% PAHs. While different compositions may have been used in Australia, all PAHs (including Sum of PAH) in the sleeper sample analysed were reported below LOR, and it is considered unlikely that the encountered railway sleepers were treated with creosote, or had any potential to generate creosol leachate.
  - The below LOR concentrations of shorter chain and more mobile hydrocarbons indicate that leaching of BTEXN and TRH is unlikely to occur.

- Validation samples UST_59_0.8_W, UST_59_1.6_W, UST_66_0.8_W, UST_66_1.6_W, UST_73_0.8_W, and UST_73_1.6_W were collected from the west wall of the Former UST Area excavation below the buried railway. No exceedance of any RC, or any concentrations of TRH, BTEXN, PAHs, phenols, or metals were reported which could indicate impact from the buried railway. It is considered unlikely that the buried railway has impacted soil in this area.

  It is noted that soil samples below the northern section of the railway could not be collected as this area was backfilled by Blackcap before sampling could occur. While no soil samples were collected from directly beneath where the northern segment of the railway was removed, it is considered unlikely that contamination of soil in this area has occurred from the railway, or that contamination will be limited in area if it has occurred, as:

  - No contamination to soil was detected in samples collected from directly below the buried railway (noted above).
  - No concentrations of TRH, BTEXN, PAHs, phenols, or metals were detected in validation samples collected at DL_11, DL_23, or DL_35, which were collected an estimated 0.5 to 1.5 m from the rail line (based on field staff comments, and the separation between the railway and the pipeline trench visible in **Plate 2** in **Section 4.3**.
  - As noted in **Section 4.3**, EPA Tasmania and EPA NSW consider railway sleepers as inert waste based on these agencies historical experience with railway materials.

Based on the consideration, while the buried railway was removed from the Site as a precaution, it is not considered likely to have been an ongoing source of impact to the Precinct South.

While buried railways may be present in other areas of the Site, as discussed in **Section 4.3**, they are considered unlikely to be sources of impact to the Site which require remediation for the proposed future Site uses as:

- Other potential buried railways are from a similar period and age and are considered likely to have similar properties and not be acting as ongoing sources of impact.
- No buried railways have been encountered elsewhere on the Site, including during excavation for remediation conducted along the historic location of railways to the north in 2020 (AECOM, 2021b), and while no records have been located, removal of railways to some level has historically occurred.
- Buried railway sleepers (not connected to an intact railway) have been previously encountered in fill on-Site in the Escarpment area during remediation work in 2019 to 2020, and were assessed as inert and non-polluting (AECOM, 2020d). While analysis of samples of the buried sleeper in the Escarpment indicated that they likely had been treated with creosote, no indications of impact to surrounding soil were observed, and advice from EPA Tasmania received at that time provided their view that, based on experience with railway sleepers, even if treated with creosote they are generally inert and non-polluting.

The potential presence of buried railways should be noted in the SEMP.

6.2 Change in Use Investigation

Two assessment samples, OL_EX_107_1.1 and OL_EX_110_1.1, were collected from the trench advanced at the location of concentrations of TRH >C10-C16 (minus naphthalene) detected in excess of the Commercial / Industrial RC during previous works in 2020, which were not further excavated as, at that time, the proposed future use of this area of the Precinct South was as Open Space.

The location of the trench is shown on **Figure F3**, and the results of samples are presented on **Table T1**. Soil excavated to advance the trench was backfilled in place following collection of soil samples.

The samples collected at these locations did not report concentrations of TRH >C10-C16 (minus naphthalene) above the LOR, and speciation of TRH could not be conducted. Heavier chain hydrocarbons (TRH >C16-C34) were detected in soil samples. However, this hydrocarbon range:

- Does not have any adopted criteria and are not considered to represent a risk to future Site uses under the conditions in the RC.
- Is low (279 mg/kg [OL_EX_107_1.1] to 310 mg/kg [OL_EX_110_1.1]) and the hydrocarbon impact in soil is unlikely to be an ongoing source of impact to groundwater or indicative of the presence of LNAPL as:
    - The adopted RC are considered protective of ongoing uses, and heavier chain hydrocarbons such as these are lower solubility and mobility in soil and groundwater.
    - LNAPL is considered unlikely as:
        - No indication of leakage from the removed pipeline was observed and recorded during remediation (AECOM, 2021b)
        - No groundwater results which could be considered to indicate a dissolved phase hydrocarbon plume have been detected in inferred down hydraulic gradient groundwater wells (AECOM, 2024a).

Detected concentrations of TRH in these samples were lower than previous assessment in 2020. The potential reasons for the low detected concentrations of TRH in the validation samples from the trench considered are:

- The potential exists that the locations of 2020 sample points OL-EX-107 and OL-EX-108 were missed or incorrectly recorded, and samples were collected at the wrong location. However, this is considered of low probability as:
    - The backfill material used in 2020 was visually distinct from the surrounding soil, and field staff advancing the investigation trench were confident that the trench was within the route of the former excavation and reached soil beneath it, where samples were collected.
    - The locations from which samples were collected in 2020 were recorded by field staff from Geo-Environmental Solutions Pty Ltd (GES) using a hand-held GPS unit with a reported accuracy of +/- 1-3 m, depending on signal strength at the time of record. The investigation trench was approximately 5 m in length and, even if the maximum margin of error (3 m) was achieved directly along the alignment of the trench, should have still exposed potentially impacted soil at either end which would have been visible to AECOM field staff.
- TRH may have had an opportunity to oxidise or volatilise during the period in 2020 when soil was exposed to ambient air following the trench being opened to remove the section of the Oil Line previously present and prior to placement and compaction of backfill, or exposure to air following trenching may have provided additional oxygen to support biological oxidation of TRH.

  The trench is likely to have been open for a period of greater than 2 weeks while awaiting results of wall and base validation samples, prior to back-filling. Shorter carbon chain TRH ranges are generally more volatile and oxidisable/reactive than longer carbon chain hydrocarbons, and if volatilisation/oxidation had occurred, results like those observed (short chain TRH below LOR and some remnants of longer chain TRH) would be expected.

The fuel impact detected in 2020 may have been limited in extent. **Plate 9**, taken from Figure F14 from AECOM, 2020b, shows the location of the initial samples and surrounding samples, noting that limited TRH concentrations are present in the surrounding area and no other exceedances of the Commercial RC were detected in this section of pipeline removal. Potential hydrocarbon impacts would be delineated to the north, south and west based on surrounding samples collected from the base of the Diesel or Oil Line trenches in these areas and may be considered partially delineated to the east by OL-EX-108 and OL-EX-146, collected from the walls of the Oil Line trench.

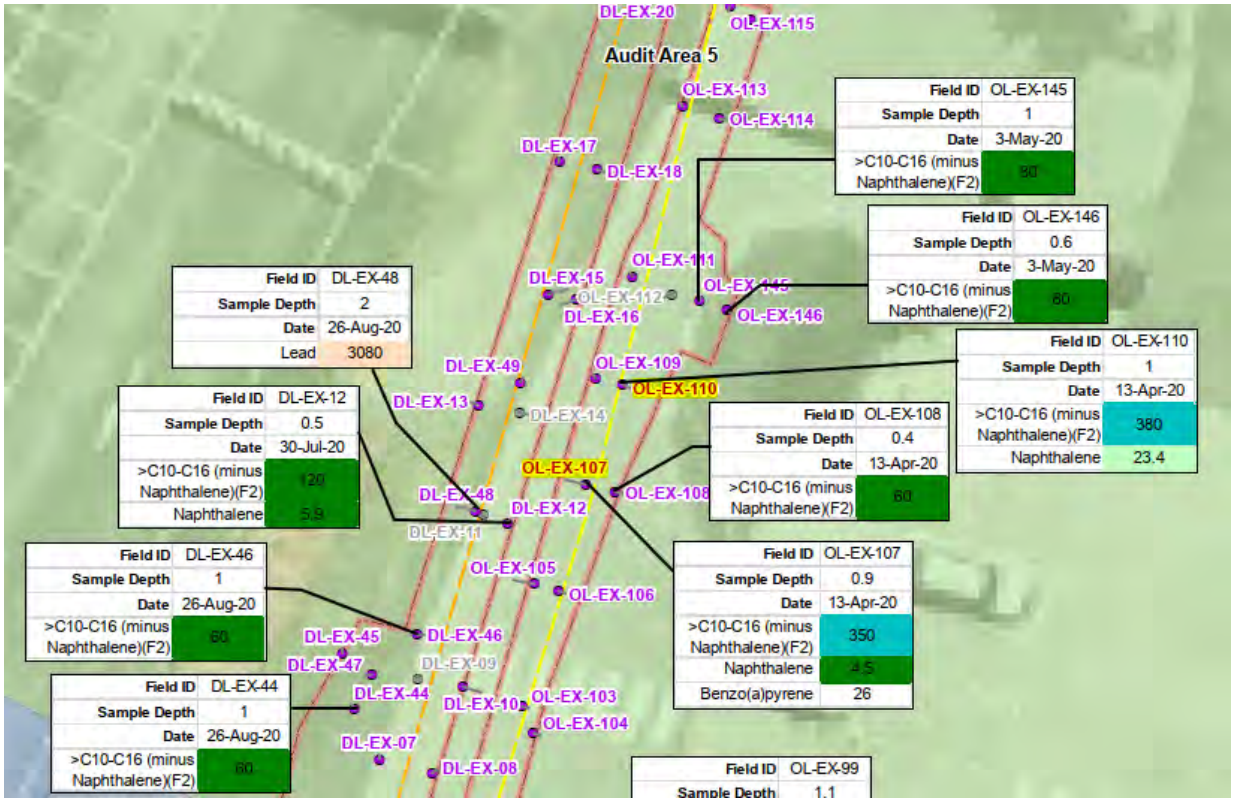

Plate 9 Sample Results Surrounding OL-EX-107 and OL-EX-110, 2020 Remediation (AECOM, 2020b)

A level of vapour management for future buildings is required in the AA3 DSI (AECOM, 2022a) as discussed in **Section 6.1.3** above and would also provide protection/mitigation of soil vapour from potential impacts in this area.

