- A layer of imported engineered fill and concrete slab, at least 1 m thick (**Figure F6** and **Appendix C**), noting that this additional excavation and rebuild of surface level is not yet confirmed as part of Multipurpose Stadium design.

The existing Site Suitability Statement and supporting assessments did not allow for any change in the existing surface elevation, and further included an assumption that intrusive maintenance works would be unlikely to take place at more than 2 m below current surface level. Additional risks may exist during construction or ongoing Site use from contact with deeper soil, or from increased risks of vapour intrusion as less vertical distance between potential vapour sources is present.

In addition, a proposed structure (the multipurpose stadium) extends beyond the assessment area boundaries, and must be considered in assessment of the suitability of development.

It is noted that groundwater beneath the Goods Shed and Yard has been historically detected at between 0 and 1 mAHD (see **Figure F12a-d**), and no contact with groundwater is expected or should occur during long term Site use. Any potential contact with groundwater should be managed in accordance with the SEMP, and by a CEMP during construction.

In order to manage and mitigate risks to future Site users from changes to elevation, the next update to the SEMP will include the following requirements:

- Any engineered fill or other materials used to increase the surface level to 3 mAHD must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.
- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Vapour protection for CS3, as discussed in **Section 5.2.2**, with independently verified design and installation is to be included in any structures to be established in this area. Any selected protection measure must be suitable to prevent vapour intrusion from TPH, BTEXN, and methane.
- While not currently proposed as part of the development of this area, the SEMP should be updated to include the following planning control for any future structures where groundwater may be at or within 1 m of the surface:
  - Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, design and construction must include measures to prevent:
    - Potential vapour intrusion into buildings and structures as discussed in **Section 5.2.2**.
    - Groundwater intrusion into buildings and structures such as drainage or tanking. Any drained groundwater must be considered potentially contaminated waste and be removed by a licenced waste transporter or discharged under a trade waste agreement.
    - Any dewatering must also consider and include measures to prevent potential exposure and oxidation of PASS in any previously saturated soil which is drained.
- Prior to development of this area, Site Suitability Statements must be issued for portions of the land beyond the assessment area boundaries which proposed building structures extend to. The structures which are currently proposed across multiple assessment areas are listed in **Table 27** in **Section 5.3**. The updates and management measures relating to ASS described in **Section 5.5.1** must also be implemented.

If the above mitigations and management measures are implemented, no unacceptable risks to future users are considered to be introduced by the proposed change in land use and elevation.

6.2 The Escarpment (Audit Area 4 West)

6.2.1 Additional Environmental Data

6.2.1.1 Soil

Additional soil data for the Escarpment collected since issue of the Site Suitability Statement for this area consists of:

- 25 primary samples collected during *in situ* sampling to categorise soil to be excavated from this area (AECOM, 2025b), from 9 locations at *in situ* categorisation grid based sample bores E7, E8, F7, F8, G6, G7, H6, H7, and I6.
- Four primary samples collected during installation of groundwater wells MW120A and MW194 in 2025 (AECOM, 2025d).

Locations of soil samples which have provided new data are shown on **Figure F8** and **Figure F10**. Results of soil sampling are screened against the Tier 1 criteria in **Table T1** to **Table T3**, and against the RC on **Table T4**.

Soil locations with exceedances of adopted criteria collected since issue of the Site Suitability Statements are shown screened against criteria in **Figure F11a-e**.

Due to the number and density of sample locations, visual display of exceedances of Tier 1criteria for the *in situ* characterisation samples (AECOM, 2025b) on a figure is not practicable, and review of these samples against Tier 1 criteria are discussed below. Exceedances of the RC in the *in situ* characterisation samples is shown on **Figure F11e**.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in soil samples collected after issue of the Site Suitability Statement:

- Low / Medium to High Density Residential – metals (lead); PAHs (benzo(a)anthracene, benzo(a)pyrene, dibenz(a,h)anthracene)
- Commercial/Industrial – PAHs (benzo(a)pyrene)
- Recreation / Open Space - PAHs (benzo(a)anthracene, benzo(a)pyrene, dibenz(a,h)anthracene)
- Modified / Highly Modified Ecosystems – TRH >C16-C34, metals (copper, lead, nickel, zinc), PAHs (benzo(a)pyrene).

The other PEVs which are precluded, based on exceedances of criteria detected in soil in the new data considered in this assessment, are consistent with the level of residual contamination described in the existing Site Suitability Statement. The Site is considered suitable for the new development if the mitigation and management measures detailed in the SEMP are implemented to prevent a complete exposure pathway from being established between future Site users and residual soil contamination.

No exceedances of soil RC have been detected in or adjacent to the Escarpment in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in that assessment. In addition, exceedance of the RC in soil to the south of the Precinct North (in the Precinct South) were excavated and removed in 2023 (AECOM, 2024f), noting that while the report on this remediation has not yet been finalised, all impacted soil within the Precinct North was considered removed in the Site Suitability Statement.

No change in precluded PEVs, and no requirement for further soil remediation, is considered to be identified based on the additional data collected in the Escarpment since issue of the Site Suitability Statement.

6.2.1.2 Groundwater

The groundwater wells, in or adjacent to the Escarpment, which have had groundwater samples collected and analysed since the Site Suitability Statement for this area was issued are listed in **Table 21** below.

Table 21 Groundwater Wells in and adjacent to the Escarpment

Well ID	Description	Included in Existing Site Suitability Statement?	Recent GME Data		
			Targeted GME – The Gateway (2022)	Targeted GME – The Precinct South (2023)	Site-Wide GME (2025
Within the Escarpment					
BG1	Shallow (<10 m bgl) aquifer well, central area. Previously treated as background well – potentially screened across fill and dolerite. MW194 installed adjacent screened in dolerite	✓	×	×	✓
M3	Shallow (<10 m bgl) aquifer well, central area. Considered lost/destroyed under new roadway	✓	×	×	×
MW103	Shallow (<10 m bgl) aquifer well, south central area. Lost/destroyed.	✓	×	×	×
MW120	Shallow (<10 m bgl) aquifer well, north-west corner. Previously treated as background well – considered lost/destroyed by installation of an access stairway (the StairLink) in the area	✓	×	×	×
MW120A	Shallow (<10 m bgl) aquifer well, north-west corner. Replacement for MW120	×	×	×	✓
NR3	Shallow (<10 m bgl) aquifer well, eastern boundary. Appears to be filled with gravel / not considered suitable for sampling.	✓	×	×	×
MW194	Shallow (<10 m bgl) aquifer well, central area. Adjacent to BG1 and screened in dolerite aquifer only.	×	×	×	✓
Adjacent Areas					
MW145	Shallow (<10 m bgl) aquifer well, cross-gradient over eastern boundary in Audit Area 4 East. Casing filled with concrete – considered destroyed	✓	×	×	×
NR1	Shallow (<10 m bgl) aquifer well, cross-gradient over eastern boundary in Audit Area 4 East.	✓	×	×	×
MW121	Shallow (<10 m bgl) aquifer well, cross gradient and south-west in the Promenade and Underground Carpark.	×	×	×	✓
MW131	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
MW132	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
MW133	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
MW134	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
R1	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×

Well ID	Description	Included in Existing Site Suitability Statement?	Recent GME Data		
			Targeted GME – The Gateway (2022)	Targeted GME – The Precinct South (2023)	Site-Wide GME (2025
BH1_PS	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Lost/destroyed	✓	×	×	×
MW177	Shallow (<10 m bgl) aquifer well, south-east and down-gradient in the Promenade and Underground Carpark.	×	×	×	✓
MW182	Shallow (<10 m bgl) aquifer well, south-east and down-gradient in the Promenade and Underground Carpark. Delineates LNAPL Plume A1	×	×	×	✓
MW183	Shallow (<10 m bgl) aquifer well, south-east and down-gradient in the Promenade and Underground Carpark. Installed in LNAPL Plume A1	×	×	×	✓
MW184	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Installed between LNAPL Plumes A1 and A2.	×	×	×	✓
MW190	Shallow (<10 m bgl) aquifer well, south-west and down-gradient in the Precinct North.	×	×	×	✓
MW191	Shallow (<10 m bgl) aquifer well, south and down-gradient in the Promenade and Underground Carpark. Delineates LNAPL Plume A2	×	×	×	✓

Notes: ✓: Analytical data available; ×: Analytical data not available

The following is noted on the spatial and temporal distribution of monitoring of groundwater at and around the Escarpment since the Site Suitability Statement was issued:

- No off-Site background wells are present. However, BG1, MW120A, and MW194 are upgradient of historic land contaminating activities and are considered to represent background conditions.
- A number of wells downgradient have been lost/destroyed by Site activities undertaken since issue of the Site Suitability Statement. However, replacement wells (as discussed in AECOM, 2024d) have been installed and sampled to fulfil the purposes of these wells.
- Only one GME, which included sampling of groundwater in or adjacent to the Escarpment, has been conducted since issue of the Site Suitability Statement. However, no potentially contaminating activities are considered to have occurred in this area, and no requirement for future or ongoing monitoring was identified as part of the Site Suitability Statement. The GME conducted in 2025 was undertaken to confirm past results.

Groundwater well locations are shown on **Figure F10**. Results of groundwater sampling are screened against the Tier 1 criteria in **Table T6** to **Table T8**, and against the RC in **Table T9**, with exceedances of adopted criteria are shown on **Figure F13a-c**. Groundwater samples have typically been assessed for key CoPC with exceedances detected in previous GMEs, including TRH/TPH, PAHs, and metals.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in groundwater samples collected after issue of the Site Suitability Statement:

- Drinking Water (Human Health) – benzene, toluene, naphthalene, metals (manganese); cyanide (total)
- Drinking Water (Aesthetics) – metals (manganese); Major Ions (chloride, sodium, sulfate (as SO_4)); TDS

- Recreation (Primary/Secondary Contact) – benzene, naphthalene
- Eco-system protection – TRH (>C10-C40 (sum)); TPH (C10-C36 (sum)); metals (copper, manganese, zinc); Phenolic compounds (2,4-dimethylphenol)
- Vapour Intrusion (Residential) – TRH (>C10-C16).

These CoPC and concentrations are consistent with the data considered in the existing Site Suitability Statement. It is noted that:

- Groundwater is not considered likely to be extracted for drinking purposes, based on the available urban reticulated water supply at the Site and surrounding areas, and the high TDS concentrations. Extraction of groundwater for drinking purposes is restricted by the SEMP.
- Exceedances of recreation criteria are delineated and below criteria in MW153, located down-gradient of the Site prior to the inferred point of discharge (Sullivan's Cove to the south), and are not considered likely to be above criteria at the point of discharge or where contact with receptors may potentially occur.
- As discussed in **Section 5.5.5,** the *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), including the 2025 addendum (AECOM, 2025i) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).
- Residential use is not proposed for this area and the exceedances of vapour intrusion criteria is not considered to represent an unacceptable risk to the proposed development.

LNAPL Plumes A1 and A2 are inferred down-gradient of the Escarpment, and while groundwater contours from February 2025 (**Figure F12c**) indicate there is potential for northerly flow from LNAPL plumes areas, it was noted at the time these contours were derived that this was likely to be an artifact as no wells along the northern boundary of the Site were accessible for gauging at that time (AECOM, 2025f). The updated contours from gauging in June 2025 (**Figure F12d**, AECOM, 2025d) do not show a northerly component of groundwater flow.

Based on assessment of LNAPL Plumes in 2025 (see **Section 5.5.4.1**), detectable LNAPL was not present in or adjacent to this assessment area, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (Former LNAPL Plume A3). No groundwater concentrations indicative of free-phase LNAPL was detected, and LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development, provided the controls in the SEMP (AECOM, 2025h) are implemented.

No exceedances of groundwater RC have been detected in or adjacent to the Escarpment in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in that assessment, and no requirement for groundwater remediation is considered to be present.

Based on the distribution (temporal and spatial) of groundwater sampling, the consistency of results with previous monitoring, and no exceedances of RC detected, there have been no changes in groundwater conditions which would indicate an unacceptable risk to future Site users since issue of the Site Suitability Statement for this area, if the management controls within the SEMP are implemented.

6.2.1.3 Soil Vapour

No soil vapour sampling events has occurred involving locations in the Escarpment since the issue of the Site Suitability Statement. Soil vapour intrusion has not been identified as a risk within this area based on soil or groundwater samples collected and analysed and the proposed future uses of the area, and no vapour protection system is considered required for any structures contained entirely within this assessment area, such as if the existing Goods Shed is moved to the Escarpment, as proposed.

However, it is considered that there are potential risks of soil vapour intrusion under the proposed development of the Site as:

- Soil vapour from other parts of the Site has the potential to laterally migrate along the base of proposed structures (i.e., the Multipurpose Stadium) which extend beyond the boundaries of this area, and may have a risk of infiltration in this area (**Section 6.5**). Concentrations of methane,

BTEXN, and TPH/TRH have been detected in soil vapour in areas of the Site which share a building footprint with this area.

On this basis, it is considered that there are potential risks of vapour intrusion into new structures in this area by methane, BTEXN and TPH/TRH vapours if development continues as proposed.

Mitigation and management measures, as discussed in **Section 5.2.2**, will be required for future development.

6.2.2 Change in Land Use and Elevation

The current Site Suitability Statement for the Escarpment states that *the site is suitable for the site uses as follows: residential, including medium to high density, retail, commercial, recreational/public open space use, transport (roads etc) and other less sensitive uses,* subject to specific conditions which are detailed in Site Suitability Statement.

The updated uses of this assessment area, consisting of the Multipurpose Stadium and Associated Concourse and relocation of the Goods Shed, which are considered commercial uses, and open spaces are included in the existing Site Suitability Statement, which is considered applicable for the current surface elevation.

In addition, proposed structures (the Multipurpose Stadium and underground carpark) extend beyond the assessment area boundaries, and must be considered in assessment of the suitability of development.

As part of development, it is proposed that the surface of this area be reduced as follows (see **Section 5.3.2** and **Figure F5**):

- 3 mAHD within the footprint of the Multipurpose Stadium, which would require reduction of the current Site surface elevation by between approximately 2 to 3.5 m.
- 4.8 mAHD in the practice wickets area, which would require reduction of the current Site surface elevation by between approximately 2.5 to 3 m.
- 1.7 mAHD in a proposed basement carpark area, which would require reduction of the current Site surface elevation by between approximately 3 to 4 m.

The proposed final surface elevation is shown on **Figure F5**. Deeper excavations may be required for installation of:

- Footings or foundations, which are likely to extend to bedrock. While dolerite is relatively shallow (<2 m bgl) in the northern portion of the Escarpment, deeper areas exist to in the southern and eastern portions of the area.
- A layer of imported engineered fill and concrete slab, at least 1 m thick (**Figure F6** and **Appendix C**), noting that this additional excavation and rebuild of surface level is not yet confirmed as part of Multipurpose Stadium design.

The existing Site Suitability Statement and supporting assessments did not allow for any change in the existing surface elevation, and further included an assumption that intrusive maintenance works would be unlikely to take place at more than 2 m below current surface level. Additional risks may exist during construction or ongoing Site use from contact with deeper soil, or from increased risks of vapour intrusion as less vertical distance between potential vapour sources is present.

It is also noted that groundwater beneath the Escarpment has been historically detected at between 2 and 5 mAHD. The potential exists for groundwater to come into contact with deeper excavations and potentially the surface elevation based on the current development, and to infiltrate the proposed underground carpark. Assessment of risks and mitigations associated with the intersection of groundwater and proposed final surface elevations is provided in **Section 6.5.2**. However, based on this assessment, no unacceptable risks to future users have been identified based on the 70% complete stadium design.

In order to manage and mitigate risks to future Site users from changes to elevation, the next update to the SEMP will include the following requirements:

- Any engineered fill or other materials used to increase the surface level must either:

- Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
- Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.

- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Vapour protection for CS3, as discussed in **Section 5.2.2**, with independently verified design and installation is to be included in any structures to be established in this area. Any selected protection measure must be suitable to prevent vapour intrusion from TPH, BTEXN, and methane.
- Groundwater drainage in the north, west and north-west of the stadium must include:
  - Capture and disposal as potentially contaminated waste of any drained groundwater.
  - No intersection between drainage layers and the locations of LNAPL plumes.
  - A vapour mitigation layer is present above the drainage layer, which the same performance requirements as described in **Section 5.2.2**
  - Assessment of any soil to be dewatered and management of potential PASS as described in **Section 5.5.1**.
- The SEMP should be updated to include the following planning control for any future structures where groundwater may be at or within 1 m of the surface:
  - Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, design and construction must include measures to prevent:
    - Potential vapour intrusion into buildings and structures as discussed in **Section 5.2.2**.
    - Groundwater intrusion into buildings and structures such as drainage or tanking. Any drained groundwater must be considered potentially contaminated waste and be removed by a licenced waste transporter or discharged under a trade waste agreement.
    - Any dewatering must also consider and include measures to prevent potential exposure and oxidation of PASS in any previously saturated soil which is drained.
- Prior to development of this area, Site Suitability Statements must be issued for portions of the land beyond the assessment area boundaries which proposed building structures extent to. The structures which are currently proposed across multiple assessment areas are listed in **Table 27** in **Section 5.3**.
- The updates and management measures relating to ASS described in **Section 5.5.1** must also be implemented.

If the above mitigations and management measures are implemented and documented in the SEMP, no unacceptable risks to future users are considered to be introduced by the proposed change in land use and elevation.

6.3 The Promenade and Underground Carpark (Lot E and UGC)

6.3.1 Additional Environmental Data

6.3.1.1 Soil

Additional soil data for the Escarpment collected since issue of the Site Suitability Statement for this area consists of:

- 247 primary samples collected during *in situ* sampling to categorise soil to be excavated from this area (AECOM, 2025b), from 41 locations at *in situ* categorisation grid based sample bores C12, D11 to D13, E9 to E13, F8 to F13, G8 to G13, I7 to I13, and J6 to J13.
- 14 primary samples collected during installation of groundwater wells MW182 to MW186, and MW191, and soil vapour bores SV31 and SV32 in 2025 (AECOM, 2025d).

Locations of soil samples which have provided new data are shown on **Figure F8** and **Figure F10**. Results of soil sampling are screened against the Tier 1 criteria on **Table T1** to **Table T3**, and against the RC on **Table T4**.

Soil locations with exceedances of adopted criteria collected since issue of the Site Suitability Statements are shown screened against criteria in **Figure F11a-e**.

Due to the number and density of sample locations, visual display of exceedances of Tier 1 criteria for the *in situ* characterisation samples (AECOM, 2025b) on a figure is not practicable, and review of these samples against Tier 1 criteria are discussed below. Exceedances of the RC in the *in situ* characterisation samples are shown on **Figure F11e**.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in soil samples collected after issue of the Site Suitability Statement:

- Low / Medium to High Density Residential – TRH (>C10-C16(minus naphthalene), >C16-C34, >C34-C40), metals (arsenic, cadmium, lead, zinc); PAHs (benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs)
- Commercial/Industrial – metals (lead); PAHs (benz(a)anthracene, benzo(b)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene)
- Recreation / Open Space - TRH ((>C10-C16(minus naphthalene, >C16-C34, >C34-C40), metals (lead), PAHs (benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs)
- Modified / Highly Modified Ecosystems – TRH (>C16-C34), metals (copper, lead, nickel, zinc), PAHs (benzo(a)pyrene)
- Vapour Intrusion (Residential) – TRH (>C10-C16 (excluding naphthalene)); PAHs (naphthalene)
- Vapour Intrusion (Commercial/Industrial) – TRH (>C10-C16 (excluding naphthalene)); PAHs (Naphthalene).

Residential use is not proposed in this area, or in any structures which have footprints which included this area, and thus the detected exceedance of the vapour intrusion criteria for residential use is not considered to represent an unacceptable risk to human health for the proposed development. The required vapour mitigation measures provided in the SEMP and discussed in **Section 5.2.2** provide additional mitigation against vapour intrusion.

The other PEVs which are precluded, based on exceedances of criteria detected in soil in the new data considered in this assessment, are consistent with the level of residual contamination described in the existing Site Suitability Statement. The Site is considered suitable for the new development if the mitigation and management measures detailed in the SEMP are implemented to prevent a complete exposure pathway from being established between future Site users and residual soil contamination.

Exceedances of the RC in this area are presented in **Table 22** below.

Table 22 Soil RC Exceedances - The Promenade and Underground Carpark

Land Use	CoPC	RC	Exceedance Locations
Potential Future Commercial (unknown construction or multi-storey building)	TRH >C10-C16 (minus naphthalene)	140 mg/kg	• E10, F10, G10, G11, H09, H10, H11, I10, I11, J10 • MW183, MW184, MW185, MW186, SV32
	Naphthalene	12 mg/kg	• G10
Potential Future Commercial/Light Industrial Workers (working within a basement)	TRH >C10-C16 (minus naphthalene)	770 mg/kg	• E10, F10, G10, G11, H09, H10, H11, I11 • MW183, MW184, MW185
	Naphthalene	97 mg/kg	• G10
Potential Future Maintenance Worker	Lead	620 mg/kg	• F11, G11, G13, H10, H12, H13, I13, J06, J08, J10, J12

These exceedances of the RC are not considered to represent unacceptable risks to the future development of the Site or a requirement for future remediation as:

- Exceedances of RC for TRH >C10-C16 and naphthalene in soil may represent a risk of potential vapour intrusion into future structures. However, soil and groundwater concentrations are indirect measures and, where available, actual soil vapour or air samples should be considered to determine the level of risk from soil vapour.

  On this basis, the following has been considered for assessment of risks of vapour intrusion from soil to future commercial/light industrial workers:

  - The samples with exceedances of the commercial/light industrial worker RC collected from groundwater monitoring wells are all from locations in the vicinity of soil vapour bores tested as part of the same event (2025d), as listed below in **Table 23**.

Table 23 The Promenade and Underground Carpark - Distance between Groundwater Wells and Soil Vapour Bores

Groundwater Well	Nearby Soil Vapour Bore(s)	Approximate Distance (m)
MW183	SV31	4.2
MW184	SV31	24
	SV32	30
MW185	SV32	2.5
MW186	SV32	30

  No soil vapour concentrations in either soil vapour bore in the proximity to these locations, or any other soil vapour bores installed currently (see **Section 6.3.1.3**) or historically (Coffey, 2021a), have reported soil vapour concentrations of TRH or naphthalene which would indicate a potential risk to future Commercial/Industrial use. The sources of hydrocarbons in soil in this location are LNAPL Plumes A1 and A2, which have been identified as diesel ultimately sourced from historic fuel storage for rail refuelling in this area, and while there is some distance between the exceedances in MW184 and MW186 and the soil vapour bores, it is considered probable that the fuel impacts in these locations would have similar properties and concentrations of vapour generation.

  - Soil vapour sampling was conducted in SV32, where an exceedance in soil was detected, and did not report potentially hazardous levels of soil vapour (see **Section 6.3.1.3**).

  - The samples with exceedances collected from *in situ* characterisation bores (E10, F10, G10, G11, H09, H10, H11, I10, I11, J10) are located in the same areas of historic railyard activities

(see **Figure F4**) and typically downgradient of the LNAPL plumes and historic refuelling activities, or of the former Roundhouse where maintenance and refuelling of rail engines was conducted in this area and ended in the 1980s, and the source of hydrocarbons is inferred to be primarily diesel fuel used for rail work. It is noted that:

- All soil with identified hydrocarbon exceedances from these bores is intended for excavation as part of development and will not remain on-Site.
- It is considered likely that, based on the source and age of impacts, the hydrocarbons present in soil are likely to be of low volatility and have had long periods to generate and release more hazardous volatile constituents. Similar to the samples from groundwater wells and soil vapour bores in this area discussed above, it is not considered likely that hazardous vapour concentrations will be generated by these impacts.

Based on the above, it is considered that, based on CoPC concentrations in soil vapour, that there is a low risk of vapour intrusion from soil impacts, although it cannot be completely discounted as some locations with soil concentrations indicative of vapour risk are not in the vicinity of soil vapour bores. To mitigate and manage potential risks, future structures in this area are considered to require a vapour protection system with an independently verified design and installation, as described in **Section 5.2.2**.

- All exceedances of the future maintenance worker RC for lead are within the volume of soil proposed for excavation as part of development (AECOM, 2025b), with locations shown on **Figure F11e**. The exceedances detected in samples F11_2.5, G11_1.5, H10_2.5, H12_2.5, H13_1.5, H13_2.0, J06_2.0, J06_2.5, J08_1.5, J10_1.0, J12_1.0 are delineated vertically by shallower and deeper samples (**Table T4**), and will be removed by excavation as part of development. However, the remaining samples (G13_2.5, G13_3.0, and I13_1.5), were collected from the bottom of boreholes, and may remain on Site following development.

  Direct remediation of the detected impacts is not practicable at this time due to tenant leases in the areas of detected impact.

  For development of the Site, the following should be undertaken to mitigate risks of potential exposure to lead in soil by future intrusive maintenance workers:

  - The elevated lead detections listed above must be noted in the SEMP as potential area(s) of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.
  - The soil with elevated lead concentrations should be remediated if accessible, and if bulk excavation for development does not occur.
  - Any subsurface services in this area should be installed in sealed conduits or clean soil corridors to minimise any ongoing contact with existing Site soil, including any lead-impacted soil which is not removed as part of Site development, by future maintenance workers.