On the basis of the results of additional sampling in this area, and recommended vapour mitigation measures included the AA3 DSI which would be applicable for any buildings constructed in this area of the Site, it is considered unlikely that the detected TRH >C10-C16 (minus naphthalene) detected at OL-EX-107 and OL-EX-110 in 2020 represents a source of unacceptable risk to future Site uses, and no further investigation or remediation is considered required.

6.3 Stockpile Remediation

Assessment of stockpile remediation prior to reuse or disposal, including assessment of analytical results, are included in:

- *Soil Categorisation and Waste Management Plan – Precinct South Remediation – Former UST Area Excavation Stockpiles* (AECOM, 2023c)
- *Stockpile Remediation Validation and Waste Management Plan – PS-Pb-SP1 and PS-Pb-SP2* (AECOM, 2023d)

Copies of these assessments are attached in **Appendix F**, and are summarised for material reused on Site in **Section 6.4.2.2** below.

6.4 Backfill Material

6.4.1 Virgin Excavated Natural Material (VENM)

VENM for use as backfill was imported to the Site from Pawleena Quarry, located at 798 Pawleena Road, Pawleena.

An assessment of the quarried material, *Crushed Rock Backfill Assessment* (EM&C, 2019), was provided to the Environmental Auditor prior to import of the material for use as backfill in previous

remediation works in other Site areas. The material used has been quarried at the same location from the same lithology.

As part of previous assessment of the VENM, it was noted that:

- The proposed backfill material was natural crushed dolerite and was free of any apparent anthropogenic fill. The VENM was classified as Fill Material under IB105 Section 4.1.2 – "*Fill Material includes inert construction material, spoils and rocks, which have not been contaminated with any substance*".
- Exceedance of the Level 1 Fill Material maximum total concentrations (IB105) for manganese was reported in three of the four representative samples collected and reported in EM&C 2019. IB105 Section 4.1 notes that Fill Material may naturally contain contaminants at levels which are higher than Fill criteria due to regional geological characteristics. EPA Tasmania reported during previous use that the VENM appeared suitable for the proposed use (as backfill) if it did not pose a risk to human health or the environment.
- No exceedances of the Health Investigation Levels (HILs) or Ecological Investigation Levels (EILs) adopted in EM&C, 2019 were detected.

On this basis, the VENM was assessed to not present an unacceptable risk to human or ecological health for the future proposed land uses at the Site. Material from Pawleena Quarry has been previously accepted by the Auditor for use as backfill. An indicative sample (UST_OL_DL_BF) was collected and assessed for the key CoPC and reported below LOR for all analytes (see **Table T1**).

Imported VENM was used as cover material and as backfill in the Diesel Line, Former UST Area, and Northern Excavation Area excavations.

6.4.2 Reuse of Excavated Material

6.4.2.1 Excavated Soil without Remediation

<u>Oil Line Trench and Former UST Area Soil</u>

An estimated 270 m^3 of soil from the section of the Oil Line trench north of the Former UST Area excavated from between chainage 0 and ~77, and shallow soil from between 0.5 and 1.5 m bgl from the Former UST Area, was reused as fill material in the Northern Excavation Area as discussed in **Section 5.5.2**.

Assessment of the pipeline trench materials for reuse is reported in *Macquarie Point – Precinct South Lead Area Backfill Assessment* (AECOM, 2023e), attached in **Appendix F** and summarised briefly below.

- Soil used as backfill was sourced from the following stockpiles:
  - UST_SP_0.5-1.0, approximately 85 m^3 sourced from between 0.5 to 1.0 m bgl in the Former UST Area
  - UST_SP_1.0-1.5, approximately 65 m^3 sourced from between 1.0 to 1.5 m bgl in the Former UST Area
  - OL_SP, approximately 120 m^3 sourced from soil surrounding the Oil Line north of chainage 77. A section of soil at the end of the Oil Line excavation, from chainage 77 to 80, was segregated and stockpiled separately based discolouration, odours, and PID readings noted by field staff.
- An *in situ* assessment of backfill material was conducted as backfilling was conducted by BlackCap prior to receipt of Auditor approval and is attached in **Appendix F**. Exceedances of the Commercial / Industrial RC were detected for TRH >C10-C16 (minus naphthalene), however following speciation of these samples, no exceedances of applicable RC for future uses of the Precinct South were detected in the aromatic and aliphatic TRH subranges reported. No other exceedances of RC for Commercial / Industrial, Maintenance Worker, or Open Space use were detected in *in situ* samples.

- Prior to backfilling:
    - Exceedances of the Commercial / Industrial RC were detected for TRH >C10-C16 (minus naphthalene) in precursor stockpiles, however where speciated, no exceedance of criteria was reported for aliphatic or aromatic subranges of TRH. Although not all exceedances of this RC detected prior to backfill were speciated, stockpiled material was present at the Site surface for approximately 2 months and was moved at least once, which would provide an opportunity for oxidation and volatilisation to lower concentrations of hydrocarbons.
    - Exceedance of the Intrusive Maintenance Worker RC for lead in one sample in a precursor stockpile. No other exceedances of this RC for lead were detected in other stockpiles, or samples from the same stockpile, and no lead in excess of criteria was detected in *in situ* samples, and it is considered unlikely that the reported detection represents an unacceptable risk to future Site users.

Based on the above, the use of this material as backfill is not considered likely to represent an unacceptable risk to future Site uses. This assessment was reviewed by the Auditor and a record of Auditor comments and acceptance of responses on 12 April 2024 is included in **Appendix F**.

Gateway Area Soil Stockpile RH_SP

A small (20 m^3) stockpile of soil from beneath a slab in the Gateway area of the Site, to the west of the Precinct South, was generated during removal of overburden to access deeper impacted material during a remediation pilot trial conducted in June and July of 2022.

The material was assessed in *Soil Categorisation and Waste Management Plan – Stockpile RH_SP* (AECOM, 2023f) and did not report any CoPC concentrations in excess of the Site RC. The results of assessment were submitted to the Site Auditor, who accepted the proposed reuse scenario via email on 28 March 2023. Assessment of this stockpile and Auditor acceptance is include in **Appendix F**.

6.4.2.2 Remediated Soil

An estimated 210 m^3 of soil excavated from the Former UST Area and a section of the Oil Pipeline Excavation within it was reused as fill material in the Northern Excavation Area as discussed in **Section 5.5.2**

Assessment of the remediation (via biopiling/landfarming) and suitability for reuse of this material is reported in *Soil Categorisation and Waste Management Plan – Precinct South Remediation – Former UST Area Stockpiles* (AECOM, 2023c), and is summarised briefly below.

- Soil used as backfill was sourced from the following stockpiles:
    - UST_SP1, approximately 200 m^3 of soil sourced from between initial excavation of the Former UST Area between 1.5 to 2 m bgl (and shallower soil from the southern end of the excavation where field screening noted indications of hydrocarbon impact), from the eastern extension of this excavation under the SeaRoad Shed Slab, and from the Oil Line excavation between chainage 77 and 80, where field screening noted indicators of hydrocarbon impact.
    - UST_SP_Ext_59SP, approximately 10 m^3 of soil from a separate chase out of impact.
- The stockpiles were wetted and dosed with a commercially available fertiliser to support microbial activity and allowed to sit for approximately two weeks. It is noted that stockpiles were present at the Site surface for between one and two months prior to dosing.
- Prior to remediation, samples from the stockpiles reported concentrations of naphthalene, TRH C6-C10 (minus BTEX), and/or TRH >C10-C16 (minus naphthalene) in excess of Site Specific RC for future Residential and Commercial/Industrial uses. Following remediation, concentrations of TRH C6-C10 (minus BTEX) in excess of Site Specific RC for future Residential uses were reported in both stockpiles, however this use is not considered likely to occur in the Precinct South. No exceedances of RC for Commercial / Industrial, Maintenance Worker, or Open Space use were detected in post-remediation samples.

Based on the above, the use of this material as backfill is not considered to represent an unacceptable risk to future Site uses. Assessment of this stockpile and Auditor acceptance for reuse received on 14 July 2023 is include in **Appendix F**.

6.4.2.3 SeaRoad Shed Slab Concrete

Concrete from the SeaRoad Shed Slab was cut and removed to excavate underlying soil. Section 4.1.2 of IB105 notes that inert building materials can be considered Level 1 – Fill Material, and the concrete was considered suitable for reuse as:

- No staining, odours, or other indicators of potential impact were observed on concrete.
- The proposed area of reuse would be under a cover layer to prevent surface contact with crushed concrete and would be installed above the water table to reduce potential for leaching or a change in groundwater pH.

This approach was accepted by the Auditor via email on 28 March 2023, and the removed concrete was crushed and reused as fill in the Former UST Area excavation.

Approximately 50 m^3 of crushed concrete was reused in this manner.

6.5 Data Quality

The objective of the QA/QC program is to provide an assessment of the reliability of the data presented for interpretation. QA/QC assessment of the analytical data and sampling methodology has been conducted by AECOM on assessment of the data collected by during the field program against the DQIs discussed in **Section 3.2**. The detailed data validation report is presented in **Appendix D**, and results are summarised below.

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- If all duplicate samples are included, a total of 905 RPD values are calculated, with 86 RPD values (~9.5%) reported above the adopted acceptable RPD DQO limits. If the inter-laboratory duplicates with sample receipt discrepancies noted below are excluded, a total of 712 RPD values are calculated, with 37 RPD values (~5.2%) reported above the adopted acceptable RPD DQO limits.

  The RPD exceedances were predominantly associated with concentrations of PAHs and metals. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

- Detectable concentrations of copper, lead and zinc were present in rinsate blank DL_QCB04, collected during sampling of the Diesel Line excavation on 2 March 2023. The detected concentrations are not considered to affect the outcomes of interpretation of this data as no exceedances of criteria for these CoPC were detected during the sampling on that date, and if cross-contamination occurred resulting in higher detections of metals in validation samples, additional excavation may have occurred.

- Three secondary laboratory sample batches (975786, 978711, 993445, and 997785) were received between 6.2 and 9.7°C, greater than the recommended temperature of 6°C. The higher than recommended receipt temperatures are not expected to affect interpretation as primary samples reported higher concentrations of CoPC considered sensitive to temperature degradation and were used for interpretation.

  In addition, if inter-laboratory samples received outside the recommended temperature range are excluded, inter-laboratory sample analysis for sample batches received below the recommended temperature was conducted at a rate of one sample per 22 primary samples, which is close to the required rate and would be considered suitable for interpretation.

- Other laboratory QA/QC sampling procedures including analysis of matrix spike recoveries, laboratory duplicates and frequency of QA/QC reported some minor variances from recommended limits or ranges, indicating minor possibility of under- or over-reporting for some chemicals.

These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of remediation.

7.0 Discussion and Summary

7.1 Removal of Pipelines

Redundant fuel pipelines were removed from beneath the Precinct South in the areas shown on **Figure F2** and **Figure F4**.The northern sections of the pipelines were previously removed in 2020 (AECOM, 2021b).

While it is understood that the pipelines were no longer in use, prior to removal it was unclear if residual hydrocarbon products remained in the pipelines which could present an ongoing source of contamination, or if there was residual contamination surrounding the pipes from historic leaks. In addition, there was potential that the pipelines could present a preferential pathway for contamination travelling across the Site.

Two distinct pipelines (the Diesel Line and the Oil Line) were excavated and removed as from the Site part of the work, with the following features noted:

- The Diesel Line:
  - The Diesel Line was comprised of a 200 mm diameter pipe of steel construction with bituminous cladding. Asbestos was detected within the cladding, and the pipeline and surrounding soils were removed and managed as potential ACM.
  - Prior to removal, the Diesel Line ran north-south beneath a Site road from the termination point of previous remediation undertaken in 2020, to the south-east corner of the Red Shed, where it turned west and terminated at a flanged cap. A pipeline with a 45° elbow, potentially a historic “Naval Oil Pipeline” (see **Sections 2.2.3** and **4.1.1**) was uncovered immediately to the west and was also removed within the Site boundary to the extent possible.
  - Approximately 110 m of the Diesel Line (including the section in front of the Red Shed) was removed. Where the section in front of the Red Shed ran off Site, it was sealed and capped with concrete seals at the Site boundary on the eastern end, and approximately 5 m from the Site boundary (due to services under Evans Street and access requirements for the Red Shed) on the western end.
  - Approximately 205 m^3 of soil surrounding the Diesel Line, including soil surrounding the Oil Line to the south where the pipelines were removed from a single trench, was excavated and disposed of off Site as potential ACM.
  - Clear, non-odorous water was encountered in the main section of the Diesel Line (running north/south), and a mixture of degraded diesel and water was encountered in the section in front of the Red Shed when tapped prior to cutting. Both liquids were decanted from the pipeline before cutting and removed from Site.
- The Oil Line
  - The Oil Line was comprised of a 200 mm diameter pipe of steel construction with bituminous cladding. No ACM was detected within the cladding following testing undertaken as part of this program of work, or during previous remediation in 2020.
  - Prior to removal, the Oil Line ran north-south beneath a Site road from the termination point of previous remediation undertaken in 2020, to the Site boundary to the south.
  - Approximately 90 m of the Oil Line was removed from the Site as part of these works and was sealed with a cement cap approximately 2 m from where the pipeline crosses the Site boundary to the south due to the presence of buried services along Evans Street.
  - Approximately 120 m^3 of soil surrounding the Oil Line was reused as fill in the Northern Excavation Area, with remediation by biopiling / land farming if assessed as required to reduce hydrocarbon impacts.
  - No liquid was encountered in the Oil Line during excavation and removal.

Validation of the excavations surrounding each pipeline is discussed in **Section 7.2** below.

On the basis of the above, no unacceptable risks to future Site uses associated with the remnant pipelines are considered likely to remain on Site, and no further excavation or remediation of these pipelines is considered required.

7.2 Soil Excavation

An estimated volume of 1,320 m^3 of soil was excavated to remove potentially contaminated soil surrounding remnant pipelines and areas of contaminated soil within the Precinct South. The areas of excavation are shown on **Figure F2** to **Figure F4**.

The areas of excavation were determined by the following factors:

- The locations of two remnant pipelines (the Oil Line and Diesel Line), and two areas of soil impact (the Northern Excavation Area and the Former UST Area) identified in the RWP and Technical Specification.
- Field observations of soil encountered during excavations, by field staff from AECOM and BlackCap
- Results of validation sampling assessed against the RC by AECOM. Further excavation was undertaken where possible when exceedances of the RC for the proposed future Site uses were identified.
- Restrictions on further excavation including:
    - The Site boundary to the east (for the Northern Excavation Area) or the south (for the removal of pipelines).
    - LNAPL Plume B to the east (for the Former UST Area), where safety concerns around physical disturbance of LNAPL on groundwater were identified.
    - Groundwater at approximately 2 m bgl.

The excavations were backfilled with a combination of imported VENM from Pawleena Quarry, pipeline trench material which was assessed to not present an unacceptable risk to future Site uses, or excavated soil which was remediated on Site to reduce hydrocarbon concentrations.

106 primary soil validation samples were collected from the walls and bases of the excavations by AECOM at a frequency of approximately every 12 linear metres (trench excavations) or every 5 m (soil excavations), and assessed against the Site Specific RC for the following future use scenarios:

- Residential. It is noted that Residential use is not considered likely to occur in the Precinct South and exceedances of the RC for this purpose were not considered to require further remediation.
- Commercial / Light Industrial
- Intrusive Maintenance Worker
- Open Space

The following was considered during validation of excavation extent:

- Detected CoPC in the soil in excess of the RC consisted primarily of TRH C10-C16 (excluding naphthalene) and lead, although TRH C6-C10 (excluding BTEX) and naphthalene were detected at some locations. Additional assessment of TRH samples to assess the concentrations of aliphatic and aromatic hydrocarbon species was undertaken for some samples, as discussed in **Section 6.1** to further assess the level of risk detected impacts represented.

  Where exceedances of the Site RC were detected, excavations were extended in order to remove contamination and additional validation samples collected at the boundaries of the area of additional excavation.

- The Potential Future Maintenance Worker RC is considered applicable for the first 1 m bgl for non-volatile CoPC, as future intrusive works following development, such as installation or repair of conduits, are considered unlikely to occur below this depth. Where exceedances of this RC were reported for samples collected from the base of the excavation at a depth of greater than 1 m bgl, no further excavation was recommended.
- Where excavations encountered groundwater (i.e., at approximately 2 m bgl in both the Former UST Area and in the Northern Excavation Area), validation samples were not collected from the base of the excavation. Partitioning to vapour is considered to be dominated by groundwater concentrations rather than soil in the saturated zone, and the SEMP (AECOM, 2021e) contains restrictions on access to groundwater.

  It is noted that, if the proposed future development of the Precinct South includes excavation or dewatering, contamination which may be present in deeper soil will need to be considered and assessed.

Validation of each excavation is discussed below by area. On the basis of the work conducted and described in this report, no further soil remediation or excavation is considered required in the Precinct South.