No change in precluded PEVs, and no requirement for further soil remediation, is considered to be identified based on the additional soil data collected in the Promenade and Underground Carpark since issue of the Site Suitability Statement.

6.3.1.2 Groundwater

The groundwater wells, in or adjacent to the Promenade and Underground Carpark, which have had groundwater samples collected and analysed since the Site Suitability Statement for this area was issued are listed in **Table 24** below.

BG1	Shallow (<10 m bgl) aquifer well, north and up-gradient in the Escarpment	×	×	×	✓

Notes: ✓: Analytical data available; ×: Analytical data not available

The following is noted on the spatial and temporal distribution of monitoring of groundwater at and around the Promenade and Underground Carpark since the Site Suitability Statement was issued:

- No off-Site background wells are present. However, BG1, MW121, and MW194 are upgradient of historic land contaminating activities and are considered to represent background conditions.
- A number of wells downgradient have been lost/destroyed by Site activities undertaken since issue of the Site Suitability Statement. However, replacement wells (as discussed in AECOM, 2024d) have been installed and sampled to fulfil the purposes of these wells.
- Sampling has been undertaken in former areas of potential concern within this area near LNAPL plumes, and up-, cross- and down-gradient, since issue of the Site Suitability Statement, and is considered suitable for detection of any changes in the risk profile or groundwater conditions.

Groundwater well locations are shown on **Figure F10**. Results of groundwater sampling are screened against the Tier 1 criteria in **Table T6** to **Table T8**, and against the RC in **Table T9**, with exceedances of adopted criteria are shown on **Figure F13a-c**. Groundwater samples have typically been assessed for key CoPC with exceedances detected in previous GMEs, including TRH/TPH, PAHs, and metals.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in groundwater samples collected after issue of the Site Suitability Statement:

- Drinking Water (Human Health) – metals (manganese), cyanide (total)
- Drinking Water (Aesthetics) – metals (manganese); Major Ions (chloride, sodium, sulfate (as SO_4)); TDS
- Ecosystem protection – TRH (>C10-C40 (sum)); TPH (C10-C36 (sum)), metals (aluminium, copper, manganese, zinc); PAHs (phenanthrene, fluoranthene); Nutrients (ammonia (as N))
- Vapour Intrusion (Structures) – methane.

These CoPC and concentrations are consistent with the data considered in the existing Site Suitability Statement, noting that methane in groundwater was not considered in that assessment. It is noted that:

- Groundwater is not considered likely to be extracted for drinking purposes, based on the available urban reticulated water supply at the Site and surrounding areas, and the high TDS concentrations. Extraction of groundwater for drinking is restricted by the SEMP.
- As discussed in **Section 5.5.5,** the *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), including the 2025 addendum (AECOM, 2025i) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).
- Residential use is not proposed for this area and the exceedances of vapour intrusion criteria is not considered to represent an unacceptable risk to the proposed development.
- Protection against methane intrusion was considered in the Site Suitability Statement for this area, and the requirements within **Section 5.2.2** are consistent with the controls adopted as part of the previous assessment of Site Suitability.

LNAPL Plumes A1 and A2 are within the Promenade and Underground Carpark, and former LNAPL Plume A3 is inferred down-gradient. Based on assessment of LNAPL Plumes in 2025 (refer to **Section 5.5.4.1**), measurable LNAPL was not present in or adjacent to this assessment area, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3). No groundwater concentrations indicative of free-phase LNAPL were detected, and LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development, provided the controls in the SEMP (AECOM, 2025h) are implemented.

No exceedances of groundwater RC have been detected in or adjacent to the Promenade and Underground Carpark in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in that assessment, and no requirement for groundwater remediation is considered to be present.

Based on the distribution (temporal and spatial) of groundwater sampling, the consistency of results with previous monitoring, and no exceedances of RC detected, there have been no changes in groundwater conditions which would indicate an unacceptable risk to future Site users since issue of the Site Suitability Statement for this area, if the management controls in the SEMP are implemented.

6.3.1.3 Soil Vapour

One soil vapour sampling event, conducted in 2025 (AECOM, 2025d), has occurred, involving two locations (SV31 and SV32) in the Promenade and Underground Carpark since the issue of the Site Suitability Statement.

New soil vapour date from both bores reported concentrations of methane which indicate a potential risk of vapour intrusion. In addition:

- Vapour management and mitigation for potential methane and TRH/TPH vapour intrusion was required for this area under the existing Site Suitability Statement, and none of the new data received or in the changes in proposed development is considered to change these requirements.
- Soil vapour from other parts of the Site has the potential to laterally migrate along the base of proposed structures (i.e., the Multipurpose Stadium) which extend beyond the boundaries of this area, and may have a risk of infiltration in this area (**Section 6.5**). Concentrations of methane, BTEXN, and TPH/TRH have been detected in soil vapour in areas of the Site which share a building footprint with this area.

On this basis, it is considered that there are potential risks of vapour intrusion into new structures in this area by methane, BTEXN and TPH/TRH vapours if development continues as proposed.

Mitigation and management measures, as discussed in **Section 5.2.2**, will be required for future development.

6.3.2 Change in Land Use and Elevation

The current Site Suitability Statement for the Promenade and Underground Carpark states that *the site is suitable for the site uses as follows: residential (including medium to high density), commercial/*

industrial, recreational/public open space use, access way and transport (roads etc) and other less sensitive uses, subject to specific conditions which are detailed in Site Suitability Statement.

The updated use of this assessment area, consisting of the Multipurpose Stadium and Associated Concourse, is considered a commercial/industrial land use. The following areas of the Promenade and Underground Carpark area were not assessed as suitable for commercial/industrial land use in the existing Site Suitability Statement:

- The Access Link area, a proposed open air transport corridor, and a section of the Open Space area, along the eastern boundary of the assessment area, which were assessed and considered suitable for Open Space use in the Site Suitability Statement (see **Figure F3**), are now proposed as part of the Multipurpose Stadium. The north-east corner of the Access Link is also now proposed to form part of the new underground carpark in the north-east of the Site.

  Potential vapour intrusion risks for commercial use (the new proposed land use) from hydrocarbons in soil were identified in this area in the Site Suitability Statement.

In addition, proposed structures (the Multipurpose Stadium and underground carpark) extend beyond the assessment area boundaries, and must be considered in assessment of the suitability of development.

As part of development, it is proposed that the surface of this area be reduced as follows (see **Section 5.3.2** and **Figure F5**):

- 3 mAHD within the footprint of the Multipurpose Stadium, which would require reduction of the current Site surface elevation by between approximately 2 to 3.5 m.
- 4.8 mAHD in the practice wickets area, which would require reduction of the current Site surface elevation by between approximately 1.5 to 2.5 m.
- 1.7 mAHD in a proposed basement carpark area, which would require reduction of the current Site surface elevation by between approximately 3 m (noting that only a relatively minor portion of the Promenade and Underground Carpark is proposed for the basement carpark).

The proposed final surface elevation is shown on. Deeper excavations may be required for installation of:

- Footings or foundations, which are likely to extent to bedrock. While dolerite is relatively shallow (<2 m bgl) in the north-west portion of the Promenade and Underground Carpark, deeper areas exist to in the southern and eastern portions of the area.
- A layer of imported engineered fill and concrete slab, at least 1 m thick (**Figure F6** and **Appendix C**), noting that this additional excavation and rebuild of surface level is not yet confirmed as part of Multipurpose Stadium design.

It is also noted that groundwater beneath the Promenade and Underground Carpark has been historically detected at between ~1 and 4 mAHD. The potential exists for groundwater to come into contact with deeper excavations and potentially the surface elevation based on the current development, and to infiltrate the proposed underground carpark. Assessment of risks and mitigations associated with the intersection of groundwater and proposed final surface elevations is provided in **Section 6.5.2**. However, based on this assessment, no unacceptable risks to future users have been identified based on the 70% complete stadium design.

In order to manage and mitigate risks to future Site users from changes to elevation, the next update to the SEMP will include the following requirements:

- Any engineered fill or other materials used to increase the surface level must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.

- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Vapour protection for CS3, as discussed in **Section 5.2.2**, with independently verified design and installation is to be included in any structures to be established in this area. Any selected protection measure must be suitable to prevent vapour intrusion from TPH, BTEXN, and methane.
- Groundwater drainage in the north, west and north-west of the stadium must include:
  - Capture and disposal as potentially contaminated waste of any drained groundwater.
  - No intersection between drainage layers and the locations of LNAPL plumes.
  - A vapour mitigation layer is present above the drainage layer, which the same performance requirements as described in **Section 5.2.2**
  - Assessment of any soil to be dewatered and management of potential PASS as described in **Section 5.5.1**.
- The SEMP should be updated to include the following planning control for any future structures where groundwater may be at or within 1 m of the surface:
  - Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, design and construction must include measures to prevent:
    - Potential vapour intrusion into buildings and structures as discussed in **Section 5.2.2**.
    - Groundwater intrusion into buildings and structures such as drainage or tanking. Any drained groundwater must be considered potentially contaminated waste and be removed by a licenced waste transporter or discharged under a trade waste agreement.
    - Any dewatering must also consider and include measures to prevent potential exposure and oxidation of PASS in any previously saturated soil which is drained.
- Prior to development of this area, Site Suitability Statements must be issued for portions of the land beyond the assessment area boundaries which proposed building structures extend to. The structures which are currently proposed across multiple assessment areas are listed on **Table 27** in **Section 5.3**.
- The updates and management measures relating to ASS described in **Section 5.5.1** must also be implemented.

If the above mitigations and management measures are implemented and documented in the SEMP, no unacceptable risks to future users are considered to be introduced by the proposed change in land use and elevation.

6.4 The Precinct North (Lot B)

6.4.1 Additional Environmental Data

6.4.1.1 Soil

Additional soil data for the Precinct North collected since issue of the Site Suitability Statement for this area consists of:

- 51 primary samples collected during *in situ* sampling to categorise soil to be excavated from this area (AECOM, 2025b), from 11 locations at *in situ* categorisation grid based sample bores K06 to K10, L08 to L10, M09 to M11, and N09 to N11.
- 8 primary samples collected during installation of groundwater wells MW187, MW190 and MW192, and soil vapour bores SV33, SV34 and SV35 in 2025 (AECOM, 2025d).

Locations of soil samples which have provided new data are shown on **Figure F8** and **Figure F10**. Results of soil sampling are screened against the Tier 1 criteria in **Table T1** to **Table T3**, and against the RC in **Table T4**.

Soil locations with exceedances of adopted criteria collected since issue of the Site Suitability Statements are shown screened against criteria in **Figure F11a-e**.

Due to the number and density of sample locations, visual display of exceedances of Tier 1 criteria for the *in situ* characterisation samples (AECOM, 2025b) on a figure is not practicable, and review of these samples against Tier 1 criteria are discussed below. Exceedances of the RC in the *in situ* characterisation samples is shown on **Figure F11e**.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in soil samples collected after issue of the Site Suitability Statement:

- Low / Medium to High Density Residential – TRH (>C16-C34), metals (arsenic, chromium, lead); PAHs (benz(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs)
- Commercial/Industrial – metals (lead), PAHs (benz(a)anthracene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene)
- Recreation / Open Space - TRH (>C10-C16, >C16-C34), metals (arsenic, chromium, lead), PAHs (benz(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs)
- Modified / Highly Modified Ecosystems – TRH (>C16-C34), metals (arsenic, copper, lead, nickel, zinc), PAHs (benzo(a)pyrene)
- Vapour Intrusion (Residential) – TRH (C6-C10 (excluding BTEX), >C10-C16(excluding naphthalene), PAHs (naphthalene)
- Vapour Intrusion (Commercial/Industrial) – TRH (>C10-C16 (excluding naphthalene)).

Residential use is not proposed in this area, or in any structures which have footprints which included this area, and thus the detected exceedance of the vapour intrusion criteria for residential use is not considered to represent an unacceptable risk to human health for the proposed development. The required vapour mitigation measures provided in the SEMP, and discussed in **Section 5.2.2**, provide additional mitigation against vapour intrusion.

The other PEVs which are precluded, based on exceedances of criteria detected in soil in the new data considered in this assessment, are consistent with the level of residual contamination described in the existing Site Suitability Statement. The Site is considered suitable for the new development if the mitigation and management measures detailed in the SEMP are implemented to prevent a complete exposure pathway from being established between future Site users and residual soil contamination.

Exceedances of the RC in this area are presented in **Table 25** below.

Table 25 Soil RC Exceedances - The Promenade and Underground Carpark

Land Use	CoPC	RC	Exceedance Locations
Potential Future Commercial (unknown construction or multi-storey building)	TRH >C10-C16 (minus naphthalene)	140 mg/kg	• L08, M09, M10, M11, N11 • MW190
	Naphthalene	12 mg/kg	• M10
Potential Future Maintenance Worker	Lead	620 mg/kg	• K06, L08, M09, N10

These exceedances of the RC are not considered to represent unacceptable risks to the future development of the Site or a requirement for future remediation as:

- As noted in **Section 5.2.2**, future structures in this area will require a vapour protection system with an independently verified design and installation, which includes TRH and naphthalene in the CoPC which will be mitigated by it. Any residual vapour generation will be protected against by this barrier.
- All exceedances of the future maintenance worker RC for lead are within the volume of soil proposed for excavation as part of development. The exceedances detected in samples K06_1.0, L08_1.5, and M09_1.0 are delineated vertically by shallower and deeper samples, and will be removed entirely by excavation. However, the remaining detected, exceedance, N10_1.5, was collected at the base of a bore and lead impacted soil may remain following excavation.

  Direct remediation of the detected impacts is not practicable at this time due to tenant leases in the areas of detected impact.

  For development of the Site, the following should be undertaken to mitigate risks of potential exposure to lead in soil by future intrusive maintenance workers:

  - The elevated lead detections should be noted in the SEMP as potential area(s) of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.
  - Any subsurface services in this area should be installed in sealed conduits or clean soil corridors to minimise any ongoing contact with existing Site soil by future maintenance workers.

No change in precluded PEVs, and no requirement for further soil remediation, is considered to be identified based on the additional soil data collected in the Promenade and Underground Carpark since issue of the Site Suitability Statement.

6.4.1.2 Groundwater

The groundwater wells, in or adjacent to the Precinct North, which have had groundwater samples collected and analysed since the Site Suitability Statement for this area was issued are listed in **Table 26** below.

The following is noted on the spatial and temporal distribution of monitoring of groundwater at and around the Precinct North since the Site Suitability Statement of was issued:

- A number of wells downgradient have been lost/destroyed by Site activities undertaken since issue of the Site Suitability Statement. However, replacement wells (as discussed in AECOM, 2024d) have been installed and sampled to fulfil the purposes of these wells.
- Sampling has been undertaken in former areas of potential concern within this area near LNAPL plumes, and up-, cross- and down-gradient, since issue of the Site Suitability Statement, and is considered suitable for detection of any changes in the risk profile or groundwater conditions.

Groundwater well locations are shown on **Figure F10**. Results of groundwater sampling are screened against the Tier 1 criteria in **Table T6** to **Table T8**, and against the RC in **Table T9**, with exceedances of adopted criteria are shown on **Figure F13a-c**. Groundwater samples have typically been assessed for key CoPC with exceedances detected in previous GMEs, including TRH/TPH, PAHs, and metals.

Based on the review of the sample data, the following exceedances of Tier 1 criteria were detected in groundwater samples collected after issue of the Site Suitability Statement:

- Drinking Water (Human Health) – metals (manganese), PAHs (naphthalene), cyanide (cyanide total)
- Drinking Water (Aesthetics) – metals (manganese), Major Ions (chloride, sodium); TDS
- Recreation (Primary/Secondary Contact) - PAHs (naphthalene)
- Eco-system protection – TRH (>C10-C40 (sum)); TPH (C10-C36 (sum)), metals (aluminium, copper, manganese, zinc); PAHs (anthracene, phenanthrene, fluoranthene), Nutrients (ammonia (as N))

- Vapour Intrusion (Residential) – TRH (>C10-C16 (minus naphthalene))
- Vapour Intrusion (Structures) – methane.

These CoPC and concentrations are consistent with the data considered in the existing Site Suitability Statement, noting that methane in groundwater was not considered in that assessment. It is noted that:

- Groundwater is not considered likely to be extracted for drinking purposes, based on the available urban reticulated water supply at the Site and surrounding areas, and the high TDS concentrations. Extraction of groundwater for drinking purposes is restricted by the SEMP.
- As discussed in **Section 5.5.5,** the *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h), including the 2025 addendum (AECOM, 2025i) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).
- Residential use is not proposed for this area and the exceedances of vapour intrusion criteria is not considered to represent an unacceptable risk to the proposed development.
- Protection against methane intrusion was considered in the Site Suitability Statement for this area, and the requirements within **Section 5.2.2** are consistent with the controls adopted as part of the previous assessment of Site Suitability.

LNAPL Plumes A1 and A2 are inferred up-gradient within the Promenade and Underground Carpark, and former LNAPL Plume A3 was within the Precinct North.

Based on assessment of LNAPL Plumes in 2025 (see **Section 5.5.4.1**), measurable LNAPL was not present in or adjacent to this assessment area, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3). No groundwater concentrations indicative of free-phase LNAPL were detected, and LNAPL migration or impact in this assessment area is not considered likely to occur, and the presence of LNAPL is not considered to affect the suitability of this area for the proposed development, provided the controls in the SEMP (AECOM, 2025h) are implemented.

No exceedances of groundwater RC have been detected in or adjacent to the Precinct North in sampling events since issue of the Site Suitability Statement, which is consistent with the data considered in that assessment, and no requirement for groundwater remediation is considered to be present.

Based on the distribution (temporal and spatial) of groundwater sampling, the consistency of results with previous monitoring, and no exceedances of RC detected, there have been no changes in groundwater conditions which would indicate an unacceptable risk to future Site users since issue of the Site Suitability Statement for this area. Update to the assessment of risks to off-Site ecological receptors is underway and will be required prior to any change to the Site Suitability Statement.

6.4.1.3 Soil Vapour

One soil vapour sampling event, conducted in 2025 (AECOM, 2025d), has occurred involving four locations in the Precinct North (SV18, SV33, SV34 and SV35) since the issue of the Site Suitability Statement.

New soil vapour date from all bores reported concentrations of methane which indicate a potential risk of vapour intrusion. Soil vapour collected from bore SV18 also reported concentrations of naphthalene above the adopted criteria for residential land use.

In addition:

- Vapour management and mitigation for potential methane and TRH/TPH vapour intrusion was required for this area under the existing Site Suitability Statement, and none of the new data received or in the changes in proposed development is considered to change these requirements.
- Residential land use is not proposed for this area, and the detected naphthalene is not considered to indicate a potential risk to future users under the current development plan. However, it is noted that a risk naphthalene intrusion may be introduced by the proposed development as discussed in the next bullet point below.

- Soil vapour from other parts of the Site has the potential to laterally migrate along the base of proposed structures (i.e., the Multipurpose Stadium) which extend beyond the boundaries of this area, and may have a risk of infiltration in this area (**Section 6.5**). Concentrations of methane, BTEXN, and TPH/TRH have been detected in soil vapour in areas of the Site which share a building footprint with this area.

On this basis, it is considered that there are potential risks of vapour intrusion into new structures in this area by methane, BTEXN and TPH/TRH vapours if development continues as proposed.

Mitigation and management measures, as discussed in **Section 5.2.2**, will be required for future development.

6.4.2 Change in Land Use and Elevation

The current Site Suitability Statement for the Precinct North states that *site is suitable for the proposed site use of 'Arts and Institutional Area', which is considered to be a 'Commercial' use setting, involving commercial and cultural uses, including retail, (the site would also be suitable for high density residential uses above – but not on - the ground floor, and other less sensitive uses such as industrial use),* subject to specific conditions which are detailed in Site Suitability Statement.

The updated uses of this assessment area, consisting of the Multipurpose Stadium and Associated Concourse, the underground carpark, and buildings associated with the Antarctic Facilities Precinct and the Complementary Integrated Mixed Use Zone, which are considered commercial uses, and open spaces are included in the existing Site Suitability Statement, which is considered applicable for the current surface elevation, with the exception of underground carparking which was not considered for this assessment area in the Site Suitability Statement.

In addition, proposed structures (the Multipurpose Stadium and underground carpark) extend beyond the assessment area boundaries, and must be considered in assessment of the suitability of development.

As part of development, it is proposed that the surface of this area be reduced to:

- 3 mAHD within the footprint of the Multipurpose Stadium and concourse, or reduction of the Site surface elevation by between approximately 2.5 to 3.5 m.
- 2.9 mAHD in the Complementary Integrated Mixed Use Zone, or reduction of the Site surface elevation by between approximately 0.3 to 1 m.
- 1.7 mAHD in a proposed basement carpark area, or reduction of the Site surface elevation by between approximately 3 to 4 m.

The proposed final surface elevation is shown on **Figure F5**. Deeper excavations may be required for installation of:

- Footings or foundations, which are likely to extend to bedrock. While dolerite is relatively shallow (<2 m bgl) in the northern portion of the Precinct North, deeper areas exist to in the southern and eastern portions of the area.
- A layer of imported engineered fill and concrete slab, at least 1 m thick (**Figure F6** and **Appendix C**), noting that this additional excavation and rebuild of surface level is not yet confirmed as part of Multipurpose Stadium design.

The existing Site Suitability Statement and supporting assessments did not allow for any change in the existing surface elevation, or installation of basement structures, and further included an assumption that intrusive maintenance works would be unlikely to take place at more than 2 m below current surface level. Additional risks may exist during construction or ongoing Site use from contact with deeper soil, or from increased risks of vapour intrusion as less vertical distance between potential vapour sources is present.

It is also noted that groundwater beneath the Precinct North has been historically detected at between 0.5 and 1.5 mAHD. The potential exists for groundwater to come into contact with deeper excavations and potentially the surface elevation based on the current development, and to infiltrate the proposed underground carpark. Assessment of risks and mitigations associated with the intersection of groundwater and proposed final surface elevations is provided in **Section 6.5.2**. However, based on

this assessment, no unacceptable risks to future users have been identified based on the 70% complete stadium design.

In order to manage and mitigate risks to future Site users from changes to elevation, the next update to the SEMP will include the following requirements:

- Any engineered fill or other materials used to increase the surface level must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.
- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Vapour protection for CS3, as discussed in **Section 5.2.2**, with independently verified design and installation is to be included in any structures to be established in this area. Any selected protection measure must be suitable to prevent vapour intrusion from TPH, BTEXN, and methane.
- Groundwater drainage in the north, west and north-west of the stadium must include:
  - Capture and disposal as potentially contaminated waste of any drained groundwater.
  - No intersection between drainage layers and the locations of LNAPL plumes.
  - A vapour mitigation layer is present above the drainage layer, which the same performance requirements as described in **Section 5.2.2**
  - Assessment of any soil to be dewatered and management of potential PASS as described in **Section 5.5.1**.
- The SEMP should be updated to include the following planning control for any future structures where groundwater may be at or within 1 m of the surface:
  - Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, design and construction must include measures to prevent:
    - Potential vapour intrusion into buildings and structures as discussed in **Section 5.2.2**.
    - Groundwater intrusion into buildings and structures such as drainage or tanking. Any drained groundwater must be considered potentially contaminated waste and be removed by a licenced waste transporter or discharged under a trade waste agreement.
    - Any dewatering must also consider and include measures to prevent potential exposure and oxidation of PASS in any previously saturated soil which is drained.
- Prior to development of this area, Site Suitability Statements must be issued for portions of the land beyond the assessment area boundaries which proposed building structures extent to. The structures which are currently proposed across multiple assessment areas are listed on **Table 27** in **Section 5.3**.
- The updates and management measures relating to ASS described in **Section 5.5.1** must also be implemented.

If the above mitigations and management measures are implemented and documented in the SEMP, no unacceptable risks to future users are considered to be introduced by the proposed change in land use and elevation.

6.5 Changes Affecting Multiple Assessment Areas

6.5.1 Building Footprints and Structures Which Extent Across Multiple Areas

As noted in **Section 5.3.1**, the updated development plan of the Site includes proposed structures which extent across two or more of the assessment areas used in the Environmental Audit. As such, no construction of any structure should be commenced unless all areas within the proposed footprint have had Site Suitability Statements for the proposed use issued. **Table 27** below lists proposed structures which cover multiple assessment areas (see **Figure F2**).

Table 27 Proposed Structures which extend beyond assessment area boundaries

Structure	Assessment Areas
Multipurpose Stadium and Associated Concourse	• The Goods Shed and Yard • The Escarpment • The Promenade and Underground Carpark • The Precinct North • The Precinct South • The Gateway
The Antarctic Facilities Zone (buildings and underground carpark)	• The Escarpment • The Promenade and Underground Carpark • The Precinct North • Audit Area 4 East
Complementary Integrated Mixed Use Zone (building footprints)	• The Goods Shed and Yard • The Precinct North • The Precinct South

The potential for soil vapour intrusion has been identified at the Site (**Section 5.2.2**, and the sub-sections discussion soil vapour in **Sections 6.1** to **6.4**). Soil vapour can migrate laterally along the base of structures and infiltrate into other areas of the Site.

The proposed areas for the Multipurpose Stadium and underground carpark are adjacent to each other, and the underground carpark underlays the Antarctic Facilities Zone buildings. While the design has not been finalised, the features overlap each other and form a continuous structure.