7.2.1 Pipeline Excavations

- Approximately 325 m^3 of soil surrounding the fuel pipelines was excavated, consisting of 120 m^3 surrounding the Oil Line north of the former UST Area, and 205 m^3 surrounding the Diesel Line, and surrounding the Oil Line south of the Former UST Area where the pipelines were within a single trench.
- No staining or indicators of leaks from either the Diesel or Oil Line were noted in soil surrounding the pipelines during removal. Potential indicators of hydrocarbon/fuel impact were observed in the soil surrounding the pipelines where they passed through the Former UST Area but are considered likely to be associated with the former UST impacts in this area.
- Contaminant concentrations with the potential to represent unacceptable risks to the proposed future uses of the Precinct were detected within the surrounding soil during validation of excavation consisting of:
  - Potential ACM fragments (cladding fragments) in the soil removed from around the Diesel Line. This soil, and identified fragments, were removed from Site.
  - Concentrations of TRH >C10-16 (minus naphthalene) exceeding the Potential Future Commercial (unknown construction or multi-storey building) RC at DL_23_1.0 and OL_17_0.6E. Speciation of soil samples collected at these locations identified that no exceedance of RC applicable to future uses of the Precinct South were present.
  - Exceedances of Commercial/Light Industrial, and/or Intrusive Maintenance Worker RC were reported at DL_71_0.6E, DL_71_1.0, OL_77_0.6W and OL_77_1.0. However, soil at these locations was removed as part of the Former UST Area excavation, or as soil surrounding the Diesel Line, and does not remain on Site.
- The surface at the locations of pipeline excavation were covered with bitumen to reinstate the Site road following backfilling with a mixture of VENM, crushed concrete from the SeaRoad Shed Slab, reinstated road base, and beneficial reuse of stockpile RH_SP from the Gateway area of the Site.

7.2.2 The Northern Excavation Area

- Approximately 650 m^3 of soil was excavated from the Northern Excavation Area to remove previously detected lead concentrations in excess of the future Maintenance Worker RC.
- Concentrations of lead, TRH C6-C10 fraction (minus BTEX) and/or TRH >C10-16 (minus naphthalene) in excess of Residential, Commercial/Light Industrial, and Maintenance Worker RC were reported in validation samples collected from soil removed from the Northern Excavation Area and is no longer present on Site.

- No exceedances of the Site Specific RC for the Commercial / Light Industrial, Intrusive Maintenance Worker, and Open Space uses, which are considered applicable to future uses of the Precinct South, were detected in validation samples collected from material which remains *in situ* in the Northern Excavation Area.
- Blue colouration was noted in a small quantity (<100 g estimated) in a soil stockpile (OL_EX_SP6) from the southern end of this area and identified by AECOM field staff, based on colour, as potential Prussian Blue, a material with high cyanide concentrations. Assessment of the soil from this stockpile did not identify elevated levels of cyanide, and no other blue colouration was observed in the stockpile or excavation wall, and it is not considered likely that the observation constituted a potential risk to future Site uses.
- Two isolated fragments of ACM were noted in stockpiles OL_EX_SP4 and OL_EX_SP5 (one in each stockpile) collected from the southern wall of this excavation. No other fragments were observed in these stockpiles, and no asbestos fibres were detected in additional analysis conducted on OL_EX_SP4.

  Isolate fragments of ACM can be common in industrial fill. No other fragments were observed in stockpiles from this area or in the excavation, and as only two fragments were observed in the approximate 90 m^3 volume of OL_EX_SP4 and OL_EX_SP5, it is considered unlikely that the ACM observed represents an area of asbestos impact in excess of the ASC NEPM criteria of <0.05%$^{w}/_{w}$ for Commercial/Industrial land use. As the two samples were collected, and no further fragments were observed, collection, sorting and weighing of a 20 kg sample of soil using the methodology described in the ASC NEPM could not be conducted.
- A buried boiler, filled with water, was uncovered in the eastern portion of the Northern Excavation Area, near the Site boundary. The source of the boiler is not known. There were no pipes or other lines connected to it, and it is considered likely that it was buried as waste by a previous Site occupier at an unknown time.

  The water within the boiler was sampled and reported concentrations of TRH C6-C10 (minus BTEX) in excess of Commercial RC, and of TRH >C10-16 in excess of Residential RC, and the water was decanted and disposed off-Site by Veolia (under BlackCap supervision).

  Assessment of soil samples to the north, south, east, and from below the boiler, and of stockpiled soil excavated to the west of the buried boiler, did not report any indication that soil impacts from the boiler may be present. The closest groundwater well, MW163, which is inferred to be approximately 10 m down hydraulic gradient, did not have any detectable concentrations of TRH in preliminary assessment of a sample collected on 5 December 2023, and has not had detection of TRH above Site RC in previous sampling in 2019.

  Based on currently available information, no unacceptable risk to future Site use has been identified associated with the former boiler, and no further remediation or management actions are recommended.
- The Northern Excavation Area was backfilled with a combination of VENM and with Site soil excavated from the Oil Line excavation and the Former UST Area. Where excavated soil had exceedances of RC, on-Site remediation was conducted to reduce hydrocarbon concentrations below a level assesses as representing unacceptable risks to future Site use. A surface layer of VENM was placed to act as a barrier to casual access to soil.

7.2.3 The Former UST Area

- Approximately 360 m^3 of soil was excavated from the Former UST Area to remove hydrocarbon impacts associate with historic USTs (removed during an earlier period).
- Concentrations of lead, TRH C6-C10 fraction (minus BTEX), TRH >C10-16 (minus naphthalene) and/or naphthalene in excess of Residential, Commercial/Light Industrial, and Maintenance Worker RC were reported in validation samples collected from soil removed from the Former UST Area and is no longer present on Site.

- The following exceedances of RC applicable to future uses of the Precinct South were detected in validation samples collected from material which remains *in situ*:
  - Concentrations of TRH C6-C10 fraction (minus BTEX) and/or TRH >C10-16 (minus naphthalene) were reported above Commercial / Light Industrial RC at the following locations:
    - UST_77_SE_1.6 and UST_80_1.2_S at the southern end of the excavation.

    Speciation of the soil samples collected at these locations was conducted and, while concentrations of aliphatic and aromatic TRH >C21-C35 in excess of Residential RC were detected, no exceedance of RC considered applicable to future Precinct South uses were detected.

    - UST_EXT_59E_1.6 and UST_EXT_59N_1.6 in the eastern portion of the excavation, under the area cut out from under the SeaRoad Shed Slab.

    The results of TRH speciation at UST_EXT_59E_1.6 reported an exceedance of the Commercial/Light Industrial (Working within a basement) RC for aliphatic TRH >C8-C10. It is also noted that samples were not collected at 0.8 m bgl at these locations, and the detected concentrations of aromatic TPH >C8-C10 at UST_EX_59N_1.6 are not delineated vertically and would be considered to represent a potential vapour intrusion risk if present in soil less than 1 m bgl.

    Detected concentrations are not considered to represent an unacceptable risk to current uses or future development as:

    - The planned use of this area until future development is Open Space, for which the reported concentrations do not represent a potential vapour risk.
    - Previous sub-slab soil vapour assessment conducted in 2019 included sample points within 5 to 13 m of the detected soil impacts and did not report potentially hazardous concentrations of hydrocarbon vapour.
    - The AA3 DSI (AECOM, 2022a) notes that further vapour assessment or protection is required for any future development which alters the Site surface. In the event that a change in Site surface occurs, further investigation or protection measures should be considered and prevent unacceptable risk from soil impacts at these locations.
    - The AA3 DSI also contains a requirement that mitigation methods for potential methane intrusion detected in parts of Audit Area 3, which are now contained in the Precinct South, are required to be incorporated into for future building designs. Suitable methane intrusion protection measures would also capture and prevent soil vapour intrusion from hydrocarbons in soil.
  - The concentration of lead at 1.6 m bgl at UST_66_E_1.6 exceeded the Intrusive Maintenance Worker RC. This concentration is not considered to represent an unacceptable risk to future Site users as:
    - The Maintenance Worker RC is considered applicable for soil up to 1 m bgl. This exceedance of criteria was detected at 1.6 m bgl and is delineated vertically at 0.8 m bgl by UST_66_0.8_E, and this soil is not considered likely to come into contact with future Maintenance Workers.
    - The extent of lead above RC is considered likely to be limited in extent, as surrounding validation samples to the north, south, east and west did not report lead concentrations in excess of this RC.
    - The adopted RC for lead is 620 mg/kg. The reported result at UST_66_E_1.6 was 621 mg/kg, which is a minor exceedance of the criteria. The RWP and the AA3 DSI both contain statistical assessment of minor exceedances of criteria in accordance with the ASC NEMP, and similar isolated exceedances of RC are present within the Precinct South and not considered to represent an unacceptable risk to future Maintenance Workers.

No other exceedances of the Site Specific RC for Commercial / Light Industrial, Intrusive Maintenance Worker, and Public Open Space uses were detected in validation samples collected from material which remains *in situ* in the Former UST Area.

- A railway, buried just below the surface, was uncovered in the western portion of the Former UST Area and removed as a precautionary measure by BlackCap. Based on review of historic aerial photographs, the railway is believed to have been installed at some point prior to 1946 and buried between 1984 and 1990.

  Assessment of the buried railway concluded:

  - PAH concentrations in the rail sleeper sample was reported below LOR, and it is not considered likely that the encountered sleepers had been treated with creosote.
  - Assessment of a sample collected of the railway sleepers following removal detected heavy chain (TRH >C16-C24 and TRH >C34-C40) hydrocarbons, but did not no detect any shorter chain TRH, BTEXN, or PAHs, which are considered more likely to be leachable.
  - Pipeline and Former UST Area excavation validation soil samples collected from beneath, or less than 2 m from, the buried railway did not report any results which may indicate impact from the railway was present.