As such, the following soil vapour locations, which are located beneath the future stadium or underground carpark, have been considered when assessing soil vapour risks for the proposed development:

- The Goods Shed and Yard: SV36
- The Promenade and Underground Carpark: SV33, SV32
- The Precinct North: SV18, SB33, SV34
- The Precinct South: SV46
- The Gateway: SV45.

Soil vapour data from bores SV41 and SV43, outside the proposed stadium footprint, have also been considered.

Exceedances of adopted soil vapour concentration (**Section 3.1.3**) have been detected in these bores for:

- All structures - Methane
- Residential – Benzene, Naphthalene, TPH (aliphatic >C8-C10, aromatic >C8-C10)
- Commercial / Industrial – Benzene, Naphthalene, TPH (aromatic >C8-C10) (within the Gateway only)

Soil vapour sampling locations are shown on **Figure F10**, and results of sampling are presented in **Table T10**.

While residential use is not proposed for any area considered in this report and detected exceedances of criteria are not considered to represent a risk to future Site use, methane concentrations represent a potential vapour intrusion risk. Methane is considered likely to be sourced from the anerobic digestion of either residual fuel impacts from Site use, or organic material in former river- or sea-bed buried during land reclamation. Methane in groundwater above the adopted criteria is widespread on the Site, and if sourced from buried materials under reclaimed land, there are likely to be multiple discontinuous areas where potentially hazardous concentrations are generated.

In addition, exceedances of Commercial / Industrial criteria adopted for benzene, naphthalene, and/or TRH (aliphatic >C8-C10) were also identified in the soil bores SV41 and SV43, located in the Gateway area to the south-west of the proposed stadium footprint, and are considered likely to be due to contamination from former gasworks operations in this area. While exceedances of criteria for this land use have not been identified in samples collected from soil vapour within the stadium footprint, previous investigations of the Gateway area have identified that the fill is highly heterogenous and that minor pockets of gasworks contamination which have not been detected during previous investigations may be present.

As discussed in **Section 5.2.2**, the existing Site Suitability Statement for the Promenade and Underground Carpark included a requirement for vapour mitigations against TPH and methane to be included in future structures. Based on the additional data collected since issue of the Site Suitability Statement, and with consideration of the detected soil vapour concentrations in soil vapour in and adjacent to the proposed building structure for this area, for Site Suitability, the vapour protection system should be designed and verified as preventing vapour intrusion from benzene, naphthalene, TPH, and methane.

6.5.2 Groundwater and Surface Elevation

As part of development of the Site, lowering of surface is proposed, and may introduce potential environmental risks if:

- The final design surface is lowered below the surface of groundwater. If this occurs, groundwater may potentially reach the surface and either:
  - Come into contact with Site users; or
  - Migrate along the surface and potentially impact stormwater, other portions of the Site, or off-Site locations.
- Groundwater is less than 1 m below the surface. The Site Specific RC (**Section 3.2**) included an assumption that groundwater will be ≥1 m below the surface when deriving criteria values for potential vapour intrusion from groundwater. If groundwater is shallower than this, the RC are not applicable and unquantified risks of vapour intrusion may be present.
- PASS is dewatered and may potential oxidise and acidify.

As such, any future development of the Site which involved modification of the surface elevation must assess the proposed change against groundwater elevations. If groundwater will be or is likely to be ≤1 m below the final surface, the proposed development must include measures and/or mitigations to:

- Prevent groundwater from reaching the surface or structures, such as drainage or tanking. Any such measures:
  - Must capture any drained groundwater for assessment and disposal as potential contaminated waste.
  - Must not transport or potentially increase the migration of groundwater or other contaminants on groundwater (such as LNAPL or DNAPL) to sensitive receptors (such as stormwater or the River Derwent/Sullivans Cove).
- Assess and prevent unacceptable risks from groundwater-derived vapour via either:
  - Additional assessment of vapour risks from shallow groundwater which demonstrates that no unacceptable risks are present; or
  - A vapour protection system suitable for potential vapour risks from groundwater.

- Identify if PASS may be dewatered and, if so, include measures to neutralise potential oxidation and prevent acidification as required by the assessment of acid sulfate soil at the Site (see **Section 5.5.1**).

These requirements must be documented in the SEMP.

Based on the proposed final surface elevations of the Site (**Section 5.3.2**), and the most recent inferred groundwater contours from July 2025 (**Figure F12d**), an area of the Site with three proposed future uses has identified under the proposed future development where potential interactions with groundwater may introduce risks to future Site users. The area is shown on **Figure F15**, and the three land uses, with proposed final surface elevations and inferred groundwater depths, are listed on **Table 28** below.

Table 28 Areas of Potential Shallow Groundwater

Area	Location	Elevation (mAHD)	
		Final Surface	Groundwater
Multipurpose Stadium	North, west and north-west of stadium footprint	3	2 to 3.7
Practice Wickets	North-west corner of Site	4.8	3.4 to 4+
Underground Carpark	North-east corner of Site	1.7	0.6 to 1.7

The Multipurpose Stadium 70% design includes installation of a drainage layer and capture of groundwater as shown on **Plate 4** below. Captured groundwater from the drainage layer will be diverted to sumps for further disposal.

Plate 4 Multipurpose Stadium - Groundwater Drainage Layer Design

The proposed design is considered to appropriately mitigate potential environmental risks from shallow or surface groundwater as:

- The drainage design includes a HDPE liner which will prevent physical migration of groundwater to the surface, and potential contact with Site users or migration along the surface to other areas or stormwater.
- Groundwater in the drainage layer will be captured and is currently proposed for disposal under a Trade Waste Agreement (TWA). Discharge of the captured groundwater under a TWA is an appropriate disposal method to prevent groundwater from discharging to
- The drainage layer is upgradient and above the elevation of known LNAPL and DNAPL, and does not include active pumping/extraction which could encourage migration from these areas into the drainage layer. As such, groundwater with impacts relating to LNAPL or DNAPL are unlikely to be captured, and would be disposed of as potentially contaminated waste, and would not have the potential to discharge to stormwater or sensitive receptors near the Site (i.e., River Derwent or Sullivans Cove).
- While groundwater may be present at less than 1 m below the surface in the drainage layer, and represents a potential vapour intrusion risk. Mitigation and management is required and included in the design, consisting of the vapour intrusion mitigation barrier (**Section 5.2.2**) required for the stadium, which is present above the drainage layer.

  This barrier will mitigate potential vapour intrusion into the Multipurpose Stadium and playing field.
- A dewatering management plan (DWMP) is required for works which may drain saturated soils (**Section 5.5.1**). Under this document, procedures for the management and neutralisation of any dewatered PASS will be documented and implemented.

For the other two areas with potential risks from shallow groundwater:

- In the Practice Wickets area, groundwater is inferred to still be approximately 0.8 m below the design surface, based on surrounding wells, and is not considered at risk of surface infiltration by physical groundwater. Based on the open space/recreational use of this area, vapour intrusion and accumulation is not considered to represent an unacceptable risk as the Practice Wickets area is:
  - Not in an area of high risk from volatile impacts, based on historic uses, and is hydraulically up-gradient of areas which may have volatile impacts (i.e., LNAPL Plume A2 is ~75m south-east of this area, and the former gasworks area is ~85 m south), and historic soil and groundwater sampling in this area of the Site has typically reported potential volatiles, such as TRH/TPH, as low or below LOR in groundwater.
  - Proposed for open space / recreation use, and will have limited to no capacity for capture and accumulation of vapours which may represent hazardous levels (noting that such vapours are considered unlikely based on the history and available environmental data for this area). Vapours which migrate from groundwater to open air typically attenuates and dissipates swiftly due to atmospheric wind and pressure changes.
- The underground carpark design and final elevations are not yet finalised. However, Section 4.4 – Planning Controls of the SEMP (AECOM, 2025h) states that:
  - *Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, additional assessment of the potential vapour intrusion risk to building users, based on data representative of that part of the Site, will be required.*

  Such assessment by a suitably qualified and experienced environmental professional will be required as part of design and construction of the underground carpark and should be a condition of suitability.

  It is recommended that the requirement in the SEMP be updated to include consideration and mitigation of potential groundwater infiltration in structures, such as the proposed underground carpark.

Based on the above, potential shallow groundwater interactions are not considered to introduce unacceptable risks or make the Site unsuitable for the proposed development as:

- In the 70% detailed design of the Multipurpose Stadium:
  - Any drained groundwater is captured and disposed of as potentially contaminated waste under a TWA or similar, and should not be discharged to sensitive receptors.
  - The drainage layer does not intersect and capture LNAPL , which may render groundwater unable to be discharged under TWA.
  - A vapour mitigation layer is present above the drainage layer, as required in **Section 5.2.2**, and will act as mitigation against potential vapour intrusion risks from shallow groundwater.
  - Any potential soil which may be dewatered by the drainage layer is assessed and managed by a DWMP, as required by the acid sulfate soil investigation (**Section 5.5.1**).

  Any changes to these features in future design requires review and reassessment of environmental risks.
- Potential shallow groundwater below the Practice Wickets is not considered to represent an unacceptable risk, as groundwater is not considered likely to infiltrate to the proposed surface elevation of 4.8 mAHD, and vapour intrusion from groundwater is not considered to represent a risk in consideration of the open space use of the area and the Site history and environmental data in this area.
- The design of the underground water carpark, including the final surface elevation within the carpark (i.e., the level of the lowest floor) is not yet finalised and risks and mitigations from shallow groundwater cannot be assessed. However, the SEMP contains requirements to assess vapour intrusion for structures within 1 m of groundwater, prohibits contact between Site users and groundwater.

  The SEMP will need to be referenced and complied with during the design of the underground carpark in the future.

7.0 Conclusions and Recommendations

7.1 Conclusions

Prior to the development of Macquarie Point, Division 2, Section 39F(1) of the *Macquarie Point Development Act 2012* (the Act) requires that an accredited site auditor certifies that remediation of each part of the Site has occurred to a standard that is satisfactory for the purposes of the proposed redevelopment.

Auditor certification has been recorded in Site Suitability Statements, with the overall aim of the Site's Environmental Audit being issue of Site Suitability Statements for all areas.

To date, four Site Suitability Statements have been issued by the EPA-accredited Site Auditor, as part of contaminated land audit reports, consisting of:

- The Goods Shed and Yard - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1* (Coffey, 2019a)
- The Escarpment (Audit Area 4 West) - *Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West* (Coffey, 2020)
- The Promenade and Underground Carpark (Lot E and UGC) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark* (Coffey, 2021a)
- The Precinct North (Lot B) - *Contaminated Land Audit Report – Macquarie Point Development Project – Lot B* (Coffey, 2021b).

The Site Suitability Statements should be read in conjunction with the contaminated land audit reports, which form part of the assessment of and requirements for the Site's suitability for the proposed development.

However, in 2024, the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024), was released by the Corporation, which updated and modified the vision for development of the Site. As a result, the Site Suitability Statements issued prior to the Precinct Plan (listed above) are no longer accurate to the proposed future uses of the Site and require review and update for the changes in Site uses and proposed development.

This report has been prepared to describe the changes in proposed land use and to assess if any changes in mitigation or management measures are required to prevent any unacceptable risk to future users or ecological receptors on the Site or adjacent properties.

7.1.1 Changes in Land Use

Table 29 below summarises the changes in Site use proposed for each of the four assessment areas considered in this report

Table 29 Changes in Land Use by Area

Assessment Area	Changes in Land Use
The Goods Shed and Yard (Audit Area 1)	• The Goods Shed will be removed from this area. • Proposed Open Space use to the west and north of the Goods Shed now forms park of the Multipurpose Stadium and Associated Concourse zone. • Sections of this area will be lowered to final surface elevations of between 2.9 to 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Escarpment (Audit Area 4 West)	• Land use of parts of this area has changed to Open Space. It is noted that the Goods Shed, located in the Goods Shed and Yard (Audit Area 1) is likely to be moved to this area, and assessment for commercial/industrial uses is still considered required. • The south-eastern corner is included in the proposed footprint of the underground carpark. • High density residential use is no longer planned in this area. • Sections of this area will be lower to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Promenade and Underground Carpark (Lot E and UGC)	• Open Space land use in the southern portion of this area is now included in the Multipurpose Stadium and Associated Concourse zone. While, the majority of this space was assessed for a proposed underground carpark, which was assessed for commercial/industrial use, portions of in the eastern and western areas of this assessment area were only considered for Open Space use. • Land proposed for an “Access Link”, or open transport corridor, in the eastern portion of this area was assessed for Open Space use, but is now considered for commercial/industrial use as part of the Multipurpose Stadium and Associated Concourse zone. • High density residential (above the first floor) is no longer planned in this area. • Sections of this area will be lower to final surface elevations of between 1.8 and 4.8 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.
The Precinct North (Lot B)	• Land use is still considered to be commercial / light industrial. • A single storey underground carpark is proposed in the northern portion of this assessment area. • Sections of this area will be lower to final surface elevations of between 1.8 and 3 mAHD. • As part of construction of the Multipurpose Stadium, footings will be advanced to dolerite bedrock.

7.1.2 Additional Environmental Data or Changes in Adjacent Property Uses

In addition to the changes in land use and surface elevation arising from the new proposed development of the Site, new environmental data, and proposed changes to surrounding land uses, have been identified in the period since issue of the Site Suitability Statements.

New information available since the previous Site Suitability Statements were issued, that potentially affects the validity of those statements, is summarised on **Table 30** below.

Table 30 Additional Assessments or Foreseen Changes in Site Condition Considered

New Information or Change	Description and Consequences
Issue of the *State Policies and Projects (Macquarie Point Precinct) Order 2025* (the Order)	The Order provides the approval conditions for development of the Multipurpose Stadium. However, the environmental requirements are consistent with those in the *Macquarie Point Development Corporation Act 2012*, which provided the legislative framework for previous Site Suitability Statements, and no change to the process of Site Suitability are considered to arise from this change.
Updates and consolidation of the SEMPs referenced in Site Suitability Statements	The initial area-specific SEMPs issued for each area have been updated and consolidated into a single Site-wide SEMP. Each iteration of the SEMP has retained the conditions and information from previous versions.
Building and structure footprints overlapping areas of potential vapour intrusion	The current SEMP includes areas specific requirements relating to vapour mitigation in future buildings and structures, with identified soil vapours consisting of methane, TRH and BTEXN. The new planned development includes proposed structures with footprints which extend across areas of elevated potential vapour intrusion.
Designs for in-ground plants, including deep-rooted plants	Additional designs for in-ground plants have been proposed, which required assessment for environmental risk and confirmation from the Environmental Auditor to meet the requirements of the SEMP.
Review of the Site-Specific RC	The RC, which have been used to assess and identify areas of soil and groundwater where remediation is considered required for future development, have been reviewed and updated.
Collection of new environmental data from soil, groundwater, and soil vapour	Additional monitoring and investigation events have been conducted since issue of the Site Suitability Statements and have been assessed for any information which could influence Site Suitability. The following assessments relevant to areas with issued Site Suitability Statements have been considered: • Investigations of ASS • GMEs and groundwater gauging conducted in 2023, 2024 and 2025. • *In situ* characterisation soil sampling conducted for Stage 1 and Stage 2 of the proposed excavation of the Site. • Installation and sampling of new groundwater wells and soil vapour bores in June 2025.
Off-Site land use changes	The Macquarie Point STP is planned for closure and replacement with an SPS and emergency storage facility. As part of these works, the Hobart Main Pipeline (sewer) beneath the Site will be decommissioned and removed, and a new sewer line installed off-Site to the south under Evans Street, and east under TasPorts land.

7.1.3 Outcomes of Review

Based on the review of proposed development changes to land use, and new environmental data, the following items require changes in management or mitigation approaches for the Site to be suitable for the intended future use:

- Development of structures across assessment area boundaries.

  The Precinct Plan includes the following proposed structures which extend across multiple assessment areas:

- The Multipurpose Stadium and Associated Concourse – The Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, the Precinct North, the Precinct South, and the Gateway.
- The underground carpark and building footprints within the Antarctic Facilities Zone – The Escarpment, the Promenade and Underground Carpark, the Precinct North, and Audit Area 4 East.
- Building footprints within the Complementary Integrated Mixed Use Zone – The Precinct North and the Precinct South.

Extension of structures across the assessment area boundaries introduces additional considerations for Site Suitability, and development of structures which extend beyond the boundaries of assessment areas should not be commenced until Site Suitability Statements have been issued for all areas within their footprints.

- Potential soil vapour intrusion into future structures from methane, TRH, and BTEXN.

  This risk has been identified due to:

  - Detections of methane, considered to arise from anaerobic degradation of either residual hydrocarbon contamination, or saturated soil from former river- and sea-bed buried by land degradation, both directly in soil vapour, and above the adopted criteria for vapour intrusion in groundwater, in multiple locations across the Site.
  - Exceedances of the Commercial/Industrial land use RC for TRH >C10-C16 and naphthalene, indicating potential vapour intrusion in soil or groundwater below or adjacent to proposed structures, in both new data collected since issue of the Site Suitability Statement, and in some areas (i.e., former Open Space and Access Link areas in the Promenade and Underground Carpark) which have been updated to a more sensitive use in the new proposed development.
  - Potential changes in risk profile from proposed excavation/changes in Site elevation, which decrease the distance between some impacts and may lead to increased concentrations in soil at the surface.

  Based on the current land uses and existing leases, and the widespread and likely discontinuous sources of methane in saturated buried soils, remediation of the source of these impacts is not considered practicable. Inclusion of a vapour protection system in future building design is considered required as part of Site Suitability for areas which include potential vapour intrusion risks, consisting of the following areas considered in this report:

  - The Goods Shed and Yard – the Multipurpose Stadium and Associated Concourse.
  - The Escarpment – the Multipurpose Stadium and Associated Concourse, and the underground carpark and building structures within the Antarctic Facilities Zone.

    (It is noted that vapour protection is not considered required for the proposed relocation of the Goods Shed to the northern portion of this area).
  - The Promenade and Underground Carpark – the Multipurpose Stadium and Associated Concourse, and the underground carpark and building structures withing the Antarctic Facilities Zone.
  - The Precinct North – the Multipurpose Stadium and Associated Concourse, the underground carpark and building structures withing the Antarctic Facilities Zone, and building structures within the Complementary Integrated Use Zone.

    The performance requirements for any vapour protection system, including recommendations for independent review of the design and construction, are provided in **Section 7.2**.

- Potential future contact between intrusive maintenance workers and areas of Site soil with lead concentrations exceeding the adopted RC for this land use:

- The existing Site Suitability Statements included an assumption that only minor or incidental changes to the surface elevation would occur, and assessed potential risks to intrusive maintenance workers to a maximum depth of 2 m below the current surface elevation.
- Concentrations of lead were reported in previous assessments in excess of the adopted RC for maintenance workers at depths below 2 m below current surface elevation, and additional soil concentrations in excess of the RC have been identified since issue of the Site Suitability Statements, noting that these exceedances have been detected in soil proposed for excavation.
- To minimise potential contact between future intrusive maintenance workers and existing Site soil with exceedances of RC:
  - Known locations of exceedances will be documented in the SEMP(s) for management during construction or development activities.
  - Subsurface services will be required to be installed within clean fill/soil corridors, or within protective conduits.
  - Additional PPE requirements will be required during future intrusive maintenance works where contact with current Site soil may occur, to minimise potential ingestion/inhalation of existing Site soil.

  The proposed additional controls and data to be added to the SEMP regarding lead impacts to soil are provided in **Section 7.2**.

- Disturbance of PASS:
  - Assessment of Site soils in 2024 and 2025 identified that, while no ASS is present on Site, PASS with the potential to acidify if disturbed/oxidised is present in saturated soils at the Site.
  - Future development activities on the Site must include management measures for PASS to prevent acidification and environmental impact on the Site, or at any receiving site if PASS is excavated and removed, as documented in *Acid Sulfate Soil Investigations* (AECOM, 2025e).
- Potential groundwater present at the surface, or shallow groundwater where risks may not be quantified by the RC, at the following locations based on the final design elevations for the Site, has been identified at:
  - The north, west, and north-west areas of the Multipurpose Stadium.
  - The Practice Wickets in the north-west corner of the Site.
  - The underground carpark in the north-east corner of the Site.

  Potential shallow groundwater interactions are not considered to introduce unacceptable risks, or risks are considered to be suitably managed or mitigated by development designs, as:
  - In the 70% detailed design of the Multipurpose Stadium:
    - Any drained groundwater is captured and disposed of as potentially contaminated waste under a TWA or similar, and should not be discharged to sensitive receptors.
    - The drainage layer does not intersect and capture LNAPL plumes, which may render groundwater unable to be discharged under TWA.
    - A vapour mitigation layer is present above the drainage layer, and will act as mitigation against potential vapour intrusion risks from shallow groundwater.
    - Any potential soil which may be dewatered by the drainage layer is assessed and managed by a DWMP, as required by the acid sulfate soil investigation.

    Any changes to these features in future design requires review and reassessment of environmental risks.
  - Potential shallow groundwater below the Practice Wickets is not considered to represent an unacceptable risk, as groundwater is not considered likely to infiltrate to the proposed surface elevation of 4.8 mAHD, and vapour intrusion from groundwater is not considered to represent

a risk in consideration of the open space use of the area and the Site history and environmental data in this area.

- The design of the underground water carpark, including the final surface elevation within the carpark (i.e., the level of the lowest floor) is not yet finalised and risks and mitigations from shallow groundwater cannot be assessed. However, the SEMP contains requirements to assess vapour intrusion for structures within 1 m of groundwater, prohibits contact between Site users and groundwater.

The SEMP should be updated to include the requirements relating to potential surface or shallow groundwater, as noted in **Section 7.2**.

- Review of potential off-Site ecological impacts:
  - The *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020h) identified that, based on a weight-of-evidence approach, groundwater discharging from the Site was unlikely to present a potential unacceptable risk to off-Site ecological receptors (if present).

    An addendum to this assessment was prepared in 2025 (AECOM, 2025i), and concluded that overall, based on the review of updated Site data and information, the outcomes of the AECOM (2020h) assessment remain valid and suitable for ongoing assessment of the Site. No material changes in the off-Site aquatic ecological risk profile have been identified, and ecological risk to receptors in the River Derwent and Sullivans Cove remains low.

    Ongoing groundwater monitoring was recommended and is included in the SEMP (AECOM, 2025h).
- The upcoming closure and removal of the Macquarie Point STP, and realignment of the Main Hobart Pipeline (Sewer):
  - The replacement of the STP with a pumping station, and associated activities including realignment of the Main Hobart, are not considered to change the environment suitability of the Site for future development.

The following changes, or updated information, are not considered to affect the previously issued Site Suitability Statements:

- Approval of the *State Policies and Projects (Macquarie Point Precinct) Order 2025* (the Order)
  - The Order provides approved conditions for the development of the Site. However, the conditions and requirements relating to the Environmental Audit and Site Suitability Statements are consistent with, and reference, the *Macquarie Point Development Act 2012*, and approval of the Order does not affect the assessment or requirements of the suitability of the Site for future development.
- Updates or consolidation of SEMP(s):
  - While the existing Site Suitability Statements reference different SEMPs, issued at the time of the initial assessment of Site's environmental suitability for development, have been updated as new data has been received, each iteration of the SEMP has included the previous requirements from Site Suitability Statements and been reviewed and accepted by the Site Auditor.
  - Updates to the SEMP, recommended in **Section 7.2**, must also be submitted to and accepted by the Auditor.
- Review and update of Site Specific RC:
  - While modifications to the Site Specific RC were identified as part of review in the context of the Precinct Plan, in all cases the changes increased criteria values, and as a result the RC used at the time of issue of Site Suitability Statements are considered conservative and appropriate for detection of potential environmental risks. As such, re-review of the existing data sets with the updated RC is not considered required.

- It is noted that some RC (i.e., vapour intrusion, intrusive maintenance worker RC) are depth dependent, and potential changes in risks from the proposed modifications to the Site surface elevation are discussed above.

- Precluded PEVs:
  - No changes in PEVs precluded since the Site Suitability Statements were initially issued have been identified in this review.
- LNAPL Plumes
  - Based on assessment of LNAPL Plumes in 2025 (refer to **Section 5.5.4.1**), LNAPL was not present at measurable thicknesses in any groundwater wells in or hydraulically up-gradient of the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, or the Precinct North, although sheen was reported in MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3).
  - No groundwater concentrations indicative of free-phase LNAPL, or soil vapour concentrations indicating potentially hazardous vapour generation (other than methane) were detected at the LNAPL Plumes, and LNAPL migration is not considered likely to occur.
  - LNAPL is still considered stable, and further remediation is not considered practicable.

  On this basis, LNAPL Plumes are not considered to make the Site areas considered unsuitable for development, if the management measures within the SEMP are implemented.

Based on the review conducted, if the recommendations provided in **Section 7.2** are implemented, and on the basis of ongoing implementation of the SEMP to manage residual environmental impacts at the Site, the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, and the Precinct North are considered suitable for the proposed development.

7.2 Recommendations

The following additional controls and mitigations are required to be added to the SEMP in order to mitigate and manage any additional environmental risks identified in the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, and the Precinct North:

- Vapour mitigation is required as part of construction of the structures in the following areas:
  - The Goods Shed and Yard.
  - The Promenade and Underground Carpark.
  - The Precinct North
  - Any buildings which include these areas in their footprint, such as the portion of the Multipurpose Stadium and Associated Concourse in the Escarpment.

  Vapour mitigation must incorporate a minimum gas protection value of 2 (EPA NSW, 2020), and the selected method should be suitable for mitigation of methane, TRH and BTEXN vapours.