  It is considered that the buried railway is unlikely to have acted as an ongoing source of impact or to have represented an unacceptable risk to current or future Site uses based on these results.

  It is noted that review of historical aerial photographs attached to the AA3 DSI identified that there may be other buried railways in the Precinct South. However, further investigation or remediation work is not considered to be required to locate or remove these railways as:

  - The railways are of a similar era and age as the buried railway removed as part of this remediation program. It is considered likely that they would have similar properties and not represent ongoing sources of contamination or unacceptable risk to current or future Site uses.
  - At least a portion of the historic railways have been removed from the Site, as no buried sections were encountered during remediation works in 2020 in areas where railways historically were present.

- The Former UST Area was backfilled with VENM. Road base was reinstated in under the Site road to the west of the SeaRoad Shed, which was then sealed with bitumen, and a fresh slab was installed to restore the SeaRoad Shed Slab to its original footprint.

7.3 Change in Use Investigation

Previous assessment of the Precinct South had reported exceedances of the Commercial RC for TRH >C10-C16 (minus naphthalene) in samples collected from the following locations:

- At 0.5 m bgl in soil bore BH62.
- At 0.9 m bgl in remediation validation sample OL-EX-107 and at 1.0 m bgl in remediation validation sample OL-EX-110.

However, at the time of remediation, the proposed future use of this area was Open Space, and the reported detections were not considered to represent an unacceptable risk to future Site uses. Further investigation was identified in the RWP based on the potential changes to future Site uses discussed in **Section 2.1.1**.

The location of BH62 was included in the excavation of the Northern Excavation Area, where soil was excavated to the water table (approximately 2 m bgl) and any soil which may have represent an unacceptable risk to future Site uses was removed. No further investigation was conducted as a result.

A 1.1 m deep trench was excavated through backfilled material where a section of the Oil Line was removed in 2020, between sample locations OL-EX-107 and OL-EX-110, and soil samples were collected from existing site fill beneath the previous remediation area.

The samples collected from the base of the trench did not report TRH >C10-C16 (minus naphthalene) above the LOR and were generally lower for all TRH ranges than the 2020 samples from this location. The potential reasons for the lower detected results considered in this report are:

- The investigation trench may have been advanced in the incorrect location. However, this is considered unlikely as:
  - The location of validation samples collected in 2020 were recorded with a handheld GPS with a reported accuracy of +/-1 to 3 m. The trench was approximately 5 m in length, and even if at the maximum deviation from recorded values, would still intersect the previous sample locations.
  - The fill material used in 2020 was distinct from the existing soil and could be clearly differentiated by field staff and provides high level of confidence that the trench was advanced through the previous remediation area.
- The TRH concentrations detected in 2020 may have oxidised or volatilised during the period the trench was open between collection of validation samples and backfilling in 2020. This period may have been greater than 2 weeks (to allow laboratory turnaround of validation samples to determine if further excavation was recommended) and the exposure to ambient air would provide an opportunity a reduction in TRH concentrations.

Further assessment of available data from 2020 was conducted and concluded that:

- The TRH concentrations detected in 2020 in excess of Commercial / Light Industrial RC may have been limited in extent and could be considered delineated to the north, south and west, and delineated in shallow soil to the east.
- The reported concentrations of TRH >C10-C16 (minus naphthalene) in 2020 would only be considered to represent an unacceptable risk to future Commercial / Light Industrial users of the Site if they constituted at least 80-90% TRH >C10-C12 aliphatic, or 35-40% TRH >C10-C12 aromatic, which is considered unlikely.

In any event, a level of vapour management for future buildings is required in the AA3 DSI (AECOM, 2022a) as discussed in **Section 6.1.3** above and would also provide protection/mitigation of soil vapour from potential impacts in this area.

On the basis of the above, it is considered unlikely that the detected TRH >C10-C16 (minus naphthalene) detected at OL-EX-107 and OL-EX_110 in 2020 represent a source of unacceptable risk to future Site uses, and no further investigation or remediation is considered required.

7.4 Soil Management Requirements

The soil remediation works described in this report have been conducted with reference to the Site-Specific RC discussed in **Section 3.1**. As part of the future Site development scenarios, the following conditions should be maintained at the Site in order to fulfil the assumptions of the RC:

- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users, with the exception of Maintenance Workers, to have direct contact with soil. Agreement with the Environmental Auditor will be required when specifying an appropriate engineered break layer to mitigate potential direct contact with underlying soils. The engineered break layer may consist of, but not be limited to:
  - Paved surfaces (e.g., concrete, asphalt, etc.)
  - Building footings
  - Sufficient clean soil to mitigate potential direct access to underlying soil during incidental digging (e.g., 0.5 – 1.0 m topsoil)
  - Other suitable materials: e.g., geosynthetic materials that may provide a suitable physical barrier and may be able to be used as alternatives to a thicker earthen layer.

Implementation of the SEMP should be continued to maintain/manage the surface cover and to specify the requirement for a Work Health and Safety Plan (WHSP) for ground-breaking activities, including IMWs.

8.0 Conclusions and Recommendations

8.1 Conclusions

Approximately 200 m of redundant fuel lines and 1,320 m^3 of soil was excavated to remove potentially contaminated soil surrounding remnant pipelines and areas of contaminated soil within the Precinct South.

All known redundant fuel lines, consisting of the Diesel Line (approximately 110 m) and the Oil Line (approximately 90 m) have been removed entirely or to as close to the Site boundary as practicable. Where fuel pipelines were cut at the Site boundary, they were sealed with concrete to prevent any leakage of remnant liquid in the pipeline. The location of the pipelines removed is shown on **Figure F2** and **Figure F4**.

Impacted or potentially impacted soil was excavated from surrounding the pipelines, and from two areas of known contamination detected during previous assessments:

- The Northern Excavation Area, where lead impacted soil was known to be present.
- The Former UST Area, where hydrocarbon impacts soil associated with previously removed USTs were present.

The extent of excavation is shown on **Figure F2** to **Figure F4**.

Excavated material was either:

- Reused as fill material where no potential unacceptable risk to future Site uses was detected (~270 m^3 of soil, sourced from the Oil Line excavation and shallow soil in the Former UST Area).
- Remediated on-Site to reduce hydrocarbon concentrations to a level where no potential unacceptable risk to future Site uses was detected (~210 m^3 of soil sourced from the Former UST Area).
- Disposed off-Site as contaminated material due to the presence of lead or ACM (~855 m^3 sourced from soil surrounding the Diesel Line or from the Northern Excavation Area)

Any excavated material not used as backfill was removed from the Site following completion of remediation.

No exceedances of Site Specific RC adopted for the proposed future uses of the Precinct South were detected in soil remaining *in situ*, with the exception of:

- Concentrations of TRH >C10-16 (minus naphthalene) exceeding the Potential Future Commercial (unknown construction or multi-storey building) RC at the following validation sample locations:
  - DL_23_1.0 and OL_17_0.6E on the pipeline excavation.
  - UST_77_SE_1.6 and UST_80_1.2_S at the southern end of the Former UST Area excavation.

  Speciation of soil samples collected at these locations identified that no exceedance of RC applicable to future uses of the Precinct South were present, and no unacceptable risk to future Site uses is considered present.
  - UST_EXT_59E_1.6 and UST_EXT_59N_1.6 in the eastern portion of the Former UST Area excavation, under the area cut out from under the SeaRoad Shed Slab.

  The results of TRH speciation at UST_EXT_59E_1.6 reported an exceedance of the Commercial/Light Industrial (Working within a basement) RC for aliphatic TRH >C8-C10. It is also noted that samples were not collected at 0.8 m bgl at these locations, and the detected concentrations of aromatic TPH >C8-C10 at UST_EX_59N_1.6 are not delineated vertically and would be considered to represent a potential vapour intrusion risk if present in soil at depths less than 1 m bgl.

Detected concentrations are not considered to represent an unacceptable risk to future development as previous sub-slab soil vapour investigation within 5 m of impacts did not report potentially hazardous soil vapour concentrations. This area of the Site is currently planned to remain as Open Space until further development, at which the detected TRH do not represent a vapour risk, and a level of soil vapour protection is required in the AA3 DSI and should be maintained to provide a level of protection and mitigation against soil vapour in this area.

- The concentration of lead at 1.6 m bgl at UST_66_E_1.6 exceeded the Intrusive Maintenance Worker RC. This concentration is not considered to represent an unacceptable risk to future Site users as:
  - The Maintenance Worker RC is considered applicable for soil up to 1 m bgl. This exceedance of criteria was detected at 1.6 m bgl and is delineated vertically at 0.8 m bgl by UST_66_0.8_E, and this soil is not considered likely to come into contact with future Maintenance Workers.
  - The extent of lead above RC is considered likely to be limited in extent, as surrounding validation samples to the north, south, east, and west did not report lead concentrations in excess of this RC.
  - The adopted RC for lead is 620 mg/kg. The reported result at UST_66_E_1.6 was 621 mg/kg, which is a minor exceedance of the criteria. The RWP and the AA3 DSI both contain statistical assessment of minor exceedances of criteria in accordance with the ASC NEMP, and similar isolated exceedances of RC are present within the Precinct South and not considered to represent an unacceptable risk to future Maintenance Workers.