  Design and construction documentation must include a documented testing and verification method for vapour intrusion mitigation measures, with reference to Appendix 7 – Verification and construction quality assurance, of *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020). Any design and/or installation of ground gas protection measures will require independent oversight and sign-off by an Environmental Auditor, or other suitably qualified and independent verifier.

- Landscaped areas and gardens should be established in aboveground planter boxes on hardstand and not directly over exposed soil. In the event that gardens are proposed in-ground, the following barrier system shall be installed:
  - Layer 1: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users.
  - Layer 2: Earthen cover (minimum 0.5 m) certified as ‘Fill Material’ in accordance with IB105.

- Layer 3: Surface coverage (comprising shallow rooted vegetation).

Deeper-rooted vegetation may be established using the designs provide in **Appendix E**, with the following additional requirements:

- Soil imported for in-ground planting must be Level 1 – Fill Material.
- No plants intended for consumption are to be included in any in-ground planting on the Site.
- The potential size of plant root structures should be considered when selecting species for cultivation on the Site. Planting structures should have sufficient volume for the plants to develop without requiring root structures to penetrate the earthen liners and extend beyond the clean-fill soil.
- The earthen liner and barrier layers included in planting designs are to be installed above the Site water table.
- In-ground planting is only to occur in open space use areas. No in-ground planting is to occur within Site buildings (i.e., within atriums, foyers, or arboretums).
- Trees, or any other deep-rooted plants, which are cultivated on the Site should be excavated and removed as soon as possible if any of the following occurs:
  - Death or significant rot/reduction in size
  - Toppling/knocking over by wind or impact.
- In the event that plant removal occurs:
  - Removal of all root structures must be included.
  - If root structures have extended and pierced the earthen liner and/or indicator barrier layer, these must be repaired and restored as part of removal of the plant(s).

- PASS within saturated soils, strongly correlating with estuarine sands, has been identified beneath the Site and should be considered during future works.

  Future activities at Macquarie Point should identify all activities which have the potential to disturb or expose (i.e., dewater) PASS at the Site, as identified in *Acid Sulfate Soil Investigations* (AECOM, 2025b), and:

  - The SEMP should be updated with a description and locations of identified PASS.
  - The SEMP should include overarching management obligations for disturbance of ASS and/or water table drawdown via dewatering, include a requirement for scope specific Acid Sulfate Soil Management Plans (ASSMP) and/or Dewatering Management Plans (DWMP) to be developed for each discrete works package involving civil and general earthworks activities, water table drawdown via dewatering, and any other significant soil disturbance activities or changes to natural groundwater and surface water systems.

    These documents should be prepared by those undertaking works which may disturb PASS, and must include:

    - Estimated volumes and action criteria for PASS which may be disturbed by the proposed works.
    - Procedures for the handling of disturbed PASS, including verification of neutralisation, groundwater generated by dewatering, and monitoring of Site environmental conditions in the vicinity of PASS disturbances.
    - Contingency measures which are specific, measurable, and attainable, and can be implemented in a timely manner in the event that action criteria or trigger values are exceeded.
  - Future structures and infrastructure at the Site should consider the potential effects of sulfides and possible acidification in design and selection of materials, and adopt appropriate mitigation measures to prevent degradation of materials overtime.

- Any groundwater, or run-off which may have come into contact with PASS, should be considered as potentially contaminated. pH and the potential to acidify should be considered in assessment any such water prior to disposal

- Any engineered fill or other materials used to increase the surface level to 3 mAHD must either:
  - Be classified as Level 1 – Fill, in accordance with the guidelines provided by IB105; or
  - Be approved for use by an Environmental Auditor, who may identify other conditions or controls based on the nature of the material used. For example, crushed dolerite sourced from other areas of the Site may be suitable for this purpose, but will require assessment and Environmental Auditor approval, as well as any other required approvals from planning authorities or EPA, prior to any such use.
- The areas of soil listed below, where lead in soil has been identified as exceeding the intrusive maintenance worker RC:
  - Soil surrounding the Hobart Main Pipeline (sewer) (already noted in Section 3.2.3 of the SEMP.
  - Soil surrounding *in situ* sample points K14, K18, L13, M13, M14, K06, L08, M09, N10, F11, G11, G13, H10, H12, H13, I13, J06, J08, J10, J12

  These locations should be noted as a potential area of elevated contamination, and addition PPE/management requirements put in place for intrusive works in this area (as part of future CEMPs or ongoing maintenance) to minimise potential exposure to lead in soil.
- Any subsurface services or utilities should be preferably installed within the engineered layer of clean fill. If services must be installed in existing Site soil, they must be installed in either clean soil corridors, or protected conduits, to minimise any contact with existing Site soil by future maintenance workers.
- Any future development of the Site which involved modification of the surface elevation must assess the proposed change against groundwater elevations. If groundwater will be or is likely to be ≤1 m below the final surface, the proposed development must include measures and/or mitigations to:
  - Prevent groundwater from reaching the surface or structures, such as drainage or tanking. Any such measures:
    - Must capture any drained groundwater for assessment and disposal as potential contaminated waste.
    - Must not transport or potentially increase the migration of groundwater or other contaminants on groundwater (such as LNAPL or DNAPL) to sensitive receptors (such as stormwater or the River Derwent/Sullivans Cove).
  - Assess and prevent unacceptable risks from groundwater-derived vapour via either:
    - Additional assessment of vapour risks from shallow groundwater which demonstrates that no unacceptable risks are present; or
    - A vapour protection system suitable for potential vapour risks from groundwater.
  - Identify if PASS may be dewatered and, if so, include measures to neutralise potential oxidation and prevent acidification as required by the assessment of acid sulfate soil at the Site.

Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract *Macquarie Point Development Project – Review of Site Specific Remediation Criteria and of issued Site Suitability Statements* dated 18 February 2025.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 20-May-2025 and 01-Feb-2026, and is based on the reports and information referenced within the report text which was available at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

								Maximum	0.3	0.3	
								Minimum	0.0001	0.00001	

Notes:

1. Field methane readings were recorded prior to and following sampling. The higher value is presented on this table.
2. Flow rate and field methane concentrations were measured using GA5000 landfill gas meter with a limit of resolution (LOR) of 0.1 %v/v and 0.1 L/hr.
3. Where methane concentration or flow rate has been recorded as below LOR, the LOR has been used for the calculation of GSV
4. GSV has been calculated using the maximum recorded flow rate.
5. 2 minute average flow rates were not recorded for all soil vapour bores.
6. Positive - Air flow from subsurface to surface; Static - no differential pressure difference recorded between bore and surface, limited soil vapour flow anticipated; Negative - Air flow from surface to subsurface, potential barometric pumping.

4 TREE PLANTING TYPICAL ON EXISTING GRADE
Scale: 1:20

PLANTING HOLE SIZE: POT SIZE	ROOT BALL SIZE (DIA)	PLANTING HOLE (MIN)
400L	980mm	2940mm
200L	700mm	2100mm
100L	520mm	1560mm
75L	465mm	1395mm
45L	420mm	1260mm

NOTE: BELOW TYPICAL REFERS TO THE ABOVE POT SIZES.

NOTES:
1. TREES SHALL HAVE A WELL DEVELOPED TAPER AND BE SELF SUPPORTING.
2. SPECIFIED TREE TO MEET THE REQUIREMENTS OF AS 2303.2018 "TREE STOCK FOR LANDSCAPE USE"
3. ENSURE ALL LABELS, WIRES, TWINE AND OTHER BINDING MATERIALS ARE REMOVED FROM PLANTING MATERIAL, INCLUDING ROOTBALLS PRIOR TO BACKFILLING.
4. TO PROMOTE LATERAL ROOT GROWTH THE PLANTING HOLE SHALL BE NO LESS THAT THREE (3) TIMES THE DIAMETER OF THE ROOT BALL. IF SPACE RESTRICTIONS EXIST STAKE SPACING SHALL BE REDUDED TO NO LESS THAN TWO (2) TIMES TH DIAMETER OF THE ROOT BALL. SLOPE ALL SIDES AT 45 DEGREES.
5. WATER IMMEDIATELY FOLLOWING PLANTING, SAUCER TO BE FILLED TWICE
6. SITE TO BE LEFT CLEAN AND TIDY ON COMPLETION OF PLANTING, REMOVE WEEDS AND BUILDING SPOIL FROM TREE PLANTING ZONE.
7. REFER SPECIFICATION FOR ALL TREE PLANTING.

5 TREE PLANTING - GARDEN BED
Scale: 1:20

PLANTING HOLE SIZE: POT SIZE	ROOT BALL SIZE (DIA)	PLANTING HOLE (MIN)
400L	980mm	2940mm
200L	700mm	2100mm
100L	520mm	1560mm
75L	465mm	1395mm
45L	420mm	1260mm

NOTE: BELOW TYPICAL REFERS TO THE ABOVE POT SIZES.

NOTES:
1. TREES SHALL HAVE A WELL DEVELOPED TAPER AND BE SELF SUPPORTING.
2. SPECIFIED TREE TO MEET THE REQUIREMENTS OF AS 2303.2018 "TREE STOCK FOR LANDSCAPE USE"
3. ENSURE ALL LABELS, WIRES, TWINE AND OTHER BINDING MATERIALS ARE REMOVED FROM PLANTING MATERIAL, INCLUDING ROOTBALLS PRIOR TO BACKFILLING.

SELSP16- MACQUARIE POINT
SEWAGE PUMPING STATION
MACQUARIE POINT STP RELOCATION
EVANS STREET - GENERAL ARRANGEMENT

Drawing Number: 0089-DWG-SELSP16-CI-9100
Sheet Number: 1 of 1
Revision: B

GENERAL NOTES:

A. SIDES OF EXCAVATION TO BE KEPT VERTICAL TO AT LEAST 150 ABOVE THE PIPE.
B. ALL ROCK INTRUSIONS OUT OF TRENCH WALL MUST BE REMOVED PRIOR TO ANY PIPE LAYING OPERATIONS.
C. ANY FOREIGN MATTER SUCH AS VEGETATION OR LITTER SHALL BE REMOVED FROM THE TRENCH PRIOR TO PIPE LAYING AND BACKFILL.
D. MARKER TAPE IS REQUIRED WHERE THE SEWER IS NOT THE DEEPEST SERVICE.
E. PLACE MARKER TAPE AT 1.5M DEEP OR ON FIRST BACKFILL LAYER, WHICHEVER IS SHALLOWER.

TABLE 201-D: TRENCH DIMENSIONS

SEWER SIZE (DN)	L b :BEDDING DEPTH		L c :OVERLAY	L c :SIDE SUPPORT	
	MINIMUM	MAXIMUM	(MINIMUM)	MINIMUM	MAXIMUM
> 900	150	250	200^2/ 300^3	300	550

TRENCH DIMENSION NOTES:

1. IF MAXIMUM BEDDING DEPTH IS EXCEEDED, FILL OVER EXCAVATION WITH SPECIAL EMBEDMENT AS PER MRWA-S-202
2. THE FIRST MINIMUM OVERLAY FIGURE IS THE MINIMUM OVERLAY REQUIRED WHEN WALK BEHIND TRENCH BACKFILL COMPACTION EQUIPMENT IS TO USED.
3. THE SECOND MINIMUM OVERLAY FIGURE IS THE MINIMUM REQUIRED WHEN:
   a. RIDE ON TRENCH BACKFILL EQUIPMENT IS USED; OR
   b. THE SEWERAGE PIPE IS IN A ROAD CARRIAGEWAY. THIS ASSUMES THAT THE FIRST BACKFILL LAYER WILL BE AT LEAST 200 THICK (WHEN COMPACTED) SO THAT THERE IS A TOTAL COVER >500 DURING MECHANICAL COMPACTION.

TABLE 201-C: MINIMUM COVER (H)

LOCATION	MINIMUM COVER
MAJOR & ARTERIAL TYPE R TRAFFICABLE ROADS	1200
ALL OTHER SEWERS	900

TABLE 201-A: TRAFFICABLE AREAS (TYPE R1)

TRENCH ZONE	PREFERRED MATERIALS		PRODUCT SPEC No.	METHOD OF PLACEMENT	MIN. COMPACTION REQUIREMENT
SURFACE ZONE	DSG	REPLACE WITH NEW PAVEMENT TO MATCH EXISTING PAVEMENT DETAIL, TO BE DETERMINED ON-SITE (ASSUME AC14 40MM MIN SURFACE). MINIMUM 450MM DEPTH OF PAVEMENT. CONSTRUCTION AS PER DSG SPECIFICATION 304.			95% R D
	HCC	REPLACE WITH NEW PAVEMENT TO MATCH EXISTING PAVEMENT DETAIL, TO BE DETERMINED ON-SITE (ASSUME AC10 35MM MIN. SURFACE). MINIMUM 300MM DEPTH OF PAVEMENT. CONSTRUCTION AS PER LGAT TSD-R06.			95% R D
TRENCH FILL ZONE	REFER TO ROAD OWNERS SPECIFICATION, IF NOT AVAILABLE: COMPLY WITH MRWA BACKFILL SPEC - MRWA SPEC 04.03, SUMMARISED AS FOLLOWS: A. FOR TRENCHES <1.5 M DEEP IN TYPE R SITUATION, THE BACKFILL SHALL BE 20MM CLASS 3 PLANT WET MIXED CRUSHED ROCK OR CRUSHED CONCRETE FOR THE FULL DEPTH. B. FOR TRENCHES > 1.5 M IN TYPE R SITUATION: - 20MM CLASS 3 PLANT WET MIXED CRUSHED ROCK OR CRUSHED CONCRETE ABOVE THE SUB-BASE LEVEL (NOMINALLY TO 600MM DEPTH BELOW THE FINISHED SURFACE LEVEL). - 20MM CLASS 4 (OR BETTER) CRUSHED ROCK OR CRUSHED CONCRETE FOR THE REMAINDER. C. IN TYPE F SITUATIONS: - THE BACKFILL SHALL BE 20MM CLASS 4 (OR BETTER) CRUSHED ROCK OR CRUSHED CONCRETE.		VICROADS SPEC 812 FOR CLASS 3 & 4 FCR. 818 FOR CLASS 4 CRUSHED SCORIA. RC500.22 FOR CLASS 4 CRUSHED CONCRETE.	BACKFILL MATERIAL SHALL BE PLACED AND COMPACTED IN LAYERS AND MOISTURE CONDITIONED AS REQUIRED TO ACHIEVE THE REQUIRED DENSITY. WHERE HAND HELD OR WALK BEHIND COMPACTION EQUIPMENT IS USED ON THE BACKFILL ZONE, AVOID COMPACTION WITHIN 300MM OF TOP OF PIPE. WHERE HEAVIER COMPACTION IS USED IN THE BACKFILL ZONE, AVOID COMPACTION WITHIN 500MM OF TOP OF PIPE.	95% R D
EMBEDMENT ZONE	- ALL NOMINATED EMBEDMENT IS SATISFACTORY IN TYPE R SITUATIONS, HOWEVER, IT IS CRITICAL THAT EMBEDMENT HAVE THE CORRECT MOISTURE CONTENT AND BE PROPERLY PLACED TO ACHIEVE ADEQUATE COMPACTION. - SELECTED MATERIALS SHALL BE WORKED AROUND THE PIPE TO ENSURE ALL VOIDS AT HAUNCHES ARE FILLED AND THE PIPE IS PROVIDED WITH GOOD SUPPORT ALONG ITS ENTIRE LENGTH. - EMBEDMENT TO BE PLACED UNDER THE HAUNCHES BY SHOVEL AND COMPACTED USING HAND TAMPERS OR VIBRATING PROBES OR PLATES. - RISK OF PIPELINE DEFLECTION MAY BE FURTHER REDUCED BY: - INCREASING THE DEPTH OF THE OVERLAY (TO UP TO 1M), OR - CEMENT STABILISING THE TOP SURFACE OF THE EMBEDMENT (HAND DISTRIBUTED CEMENT AT 2 KG PER SQUARE METRE, WORKED INTO THE TOP SURFACE BY SHOVEL).				70% i D

TABLE 201-A: TRAFFICABLE AREAS (TYPE R2)

TRENCH ZONE	PREFERRED MATERIALS		METHOD OF PLACEMENT	MIN. COMPACTION REQUIREMENT
SURFACE ZONE	HCC	REPLACE EXISTING PAVERS WITH 'LIKE FOR LIKE' IN ACCORDANCE WITH HCC AGREEMENT. ASSUME PREPARATION OF PAVERS, 30MM BEDDING SAND AND 450MM BASE PAVEMENT AS PER DSG SPECIFICATION 304		95% R D
TRENCH FILL ZONE	REFER TO BACKFILL SPECIFICATION - MRWA SPECIFICATION 04.03. - FOR BACKFILL < 1.5M DEEP, SELECTED OR ORDINARY FILL. A. SELECTED FILL. MATERIAL THAT IS FREE FROM ORGANIC OR OTHER DELETERIOUS MATERIAL, OBTAINED FROM EXCAVATION OR IMPORTED, WITH A PARTICLE SIZE OF ROCK NOT GREATER THAN 20MM, OR FOR OTHER THAN ROCK NOT GREATER THAN 75MM (REFER AS2566.2-2002). B. ORDINARY FILL. MATERIAL OBTAINED FROM EXCAVATION OR IMPORTED THAT CONTAINS NOT MORE THAN 20% BY MASS OF ROCK FRAGMENTS WITH SIZE BETWEEN 75MM AND 150MM, WITH NO ROCK OR CLAY FRAGMENTS GREATER THAN 150MM (REFER AS2566.2-2002). - FOR BACKFILL > 1.5M DEEP, AS PER PROJECT SPECIFIC BACKFILL SPECIFICATION.		REFER TO BACKFILL SPECIFICATION - MRWA SPECIFICATION 04.03. - FOR BACKFILL < 1.5M DEEP, SELECTED OR ORDINARY FILL PLACED AS REQUIRED TO MEET THE NOMINATED COMPACTION DENSITY. - FOR BACKFILL > 1.5M DEEP, PLACE AS SPECIFIED IN THE PROJECT SPECIFIC BACKFILL SPECIFICATION. PLACE AND COMPACT IN LAYERS AND MOISTURE CONDITION AS REQUIRED. WHERE HAND HELD OR WALK BEHIND COMPACTION EQUIPMENT IS USED IN THE BACKFILL ZONE, AVOID COMPACTION WITHIN 300MM OF TOP OF PIPE. WHERE HEAVIER COMPACTION IS USED IN THE BACKFILL ZONE, AVOID COMPACTION WITHIN 500MM FROM THE TOP OF PIPE.	95% R D TOP 600 mm 90% R D
EMBEDMENT ZONE	- THE EMBEDMENT PROPOSED IS SATISFACTORY IN NON TRAFFICABLE SITUATIONS, HOWEVER, IT IS CRITICAL THE EMBEDMENT HAVE THE CORRECT MOISTURE CONTENT AND BE PROPERLY PLACED TO ACHIEVE MAXIMUM COMPACTION. - SELECTED MATERIALS SHALL BE WORKED AROUND THE PIPE TO ENSURE ALL VOIDS AT HAUNCHES ARE FILLED AND THE PIPE IS PROVIDED WITH GOOD SUPPORT ALONG ITS ENTIRE LENGTH. - EMBEDMENT TO BE PLACED UNDER THE HAUNCHES BY SHOVEL OR FORK AND COMPACTED TO THE REQUIRED DENSITY.			60% i D

Executive Summary

The Macquarie Point Development Corporation (MPDC) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of a remediation strategy for the Macquarie Point site in Hobart, Tasmania (the Site).

This report provides a factual overview of the outcomes of the Well Maintenance Program undertaken at the Site between 14 September – 6 December 2023, and the Targeted Groundwater Monitoring Event (GME) undertaken at and surrounding the area referred to as the Precinct South, in the south-eastern corner of the Site, between 29 November – 6 December 2023.

The outcomes of the Well Maintenance Program and Targeted GME are summarised below:

- A Well Maintenance Program consisting of inspection of the condition of 38 groundwater wells at and surrounding Precinct South identified a number of wells requiring location or repair. To ensure serviceability of the wells prior to undertaking the GME:
  - A licenced surveyor was engaged to locate buried or 'missing' groundwater wells (for which well gatics were not visible at the surface) using metal detection and Global Positioning System (GPS) survey based on previously reported coordinates were used.
  - A licenced driller was engaged to undertake maintenance and repair work on select wells (as required), including cutting of bitumen and clearing of fill to expose gatics (where well gatics were buried under the surface), replacement of gatic bolts (where bolts were damaged, sheared or missing), replacement of gatic covers (where gatic covers were damaged), extension of the polyvinyl chloride (PVC) well casing to surface where gatics were buried under fill in re-graded areas of the Site.

  Based on the Well Maintenance Program, seven wells, namely MW13, MW137, MW142, MW143, R4, S9, and TW03, are considered to be destroyed/lost. The loss of these groundwater wells is not considered to prevent fulfilment of the objectives of the GME based on available historic data and lack of changes in use or monitoring data from nearby groundwater wells.
- A total of 31 groundwater wells at and surrounding the Precinct South were selected for gauging and sampling via low flow techniques for the Targeted GME. The outcomes of the Targeted GME are summarised below:
  - Recorded depth to groundwater ranged from 1.582 metres below ground level (m bgl) (MW164) to 3.250 m bgl (MW176) in wells screened in the shallow aquifer, and from 2.281 m bgl (MW126B) to 3.056 m bgl (MW124B) for wells screened in the deeper aquifer (top of screened interval >9 m bgl). Shallow groundwater contours indicated a generally south-westerly groundwater flow direction, with some southerly components in the southern portion of Precinct South, and possible easterly flow components at the eastern boundary, although this may be an artefact of lack of gauging data in the TasPorts area.
  - Hydrocarbon odours were noted at monitoring wells MW03, MW05, PW02 and S8.
  - Measurable Light Non-Aqueous Phase Liquid (LNAPL) was observed at four groundwater monitoring wells (MW03, MW05, PW02 and S8) in the south-eastern corner of the Precinct South, with thickness ranging from 0.050 to 0.160 m. Recorded LNAPL thickness was within historic recorded ranges in MW03 and MW05, while above historical recorded thicknesses in PW02 and S8. While LNAPL Plume B is still considered delineated on Site and unlikely to be migrating further onto the Site, additional monitoring to confirm LNAPL thicknesses and assess mobility via LNAPL baildown testing is recommended.

    No LNAPL was encountered in wells where it had not previously been reported, and no groundwater samples were collected from wells with LNAPL present.

    LNAPL is not delineated at the eastern border of the Precinct South and is considered likely to extend to TasPorts land to the east.
  - Dense Non-Aqueous Phase Liquid (DNAPL) was not encountered at any of the groundwater wells monitored.

- Concentrations of the following Chemicals of Potential Concern (CoPC) were reported above the adopted assessment criteria for Protected Environmental Values (PEVs) in at least one sample, noting exceedances were reported for Tier 1 Screening criteria including Drinking Water (Health and Aesthetics), Recreation (Primary / Secondary Contact), Vapour Intrusion (Residential), Ecosystem Protection (90%), and Buildings and Structures):
  - Benzene
  - Total recoverable hydrocarbon (TRH) fractions including TRH >C10-C40 (sum), TRH C6-C10 [minus benzene, toluene, ethylbenzene and xylenes (BTEX)](F1), TRH >C10-C16 (minus Naphthalene)(F2)
  - Metals (aluminium, arsenic, copper, lead, manganese, zinc)
  - PAHs (naphthalene, anthracene, phenanthrene, fluoranthene, benz[a]anthracene, benzo[a]pyrene)
  - Inorganics (chloride, sodium, total cyanide, ammonia)

  It is noted that the presence of LNAPL also precludes all PEVs, and that concentrations of some CoPC listed above (PAHs [naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene] and aluminium) were reported with Limit of Report (LOR) above adopted criteria. Future assessment should consider if lower LORs should be requested for these CoPC if practical.
- Concentrations of the following CoPC were reported in excess of the Site-Derived Remediation Criteria (RC) for Potential Future Residents for slab-on-grade buildings with unknown construction or multi-storey building:
  - TRH (C6-C10) (minus BTEX)

  Residential use of the Precinct South is not planned for future development and is not considered likely to occur due to currently planning limitations on residential occupancy near an active port (i.e., TasPorts land to the east of the Precinct South).

Further assessment of groundwater PEVs and nature and extent of impacts will be undertaken separately, however, precluded PEVs are consistent with previous investigations of this area reported in existing Detailed Site Investigation (DSI) reports relevant to the Precinct South, i.e. *Audit Area 5 – Detailed Site Investigation* (AECOM, 2021a), and *Audit Area 3 – Detailed Site Investigation* (AECOM, 2022). The data collected as part of this investigation is considered to be adequate to inform future assessments of the Precinct South.

1.0 Introduction

The Macquarie Point Development Corporation (MPDC) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of a remediation strategy for the Macquarie Point site in Hobart, Tasmania (the Site). The Site location is presented on **Figure F1** in the **Figures** section.

This report has been prepared to provide a factual overview of the outcomes of the Well Maintenance Program undertaken at the Site between 14 September – 6 December 2023, and the Targeted Groundwater Monitoring Event (GME) undertaken at, and surrounding, the area referred to as the Precinct South area between 29 November – 6 December 2023.

The Site layout is presented on **Figure F2** in the **Figures** section. The Precinct South layout is presented on **Figure F3** in the **Figures** section.