No other exceedances of RC applicable to future Site uses were detected in validation samples of soil which remains *in situ*. It is noted that samples were not collected from the base of the Former UST Area or Northern Excavation Area excavations, where groundwater was encountered, and if future development requires disturbance or dewatering of these areas, additional assessment or management should be undertaken.

The areas of excavation have been backfilled with a combination of reused soil, imported VENM, crushed concrete, and reinstated road base. A layer of VENM was placed over the Northern Excavation Area to prevent casual contact with soil, while the Pipeline Excavation and Former UST Area excavation were sealed with bitumen, and with concrete to reinstate the SeaRoad Shed Slab where excavation had progressed in this area. The backfill uses in each area is shown on **Figure F5**.

The following features of interest were identified during remediation:

- A boiler filled with water was uncovered in the Northern Excavation Area. The water in the boiler was decanted, and the boiler excavated, and both were removed from Site.

  Assessment of the water in the boiler reported concentrations of TRH in excess of groundwater RC, however assessment of surrounding soil validation samples did not uncover any indication of soil contamination, and the most recent groundwater data from the closest groundwater well, collected on 5 Decembe3 2023 from MW163 approximately 10 m down hydraulic gradient to the south, did not have any detectable concentrations of TRH or BTEXN (noting that this sample results has not yet been validated). This result is consistent with prior samples from MW163 collected in 2019.

  No further remediation of the area of the buried boiler is considered to be required at this time.

- A buried railway was uncovered to the west of the Pipeline Excavation and the Former UST Area. The railway was removed as a precautionary measure, however, assessment of a sample of the sleeper and of validation samples collected beneath or less than 2 m of the railway, indicate that it is considered unlikely that the sleepers were treated with creosote, and did not report any results which would indicate that the railway was either a source of contamination to the Precinct South, or represented an unacceptable risk to current or future Site uses.

  Review of historic aerial images indicated the potential that other buried railways may be present in or adjacent to the Precinct South:

  - Running north from the north-east corner of the Red Shed beneath the carpark area.

- Running north-south beneath the carpark along the western boundary of the Precinct South.
- Beneath the Goods Shed and Yard area to the west.

However, based on the results from assessment of this buried railway, and under consideration that other railways are of similar age and era and would be assumed to have similar characteristics, and may have already been removed from the Site, no further investigation or excavation of railways is considered recommended at this time.

Additional investigation of two locations, soil bore BH62 and the area between previous remediation validation samples OL-EX-107 and OL-EX-110, was proposed to assess historic sample results which may represent unacceptable risk to future Site uses. Soil at BH62 was excavated and removed as part of the Northern Excavation Area, and investigation of the soil between OL-EX-107 and OL-EX-110 did not detect any soil impacts considered to represent an unacceptable risk to future Site uses.

In any event, a level of vapour management for future buildings is required in the AA3 DSI (AECOM, 2022a) would also provide protection/mitigation of soil vapour from potential impacts in this area.

On the basis of the above, no further remediation of soil or remnant infrastructure within the Precinct South is considered required to fulfil the proposed future Site uses, if the conditions within the SEMP are fulfilled.

8.2 Recommendations

The following actions are recommended for future works prior to or during development of the Precinct of the Site:

- As part of the Contaminated Land Audit Report, a SEMP will need to be developed to maintain the Site conditions associated with the assumptions which form the basis of the Site Specific RC adopted for assessment of this remediation, namely:
  - An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of IMWs) to have direct contact with soils. Agreement with the Environmental Auditor will likely be required when specifying an appropriate engineered break layer to mitigate potential direct contact with underlying soils. The engineered break layer may consist of, but not be limited to:
    - Paved surfaces (e.g., concrete, asphalt, etc.)
    - Building footings
    - Sufficient clean soil to mitigate potential direct access to underlying soil during incidental digging (e.g., 0.5 – 1.0 m topsoil)
    - Other suitable materials: e.g., geosynthetic materials that may provide a suitable physical barrier and may be able to be used as alternatives to a thicker earthen layer.

  The SEMP will need to be in place in the future to maintain/manage the surface cover and to specify the requirement for a Work Health and Safety Plan (WHSP) for ground-breaking activities, including IMWs.
- The SEMP should also contain considerations of the following considerations:
  - Saturated soil (>2 m bgl) in the Former UST Area and Northern Excavation Area excavations, which may represent a risk to future Site users if exposed, excavated, or dewatered.
  - Areas of potential vapour intrusion near OL-EX-107 and OL-EX-110, and on the eastern boundary of the Former UST Area excavation, which may require further mitigation or investigation if the vapour control measures in the AA3 DSI are not adopted.
  - If any changes to the assumptions of future use and conditions developed for the RC occur, for example a change in surface elevation, reassessment of identified impacts and exposure scenarios must be undertaken.

10.0 Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporations and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract dated 20 December 2022.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 1 October 2023 and 9 August 2024 and is based on the conditions encountered and information reviewed and referenced in this document at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

Site Specific Remediation Criteria

- Potential Future Residents (building with a basement car park)
- Potential Future Residents (low rise slab-on-grade)
- Potential Future Residents (unknown constr. or multi-storey bldg)
- Potential Future Comm/Light Ind Workers (low-rise slab-on-grade)
- Potential Future Comm/Light Ind Workers (working within a basement)
- Potential Future Comm (unknown construction or multi-storey bldg)
- Potential Future Maintenance Workers
- Potential Future Recreational Open Space Users

CERTIFICATE OF ANALYSIS

Work Order	: **EM2303516**	Page	: 1 of 18
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 01-Mar-2023 11:20
Order number	: 60693007-2	Date Analysis Commenced	: 01-Mar-2023
C-O-C number	: 49082	Issue Date	: 07-Mar-2023 18:54
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 22		
No. of samples analysed	: 22		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP075(SIM): Particular samples required dilution prior to extraction due to matrix interferences. LOR values have been adjusted accordingly.
- EG005T: EM2303516 #1, Poor duplicate precision for zinc due to sample heterogeneity. Confirmed by re-extraction and re-analysis. The following results were observed: 441 mg/kg, 434 mg/kg, 561 mg/kg and 318 mg/kg.
- EP075(SIM): Poor duplicate precision for EM2303516_012 due to sample heterogeneity. Confirmed by re-extraction and re-analysis.

QUALITY CONTROL REPORT

Work Order	: **EM2303516**	Page	: 1 of 10
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 01-Mar-2023
Order number	: 60693007-2	Date Analysis Commenced	: 01-Mar-2023
C-O-C number	: 49082	Issue Date	: 07-Mar-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 22		
No. of samples analysed	: 22		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2303516**	Page	: 1 of 10
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 01-Mar-2023
Site	: Macquarie Point Oil and Diesel Line removal	Issue Date	: 07-Mar-2023
Sampler	: TIM SMITH02	No. of samples received	: 22
Order number	: 60693007-2	No. of samples analysed	: 22

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

TRH - Semivolatile Fraction	0	20	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

From: COC Melbourne
Subject: RE: AECOM - Macquarie Point 60693007-2 samples received 1/3

From: Smith, Timothy (Hobart) <tim.smith02@aecom.com>
Sent: Thursday, 2 March 2023 12:30 PM
To: Peter Ravlic <peter.ravlic@alsglobal.com>
Subject: [EXTERNAL] - Macquarie Point 60693007-2 samples received 1/3

CAUTION: This email originated from outside of ALS. Do not click links or open attachments unless you recognize the sender and are sure content is relevant to you.

Hi Peter, I sent some samples Tuesday and in compass the analysis selected included the 8 metals suite. Can we change this to be just lead for all soil and rinsate samples.
Thanks in advance

Tim Smith

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2304038 #12 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG020-T : EM2303927 #21 results for total metals have been confirmed by re-digestion and re-analysis.
- EP075(SIM): EM2303927_021 has LOR raised for Phenol due to laboratory background.
- EP075(SIM): EM2303927_001 Poor duplicate precision due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EG035T: EM230890#4 Poor duplicate precision for total mercury due to sample matrix. Confirmed by re-extraction and re-analysis.
- EG005T: EM2303927 #2, Poor matrix spike recovery for Lead due to sample matrix. Confirmed by re-extraction and re-analysis.
- EG035T: EM2303927-002 Poor matrix spike recovery for mercury due to sample matrix. Confirmed by re-extraction and re-analysis.