1.1 Background

Historical activities undertaken at and in proximity to the Site have resulted in soil and groundwater impacts. The Site has been divided into seven sub-areas, as shown on **Plate 1**, for the purpose of assessment, remediation and completion of an Environmental Audit. Portions of the Site which have not yet received issue of a Site Suitability Statement (i.e., Auditor sign-off) include the Gateway, Precinct South, and Audit Area 4 East. Remediation work at the Precinct South was conducted in 2023, and remediation work at the Gateway has been conducted in 2024, although has not yet had results reported.

Plate 1 Site Sub-Areas

The Site was previously divided into Audit Areas (named Audit Area 1 to Audit Area 7) for environmental assessment purposes based on previous development plans. The Precinct South, the area considered in this report, covers previous Audit Area 3 and the south-east portion of previous Audit Area 5. Previous investigations undertaken in the Precinct South are summarised in existing Detailed Site Investigation (DSI) reports relevant to these areas, i.e. *Audit Area 5 – Detailed Site Investigation* (AECOM, 2021a), and *Audit Area 3 – Detailed Site Investigation* (AECOM, 2022).

As part of environmental assessments, AECOM has conducted a series of GMEs at the Site since 2015. The most recent Site-wide GMEs were conducted in August 2019 and November 2019, the outcomes of which were reported and summarised in the AECOM report titled *Groundwater Well Installation and Monitoring 2019* (AECOM, 2020a). Since then, a targeted GME has also been undertaken at the Gateway area in December 2022, the outcomes of which were reported in the AECOM report titled *The Gateway – Data Gap Assessment* (AECOM, 2023a).

A Well Maintenance Program was undertaken between 14 September – 6 December 2023, during which a number of wells, which were either damaged or buried by Site activities (such as excavation, spray sealing of surfaces, or vehicle movements on Site), were located and repaired.

Following the Well Maintenance Program, a Targeted GME was undertaken between 29 November – 6 December 2023 at and surrounding the Precinct South area to collect updated groundwater data to record current groundwater quality and conditions in this area. These data will inform detailed assessment of the condition at Precinct South, which will be undertaken as a separate phase of work.

This factual report consolidates and summarises the results of the Well Maintenance Program and the Targeted GME.

1.2 Objectives

The objectives of the Well Maintenance Program and Targeted GME were to:

- Assess the condition of groundwater wells in and surrounding the Precinct South (including wells off-Site to the south), and, where wells were not considered suitable to sample:
  - Locate any buried or ‘missing’ groundwater wells
  - Undertake well maintenance and repair activities (if possible) of damaged wells.

  It is noted that groundwater wells in other portions of the Site that were noted to be either lost or damaged during the December 2022 Targeted Gateway GME, were also included in this program.
- Collect updated groundwater data at and surrounding the Precinct South to record current groundwater quality and conditions. Detailed assessment of the groundwater data will be undertaken separately.

The objective of this report is to provide a clear and concise summary of the results to the Well Maintenance Program and the Targeted GME undertaken at and surrounding the Precinct South area.

Detailed assessment of protected environmental values (PEV), nature and extent of impacts, historical data and trends at the Precinct South is not presented in this factual report and will be undertaken separately.

1.3 Scope of Work

The scope of work undertaken at and surrounding the Precinct South are summarised in **Table 1**.

Table 1 Scope of Work

Task	Description	Details
1	Well Maintenance Program (14 September – 6 December 2023)	• *Walkover and well inspection* (14 September 2023): A walkover and targeted well inspection was undertaken to assess the accessibility and condition of groundwater wells at and surrounding the Precinct South, to identify wells that may require to be located (due to well gatics not being visible at the surface), as well as those that may require maintenance (due to being damaged) to ensure serviceability of the wells prior to undertaking a GME. • *Well surveying and metal detection* (1 November 2023): A licenced surveyor was engaged to locate up to 25 potentially buried or 'missing' groundwater wells (for which well gatics were not visible at the surface during the inspection undertaken on 14 September 2023). A combination of methods including metal detection and Global Positioning System (GPS) survey based on previously reported coordinates were used. Of the 25 wells, 18 were relevant to the Targeted Precinct South GME scope, and seven wells were from other portions of the Site which were not locatable during the Targeted Gateway GME (AECOM, 2023a). • *Well maintenance and repair* (13 November 2023): Maintenance and repair work was undertaken on select wells (as required), including cutting of bitumen and clearing of fill to expose gatics (where well gatics were buried under the surface), replacement of gatic bolts (where bolts were damaged, sheared or missing), replacement of gatic covers (where gatic covers were damaged), extension of the polyvinyl chloride (PVC) well casing to surface where gatics were buried under fill in re-graded areas of the Site. • *Re-survey of wells* (6 December 2023): A licenced surveyor was engaged to survey the updated heights [metres Australian Height Datum (m AHD)] of the top of the PVC casing for two groundwater wells (MW146 and RN4), which were uncovered from approximately 0.5 m bgl and extended to current ground surface level during the 13 November 2023 well maintenance and repair work. Further GPS survey and metal detection was undertaken to locate three additional wells (MW142, MW143 and MW155).
2	Targeted GME (29 November – 6 December 2023)	• *Gauging event* (4 December 2023): Gauging of the groundwater Standing Water Level (SWL) and Light Non-Aqueous Phase Liquid (LNAPL) thickness, where present, was conducted at a total of 31 groundwater wells located at and surrounding the Precinct South. • *Sampling event* (29 November – 6 December 2023): Collection of 27 primary groundwater samples over a six-day sampling period, from abovementioned groundwater wells, noting no samples were collected at four wells where measurable LNAPL was observed. Quality Assurance/Quality Control (QA/QC) samples were also collected. • Laboratory analysis of collected groundwater samples and QA/QC samples by National Association of Testing Authorities (NATA) accredited laboratories.
3	Reporting	• Preparation of this report summarising the results of the activities undertaken.

Further details regarding the field methodology adopted are provided in **Section 3.0** and **Section 4.0**.

2.0 Precinct South Details

The overall Macquarie Point Site, located at 10 Evans Street, Hobart, Tasmania, is approximately 9.3 hectares (ha) and is currently zoned as '*Macquarie Point Mixed Use Zone (Activity Area 3.0)*' for mixed use under the *Sullivans Cove Planning Scheme 1997* [(Hobart City Council (HCC, 2021)].

The Precinct South is a sub-area located in the south-eastern portion of the broader Site (refer **Plate 1** and **Figure F2** in the **Figures** section). For the purpose of reference to earlier reports, the Precinct South is comprised of the historic Audit Area 3 in its entirety, and a portion of historic Audit Area 5.

Site investigations have identified impacts at the Precinct South area, located in the south-eastern portion of the Site, which are associated with a history of industrial activities including rail/locomotive operations, freight handling and distribution, fuel and oil transfer, and bulk fuel storage.

2.1 Description

The Precinct South area is described below in **Table 2**.

Table 2 The Precinct South Details

Item	Details
Identification	The Precinct South, Macquarie Point
Address	10 Evans Street, Hobart, Tasmania, 7001 (see **Figure F1** in the **Figures** section)
Precinct South Area	Approximately 1.4 ha
Title Details	The Precinct comprises a portion of land title 113521/1 (formerly CT 114462/1) which make the overall Site area.
Current Owner	State of Tasmania (Crown Land)
Local Government Authority	Hobart City Council
Current Zoning	'*Macquarie Point Mixed Use Zone (Activity Area 3.0)*' (HCC, 2021)
Layout	The Precinct South is relatively flat, with a slight rise to the northern edge. The surface is sealed with bitumen, concrete, and gravel. One building currently occupies the central southern portion of the Precinct South area: • The Red Shed, currently occupied by a microbrewery (Hobart Brewing Company). A slab is present to the east of the Red Shed which was formerly occupied by the SeaRoads Shed, which was demolished in late 2022. Red Square, to the west of the Red Shed, is currently used as an intermittent public events space, and is used as a market place for small mobile vendors (e.g. coffee and food vendors, and hairdressers). The northern and central portion of the Precinct South is currently used as public carparking. The layout of the Precinct South is shown on **Figure F3** in the **Figures** section.
Surrounding Land Uses	• North – Unoccupied area of the Site (referred to as the Precinct North), temporarily being used for carparking and storage of shipping containers. A Waste Water Treatment Plant (WWTP) is located to the north and east beyond the Site boundary.

Item	Details
	• East –TasPorts owned land including carparking and port facilities. • South – Evans Street, with commercial properties (including TasPorts and University of Tasmania) and residential properties (apartments) beyond, which extend towards Hunter Street and Sullivans Cove. • West – The Goods Shed and Yard portion of the Site, which is used as office space and for temporary events, with commercial and residential properties beyond.
Geology	The Precinct South has been subject to significant filling since the early 1800s and is located on reclaimed land. Fill material across the Precinct South, and the greater Macquarie Point site, consists of clays, sands, gravels, cobbles and bricks. Deeper fill material consists of silty sands, similar to the underlaying natural material, and may be associated with reworked natural material or dredged material. Natural soils encountered below the Precinct South consists of estuarine/marine deposits (silty sands) and weathered dolerite including clays, gravels, cobbles. Dolerite bedrock is present below the Precinct South and is noted to generally decrease in depth to the south and east. The known lithology is summarised below: • Fill material: 0 to 12 m below ground level (bgl) • Estuarine/marine deposits: 3.7 to 15 m bgl • Weathered dolerite: 11.2 to 19 m bgl • Dolerite bedrock: 5 to 25+ m bgl
Hydrogeology	Regional groundwater flow is inferred to be in a general easterly direction toward the River Derwent. The Site is underlain by a single aquifer unit (within multiple lithological units). Groundwater modelling completed by GHD Group Pty Ltd (GHD, 2014) indicates groundwater flow to the south of the Site is in an easterly direction between the southern boundary of the Site and the location of Hunter Island. The easterly groundwater flow direction is considered to be influenced by Hunter Island, which is likely to be relatively low permeability when compared to the surrounding sediment, and the higher permeability sediment located in the former Hobart Rivulet (i.e. beneath Evans Street). The former Hobart Rivulet is considered to be a likely preferential pathway for groundwater flow. There are a number of former sea walls located beneath and surrounding the Site. The sea walls were used in the progressive stages of land reclamation and are likely to influence localised groundwater flow direction. Evidence of tidal influence on groundwater levels has been previously identified to the south of the Site within the inferred groundwater flow path at MW151, where tidal variation of approximately 0.1 m has been noted. Tidal influence [i.e. increasing SWL variations] has been noted to increase toward Sullivans Cove. The inferred potentiometric contours for shallow groundwater (refer **Figure F5**the **Figures** section) based on the SWL data collected during the gauging event undertaken on 4 December 2023, at and surrounding the Precinct South, indicate that groundwater beneath the Precinct South is in a generally south-westerly direction, with some southerly components in the southern portion of Precinct South. Some possible easterly flow components are noted at the eastern boundary, although this may be an artefact of lack of gauging data in the TasPorts area. Groundwater below the Precinct South is generally encountered between 1.9 to 4 m bgl.

2.1.1 Proposed Future Land Use

Based on the *New Territory from Old Ground – Macquarie Point Strategic Framework and Masterplan 2015-2030* (the Masterplan) (MPDC, 2015), the Precinct South was intended for development for a mixture of future uses, as shown on **Figure F2** in the **Figures** section, comprising:

- Commercial (including visitor accommodation, retail, arts and institutional); and
- Public open space.

In September 2022, it was announced by the Tasmanian Government Department of State Growth that the Macquarie Point site is the preferred location for a future sports stadium and multipurpose area. In October 2023, the *Mac Point Draft Precinct Plan* (the Precinct Plan) (MPDC, 2023) was released for the redevelopment of the Site, which sets out a mixed-use precinct comprised of interconnected discrete Zones. The Precinct Plan is presented in **Plate 2**, as well as in context with the boundaries of the Precinct South on **Figure F4** in the **Figures** section.

Based on the Precinct Plan (MPDC, 2023), the Precinct South area is proposed to comprise a combination of Commercial and Open Space use areas, specifically:

- The Complementary Integrated Mixed Use Zone; and
- The ‘Multipurpose Stadium and Associated Concourse Zone’.

Basement carparking is not currently planned for this area and is considered unlikely to occur based on the shallow depth to groundwater, and potential management issues associated with residual LNAPL present in the south-eastern portion of the Site. Additional remediation and/or mitigation controls will be required if basement parking is considered in future.

Plate 2 Precinct Plan and Future Land Uses (MPDC, 2023)

2.2 Chemicals of Potential Concern

On the basis of the historical land uses of the Precinct South and surrounding areas, and previous environmental investigations that have been undertaken at and surrounding Precinct South, the following chemicals of potential concern (CoPC), summarised in **Table 3** below, may be present in the Precinct South.

Table 3 Chemicals of Potential Concern

Former Land Use/ Potential Contaminating Activity	Chemicals of Potential Concern	Potential Impacted Media
The Precinct South		
Land Reclamation	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs	• Soil • Groundwater • Soil Vapour
Freight Handling	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, pH	
Fuel Storage	Lead, TRH, PAH, BTEX, ACM	
Mechanics Workshop	Heavy metals[2], TRH, PAH, BTEX, phenolic compounds	
Adjacent Areas		
Land Reclamation	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs	• Soil • Groundwater • Soil Vapour
Roundhouse (Locomotive maintenance and refuelling)	TRH, BTEX, PAH, phenolic compounds, chlorinated hydrocarbons, SVOC, VOC	
Railyards (including fuel storage) and Freight Handling	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC	
Gasworks	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, cyanide, ammonia, ACM	
Fuel Storage and Bulk Fuel Terminals	Lead, TRH, PAH, BTEX, PFAS[3], ACM	
Port Operations	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC	
Former Hobart Rivulet	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, cyanide, ammonia, SVOC, VOC, OCPs	

Notes: TRH – Total Recoverable Hydrocarbons; PAH – Polycyclic Aromatic Hydrocarbons; BTEX – Benzene, Toluene, Ethylbenzene and Xylenes; SVOC: Semi-Volatile Organic Compounds; VOC: Volatile Organic Compounds; OCP: Organochlorine Pesticides; PFAS – Per and Poly-fluoroalkyl Substances; ACM – Asbestos Containing Material; 1 – aluminium, arsenic, cadmium, chromium, copper, lead, manganese, nickel and zinc; 2 – lead and arsenic; 3. A review of historical information has not identified the use of products containing PFAS, however there is potential for firefighting foams containing PFAS to have been used historically as part of emergency response operations at the former Bulk Fuel Terminals.

3.0 Data Quality

3.1 Data Quality Objectives

The *National Environment Protection (Assessment of Site Contamination) Amendment Measure 2013*, (ASC NEPM, 2013) *Schedule B2: Guideline on Site Characterisation* specifies that the nature and quality of the data produced in an investigation are determined by the Data Quality Objectives (DQOs). As referenced by the ASC NEPM (2013), the DQO process is detailed in the United States Environmental Protection Agency (US EPA) *Guidance on Systematic Planning Using the Data Quality Objectives Process* (2006), EPA QA/G-4 (EPA/240/B-06/001).

The process of establishing appropriate DQOs is defined by a seven-step planning approach as presented by ASC NEPM (2013) and US EPA (2006). The DQOs for the Targeted Precinct South GME project were established during the development of the field program and presented in the Sampling, Analysis and Quality Plan (SAQP) [AECOM, 2023b] previously prepared for the work. For reference, the DQOs are presented in **Appendix A**.

3.2 Data Quality Indicators

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the data include:

- Assessment of the reproducibility of the data by calculation of the Relative Percent Difference (RPD) for laboratory and field duplicate samples. This provides an indication of the precision of the data. The RPD is calculated from the absolute difference between results of the duplicate pair divided by the mean value of the duplicate pair as presented below:

  RPD (%) = 100 x (D1-D2) / ((D1+D2) / 2)

  Where: D1 = primary sample analysis; D2 = duplicate sample analysis
- Assessment of the analytical results for laboratory QC samples. This provides an indication of the accuracy of the data.
- Collection of rinsate blanks (at a rate of one per day of sampling) to provide an indication of accuracy related to potential for cross contamination of samples during sampling.
- Collection of field blanks (at a rate of one per day of sampling) to assess ambient conditions during sampling.
- Analysis of trip blanks (at a rate of one per esky) to provide an indication of accuracy related to potential for cross contamination of samples during transport.

Assessment criteria for DQI for the sampling work undertaken are listed below in **Table 4**.

Table 4 Acceptance Criteria for Data Quality Indicators

Data Quality Indicator	Acceptance Criteria
Rinsate blanks	Less than the laboratory limit of reporting (LOR)
Intra and inter laboratory field duplicates (1)	RPDs less than: • 30% for high level laboratory duplicates (i.e. >20 x LOR) • 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR) • 200% for low level laboratory duplicates (i.e. 1 to 10 x LOR)
Trip blanks	Less than the laboratory LOR
Field blanks	Less than the laboratory LOR

Data Quality Indicator	Acceptance Criteria
Laboratory duplicates (2)	RPDs Less than: • 20% for high level laboratory duplicates (i.e. >20 x LOR) • 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR)
Matrix spikes (3, 4)	Recoveries between 70-130% of the theoretical recovery
Method blanks	Less than the laboratory LOR
Laboratory control samples (4)	Recoveries between 70-130%.
Surrogate spikes	See Note 5

Notes:

1. *This RPD range is based on typical RPDs recommended in AS 4482.1-2005 (Standards Australia, 2005). Higher variations can be expected for organic analyses compared to inorganics, and for samples with low analyte concentrations or non-homogeneous samples (ASC NEPM, 2013). It is noted that AS4482.1-2005 was recently withdrawn by Standards Australia in 2022, although, it is still considered acceptable for this withdrawn standard to be used, considering the absence of replacement technical documents, and on the basis that soil sampling guidelines from other states including from EPA Victoria (2009) and Queensland Government (2018) adopt typical RPD acceptance criteria recommended in AS4482.1-2005.*
2. *If the concentrations are close to the LOR, then higher RPDs may be accepted. Variation can be expected to be higher for organic analysis than for inorganics (AS 4482.1-2005).*
3. *Assumes that samples are homogeneous and the background analyte level is less than 20% of the spike level (refer to USEPA Method 8000B). Note that there is no requirement for matrix spikes to pass as certain matrices may preclude recovery of spiked compounds. In this case data will be accepted if LCS data meets the acceptance criteria.*
4. *80% of the compounds tested must fall within the control limits. Control limits are dynamic and vary for individual tests as per USEPA Method 8000B.*
5. *Recoveries for surrogates are test dependent and are based on US EPA Method SW846. Control limits are dynamic and vary for individual tests but are within the criteria described in US EPA Method SW846.*

3.3 Assessment of Data Quality

A detailed assessment of data quality is provided in **Appendix A** which encompasses appraisal of field and laboratory QA/QC for groundwater data collected across the Precinct South and surrounding areas between 29 November – 6 December 2023.

Based on the outcomes of the DQO process, the quality of the data collected was assessed on a range of factors including:

- Documentation and data completeness; and
- Data quality, comparability, representativeness, and precision and accuracy for sampling and analysis.

The relevant evaluation criteria for each of these issues are presented in below in **Table 5** below.

Table 5 DQO Evaluation and Criteria

DQO	Evaluation Criteria	Comments
Documentation Completeness	Site properly described	**Section 1.1** and **Figure F2**
	Investigation area properly described	**Section 2.0** and **Figure F3**
	Understanding of Site history and chemicals of interest presented	DSI reports (AECOM, 2021a and 2022) and **Section 2.2**
	Sampling locations properly and accurately located	SAQP (AECOM, 2023b), **Figure F3** and **Table T2**.

DQO	Evaluation Criteria	Comments
Data Completeness	Completion of calibration records, field records, chain of custody (CoC) forms, laboratory sample receipt and test certificates from NATA accredited laboratories	**Appendix B**, **Appendix C**, **Appendix D** and **Appendix E**
	Samples tested for appropriate chemicals of interest	SAQP (AECOM, 2023b), **Section 2.2**, **Table T3** to **Table T6**, **Appendix A**, **Appendix D** and **Appendix E**
	Consideration of key receptors of interest	DSI reports (AECOM, 2021a and 2022), **Section 2.1** and **Appendix F**
	Appropriate sampling techniques, sample storage and transportation of samples	SAQP (AECOM, 2023b), **Section 4.0**, **Appendix A** and **Appendix D**
Data Comparability	Selection of NATA certified laboratory using NEPM testing procedures	SAQP (AECOM, 2023b), **Appendix A** and **Appendix E**
	Intra-laboratory and inter-laboratory duplicate samples	SAQP (AECOM, 2023b), **Appendix A**, and **Appendix C**
Data Representativeness	Collection and analysis of adequate number of representative samples from each location	SAQP (AECOM, 2023b), **Appendix A** and **Figure F3**
	Use of properly trained and qualified field personnel	SAQP (AECOM, 2023b), **Appendix A** and **Section 4.0**
Precision and Accuracy	Assessment of RPD for laboratory and field duplicate samples	**Section 3.2** and **Appendix A**
	Assessment of suitability of LORs	**Appendix A** and **Table T3** to **Table T6**
	Assessment of the analytical results for laboratory QC samples	**Section 3.2** and **Appendix A**
	Collection and assessment of rinsate and blank samples	**Section 3.2** and **Appendix A**

The Targeted Precinct South GME was undertaken in accordance with the SAQP (AECOM, 2023b). The SAQP provided detail on sampling methodologies, the rationale for sample location selection, analytical schedule and DQOs.

Detailed assessment of field and laboratory QA/QC for the groundwater data collected has been undertaken in **Appendix A**. The data validation procedure employed indicate that the following should be considered when assessing the data provided in the report:

- During the six-day groundwater sampling period, no rinsate blank sample was collected on the first day of sampling (29 November 2023), hence assessment of potential cross-contamination during sampling undertaken on this day is limited. Wells sampled on this day (RN4 and MW146) did not report any exceedances of adopted criteria which affect the overall conclusions and outcomes of assessment, and no detections which are considered likely to indicate cross-contamination were reported in the five rinsate samples collected on each other day of sampling, thus it is considered unlikely that cross-contamination may have occurred to an extent which affects assessment of groundwater condition in the Precinct South.

- LORs for select PAHs, including naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene, were reported above the adopted Ecosystem Protection (90%), Drinking Water (Health), and/or Recreation (Primary / Secondary Contact) criteria. Exceedances of the adopted criteria for either these CoPC, and other CoPC, have been detected in groundwater during this sampling event and previous investigations, and these uses are considered precluded for groundwater within the Precinct South.

  As a results, the LORs of these CoPC which exceed adopted criteria are not considered significant or to affect the overall assessment of precluded uses of groundwater in the Precinct South. However, future sampling events should consider if lower LORs for this CoPC should be requested if practical.

- The LOR for aluminium was reported above the adopted Ecosystem Protection (90%) screening value. However, concentrations in excess of this criteria were reported in approximately 85% of the samples analysed, and this LOR discrepancy is not considered to affect the overall assessment of groundwater condition or precluded groundwater uses in the Precinct South, as detected concentrations of aluminium above LOR already preclude this use . However, future sampling events should consider if lower LORs for this CoPC should be requested if practical.

- Recovery of the surrogate 2-Bromonaphthalene (for TPH – semi-volatile speciation) was marginally greater than the upper DQO limits, which may indicate potential for minor over-estimation of reported concentrations of semi-volatile speciated TPH fractions in MW146. This may result a minor level of conservatism in the interpretive use of the data but does not impact the reliability of the data.

- The rate of laboratory QC testing of laboratory duplicates and matrix spikes were below the expected frequency for some analytes due to insufficient sample volume, however this is not considered to impact the reliability of the data as:

  - Results are consistent with historic assessments.
  - No new sources of impact are known to have been introduced since previous investigations have been conducted.

Where there have been non-compliance from data quality indicators identified, the following conservative measures have been adopted:

- Adopted criteria lower than reported LORs have been conservatively considered precluded.
- Results have been compared to data from this event and historic assessments, and existing Site knowledge, to assess if discrepancies are consisted likely to represent meaningful gaps or effects on interpretation.

On the basis of the known contamination status of the Site, the analytical data validation procedure employed, and the field procedures adopted during the field investigations, the overall quality of the analytical data is considered to be of an acceptable standard for interpretative use.

4.0 Field Methodology

4.1 Well Maintenance Program

As described in **Table 1**, the Well Maintenance Program included the following activities:

- Walkover and well inspection (14 September 2023)
- Well surveying and metal detection (1 November 2023)
- Well maintenance and repair (13 November 2023)
- Re-survey of wells (6 December 2023)

The walkover and well inspection were undertaken by properly trained and qualified AECOM field personnel. A licenced surveyor was engaged for GPS survey work and a licenced driller was engaged for well repair work, which consisted of cutting asphalt where wells were suspected covered, hydro-excavation where wells were suspected to be buried, minor repairs with hand tools to replace bolts or gatics, and/or extension of stand-pipes and installation of new gatics if required.

The work was undertaken in accordance with a Safety Health and Environment Management Plan (SHEMP) for the project, including task-specific safe work method statements (SWMS).

4.2 Targeted GME – Gauging and Sampling

Groundwater gauging and sampling for the Targeted GME were undertaken properly trained and qualified AECOM field personnel, in accordance with the SAQP for the work, as well as guidance provided in the following documents:

- ASC NEPM (2013), *Schedule B2: Guideline on Site Characterisation*.
- Documents in the absence of relevant Tasmanian guidelines, including:
  - EPA Victoria Publication IWRG701, *Sampling and Analysis of Waters, Wastewaters, Soils and Wastes*, June 2009.
  - EPA Victoria Publication 669.1, *Groundwater Sampling Guidelines*, February 2022.
  - EPA Victoria Publication 668.1 *Hydrogeological Assessment (Groundwater Quality) Guidelines*, October 2022.

Specific details regarding the field methodology are summarised in **Table 6** below.

Table 6 Methods

Activity	Methodology
Groundwater Monitoring Well Gauging	• Monitoring wells were gauged using an Interface Meter and SWLs and total well depths were measured as m below top of casing (BTOC). • Where LNAPL was present, the bottom depth of the well was not gauged.
Groundwater Monitoring Well Sampling	• Groundwater samples were collected via low flow sampling techniques. • Water quality parameters (including pH, electrical conductivity [EC], dissolved oxygen [DO], oxidation reduction potential [ORP] and temperature) were measured during purging using a calibrated water quality meter. Sampling was undertaken following the stabilisation of the water quality parameters (i.e. DO ±10%; EC ±3%; pH ±0.05; ORP ±10mV; temperature ±0.2°C) and water level (<0.1 m). • Samples were field-filtered (using 45µm in-line filters) for analysis of dissolved metals and ferrous iron.

Activity	Methodology
Groundwater QC Sampling	• Intra-laboratory and inter-laboratory duplicate groundwater samples, rinsate blanks, trip blanks and field blanks were collected as described in **Section 3.2**.
Sample Nomenclature	All samples were clearly labelled with unique sample identification numbers consisting of the date, sample location and sampler's initials. In the case of intra and inter-duplicate samples, sample containers were labelled so as to not reveal their purpose or sample location to the laboratory.
Sample Preservation	• Samples were stored on ice, in a darkened esky whilst at the Site, and in transit to the laboratory. • As required, groundwater samples were placed in appropriately preserved laboratory-supplied containers for the analyses performed by NATA-accredited laboratories.
Equipment Decontaminatio n	• Reusable groundwater sampling equipment was decontaminated between each sample location using a Decon 90 solution and subsequently rinsed in potable water. • Clean, disposable nitrile gloves were worn during gauging and sample collection. Gloves were changed between each gauging and sampling location.
Management of Purged Groundwater	• Purged groundwater from sampling activities was placed into labelled drums and stored on-Site for future disposal by a licenced waste contractor.

Equipment calibration certificates are attached in **Appendix B**.

Field records are attached in **Appendix C**.

The CoC forms and Sample Receipt Notification (SRN) documentation are attached in **Appendix D**, and laboratory certificates are attached in **Appendix E**.

5.0 Field Observations

5.1 Well Maintenance Program

As described in **Section 1.3** and **Section 4.1**, in preparation for the Targeted GME, a Well Maintenance Program was undertaken between 14 September – 6 December 2023, which included an inspection to assess the accessibility and condition of groundwater wells at and surrounding the Precinct South, followed by survey-location and repair of a number of wells which were either damaged or buried as a result of Site activities (such as excavation, spray sealing of surfaces, or vehicle movements on Site).

The outcomes of the work were presented in the SAQP (AECOM, 2023b) and are summarised in **Table T1** in the **Tables** section.

It is noted that:

- Two wells, namely MW146 and RN4 were buried 0.5 – 0.6 m deep under fill placed in the area for regrading of the surface for the Dark MOFO event in June 2023. Hydro-excavation (non-destructive digging) was used to expose the gatics for these wells buried under fill, following which the well casings were extended and gatics raised to the surface level. The top of casing of these wells were resurveyed on 6 December 2023 to record the changed elevation resulting from the repair work.
- Seven wells, namely MW13, MW137, MW142, MW143, R4, S9, and TW03, are destroyed/lost. The loss of these groundwater wells is not considered to prevent fulfilment of the objectives of the GME as:
  - MW137 and R4 have not been previously sampled, and they have been monitored as part of delineation of LNAPL in the Promenade and Underground Carpark area (referred to in reports as LNAPL Plume A2). Nearby wells MW146 (located between the historic location of LNAPL Plume A2 and Precinct South) and RN4 (located in the north-western portion of Precinct South) are down-hydraulic gradient of the inferred LNAPL Plume A2 and are suitable for assessment of potential migration of LNAPL or dissolved hydrocarbons to the Precinct South.
  - At S9, historical groundwater data are available from 2015, 2016, 2017, 2018 and 2019, with no exceedances of Site-Derived RC reported. Updated groundwater data has been collected from monitoring wells up- and down- inferred hydraulic gradient which enables assessment of groundwater quality in this area.
  - At MW13:
    - Historical groundwater data are available from 2015 and 2019. No exceedances of Site-Derived RC have been reported.
    - MW13 is inferred to have been located up- or cross-hydraulic gradient of historical fuel-related sources of contamination identified within this portion of the Site. Based on aerial images, the area surrounding and up-gradient of MW13 has predominantly been used for freight storage & as open-space since the mid 1970s until 2014, and for carparking & open space since 2016, without any new sources of potential impact to groundwater known to be introduced since the previous monitoring event.
    - Updated groundwater data has been collected from up-hydraulic gradient (MW127A/B and MW55) as well as down-hydraulic gradient (several wells).
    - MW13 previously delineated LNAPL to the west of Plume B. Excavation to the water table was conducted 9.5 m to the west of MW13 in 2023 and no LNAPL or sheen was apparent on the groundwater, as show on **Plate 3** in **Section 5.2**, and is considered suitable to delineate LNAPL in this direction.

  As MW13 does not have historical impact to groundwater reported, has not had contaminant sources of impact between the previous monitoring events introduced, and the Targeted GME included assessment of groundwater up, down, and cross-gradient, replacement of this well is not proposed.

- At TW03:
  - Historical groundwater data are available from 2016, 2017, 2018 and 2019. No exceedances of Site-Derived RC have been reported.
  - No new contaminant sources have been identified in this area since the previous monitoring. Potential sources of contamination (oil and diesel pipelines and lead impacted soil) in this area have been removed (AECOM, 2021b).
  - Previous groundwater gauging has reported potential off-Site mounding and localised westerly groundwater flow from TasPorts land to the east. The off-Site area potentially hydraulically upgradient currently consists of a sealed bitumen surface and apparent warehouse space, and review of aerial photographs on NearMap[1] between at least 6 March 2011 (the point at which NearMap images are available) and when the Targeted GME was undertaken does not indicate any change in use. As noted above, multiple GMEs conducted in this period have not reported any contamination in groundwater in TW03 which may indicate an off-Site source.

    While the presence/absence of groundwater mounding and potential off-Site impacts entering Site groundwater could not be assessed as part of this GME with the loss of TW03, it is considered unlikely that groundwater conditions have altered in a manner which may introduce new contamination based on no apparent changes in off-Ste use, and removal of on-Site sources of potential impact.

  As TW03 does not have historical impact to groundwater reported, and is not considered likely to have had any new source of potential impact between the previous monitoring events introduced, replacement of this well is not proposed.
- MW142 and MW143 are buried under fill placed in the area for regrading of the surface for the Dark MOFO event and were unable to be accessed. These wells, located within and immediately down-gradient of the extent of the historic LNAPL Plume A3, were last monitored as part of the November 2019 GME (AECOM, (2020a).

  The exclusion of these groundwater wells is not considered to prevent fulfilment of the objectives of the GME as:
  - LNAPL has not been measured at MW142 during any GMEs or during monitoring as part of LNAPL remediation (AECOM, 2021c) undertaken between 2016 – 2019 since installation of the well in October 2015, although LNAPL droplets were noted on the interface probe during gauging in October 2016.
  - LNAPL remediation, including at MW143, was undertaken between 2015 and 2017, and LNAPL was not detected in the well between July 2017 and November 2019. LNAPL is not considered to remain in this well (AECOM, 2021c).
  - The Targeted GME included gauging and assessment of groundwater from nearby wells, including MW146 (down-hydraulic gradient and between these wells and the border of the Precinct South) and RN4 (down-hydraulic gradient and located at the border of the Precinct South closest to these wells) and MW155 (which is cross-hydraulic gradient of MW142 and MW143). No LNAPL or hydrocarbon concentrations indicative of LNAPL were detected in these wells, and it is considered unlikely that LNAPL is migrating into the Precinct South.

Following completion of the Well Maintenance Program, a total of 31 groundwater wells at and surrounding the Precinct South were selected for the Targeted GME.

5.2 Groundwater and LNAPL Gauging

A groundwater gauging event was undertaken on 4 December 2023 to measure groundwater SWLs and LNAPL thickness (where present) at a total of 31 groundwater wells located at and surrounding the Precinct South.

[1] Nearmap.com, accessed 30 January 2024

Based on the SWL data collected during the gauging event, the inferred potentiometric contours for shallow groundwater are presented in **Figure F5** the **Figures** section, noting that:

- SWLs from deep groundwater monitoring wells, i.e. wells installed to depth of >10 m bgl, namely, MW124B, MW125B, MW126B and MW127B, are not considered in the potentiometric contours.
- Two wells, MW150 and MW155, were unable to be gauged as part of the gauging event on 4 December 2023. MW150, which is located in the middle of Evans Street, was unable to be safely accessed due to traffic, and MW155, which was initially buried under fill, was uncovered and accessed on 6 December 2023. Thus, SWL records collected at the time of sampling of these wells, from 1 December 2023 for MW150 (i.e. three days before the gauging event), from and 6 December 2023 for MW155 (i.e. two days after the gauging event) were used for the preparation of potentiometric contours. There is potential for some minor localised effects on the potentiometric contours based on this time gap, however, overall contours are consistent with previous gauging and inclusion of these SWL data are not expected to significantly impact interpretation of the contours.

The following are noted:

- Recorded depth to groundwater ranged from:
  - 1.582 m bgl (MW164) to 3.250 m bgl (MW176) in wells screened in the shallow aquifer
  - 2.281 m bgl (MW126B) to 3.056 m bgl (MW124B) for wells screened in the deeper aquifer (top of screened interval >9 m bgl).
- The inferred potentiometric contours for shallow groundwater indicate that groundwater at and surrounding the Precinct South has a generally south-westerly flow direction, with some southerly components in the southern portion of Precinct South, and possible easterly flow components at the eastern boundary, although this may be an artefact of lack of gauging data in the TasPorts area.
- Hydrocarbon odours were noted at monitoring wells MW03, MW05 and PW02. Although hydrocarbon odour at well S8 was not noted in the field records, the field staff has verified that LNAPL was confirmed at S8 (using an interface meter as well as a bailer) and that hydrocarbon odour was present at S8.
- Dense Non-Aqueous Phase Liquid (DNAPL) was not encountered at any of the groundwater wells monitored.
- Measurable LNAPL was observed at four groundwater monitoring well locations (MW03, MW05, PW02 and S8) as summarised in **Table 7**, with thickness ranging from 0.050 to 0.160 m. The historical reported range of LNAPL thickness from previous GMEs and monitoring at these wells (AECOM, 2021c) has also been included.

Table 7 LNAPL Measured in Groundwater Wells during Gauging Event (4 December 2023)

Well ID	Depth to Groundwater (m bgl)	Depth to LNAPL (m bgl)	LNAPL Thickness (m)	Historical Maximum LNAPL Thickness (m)	Thickness Within Historical Range?
MW03	1.97	1.92	0.050	0.091	Yes
MW05	2.17	2.1	0.070	0.096	Yes
PW02	2.25	2.09	0.160	0.080	No
S8	1.99	1.87	0.120	0.014	No

With regards to delineation of LNAPL, it is noted that:

- As well MW13 was destroyed (refer **Table T1**) during pipeline removal works in this area, there is a potential gap in LNAPL delineation to the west of groundwater well S8. However, excavation to groundwater was undertaken approximately 9.5 m west of groundwater well MW13 as part of soil remediation in the Precinct South in 2023, and no LNAPL or sheen was apparent on the surface of the groundwater exposed. A photograph of the groundwater encountered in this excavation is presented in **Plate 3**.
- Consistent with historic assessment, LNAPL is not delineated off-Site in TasPorts land to the east, however, repeated requests for access to gauge or monitor groundwater condition in this direction have not been granted by TasPorts. The LNAPL plume has been previously assessed as likely to be present on TasPorts land, and originate from historic activities (bulk fuels storage and handling) on both the Site and TasPorts land.

Plate 3 Groundwater in excavation approximately 9.5 m west of groundwater well S8 undertaken as part of soil remediation work in the Precinct South in 2023

The recorded LNAPL thickness in PW02 (0.160 m) and S8 (0.120 m) exceeded the historical maximum LNAPL thicknesses recorded for these wells and for Plume B as a whole (0.096 m, previously detected in MW05 in 2018) (AECOM, 2022). The cause of increase is not known, but as the inferred source of Plume B (historic fuel storage tanks in the area and on the TasPorts land to the east) have been removed, and no new sources, such as a fuel spill or installation of new storage tanks or lines, are known to have occurred in the area, it is considered likely that the recorded LNAPL thicknesses are localised changes to the existing plume and do not represent a change in plume mobility. Recent works, such as the removal of the SeaRoads Shed in late 2022, or remediation excavation conducted to the west in 2023, may have introduced vibrations in the ground or, in the case of the remediation excavation, created a temporary void, which has affected the LNAPL area.

Remediation attempts at Plume B, conducted between 2000-2001 and 2015-2019, generally reported low recoverability and general impracticability of LNAPL remediation via extraction (AECOM, 2021c). In

order to assess if the recorded LNAPL thickness in this GME represents a change in plume conditions which may indicate further remediation could be considered, an additional LNAPL gauging and transmissivity testing event was conducted between 20-21 March 2024 (AECOM, 2024a) and reported that:

- Detected LNAPL thicknesses in wells in March 2024 were consistent with, or less than, the reported LNAPL thicknesses in December 2023. LNAPL was only detectable in three wells (MW05, PW02, and S8) and was no longer detectable in MW03.
- LNAPL transmissivity in PW02 and S8 was calculated following baildown testing and was at or below the range at which further LNAPL recovery was considered efficient. Insufficient LNAPL recovery occurred in MW05 to assess LNAPL transmissivity, and is considered indicative of overall low LNAPL transmissivity.

Based on these results, and on the lack of any identified source of ongoing LNAPL release which could be increasing the volume of LNAPL in Plume B, it is considered that LNAPL Plume B remains stable and is unlikely to have mobilised. Further remediation of LNAPL Plume B was considered unlikely to have a material impact on reducing the residual LNAPL volume.

During the Targeted GME, samples were collected from 27 groundwater wells, noting no samples were collected at four wells where measurable LNAPL was observed.

Table 8 below summarises the stabilised groundwater quality parameters measured during the Targeted GME, at the time of groundwater sampling via low-flow sampling method. The table summarises data from wells at and surrounding the Precinct South, including off-Site wells.

Table 8 Summary - Field Water Quality Parameters

Wells	Values	pH	EC (mS/cm)	ORP (mV) [1]	DO (mg/L)
Shallow Wells (i.e. wells installed to depths of ≤10 m bgl)	Minimum	6.58 (MW126A)	305 (MW163)	-1231.0 (RN4)	0.00 (MW60)
	Maximum	7.35 (MW163)	33,578 (MW153)	-20.4 (MW175)	0.16 (MW146)
	Average	NA	3125	-141.9	0.07
Deep Wells (i.e. wells installed to depth of >10 m bgl)	Minimum	6.38 (MW127B)	241 (MW127B)	-125.9 (MW124B)	0.02 (MW124B)
	Maximum	7.76 (MW124B)	1994 (MW126B)	-32.1 (MW127B)	0.10 (MW126B)
	Average	NA	1171	-78.4	0.06

Notes: mS/cm – millisiemens per centimetre; mv – millivolts; 1 –Field-collected ORP data has been presented herein, i.e. ORP data has not been corrected with reference to the electrode used in the field; NA – calculation of average is not applicable to pH values.

6.0 Analytical Results

Groundwater analytical data obtained from the laboratories were reviewed and screened against assessment criteria for comparison purposes only. The selected assessment criteria are detailed in **Appendix F**, including adopted Tier 1 Screening Criteria, and Site-Derived Remediation Criteria (RC) for groundwater (AECOM, 2016). These were also presented in the SAQP (AECOM, 2023b) previously prepared for the work.

Groundwater analytical data compared with adopted Tier 1 Screening Criteria are presented in **Table T3** to **Table T5**. Groundwater analytical data compared with Site-Derived RC are presented in **Table T6**. **Figure F6** - **Figure F9** in the **Figures** section shows locations with CoPC above the adopted assessment criteria in groundwater samples.

A summary of the exceedances of the adopted assessment criteria are presented on **Table 9** below.

Table 9 Summary of Exceedances of Assessment Criteria

PEV	CoPC	Criteria Exceeded [1]	Range of Reported Concentrations [1]	Number of Exceedances
Tier 1 Screening Criteria				
Drinking Water (Health)	Benzene	1	<1 - 2	1 of 27 primary results
	Arsenic	0.01	<0.001 - 0.011	1 of 27 primary results
	Lead	0.01	<0.001 - 0.025	2 of 27 primary results
	Manganese	0.5	0.079 - 3.47	17 of 27 primary results
	Naphthalene	0.17	<1 - 2.6	2 of 26 primary results
	Benz(a)anthracene	0.03	<1 - 1.2	1 of 26 primary results
	Benzo(a)pyrene	0.01	<0.5 - 1.3	1 of 26 primary results
	Cyanide Total	80	<4 - 186	2 of 26 primary results
Drinking Water (Aesthetics)	Aluminium	0.2	<0.01 - 0.32	2 of 27 primary results
	Manganese	0.1	0.079 - 3.47	26 of 27 primary results
	Total Dissolved Solids	600	189 - 22000	18 of 27 primary results
	Chloride	250	10 - 11600	7 of 27 primary results
	Sodium	180	7 - 5990	9 of 27 primary results
Recreation (Primary / Secondary Contact)	Naphthalene	1.7	<1 - 2.6	1 of 26 primary results
	Benz(a)anthracene	0.3	<1 - 1.2	1 of 26 primary results
	Benzo(a)pyrene	0.1	<0.5 - 1.3	1 of 26 primary results
Vapour Intrusion – Residential Health Screening Levels (HSLs)	>C10-C16 (minus Naphthalene)(F2)	760	<100 - 1140	2 of 26 primary results

PEV	CoPC	Criteria Exceeded [1]	Range of Reported Concentrations [1]	Number of Exceedances
Ecosystem Protection (90%)	Aluminium	0.0005	<0.01 - 0.32	23 of 27 primary samples
	Copper	0.003	<0.001 - 0.006	4 of 27 primary samples
	Lead	0.0066	<0.001 - 0.025	3 of 27 primary samples
	Manganese	0.08	0.079 - 3.47	26 of 27 primary samples
	Zinc	0.023	<0.005 - 0.077	4 of 27 primary samples
	Ammonia (as N)	1.2	<0.01 - 52	24 of 26 primary samples
	Anthracene	0.01	<1 - 3.7	4 of 26 primary samples
	Phenanthrene	0.6	<1 - 26.6	11 of 26 primary samples
	Fluoranthene	1	<1 - 5.4	7 of 26 primary samples
	Benzo(a)pyrene	0.1	<0.5 - 1.3	1 of 26 primary samples
	C10-C36 fraction (sum)	600	<50 - 1730	6 of 26 primary samples
	>C10-C40 fraction (sum)	600	<100 - 1710	6 of 26 primary samples
Buildings and Structures	Chloride	6000	10 - 11600	1 of 27 primary results
Aesthetics [2]	Hydrocarbon odours and measurable LNAPL were noted at monitoring wells MW03, MW05, PW02 and S8.			
Site-Derived Remediation Criteria				
Potential Future Residents (slab-on-grade buildings with unknown construction or multi-storey building)	TRH C6-C10 fraction (minus BTEX)(F1)	600	<20 - 600	1 of 27 primary results
	TRH >C10-C16 (minus Naphthalene)(F2)	800	<100 - 1140	1 of 26 primary results

Notes: *[1] Values are expressed as µg/L for organic CoPC and total cyanide, mg/L for other inorganic CoPC; [2] Aesthetic issues based on field observations.*

Concentrations of the following CoPC were reported above the adopted assessment criteria in at least one sample:

- Benzene
- TRH >C_{10}-C_{40} (sum), TRH C_6-C_{10} (minus BTEX)(F1), TRH >C_{10}-C_{16} (minus Naphthalene)(F2),
- Select metals (aluminium, arsenic, copper, lead, manganese, zinc)
- Select PAHs (naphthalene, anthracene, phenanthrene, fluoranthene, benz[a]anthracene, benzo[a]pyrene)
- Inorganics (chloride, sodium, total cyanide, ammonia)

Exceedances were reported for the following criteria:

- Tier 1 Screening Criteria:
  - Drinking Water (Health)
  - Drinking Water (Aesthetics)
  - Recreation (Primary / Secondary Contact)
  - Vapour Intrusion – Residential HSLs
  - Ecosystem Protection (90%)
  - Buildings and Structures
- Site-Derived RC:
  - Potential Future Residents (slab-on-grade buildings with unknown construction or multi-storey building)

No PEVs considered available in previous assessment (AECOM, 2021a and AECOM, 2022f) were reported precluded during the GME. No future residential use of the Precinct South is planned or considered likely, and no remediation of groundwater is considered required based on reported exceedances of RC.

As discussed in **Section 1.2**, further assessment of groundwater PEVs and nature and extent of impacts is not presented in this factual report and will be undertaken separately.

7.0 Conclusions

Based on the recent activities undertaken at and surrounding the Precinct South area, including the Well Maintenance Program and the Targeted GME, the following is noted:

- A Well Maintenance Program consisting of inspection of the condition of 38 groundwater wells at and surrounding Precinct South identified a number of wells requiring location or repair. To ensure serviceability of the wells prior to undertaking the GME:
  - A licenced surveyor was engaged to locate buried or 'missing' groundwater wells (for which well gatics were not visible at the surface) using metal detection and GPS survey based on previously reported coordinates were used.
  - A licenced driller was engaged to undertake maintenance and repair work on select wells (as required), including cutting of bitumen and clearing of fill to expose gatics (where well gatics were buried under the surface), replacement of gatic bolts (where bolts were damaged, sheared or missing), replacement of gatic covers (where gatic covers were damaged), extension of the polyvinyl chloride (PVC) well casing to surface where gatics were buried under fill in re-graded areas of the Site.
- Based on the Well Maintenance Program, seven wells, namely MW13, MW137, MW142, MW143, R4, S9, and TW03, are considered to be destroyed/lost. The loss of these groundwater wells is not considered to prevent fulfilment of the objectives of the GME based on available historic data and lack of changes in use, or monitoring data from nearby groundwater wells.
- A total of 31 groundwater wells at and surrounding the Precinct South were selected for gauging and sampling via low flow techniques for the Targeted GME. The outcomes of the Targeted GME are summarised below:
  - Recorded depth to groundwater ranged from 1.582 m bgl (MW164) to 3.250 m bgl (MW176) in wells screened in the shallow aquifer, and from 2.281 m bgl (MW126B) to 3.056 m bgl (MW124B) for wells screened in the deeper aquifer (top of screened interval >9 m bgl). Shallow groundwater contours indicated a generally south-westerly groundwater flow direction, with some southerly components in the southern portion of Precinct South, and possible easterly flow components at the eastern boundary, although this may be an artefact of lack of gauging data in the TasPorts area.
  - Hydrocarbon odours were noted at monitoring wells MW03, MW05, PW02 and S8.
  - Measurable LNAPL was observed at four groundwater monitoring wells (MW03, MW05, PW02 and S8) in the south-eastern corner of the Precinct South, with thickness ranging from 0.050 to 0.160 m. Recorded LNAPL thickness was within historic recorded ranges in MW03 and MW05, while above historical recorded thicknesses in PW02 and S8. While LNAPL Plume B is still considered delineated on Site and unlikely to be migrating further onto the Site, additional monitoring to confirm LNAPL thicknesses and assess mobility via LNAPL baildown testing is recommended.

    No LNAPL was encountered in wells where it had not previously reported, and no groundwater samples were collected from wells with LNAPL present.

    LNAPL is not delineated at the eastern border of the Precinct South and is considered likely to extend to TasPorts land to the east.
  - DNAPL was not encountered at any of the groundwater wells monitored.
  - Concentrations of the following CoPC were reported above the adopted assessment criteria for PEVs in at least one sample, noting exceedances were reported for Tier 1 Screening criteria including Drinking Water (Health and Aesthetics), Recreation (Primary / Secondary Contact), Vapour Intrusion (Residential), Ecosystem Protection (90%), and Buildings and Structures),
    - Benzene
    - TRH fractions including TRH >C10-C40 (sum), TRH C6-C10 [minus benzene, toluene, ethylbenzene and xylenes (BTEX)](F1), TRH >C10-C16 (minus Naphthalene)(F2)

- Metals (aluminium, arsenic, copper, lead, manganese, zinc)
- PAHs (naphthalene, anthracene, phenanthrene, fluoranthene, benz[a]anthracene, benzo[a]pyrene)
- Inorganics (chloride, sodium, total cyanide, ammonia)

It is noted that the presence of LNAPL also precludes all PEVs, and that concentrations of some CoPC listed above (PAHs [naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene] and aluminium) were reported with an LOR above adopted criteria. Future assessments should consider if lower LORs for assessment should be requested for these CoPC if practical.