QUALITY CONTROL REPORT

Work Order	: **EM2303927**	Page	: 1 of 11
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 03-Mar-2023
Order number	: 60693007-2	Date Analysis Commenced	: 07-Mar-2023
C-O-C number	: 49100	Issue Date	: 10-Mar-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 20		
No. of samples analysed	: 20		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2303927**	Page	: 1 of 11
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 03-Mar-2023
Site	: Macquarie Point Oil and Diesel Line removal	Issue Date	: 10-Mar-2023
Sampler	: TIM SMITH02	No. of samples received	: 20
Order number	: 60693007-2	No. of samples analysed	: 20

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **EM2304091**	Page	: 1 of 3
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 01-Mar-2023 11:20
Order number	: 60693007-2	Date Analysis Commenced	: 01-Mar-2023
C-O-C number	: 49082	Issue Date	: 14-Mar-2023 15:06
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 1		
No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP070-CWG: EM2304091_001 Unable to determine surrogate recovery due to matrix interferences.
- Rebatch of EM2303516

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2304091**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 01-Mar-2023
Site	: Macquarie Point Oil and Diesel Line removal	Issue Date	: 14-Mar-2023
Sampler	: TIM SMITH02	No. of samples received	: 1
Order number	: 60693007-2	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **SOIL**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
TPH Speciation (TPH CWG & RIVM fractions)	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
TPH Speciation (TPH CWG & RIVM fractions)	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation: Date extracted	Extraction / Preparation: Due for extraction	Extraction / Preparation: Evaluation	Analysis: Date analysed	Analysis: Due for analysis	Analysis: Evaluation
EA055: Moisture Content (Dried @ 105-110°C)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids (Option B - Non-concentrating)	ORG17-SP	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 20mL 1:1 DCM/Acetone by end over end tumble. The solvent is transferred directly to a GC vial for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Rebatch of EM2303516
- Amendment (15/03/2023): This report has been amended to add missed analysis (TRH>C12-C16 Aliphatic) on sample #1. All analysis results are as per the report.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP070-CWG: EM2304468_001 Unable to determine surrogate recovery due to matrix interferences.
- This is a rebatch of EM2303927

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Method: Compound	CAS Number	LOR	Unit	Method Blank (MB) Report	Laboratory Control Spike (LCS) Report			
					Spike	Spike Recovery (%)	Acceptable Limits (%)

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / *Container* / Client Sample ID(s)	*Sample Date*	*Extraction / Preparation*			*Analysis*		
		Date extracted	Due for extraction	Evaluation	*Date analysed*	Due for analysis	Evaluation

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids (Option B - Non-concentrating)	ORG17-SP	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 20mL 1:1 DCM/Acetone by end over end tumble. The solvent is transferred directly to a GC vial for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- This is a rebatch of EM2303927
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Arenie Vijayaratnam	Senior Inorganic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2304628 #2 Poor duplicate precision for total Lead due to sample matrix. Confirmed by re-digestion and re-analysis.It's been noted that the repeated results vary greatly. Repeated results are as follows: Lead: 330 mg/kg, 839 mg/kg, 545 mg/kg, and 351 mg/kg.
- Ep075(SIM): Poor duplicate precision for EM2304628_002 due to sample heterogeneity. Confirmed by re-extraction and re-analysis.

Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 16-Mar-2023
Order number	: 60693007-2	Date Analysis Commenced	: 17-Mar-2023
C-O-C number	: 49344	Issue Date	: 21-Mar-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 19		
No. of samples analysed	: 9		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2304628**	Page	: 1 of 8
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 16-Mar-2023
Site	: Macquarie Point Oil and Diesel Line removal	Issue Date	: 21-Mar-2023
Sampler	: TIM SMITH02	No. of samples received	: 19
Order number	: 60693007-2	No. of samples analysed	: 9

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

SAMPLE RECEIPT NOTIFICATION (SRN)

Receipt Detail	:	No. of samples received / analysed	: 19 / 9

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

Hi Peter, there are other samples that should have arrived to Springvale today. When they are logged could you please send the SRN to Rob and I. There are some changes to make as follows

The following samples are to be put on hold:
UST_77_1.6_S
UST_73_2.0_E
UST_73_2.0_W
UST_66_2.0_E
UST_66_2.0_W
UST_59_2.0_E
UST_59_2.0_W
UST_QC105
UST_QC205 – please hold and don't forward to eurofins

All other samples should be analysed for TRH, BTEXN, PAH, PHENOLs and Pb

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
~ = Indicates an estimated value.

- EP070-CWG: EM2305209_010 Unable to determine surrogate recovery due to matrix interferences.
- EG048G: EM2305209 #19 Poor insoluble matrix spike recovery for Hexavalent Chromium due to sample matrix. Confirmed by re-extraction and re-analysis.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2305209 #13 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #19 Poor spike recovery for total metal due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #21 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #30 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- Amendment (30/03/2023):This report has been amended following the request from client to split report. All analysis results are as per the previous report
- EP075(SIM): EM2305209_010 has LOR raised for 2.4-Dimethylphenol due to sample matrix interferences.
- EP075(SIM): EM2305209_023 Poor duplicate precision due to sample heterogeneity. Confirmed by MS QC.
- EP075(SIM): EM2305209_001 Poor duplicate precision for fluoranthene and pyrene due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EP075(SIM): EM2305209_023 Poor matrix spike recovery sample heterogeneity. Confirmed by DUP QC.
- EP071: EM2305209-024 Poor matrix spike recovery due to sample matrix. Confirmed by re-extraction and re-analysis.
- EP075(SIM): EM2305209_042 Poor matrix spike recovery for pyrene due to sample matrix. Confirmed by re-extraction and re-analysis.
- ALS is not NATA accredited for the analysis of organics or inorganics in timber.
- EN33a-G: EM2305209 #050 Due to limited sample for leach analysis, a scaled down amount of 30g into 600mL was used.

No. of samples analysed	: 29		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
~ = Indicates an estimated value.

- EP070-CWG: EM2305209_010 Unable to determine surrogate recovery due to matrix interferences.
- EG048G: EM2305209 #19 Poor insoluble matrix spike recovery for Hexavalent Chromium due to sample matrix. Confirmed by re-extraction and re-analysis.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2305209 #13 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #19 Poor spike recovery for total metal due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #21 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #30 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- Amendment (30/03/2023):This report has been amended following the request from client to split report. All analysis results are as per the previous report
- EP075(SIM): EM2305209_023 Poor duplicate precision due to sample heterogeneity. Confirmed by MS QC.
- EP075(SIM): EM2305209_001 Poor duplicate precision for fluoranthene and pyrene due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EP075(SIM): EM2305209_023 Poor matrix spike recovery sample heterogeneity. Confirmed by DUP QC.
- EP071: EM2305209-024 Poor matrix spike recovery due to sample matrix. Confirmed by re-extraction and re-analysis.
- EP075(SIM): EM2305209_042 Poor matrix spike recovery for pyrene due to sample matrix. Confirmed by re-extraction and re-analysis.
- ALS is not NATA accredited for the analysis of organics or inorganics in timber.
- EN33a-G: EM2305209 #050 Due to limited sample for leach analysis, a scaled down amount of 30g into 600mL was used.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023
Order number	: 60693007-3	Date Analysis Commenced	: 24-Mar-2023
C-O-C number	: ----	Issue Date	: 18-Apr-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point		
Quote number	: EN/004/21		
No. of samples received	: 29		
No. of samples analysed	: 29		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2305209**	Page	: 1 of 21
Amendment	: **1**		
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023
Site	: Macquarie Point	Issue Date	: 18-Apr-2023
Sampler	: TIM SMITH02	No. of samples received	: 49
Order number	: 60693007-3	No. of samples analysed	: 45

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Hexavalent Chromium by Alkaline Digestion and DA Finish	EG048G	SOIL	In house: Referenced to USEPA SW846, Method 3060. Hexavalent chromium is extracted by alkaline digestion. The digest is determined by photometrically by automatic discrete analyser, following pH adjustment. The instrument uses colour development using dephenylcarbazide. Each run of samples is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	SOIL	In house: Referenced to APHA 4500-CN C / ASTM D7511 / ISO 14403. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3).
Total Fluoride	EK040T	SOIL	(In-house) Total fluoride is determined by ion specific electrode (ISE) in a solution obtained after a Sodium Carbonate / Potassium Carbonate fusion dissolution.
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).

Analytical Methods	Method	Matrix	Method Descriptions
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Benzo(a)pyrene- Waste Classification (TAS requirements)	EP075-TAS	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
Volatile Hydrocarbon Speciation (TPH CWG & RIVM fractions)	EP079-CWG	SOIL	In house: Conventional TPH and MAH data are determined by Purge and Trap GCMS analysis. TIC data (as fractions) and target aromatics (or groups of aromatics) are used to compute aliphatic and aromotic hydrocarbon fractions by addition or difference. Fractions conform to those outlined in TPHCWG, 1998,Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021/2004, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Alkaline digestion for Hexavalent Chromium	EG048PR	SOIL	In house: Referenced to USEPA SW846, Method 3060A.
Total Fluoride	EK040T-PR	SOIL	In house: Samples are fused with Sodium Carbonate / Potassium Carbonate flux.
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Tumbler Extraction of Solids - VIC EPA Screen	ORG17-EM	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Tumbler Extraction of Solids (Option B - Non-concentrating)	ORG17-SP	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 20mL 1:1 DCM/Acetone by end over end tumble. The solvent is transferred directly to a GC vial for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

This guideline comparison report **only** provides comparison of reported result against limit thresholds for the 'Fill Material', 'Low Level Contaminated Soil', and 'Contaminated Soil' categories in Table 2 of EPA Tasmania Information Bulletin No. 105.
This guideline comparison report is **NOT** a compliance report. Classification of soils requires consideration of a number of other factors including preliminary site investigation, sampling density and statistical calculations and measurement uncertainty.
This guideline comparison report only provides comparison data for parameters, specifically listed within Table2 of the EPA Tasmania Information Bulletin No. 105, that are analysed by ALS.
Only results in the 'Analytical Results' section have been compared to the guideline.