- Concentrations of the following CoPC were reported in excess of the Site-Derived RC for Potential Future Residents for slab-on-grade buildings with unknown construction or multi-storey building:
  - TRH (C6-C10) (minus BTEX)

  Residential use of the Precinct South is not planned for future development and is not considered likely to occur due to currently planning limitations on residential occupancy near an active port (i.e., TasPorts land to the east of the Precinct South).

Further assessment of groundwater PEVs and nature and extent of impacts will be undertaken separately, however, precluded PEVs are consistent with previous investigations of this area reported in existing DSI reports (AECOM, 2021a and AECOM, 2022) relevant to the Precinct South. The data collected as part of this investigation is considered to be adequate to inform future assessments of the Precinct South.

9.0 Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract dated 20 December 2022.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 11 December 2023 and 8 October 2024 and is based on the conditions encountered and information reviewed and referenced in this document at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

Tables

Table T1 - Well Maintenance and Repair Activities – Summary

Area	Well ID	Inspected (Yes / No)	Well located? (Yes / No)	Maintenance / Repairs performed? (Yes / No)	Comments	Well Serviceable for monitoring? (Yes / No)
Precinct South	RN4	Yes	Yes	Yes	Gatic exposed 0.5 - 0.6 m under fill. Casing extended and gatic raised to surface level. Resurvey needed	Yes
	PW02	Yes	Yes	Yes	Bolts replaced. Well cap (100mm) missing. New well cap needed.	Yes
	MW03	Yes	Yes	No	Built-up sediment under gatic cover to be hand-cleared.	Yes
	MW05	Yes	Yes	No	Built-up sediment under gatic cover to be hand-cleared.	Yes
	MW6	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW13	Yes	No	-NA-	Destroyed during pipeline removal works	No - Lost/Destroyed
	MW16	Yes	Yes	No	Built-up sediment under gatic cover to be hand-cleared.	Yes
	MW60	Yes	Yes	Yes	New 180 mm gatic installed to replace missing lid and old 120 mm diameter base	Yes
	MW125A	Yes	Yes	Yes	Bolts replaced	Yes
	MW125B	Yes	Yes	Yes	Bolts replaced	Yes
	MW126A	Yes	Yes	Yes	Bolts replaced	Yes
	MW126B	Yes	Yes	Yes	Bolts replaced	Yes
	MW154	Yes	Yes	Yes	Bolts replaced	Yes
	MW162	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW163	Yes	Yes	No	Bolts need replacement	Yes - Bolts replacement pending
	MW164	Yes	Yes	No	No repair necessary, good condition	Yes
	S4	Yes	Yes	Yes	New 180 mm gatic installed to replace missing lid and damaged base	Yes
	S6	Yes	Yes	Yes	New 180 mm gatic installed to replace missing lid and damaged base	Yes
	S8	Yes	Yes	Yes	Bolts replaced	Yes
	MW137	Yes	No	-NA-	Hydro-excavation undertaken to 0.5 - 0.6 m bgl. Not found. Considered lost/destroyed	No - Lost/Destroyed
	MW142	Yes	-NA-	-NA-	GPS survey-location was undertaken on 6 December 2023. Well is likely buried under fill and was unable to be accessed.	No - Likely buried
	MW143	Yes	-NA-	-NA-	GPS survey-location was undertaken on 6 December 2023. Well is likely buried under fill and was unable to be accessed.	No - Likely buried
	MW146	Yes	Yes	Yes	Gatic exposed 0.5 - 0.6 m under fill. Casing extended and gatic raised to surface level. Resurvey needed	Yes
	MW150	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW175	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW176	Yes	Yes	Yes	Found under fill. Battered shallow surrounding fill. Bolts OK.	Yes
20 m Buffer Zone	R4	Yes	Yes	Yes	Casing found 0.5 - 0.6 m bgl beneath fill. Damaged casing, no gatic. Casing completely filled with fine-crushed-rock gravel. Not recoverable. Destroyed.	No - Lost/Destroyed
	S9	Yes	No	-NA-	Dug to 0.4 m bgl. Not found. Considered lost/destroyed	No - Lost/Destroyed
	TW03	Yes	No	-NA-	Hydro-excavation undertaken to 0.5 - 0.6 m bgl. Not found. Considered lost/destroyed	No - Lost/Destroyed
	MW155	Yes	Yes	No	GPS survey-location was undertaken on 6 December 2023. Well was located and serviceable.	Yes
	MW151	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW152	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW153	Yes	Yes	No	No repair ncessary, good condition	Yes
Further surrounding areas beyond the 20 m Buffer Zone	MW55	Yes	Yes	Yes	Bitumen cut to expose gatic. Bolts OK.	Yes
	MW127A	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW127B	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW124A	Yes	Yes	No	No repair ncessary, good condition	Yes
	MW124B	Yes	Yes	No	No repair ncessary, good condition	Yes

Table T2 - Summary of Groundwater Monitoring Well Locations

Area	Well ID	Approximate Well Depth (m bgl)	Shallow / Deep Wells	Screened Interval (m bTOC)	Screen Lithology	Easting	Northing	Top of Casing (m AHD)	Date Sampled	Depth to Groundwater prior to purging (m bTOC)	LNAPL Observed ? (Yes / No)	Depth to LNAPL (m bTOC)	LNAPL Thickness (m)	DNAPL Observed ? (Yes / No)	SWL (m AHD) [2]	Stabilised Water Quality Parameters						Comments (Odour, Colour, Turbidity)	Rationale for inclusion in Targeted Precinct South GME
																Dissolved Oxygen (mg/L)	EC (mS/cm)	pH	Field ORP (mV) [3]	Corrected ORP (mV) [4]	Temperature (ºC)		
Precinct South	RN4	6	Shallow	1.5-6.0	Fill/Marine Deposits	527563.308	5252490.93	4.045	29-Nov-23	3.176	No	-	-	No	0.869	0.08	2.543	6.78	-1231	-1032	16	No odor, no sheen, moderate turbidity, clear	Assess groundwater within the Precinct South area

Notes:

m bgl - metres below ground level
TOC - top of casing
AHD - Australian Height Datum
SWL - Standing Water Level
EC - Electrical Conductivity (milliSiemens per centimetre)
ORP - Oxidation Reduction Potenial (milliVolts)
[1] Wells installed to depths of >10 m bgl are considered herein as deep monitoring wells, and those installed to depths of <10 m bgl are considered as shallow monitoring wells
[2] SWL values in wells containing LNAPL have been corrected for the depression of the LNAPL/water interface in the well by multiplying the apparent LNAPL thickness in the well an LNAPL specific gravity of 0.85
[3] ORP as measured in the field
[4] Corrected ORP compared to the standard hydrogen electrode (calculated by adding 199 mV to the field-measured ORP value)
^ Monitoring wells S8, MW03, MW05 and PW02 contained measurable LNAPL, thus sampling was not undertaken in these wells.
** Monitoring wells MW142 and MW143 are buried and inaccessible (as of 6 Dec 2023)*

Table T3 - Groundwater Analytical Results – Tier 1 Screening – Drinking Water and Recreation

Data Quality Objectives and Data Validation

DRAFT

Data Quality Objectives and Data Validation

1.0 Data Quality Objectives

The Data Quality Objectives (DQOs) for the Targeted Precinct South groundwater monitoring event (GME) project were established during the development of the field program and presented in the Sampling, Analysis and Quality Plan (SAQP) [AECOM, 2023b] previously prepared for the works. The DQOs are presented herein.

Guidance regarding the development of DQOs has been referenced from the following primary documents:

- *National Environment Protection (Assessment of Site Contamination) Amendment Measure 2013*, (ASC NEPM, 2013) *Schedule B2: Guideline on Site Characterisation*
- US EPA, 2006 *Guidance on Systematic Planning Using the Data Quality Objectives Process* (EPA QA/G-4).

The process of establishing appropriate DQOs is defined by the seven-step planning approach presented in the ASC NEPM and summarised in **Table 1** below.

Table 1 Data Quality Objectives

Step	Data Quality Objective Step Summary
1	***State the Problem*** – Summarise the problem that will require new environmental data and identify the resources available to resolve the problem based on a preliminary Conceptual Site Model (CSM) using available information prior to the commencement of the site investigation.
2	**Identify the Decision/Goal of the Study** – Identify the decisions that need to be made about the problem and the new environmental data required to make the decisions. Develop a decision statement linking the principal project objective(s) to the possible actions that will address the problem.
3	**Identify Information Inputs** – Identify the information needed to support any decision and whether new environmental data will be needed.
4	***Define the Boundaries of the Study*** – Specify the spatial and temporal aspects of the environmental media that the data must represent to support decision(s).
5	***Develop the Analytical Approach (or Decision Rule)*** – Define the parameter of interest, specify the action level, and integrate information from Steps 1–4 into a single statement that gives a logical basis for choosing between alternative actions.
6	***Specify Performance or Acceptance Criteria*** – Specify the decision-maker's acceptable limits on decision errors, which are used to establish performance goals for limiting uncertainties in the data.
7	***Develop the Plan for Obtaining Data*** – Identify the most resource-effective sampling and analysis design for generating the data that is required to satisfy the DQOs.

The approach adopted relative to the seven steps presented above in **Table 1** is discussed in the sections below.

DRAFT

1.1 Step 1 – State the Problem

The primary problem addressed as part of the works is the uncertainty regarding the current groundwater conditions at and surrounding the Precinct South, associated with the following:

- The current condition of groundwater, including the nature and extent of impacts, noting no groundwater assessments had been undertaken at the Precinct South since the Site-wide 2019 GMEs undertaken in August 2019 and November 2019.
- Temporal variations associated with groundwater quality.

Data collected as part of these investigations will inform future assessments, including the update of existing Detailed Site Investigation (DSI) reports and preparation of a Clean Up to the Extent Practicable (CUTEP) submission for Auditor assessment of the Precinct South.

1.2 Step 2 – Identify the Decision / Goal of the Study

As noted in **Section 1.1**, the investigation works were intended to collect data to enable assessment of current groundwater conditions associated with the Precinct South. The decision identification component of the DQO process represents the key issues that need to be reviewed and considered to resolve the problem identified in Step 1. These issues include:

- Obtaining representative physical and chemical groundwater data at and surrounding the Precinct South to address the objectives of the investigations (refer to **Section 1.2** of the main report text) and to further inform the Conceptual Site Model and future assessments.
- Comparing detected chemicals of potential concern (CoPC) concentrations against relevant screening criteria (refer to **Appendix F**) and historical data to assess the nature and extent of groundwater impacts, temporal trends, and potential risk posed to human and ecological receptors relevant to the proposed future uses and environmental values associated with Precinct South.

If the investigation results suggest potential risk, or if there remains insufficient information, recommendations shall be made on further assessment, management, or remediation measures.

1.3 Step 3 - Identify Information Inputs

To allow assessment of the data against the issues and decisions listed in **Section 1.2**, various information inputs are to be considered as follows:

- Field observations of aesthetic groundwater impacts (e.g. odours, sheen etc.) during gauging, purging and sampling of groundwater.
- Identification of the CoPC for each assessment location based on the Site-specific history, existing contamination issues, previously obtained groundwater quality data and associated objectives.
- Newly-collected groundwater data and concentrations of contaminants relative to relevant screening criteria and guidelines.
- Historical investigation data (where available) and information documented in previous Site reports including previous GMEs.

1.4 Step 4 – Define the Boundaries of the Study

The spatial boundaries (geographical limits) applied for data collection and decision making for the investigations are defined as follows:

- Evans Street and the University of Tasmania carpark to the south.
- The off-Site extent footprint of TasPorts area to the east
- The on-Site extent of the footprint of the Precinct North area to the north, the Promenade and Underground Carpark area to the northwest, and the Goods Shed and Yard area to the west.

- The area of works is vertically limited by the depths of the groundwater monitoring wells located within the investigation area, which range between approximately 4 m below ground level (bgl) and 18.9 bgl in this area.

The groundwater assessment locations are shown on **Figure F4** in the **Figures** section.

1.5 Step 5 – Develop the Analytical Approach (or Decision Rule)

Groundwater data collected as part of the investigations must be of sufficient representativeness address the primary problem (refer to **Section 1.1**) and decisions (refer to **Section 1.2**) identified as part of the DQO process.

Primary and secondary laboratories selected for the analysis of collected groundwater samples were accredited by National Association of Testing Authorities (NATA) for the requested analyses and were consistent with the following methodologies summarised in **Table 2** below.

Table 2 Laboratory Analytical Methods

Matrix	Sample Type	Analyte	Method Reference
Groundwater / Water	• Primary • QA/QC – Inter- and Intra-Laboratory Duplicate • QA/QC – Field Blank • QA/QC – Rinsate	Metals*	ICP/MS, CV/FIMS
		TRH and BTEXN	GC/FID, P&T/HS-GCMS
		PAH and phenols	GC/MS - SIM
		Free, WAD, and total cyanide	APHA 4500 CN-O, ASTM D7237
		Ammonia	APHA 4500 NH_3 - G
		Major cations (calcium, magnesium, sodium, potassium)	APHA 3120B or 3125B
		Major anions (chloride, sulfate, alkalinity)	APHA 2320B, APHA 4500-Cl - G, APHA 4500 SO_4-E
		Total Dissolved Solids (TDS)	APHA 2540C
	• Select Primary Samples ^	TRH speciation (aliphatic/aromatic)	CWG 1998
		Monitored Natural Attenuation (Nitrate, Ferrous Iron, Methane, Sulphate	APHA VCl3 reduction 4500 NO_3- + NO_2-B, APHA3500 Fe-B, HS/GC/FID, APHA 4500 SO4-E
		OCPs	USEPA SW 846-8270D
		VOC / SVOC	P&T/HS-GC/MS, GC/MS
		Chlorinated hydrocarbons	USEPA SW 846 - 8260B
	• QA/QC – Trip Blank	TRH (C_6-C_{10}) and BTEXN	USEPA SW 846-8260B

Notes: QA/QC – quality assurance/ quality control; Metals – 10 metals including aluminium, arsenic, cadmium, chromium, copper, lead, manganese, mercury, nickel and zinc; TRH – Total Recoverable Hydrocarbons; PAH – Polycyclic Aromatic Hydrocarbons; BTEXN – Benzene, Toluene, Ethylbenzene, Xylenes and Naphthalene; WAD – Weak Acid Dissociable; OCP: Organochlorine Pesticides; VOC: Volatile Organic Compounds; SVOC: Semi-Volatile Organic Compounds; ^ Approximately 25% of the samples were selected for analysis of TRH speciation and Monitored Natural Attenuation parameters, and approximately 10% of the samples were selected for analysis of OCPs, VOC/SVOC and chlorinated hydrocarbons.*

The decision for the investigation works is to obtain representative groundwater data and compare data against relevant screening or acceptance criteria. The decision rules are as follows:

- If comparison of groundwater chemical data to the relevant screening criteria (outlined in **Appendix F**) identifies exceedances, the exceedances will be subject to further investigation, assessment, remediation, or management; otherwise, groundwater will be deemed suitable for the proposed future uses and environmental values associated with the Precinct South area.
- If the investigation results suggest potential risk, or if there remains insufficient information, recommendations shall be made on further assessment, management, or remediation measures.
- If the QA/QC data meets the Data Quality Indicators (DQIs) adopted (outlined in **Section 3.2** of the main report text) to assess the precision and accuracy of the data, the data will be considered to be suitable for interpretive use. Data that fail to meet the DQIs will be managed using corrective actions (where possible) such as re-analysis of suspect samples, re-analysis of data and/or procedures, acceptance of data with acknowledged limitations/bias, or the data may be discarded.

1.6 Step 6 – Specify Performance or Acceptance Criteria

A decision error in the context of the decision rules presented in Step 5 would lead to either underestimation or overestimation of the risk level associated with particular investigations/ samples/data. Decision errors may include:

- Limitations in the available Site history information.
- Limitations based on inaccurate/inadequate data from previous investigations.
- Errors or limitations in this SAQP or proposed scope of works.
- Data not being adequately representative of Site conditions.
- Errors in the laboratory analytical reporting or procedures.
- Unnecessary implementation of remedial or management measures and controls.

Obtained field and laboratory data will be reviewed and screened against relevant assessment criteria (outlined in **Appendix F**) to make decisions regarding further assessment or management measures as part of as part of future assessments, including the update of existing DSI reports and preparation of a CUTEP submission for Auditor assessment of Precinct South.

A QA/QC and data validation program was developed as part of the SAQP (AECOM, 2023b) to ensure that data collected are sufficiently accurate and reliable for the purpose of this investigation. Data validation and assessment of QA/QC has been undertaken in **Section 2.0**.

1.7 Step 7 – Develop the Plan for Obtaining Data

The methodology presented in the SAQP (AECOM, 2023b) provided a sampling plan which was designed to meet the objectives for the investigation (refer to **Section 1.2** of the main report text), and also to achieve the nominated DQOs outlined in Steps 1 - 6. Optimisation of the data collection process has been achieved by targeting sampling based on historical information and previous assessment works undertaken at, and in the vicinity of, the Precinct South area.

The investigation was carried out to a level of accuracy and confidence required in accordance with the ASC NEPM (2013). The SAQP was reviewed by the Corporation and the Site Environmental Auditor.

2.0 Data Validation

Groundwater and QA/QC samples were collected by experienced AECOM field personnel in accordance with the SAQP (AECOM, 2023b) and with reference to the field methodology described in **Section 4.0** of the main report text. Samples were collected over a six-day field program (undertaken between 29 November 2023 – 6 December 2023) in laboratory supplied sample containers and placed in chilled eskies prior to transportation to the laboratories for analysis.

ALS Laboratories (ALS) was selected as the primary laboratory and Eurofins was selected as the secondary laboratory. Both laboratories are accredited by the National Association of Testing Authorities (NATA) for the analysis selected. All groundwater samples were analysed for metals, TRH, BTEX, PAHs, phenolic compounds, cyanide, ammonia, major ions and TDS.

Limited samples were also analysed for aliphatic/aromatic TRH speciation, Monitored Natural Attenuation (MNA) parameters (nitrate, ferrous iron, methane, sulphate), OCPs, VOC / SVOC and chlorinated hydrocarbons.

Copies of the laboratory documentation including chain of custody (CoC) documentation, sample receipt notification (SRN) reports, QC reports, and certificates of analysis are attached in **Appendix D** and **Appendix E**.

The assessment and validation of field and laboratory data quality are summarised in **Section 2.1** and **Section 2.2**, respectively.

2.1 Field Data Quality

2.1.1 Rinsate Blanks

Rinsate blanks were prepared by pouring laboratory-supplied rinsate water over non-dedicated sampling equipment to assess the potential for cross-contamination. Rinsate blank samples were analysed for a combination of analytes, including TPH/TRH, BTEXN, PAH, phenols, metals, ammonia, cyanide, ferrous iron, major ions, alkalinity and TDS. Rinsate blank results are provided in **Table A1** of this Appendix.

A total of five rinsate blank samples were collected as part of the six-day sampling program carried out at and surrounding the Precinct South. One rinsate blank sample was collected on each day of sampling, with the exception of the first day of groundwater sampling (i.e. 29 November 2023) during which no rinsate blank sample was collected due to field error. Hence, assessment of potential cross-contamination during sampling undertaken on this day is limited. Wells sampled on this day (RN4 and MW146) did not report any exceedances of Tier 1 criteria or Site-Derived RC which affect the overall outcomes of the GME. While the efficiency of equipment decontamination on 29 November 2023 cannot be assessed, based on the outcomes of rinsate assessment on the remaining five days of the GME (discussed below) and analytical results for samples from RN4 and MW146, it is considered unlikely that cross-contamination of samples occurred, or occurred at a level which affects overall results of assessment.

All samples had concentrations of target compounds reported below the laboratory LOR, with the exception of three rinsate samples, where concentrations of select analytes (i.e. total anions and alkalinity) were reported above the laboratory LOR, as outlined in **Table 3** below. Concentrations reported were either equal to the LOR, or in the same order of magnitude as the LOR.

Table 3 Rinsate Results

Work Order	Sample ID	Sample Date	Analyte	Conc. Reported in Rinsate Samples	LOR	Wells Sampled on these Dates	Conc. Reported in Groundwater Samples Collected on these Dates
EM2321824	QA303 and QA305	4/12/2023 and 6/12/2023	Total Anions	0.04 meq/L	0.01 meq/L	S6 MW6 MW16 MW125A MW125B MW154 MW155 MW164	Total Anions: 3.11 - 32.4 meq/L Bicarbonate Alkalinity: 131 - 1370 mg/L
			Bicarbonate Alkalinity as $CaCO_3$	2 mg/L	1 mg/L		
			Total Alkalinity as $CaCO_3$	2 mg/L	1 mg/L		

DRAFT

Work Order	Sample ID	Sample Date	Analyte	Conc. Reported in Rinsate Samples	LOR	Wells Sampled on these Dates	Conc. Reported in Groundwater Samples Collected on these Dates
	QA304	5/12/2023	Total Anions	0.02 meq/L	0.01 meq/L	S4 MW60 MW124A MW124B MW126A MW126B MW163	Total Alkalinity: 131 - 1370 mg/L
			Bicarbonate Alkalinity as $CaCO_3$	1 mg/L	1 m g/L		
			Total Alkalinity as $CaCO_3$	1 mg/L	1 mg/L		

Notes: 'Conc.' Refers to 'Concentrations'

Based on information provided by the laboratory, the laboratory-supplied inorganic rinsate water is monitored for metals and PFAS only, and not for alkalinity and other ions. It is understood that it is not uncommon to get detections of alkalinity close of LOR levels in laboratory-supplied water, depending on the caron dioxide levels in the air. Given concentrations of chloride, sulfate and free cyanide were reported below the laboratory LOR, it is unclear which anions may be present that may have resulted in detectable concentrations total anions; nonetheless, the concentrations reported are considered to be low.

The detections in these rinsate sample may be associated with potential cross-contamination during sampling or inadequate decontamination procedures. A total of 15 groundwater wells were sampled on these dates (4 – 6 December 2023). Concentrations of total anions and alkalinity reported in these samples were two to three orders of magnitude greater than those reported in the rinsate samples. On this basis, and because total anions and alkalinity are not considered to be the key risk-driving CoPC at the Site, the detections in the rinsate samples are not considered to impact the reliability of the data for interpretive use.

2.1.2 Field Blanks

Field blanks were collected at the rate of one per day of sampling, however, these sample were kept on hold and were not selected for analysis as the rinsate results did not report detections of key CoPC above the laboratory LOR (refer discussion in **Section 2.1.1** above).

2.1.3 Trip Blanks

One trip blank was submitted for each cooler box transported to the laboratory. A total of six trip blank samples were analysed as part of the field program. Trip blank results are provided in **Table A1** of this Appendix.

Trip blanks were analysed for select volatile compounds, including TPH C6-C9, TRH C6-C10, and BTEXN. All trip blank samples had concentrations of these target compounds reported below the LOR, indicating that cross contamination of samples occurring in transit is unlikely to have occurred.

2.1.4 Intra- and Inter-Laboratory Field Duplicate Samples

A total of three intra-laboratory duplicates and three inter-laboratory duplicate samples were collected (at groundwater wells MW146, MW127A and MW151) during the Targeted Precinct South GME program, compared to a total of 27 primary samples collected at and surrounding the Precinct South. The intra-laboratory and inter-laboratory duplicates were collected at a rate of one in nine primary samples analysed, which is greater than the DQO (one in 20 primary samples).

Groundwater RPD values reported outside the acceptable RPD limits are highlighted in **Table A2** of this Appendix.

A total of 1,369 RPD results were calculated for the field duplicate sample pairs. The RPDs between the primary and duplicate samples were within the acceptable ranges for the majority of the data, with the exception of 12 out of 1369 RPD results (i.e. approximately 0.88%). These are associated with a

combination of analytes including chloride, sulfate, ionic balance, total cyanide, ferrous iron, methane and TPH C10-C36 fraction (sum). Since >99% of the RPD results were reported within acceptable RPD limits, the groundwater dataset is considered suitable for interpretive use.

2.2 Laboratory Data Quality

Copies of the laboratory documentation including CoC, SRN reports, QC reports, and certificates of analysis are attached in **Appendix D** and **Appendix E**. ALS work orders include EM2321407, EM2321582 and EM2321824, and Eurofins work orders include 1049877and 1049962.

2.2.1 Sample Receipt Temperature

Groundwater samples were kept chilled during storage and transportation with ice in portable coolers (eskys) until received by the laboratory for analysis. The primary laboratory (ALS) reported that all sample batches were received within the recommended temperature range of 0 - 6°C, with ice present. The secondary laboratory (Eurofins) reported evidence to chill was noted for all samples batches received. Thus sample transport temperatures are considered appropriate and unacceptable sample degradation in transit is considered unlikely to have occurred.

Sample receipt temperatures can be found in the sample receipt notification reports in **Appendix D**.

2.2.2 Sample Holding Times

All samples were reported to be received by laboratories within the recommended holding times for the requested analyses, thus the results are considered suitable for interpretive use.

Proactive holding time assessments completed by the analytical laboratories are provided in **Appendix D**.

2.2.3 Limits of Reporting

The laboratory LOR and screening criteria values are detailed in **Tables T3 – T6** in the **Tables** section of the report.

All LOR values were either lower than or equal to the screening criteria applied to the samples analysed, to enable adequate assessment, with the exception of the following shown in **Table 4** below.