Additional information pertinent to this report will be found in the following separate attachments: Certificate of Analysis, Quality Control Report, QA/QC Compliance Assessment to Assist with Quality Review and Sample Receipt Notification.

Summary of Thresholds Reached or Exceeded

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **EM2305209-AA**	Page	: 1 of 15
Amendment	: **1**		
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023 11:15
Order number	: 60693007-3	Date Analysis Commenced	: 24-Mar-2023
C-O-C number	: ----	Issue Date	: 30-Mar-2023 16:56
Sampler	: TIM SMITH02		
Site	: Macquarie Point		
Quote number	: EN/004/21		
No. of samples received	: 16		
No. of samples analysed	: 16		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
~ = Indicates an estimated value.

- EP070-CWG: EM2305209_010 Unable to determine surrogate recovery due to matrix interferences.
- EG048G: EM2305209 #19 Poor insoluble matrix spike recovery for Hexavalent Chromium due to sample matrix. Confirmed by re-extraction and re-analysis.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2305209 #13 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #19 Poor spike recovery for total metal due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #21 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #30 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- Amendment (30/03/2023):This report has been amended following the request from client to split report. All analysis results are as per the previous report
- EP075(SIM): EM2305209_010 has LOR raised for 2.4-Dimethylphenol due to sample matrix interferences.
- EP075(SIM): EM2305209_023 Poor duplicate precision due to sample heterogeneity. Confirmed by MS QC.
- EP075(SIM): EM2305209_001 Poor duplicate precision for fluoranthene and pyrene due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EP075(SIM): EM2305209_023 Poor matrix spike recovery sample heterogeneity. Confirmed by DUP QC.
- EP071: EM2305209-024 Poor matrix spike recovery due to sample matrix. Confirmed by re-extraction and re-analysis.
- EP075(SIM): EM2305209_042 Poor matrix spike recovery for pyrene due to sample matrix. Confirmed by re-extraction and re-analysis.
- ALS is not NATA accredited for the analysis of organics or inorganics in timber.
- EN33a-G: EM2305209 #050 Due to limited sample for leach analysis, a scaled down amount of 30g into 600mL was used.

General Comments

This guideline comparison report **only** provides comparison of reported result against limit thresholds for the 'Fill Material', 'Low Level Contaminated Soil', and 'Contaminated Soil' categories in Table 2 of EPA Tasmania Information Bulletin No. 105.
This guideline comparison report is **NOT** a compliance report. Classification of soils requires consideration of a number of other factors including preliminary site investigation, sampling density and statistical calculations and measurement uncertainty.
This guideline comparison report only provides comparison data for parameters, specifically listed within Table2 of the EPA Tasmania Information Bulletin No. 105, that are analysed by ALS.
Only results in the 'Analytical Results' section have been compared to the guideline.

Additional information pertinent to this report will be found in the following separate attachments: Certificate of Analysis, Quality Control Report, QA/QC Compliance Assessment to Assist with Quality Review and Sample Receipt Notification.

ALS Environmental

QUALITY CONTROL REPORT

Work Order	: **EM2305209-AA**	Page	: 1 of 26
Amendment	: **1**		
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023
Order number	: 60693007-3	Date Analysis Commenced	: 24-Mar-2023
C-O-C number	: ----	Issue Date	: 30-Mar-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point		
Quote number	: EN/004/21		
No. of samples received	: 16		
No. of samples analysed	: 16		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QUALITY CONTROL REPORT

Work Order	: **EM2305209-AB**	Page	: 1 of 31
Amendment	: **1**		
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023
Order number	: 60693007-3	Date Analysis Commenced	: 24-Mar-2023
C-O-C number	: ----	Issue Date	: 30-Mar-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point		
Quote number	: EN/004/21		
No. of samples received	: 29		
No. of samples analysed	: 29		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

Dates

Date Samples Received	: 22-Mar-2023 11:15	Issue Date	: 30-Mar-2023
Client Requested Due Date	: 29-Mar-2023	Scheduled Reporting Date	: **29-Mar-2023**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Intact.
No. of coolers/boxes	: 2	Temperature	: 4.3°C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 49 / 45

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Extra samples received:**
  UST_QC106 (sample 046)
  UST_QC206 (sample 047)
  OL_90_0.6_E (sample 048)
  OL_90_1.0 (sample 049)
  Rail Timber 01 (sample 050)
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

CERTIFICATE OF ANALYSIS

Work Order	: **EM2305896**	Page	: 1 of 12
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 04-Apr-2023 11:45
Order number	: 60693007-2	Date Analysis Commenced	: 04-Apr-2023
C-O-C number	: 50529	Issue Date	: 11-Apr-2023 16:08
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 11		
No. of samples analysed	: 11		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Tahlia Freeman	Instrument Operator	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP075(SIM): EM2305896_002 Poor matrix spike recovery for pyrene due to sample heterogeneity. Confirmed by re-extraction and re-analysis.

QUALITY CONTROL REPORT

Work Order	: **EM2305896**	Page	: 1 of 7
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 04-Apr-2023
Order number	: 60693007-2	Date Analysis Commenced	: 04-Apr-2023
C-O-C number	: 50529	Issue Date	: 11-Apr-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 11		
No. of samples analysed	: 11		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Tahlia Freeman	Instrument Operator	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Arenie Vijayaratnam	Senior Inorganic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: 60693007-2	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2307528 #9 results for total Lead have been confirmed by re-digestion and re-analysis. It's been noted that the repeated results vary greatly. Repeated results are as follows: Lead: 1320 mg/kg, 2800 mg/kg and 1960 mg/kg.

General Comments

This guideline comparison report **only** provides comparison of reported result against limit thresholds for the 'Fill Material', 'Low Level Contaminated Soil', and 'Contaminated Soil' categories in Table 2 of EPA Tasmania Information Bulletin No. 105.

This guideline comparison report is **NOT** a compliance report. Classification of soils requires consideration of a number of other factors including preliminary site investigation, sampling density and statistical calculations and measurement uncertainty.

This guideline comparison report only provides comparison data for parameters, specifically listed within Table2 of the EPA Tasmania Information Bulletin No. 105, that are analysed by ALS.

Only results in the 'Analytical Results' section have been compared to the guideline.

Additional information pertinent to this report will be found in the following separate attachments: Certificate of Analysis, Quality Control Report, QA/QC Compliance Assessment to Assist with Quality Review and Sample Receipt Notification.

Work Order	: **EM2307528**	Page	: 1 of 17
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 02-May-2023
Order number	: 60693007-2	Date Analysis Commenced	: 03-May-2023
C-O-C number	: 51686	Issue Date	: 08-May-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 17		
No. of samples analysed	: 14		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Arenie Vijayaratnam	Senior Inorganic Chemist	Melbourne Inorganics, Springvale, VIC
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2307528**	Page	: 1 of 10
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 02-May-2023
Site	: Macquarie Point Oil and Diesel Line removal	Issue Date	: 08-May-2023
Sampler	: TIM SMITH02	No. of samples received	: 17
Order number	: 60693007-2	No. of samples analysed	: 14

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **SOIL**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
	0				
Matrix Spikes (MS)

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Hexavalent Chromium by Alkaline Digestion and DA Finish	EG048G	SOIL	In house: Referenced to USEPA SW846, Method 3060. Hexavalent chromium is extracted by alkaline digestion. The digest is determined by photometrically by automatic discrete analyser, following pH adjustment. The instrument uses colour development using dephenylcarbazide. Each run of samples is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	SOIL	In house: Referenced to APHA 4500-CN C / ASTM D7511 / ISO 14403. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3).
Total Fluoride	EK040T	SOIL	(In-house) Total fluoride is determined by ion specific electrode (ISE) in a solution obtained after a Sodium Carbonate / Potassium Carbonate fusion dissolution.
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Benzo(a)pyrene- Waste Classification (TAS requirements)	EP075-TAS	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Alkaline digestion for Hexavalent Chromium	EG048PR	SOIL	In house: Referenced to USEPA SW846, Method 3060A.
Total Fluoride	EK040T-PR	SOIL	In house: Samples are fused with Sodium Carbonate / Potassium Carbonate flux.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Tumbler Extraction of Solids - VIC EPA Screen	ORG17-EM	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Hi Celline, in the compass app I am using the duplicate COC from previous function and then editing to the actual sample nomenclature. For whatever reason the app at your end is not updating the edits. The correct COC

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP070-CWG: EM2307637_002 and EM2307637_003 Unable to determine surrogate recovery due to sample matrix.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP071: EM2307637-011 Poor duplicate precision due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EP070-CWG: EM2307637_002 Higher than expected matrix spike recovery due to matrix effects.
- EP075(SIM): EM2307637_005 Higher than expected matrix spike recovery for pyrene due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- Amendment (09/05/2023): This report has been amended to add missed analysis EP070-CWG for sample #1, #2 and #3. All analysis results are as per the report.

Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: EN/004/21		
No. of samples received	: 16		
No. of samples analysed	: 15		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment

Matrix Spikes (MS)					
PAH/Phenols (GC/MS - SIM)	0	5	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / ***Container*** / *Client Sample ID(s)*	***Sample Date***	*Extraction / Preparation*			*Analysis*