Table 4 Analytes with LORs greater than the adopted Screening Criteria

Screening Criteria	Analyte	LOR Value (µg/L) [a]	Screening Value (µg/L) [a]	Comment
Ecosystem Protection (90%)	Aluminium	0.01 mg/L	0.0005 mg/L	Detectable concentrations were reported. Refer further discussion below.
	Anthracene	1	0.01	
	Phenanthrene	1	0.6	
	Benzo(a)pyrene	0.5	0.1	
	1,2,3-Trichlorobenzene, Hexachlorobutadiene, Bis(2-ethylhexyl)phthalate, 2,6-Dinitrotoluene, Hexachlorocyclopentadiene, Pentachlorobenzene, Chlorpyrifos, Diazinon, Dimethoate, Malathion, Aldrin, Dieldrin, g-BHC (Lindane), DDE, DDT, Endosulfan 1, Endosulfan 2, Endrin, Heptachlor, Heptachlor epoxide, Hexachlorobenzene (HCB), Methoxychlor, 3,3-Dichlorobenzidine	Various	Various	Concentrations of these 23 analytes were reported below the LOR (i.e. not detectable) in all samples. Refer further discussion below.

DRAFT

Screening Criteria	Analyte	LOR Value (µg/L) [a]	Screening Value (µg/L) [a]	Comment
Drinking Water (Aesthetics)	Styrene, 2-Chlorophenol, 2,4-Dichlorophenol, 1,2-Dichlorobenzene, 1,4-Dichlorobenzene	Various	Various	Concentrations of these 5 analytes were reported below the LOR (i.e. not detectable) in all samples. Refer further discussion below.
Drinking Water (Health)	Naphthalene	1	0.17	Detectable concentrations were reported. Refer further discussion below.
	Benz(a)anthracene	1	0.03	
	Benzo(a)pyrene	0.5	0.01	
	N-2-Fluorenyl Acetamide, 7,12-Dimethylbenz(a)anthracene, 3-Methylcholanthrene, Dibenz(a,h)anthracene, Indeno(1,2,3-cd)pyrene, 1,2-Dibromoethane (EDB), 1,2-Dichloropropane, 1,2,4-Trichlorobenzene, Vinyl chloride, Bromomethane, 1,1-Dichloroethane, Carbon Tetrachloride, 1,2-Dichloroethane, 1,1,2-Trichloroethane, 1,1,1,2-Tetrachloroethane, trans-1,4-Dichloro-2-butene, cis-1,4-Dichloro-2-butene, 1,1,2,2-Tetrachloroethane, 1,2,3-Trichloropropane, Pentachloroethane, 1,2-Dibromo-3-chloropropane, Hexachlorobutadiene, 2-hexanone (MBK), N-Nitrosodibutylamine, N-Nitrosodiethylamine, N-Nitrosodipropylamine, N-Nitrosomethylethylamine, N-Nitrosomorpholine, N-Nitrosopiperidine, N-Nitrosopyrrolidine, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, 4-Aminobiphenyl, Azobenzene, Chlorobenzilate, Dimethylaminoazobenzene, Nitrobenzene, Bis(2-chloroethyl) ether, Hexachlorocyclopentadiene, Hexachloroethane, Pirimphos-ethyl, Aldrin, Dieldrin, Aldrin + Dieldrin, a-BHC, b-BHC, DDD, DDE, Heptachlor, Heptachlor epoxide, Hexachlorobenzene (HCB), 3,3-Dichlorobenzidine, 4-Chloroaniline	Various	Various	Concentrations of these 53 analytes were reported below the LOR (i.e. not detectable) in all samples. Refer further discussion below.

DRAFT

Screening Criteria	Analyte	LOR Value (µg/L) [a]	Screening Value (µg/L) [a]	Comment
Recreation (Primary / Secondary Contact)	Benz(a)anthracene	1	0.3	Detectable concentrations were reported. Refer further discussion below.
	Benzo(a)pyrene	0.5	0.1	
	N-2-Fluorenyl Acetamide, 7,12-Dimethylbenz(a)anthracene, 3-Methylcholanthrene, Dibenz(a,h)anthracene, Vinyl chloride, Bromomethane, 1,1,2-Trichloroethane, trans-1,4-Dichloro-2-butene, cis-1,4-Dichloro-2-butene, 1,1,2,2-Tetrachloroethane, 1,2,3-Trichloropropane, 1,2-Dibromo-3-chloropropane, 2-hexanone (MBK), N-Nitrosodibutylamine, N-Nitrosodiethylamine, N-Nitrosodipropylamine, N-Nitrosomethylethylamine, N-Nitrosomorpholine, N-Nitrosopiperidine, N-Nitrosopyrrolidine, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, 4-Aminobiphenyl, Azobenzene, Dimethylaminoazobenzene, Nitrobenzene, Bis(2-chloroethyl) ether, Hexachlorocyclopentadiene, Aldrin, Dieldrin, a-BHC, b-BHC, DDD, DDE, Heptachlor epoxide, Hexachlorobenzene (HCB), 3,3-Dichlorobenzidine	Various	Various	Concentrations of these 37 analytes were reported below the LOR (i.e. not detectable) in all samples. Refer further discussion below.

*Notes: a – Units of LOR and screening values presented are µg/L unless specified otherwise, with the values presented in **Tables T3 – T6** in the **Tables** section of the report.*

Analytes for which LOR values which were reported above adopted screening criteria are discussed below:

- LORs for up to 63 analytes, classified as a combination of fumigants, halogenated aromatic/aliphatic compounds, phthalate esters, nitrosamines, nitroaromatics, benzidine, anilines, haloethers, chlorinated hydrocarbons, organophosphorus and organochlorine pesticides, were reported above the adopted Ecosystem Protection (90%), Drinking Water (Aesthetics), Drinking Water (Health) and Recreation (Primary / Secondary Contact) criteria. These analytes have not typically been detected in soil and groundwater at the Site and are not considered key risk-driving CoPC for the Site. Thus, these are not considered to adversely impact the ability to adequately assess site data.
- LORs for select PAHs, including naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene, were reported above the adopted Ecosystem Protection (90%), Drinking Water (Health), and/or Recreation (Primary / Secondary Contact) criteria. Exceedances of the adopted criteria for either these CoPC or others have been detected in groundwater during this sampling event and previous investigations, and these uses are considered precluded for groundwater within the Precinct South.

  The LORs selected are not considered to affect the overall assessment of precluded uses of groundwater in the Precinct South. However, it is recommended that future sampling events consider the LORs adopted for these CoPC.

- The LOR for aluminium was reported above the adopted Ecosystem Protection (90%) screening value. However, concentrations in excess of this criteria were reported in the approximately 85% of the samples analysed, and this LOR discrepancy is not considered to affect the overall assessment of groundwater condition or precluded groundwater uses in the Precinct South. However, it is recommended that future sampling events consider the LORs adopted for this CoPC.

2.2.4 Laboratory Duplicates RPDs

The laboratory duplicate results are presented in the analytical laboratory QC reports provided in **Appendix E**.

The RPD between analytical results for field samples and their corresponding laboratory duplicates were all reported within acceptable limits, noting acceptable limits are dependent on the magnitude of results in comparison to the level of reporting, i.e. no limits where the result is less than 10 times the LOR; 0% - 50% where the result is between 10 and 20 times the LOR; and 0% - 20% where the result is greater than > 20 times the LOR.

2.2.5 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix E**.

Matrix spike recoveries were noted to be within the DQO range of 70% - 130%, or laboratory-derived limits for the methods used, with the exceptions of the outliers noted in **Table 5** below.

Table 5 Matrix Spike Outlier

Work Order	Sample ID	Analyte	Matrix Spike	Limits
Groundwater				
EM2321582	Anonymous	Sulfate as SO_4	ND	ND[1]
	Anonymous	Chloride	ND	ND[1]
	QA102	Methane	ND	ND[1]
	Anonymous	Manganese	ND	ND[1]
EM2321824	MW125B	Ammonia as N	ND	ND[1]

Notes: ND – Matrix spike recovery not determined; 1 – Background levels greater than or equal to 4 times the spike level.

Three of the five results above are from 'Anonymous' external samples, which are not specifically part of this project but formed part of the laboratory QC process and bact.

Matrix spike recoveries were only reported where background levels of CoPC were greater than or equal to 4x the spike level. Matrix spike recoveries were not determined for the above-mentioned outliers and are not considered to impact data quality.

2.2.6 Laboratory Method Blanks

All groundwater laboratory method blanks were reported within the acceptable range, i.e. below the laboratory LORs.

2.2.7 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory QC reports provided in **Appendix E**. All surrogate spike recoveries were within the surrogate control limits adopted, with the exception of the outlier noted in **Table 6** below.

Table 6 Matrix Spike Outliers

Work Order	Sample ID	Analyte	Matrix Spike	Limits
EM2321407	MW146	2-Bromonaphthalene	121%	71 – 117%

Recovery of the surrogate 2-Bromonaphthalene (for TPH - semivolatile speciation) was marginally greater than the upper DQO limits, which may indicate potential for minor over-estimation of reported concentrations of semi-volatile speciated TPH fractions in MW146. This may result a minor level of conservatism in the interpretive use of the data but does not impact the reliability of the data.

2.2.8 Laboratory Control Spikes

Laboratory control spike (LCS) recoveries, presented in **Appendix E**, were within the laboratory-derived control limits for the methods used, with the exception of the outliers reported in **Table 7** below.

Table 7 Laboratory Control Spike Recovery Outliers

Work Order	Analyte	Recovery	Limits
Matrix – Water			
EM2321407	Vinyl chloride	138%	58.1-135%
EM2321582		140%	

Recovery of the LCS for vinyl chloride was marginally greater than the DQO limits, indicating minor over-estimation of concentrations of this analyte. Vinyl chloride has not typically been detected in soil and groundwater at the Site and is not considered key risk-driving CoPC for the Site. It was analysed in three primary groundwater samples and concentrations were reported below the laboratory LOR in all three samples, hence the LCS recovery is not considered to impact the reliability of the data.

2.2.9 Frequency of Quality Control Spike

Frequency of QC spikes, presented in **Appendix E**, were at the rate expected by applicable QC specifications, with the exceptions of the outliers listed in **Table 8** below.

Table 8 Frequency of Quality Control Samples

Work Order	Type	Analyte	Rate (%)		Quality Control Specification
			Actual	Expected	
EM2321407	Laboratory Duplicates	• Pesticides • SVOC • TPH Speciation • TRH – Semivolatile fractions	0	10	NEPM 2013 B3 & ALS QC Standard
	Matrix Spikes		0	5	
EM2321582	Laboratory Duplicates	• PAH/Phenols • Pesticides • SVOC • TPH Speciation • TRH – Semivolatile fractions	0	10	NEPM 2013 B3 & ALS QC Standard
	Matrix Spikes		0	5	
EM2321824	Laboratory Duplicates	• PAH/Phenols • TRH – Semivolatile fractions	0	10	NEPM 2013 B3 & ALS QC Standard
	Matrix Spikes		0	5	

DRAFT

The actual rate of laboratory QC samples analysed for the above-mentioned analytes were below the expected frequency as there was insufficient sample volume to complete these analyses. These outliers are not considered to impact the reliability of the data.

3.0 Summary

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- During the six-day groundwater sampling program, no rinsate blank sample was collected on the first day of sampling (29 November 2023), hence assessment of potential cross-contamination during sampling undertaken on this day is limited. Wells sampled on this day (RN4 and MW146) did not report any exceedances of adopted criteria which affect the overall outcomes of the GME, and no detections which are considered likely to indicate cross-contamination were reported in the five rinsate samples collected on each other day of sampling, thus it is considered unlikely that cross-contamination may have occurred to an extent which affects assessment of groundwater condition in the Precinct South.
- LORs for select PAHs, including naphthalene, anthracene, phenanthrene, benzo(a)pyrene and benz(a)anthracene, were reported above the adopted Ecosystem Protection (90%), Drinking Water (Health), and Recreation (Primary / Secondary Contact) criteria. These analytes have previously been identified as Site-related CoPC and will be considered as a CoPC for the purpose of informing the CSM for the Precinct South as part of the update of existing DSI reports.
- The LOR for aluminium was reported above the adopted Ecosystem Protection (90%) screening value, with concentrations in approximately 15% of the primary samples reported to be below the LOR. Concentrations reported in the remaining 85% of the samples exceeded screening value. As exceedances of adopted criteria are present in Site groundwater, the elevated LOR is not considered to affect conclusions regarding the nature and extent of dissolved aluminium.
- Recovery of the surrogate 2-Bromonaphthalene (for TPH - semivolatile speciation) was marginally greater than the upper DQO limits, which may indicate potential for minor over-estimation of reported concentrations of semi-volatile speciated TPH fractions in MW146. This may result a minor level of conservatism in the interpretive use of the data but does not impact the reliability of the data.
- The rate of laboratory QC testing of laboratory duplicates and matrix spikes were below the expected frequency for some analytes due to insufficient sample volume, however this is not considered to impact the reliability of the data as:
    - Results are consistent with historic assessments.
    - No new sources of impact are known to have been introduced since previous investigations have been conducted.

These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of the Precinct South and surrounding areas.

Notes:
**RPDs have only been considered where a concentration is greater than 1 times the EQL.*
***High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 200 (1-10 x EQL); 50 (10-20 x EQL); 30 (> 20 x EQL))*
****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory*
LOR: Limit of Reporting
Grey coloured text indicates concentration values were reported below the laboratory limits of reporting

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale and ALS Sydney.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Receipt Detail	:	No. of samples received / analysed	: 24 / 20

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Preliminary results will be available on the scheduled reporting date listed in this report. However the final report with methane analysis will be complete on 19/12.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Hi Farjad,
In this sample batch, could you please trip-blank sample off-hold, and analyse it for TRH (C_6-C_{10}) and BTEXN?
Thanks

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Notes

EXTRA SAMPLE: TRIP BLANK (2VIALS). PLACED ON HOLD.

Hi Farjad,

For this sample batch (1049962):

1. Could you please update the SRN as follows:
   - Sample Date for **QA503** = 1 Dec 2023
   - For **QA202**, please **exclude** analysis of:
     - VOC, SVOC, OCP and chlorinated hydrocarbons
   - For **QA202** and **QA203**, please **include** analysis of:
     - Cyanide (Free, Total and WAD
     - TDS, Major cations, Major Ions, Ionic Balance

2. Sample receipt suggests some sample(s) exceeded holding time. Could you advise which these are?

Thanks,

Supriya Lath PhD

ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP070-CWG: EM2321407-001 Higher than expected surrogate recovery due to matrix interference. Confirmed by re-prep and re-analysis.
- ED041G: EM2321407 #1 and #6 has been confirmed for Sulfate by re-preparation and re-analysis.
- ED045G: EM2321407 #1 and #6 has been confirmed for Chloride by re-preparation and re-analysis.
- EG051G: EM2321407 #1-2 and #6 Results for Ferrous Iron have been confirmed by re-preparation and re-analysis.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075: Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EA015H: EM2321407 #5 TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- Ionic balances were calculated using: major anions - chloride, alkalinity and sulfate; and major cations - calcium, magnesium, potassium, sodium and ammonia for sample #5.
- EK057G: EM2321407 #1 Poor matrix spike recovery for NO2 due to sample matrix.
- EP075: Where reported, 'Sum of PAH' is the sum of the USEPA 16 priority PAHs
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Inter-Laboratory Testing

Analysis conducted by ALS Sydney, NATA accreditation no. 825, site no. 10911 (Chemistry) 14913 (Biology).

(WATER) EP033: C1 - C4 Hydrocarbon Gases

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2321407**	Page	: 1 of 14
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: 60693007/3	Date Samples Received	: 01-Dec-2023
Site	: Macquarie Point, 41 Evans St, Hobart	Issue Date	: 13-Dec-2023
Sampler	: C. Teller	No. of samples received	: 9
Order number	: Project: 60693007/3	No. of samples analysed	: 8

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Ferrous Iron by Discrete Analyser	EG051G	WATER	In house: Referenced to APHA 3500 Fe-B. A colorimetric determination based on the reaction between phenanthroline and ferrous iron at pH 3.2-3.3 to form an orange-red complex that is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
Free CN by Segmented Flow Analyser	EK025SF	WATER	In house: Referenced to ASTM D7237, APHA 4500-CN-C&O and ISO 14403: Using an automated segmented flow analyser, a sample at high pH (sodium hydroxide preserved) is buffered to pH 6.0. The hydrogen cyanide present passes across a gas dialysis membrane into an acceptor stream consisting of 0.01 M sodium hydroxide. The acceptor stream mixes with a buffer at pH 5.2 and reacts with chloramine-T to form cyanogen chloride. Cyanogen chloride reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour, measured at 600nm. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	WATER	In house: Referenced to APHA 4500-CN C&O / ASTM D7511 / ISO 14403. Sodium hydroxide preserved samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Weak Acid Dissociable Cyanide by Segmented Flow Analyser	EK028SF	WATER	In house: Referenced to APHA 4500-CN C&O / ISO 14403. Samples preserved with sodium hydroxide are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN- The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4-pyridine carboxylic and 1,3-dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
C1 - C4 Gases	EP033	WATER	Technical Guidance for the Natural Attenuation Indicators: Methane, Ethane, and Ethene, US EPA - Region 1, EPA New England, July 2001. Automated static headspace, dual column GC/FID. A 12 mL sample is pipetted into a 20 mL headspace vial containing 3g of sodium chloride and sealed. Each sample is equilibrated with shaking at 40 degrees C for 10 minutes prior to analysis by GC/FID using a pair of PLOT columns of different polarity.
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	WATER	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Semivolatile Organic Compounds	EP075	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Volatile Hydrocarbon Speciation (TPH CWG & RIVM fractions)	EP079-CWG	WATER	In house: Conventional TPH and MAH data are determined by Purge and Trap GCMS analysis. TIC data (as fractions) and target aromatics (or groups of aromatics) are used to compute aliphatic and aromotic hydrocarbon fractions by addition or difference. Fractions conform to those outlined in TPHCWG,Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

CERTIFICATE OF ANALYSIS

Work Order	: **EM2321582**	Page	: 1 of 32
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007/3	Date Samples Received	: 04-Dec-2023 11:28
Order number	: 60693007/3	Date Analysis Commenced	: 06-Dec-2023
C-O-C number	: ----	Issue Date	: 13-Dec-2023 14:00
Sampler	: C. TELLER		
Site	: Macquarie Point, 41 Evans St, Hobart		
Quote number	: EN/004/23		
No. of samples received	: 12		
No. of samples analysed	: 11		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Sample MW 152 (Blue container) has been received empty. Bottle's cap was loose.
- ED041G: EM2321582-006 required dilution prior to Sulfate as SO4 2- analysis due to sample matrix interference. LOR values have been raised accordingly
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075: Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EG020F: EM2321582#7 has been diluted prior to metals analysis due to sample matrix. LOR values have been raised accordingly.
- EA015H: EM2321582 #3 TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- EP070-CWG: EM2321582-009 Insufficient sample remains for standard analysis. Where applicable LOR values have been adjusted accordingly.
- EP071: Sample EM2321582-009 was extracted using volatiles vials instead of unpreserved amber bottle.
- EP070-CWG: Sample EM2321582-009 was extracted using volatiles vials instead of unpreserved amber bottle.
- Ionic balances were calculated using: major anions - chloride, alkalinity and sulfate; and major cations - calcium, magnesium, potassium, sodium and ammonia for sample #1.
- EP075: Where reported, 'Sum of PAH' is the sum of the USEPA 16 priority PAHs
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Analytical Results

Inter-Laboratory Testing

Analysis conducted by ALS Sydney, NATA accreditation no. 825, site no. 10911 (Chemistry) 14913 (Biology).

(WATER) EP033: C1 - C4 Hydrocarbon Gases

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2321582**	Page	: 1 of 17
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: 60693007/3	Date Samples Received	: 04-Dec-2023
Site	: Macquarie Point, 41 Evans St, Hobart	Issue Date	: 13-Dec-2023
Sampler	: C. TELLER	No. of samples received	: 12
Order number	: 60693007/3	No. of samples analysed	: 11

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Ferrous Iron by Discrete Analyser	EG051G	WATER	In house: Referenced to APHA 3500 Fe-B. A colorimetric determination based on the reaction between phenanthroline and ferrous iron at pH 3.2-3.3 to form an orange-red complex that is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
Free CN by Segmented Flow Analyser	EK025SF	WATER	In house: Referenced to ASTM D7237, APHA 4500-CN-C&O and ISO 14403: Using an automated segmented flow analyser, a sample at high pH (sodium hydroxide preserved) is buffered to pH 6.0. The hydrogen cyanide present passes across a gas dialysis membrane into an acceptor stream consisting of 0.01 M sodium hydroxide. The acceptor stream mixes with a buffer at pH 5.2 and reacts with chloramine-T to form cyanogen chloride. Cyanogen chloride reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour, measured at 600nm. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	WATER	In house: Referenced to APHA 4500-CN C&O / ASTM D7511 / ISO 14403. Sodium hydroxide preserved samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Weak Acid Dissociable Cyanide by Segmented Flow Analyser	EK028SF	WATER	In house: Referenced to APHA 4500-CN C&O / ISO 14403. Samples preserved with sodium hydroxide are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN- The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4-pyridine carboxylic and 1,3-dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
C1 - C4 Gases	EP033	WATER	Technical Guidance for the Natural Attenuation Indicators: Methane, Ethane, and Ethene, US EPA - Region 1, EPA New England, July 2001. Automated static headspace, dual column GC/FID. A 12 mL sample is pipetted into a 20 mL headspace vial containing 3g of sodium chloride and sealed. Each sample is equilibrated with shaking at 40 degrees C for 10 minutes prior to analysis by GC/FID using a pair of PLOT columns of different polarity.
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	WATER	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Semivolatile Organic Compounds	EP075	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Volatile Hydrocarbon Speciation (TPH CWG & RIVM fractions)	EP079-CWG	WATER	In house: Conventional TPH and MAH data are determined by Purge and Trap GCMS analysis. TIC data (as fractions) and target aromatics (or groups of aromatics) are used to compute aliphatic and aromotic hydrocarbon fractions by addition or difference. Fractions conform to those outlined in TPHCWG,Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

QUALITY CONTROL REPORT

Work Order	: **EM2321582**	Page	: 1 of 20
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007/3	Date Samples Received	: 04-Dec-2023
Order number	: 60693007/3	Date Analysis Commenced	: 06-Dec-2023
C-O-C number	: ----	Issue Date	: 13-Dec-2023
Sampler	: C. TELLER		
Site	: Macquarie Point, 41 Evans St, Hobart		
Quote number	: EN/004/23		
No. of samples received	: 12		
No. of samples analysed	: 11		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW

Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- ED041G/EK057G: EM2321824 #18 and #19 Samples required dilution prior Sulfate and Nitrite as N analysis due to matrix interferences. LOR values have been adjusted accordingly.
- ED041G: EM2321824 #11 Sample required dilution prior Sulfate analysis due to matrix interferences. LOR value has been adjusted accordingly.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Analysis conducted by ALS Sydney, NATA accreditation no. 825, site no. 10911 (Chemistry) 14913 (Biology).

(WATER) EP033: C1 - C4 Hydrocarbon Gases

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2321824**	Page	: 1 of 14
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: 60693007/3	Date Samples Received	: 07-Dec-2023
Site	: Macquarie Point, 41 Evans St, Hobart	Issue Date	: 14-Dec-2023
Sampler	: C. TELLER	No. of samples received	: 24
Order number	: 60693007/3	No. of samples analysed	: 20

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EK055G: Ammonia as N by Discrete Analyser	EM2321824--002	MW125B	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)

Matrix Spikes (MS)						
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	0	17	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	EP071	0	17	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Ferrous Iron by Discrete Analyser	EG051G	WATER	In house: Referenced to APHA 3500 Fe-B. A colorimetric determination based on the reaction between phenanthroline and ferrous iron at pH 3.2-3.3 to form an orange-red complex that is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
Free CN by Segmented Flow Analyser	EK025SF	WATER	In house: Referenced to ASTM D7237, APHA 4500-CN-C&O and ISO 14403: Using an automated segmented flow analyser, a sample at high pH (sodium hydroxide preserved) is buffered to pH 6.0. The hydrogen cyanide present passes across a gas dialysis membrane into an acceptor stream consisting of 0.01 M sodium hydroxide. The acceptor stream mixes with a buffer at pH 5.2 and reacts with chloramine-T to form cyanogen chloride. Cyanogen chloride reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour, measured at 600nm. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	WATER	In house: Referenced to APHA 4500-CN C&O / ASTM D7511 / ISO 14403. Sodium hydroxide preserved samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Weak Acid Dissociable Cyanide by Segmented Flow Analyser	EK028SF	WATER	In house: Referenced to APHA 4500-CN C&O / ISO 14403. Samples preserved with sodium hydroxide are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN- The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4-pyridine carboxylic and 1,3-dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
C1 - C4 Gases	EP033	WATER	Technical Guidance for the Natural Attenuation Indicators: Methane, Ethane, and Ethene, US EPA - Region 1, EPA New England, July 2001. Automated static headspace, dual column GC/FID. A 12 mL sample is pipetted into a 20 mL headspace vial containing 3g of sodium chloride and sealed. Each sample is equilibrated with shaking at 40 degrees C for 10 minutes prior to analysis by GC/FID using a pair of PLOT columns of different polarity.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.
