C-O-C number	: 50528	Date Issued	: 06-Apr-2023 14:41
No. of samples received	: 27		
No. of samples analysed	: 25	Quote number	: ME/386/22

General Comments

This guideline comparison report **only** provides comparison of reported result against limit thresholds for the 'Fill Material', 'Low Level Contaminated Soil', and 'Contaminated Soil' categories in Table 2 of EPA Tasmania Information Bulletin No. 105.

This guideline comparison report is **NOT** a compliance report. Classification of soils requires consideration of a number of other factors including preliminary site investigation, sampling density and statistical calculations and measurement uncertainty.

This guideline comparison report only provides comparison data for parameters, specifically listed within Table2 of the EPA Tasmania Information Bulletin No. 105, that are analysed by ALS.

Only results in the 'Analytical Results' section have been compared to the guideline.

Additional information pertinent to this report will be found in the following separate attachments: Certificate of Analysis, Quality Control Report, QA/QC Compliance Assessment to Assist with Quality Review and Sample Receipt Notification.

Work Order	: **EM2305901**	Page	: 1 of 18
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 04-Apr-2023
Order number	: 60693007-2	Date Analysis Commenced	: 04-Apr-2023
C-O-C number	: 50528	Issue Date	: 06-Apr-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 27		
No. of samples analysed	: 25		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
MINNIE TRAN	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 04-Apr-2023
Site	: Macquarie Point Oil and Diesel Line removal	Issue Date	: 06-Apr-2023
Sampler	: TIM SMITH02	No. of samples received	: 27
Order number	: 60693007-2	No. of samples analysed	: 25

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Hexavalent Chromium by Alkaline Digestion and DA Finish	EG048G	SOIL	In house: Referenced to USEPA SW846, Method 3060. Hexavalent chromium is extracted by alkaline digestion. The digest is determined by photometrically by automatic discrete analyser, following pH adjustment. The instrument uses colour development using dephenylcarbazide. Each run of samples is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	SOIL	In house: Referenced to APHA 4500-CN C / ASTM D7511 / ISO 14403. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3).
Total Fluoride	EK040T	SOIL	(In-house) Total fluoride is determined by ion specific electrode (ISE) in a solution obtained after a Sodium Carbonate / Potassium Carbonate fusion dissolution.
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Benzo(a)pyrene- Waste Classification (TAS requirements)	EP075-TAS	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Alkaline digestion for Hexavalent Chromium	EG048PR	SOIL	In house: Referenced to USEPA SW846, Method 3060A.
Total Fluoride	EK040T-PR	SOIL	In house: Samples are fused with Sodium Carbonate / Potassium Carbonate flux.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Tumbler Extraction of Solids - VIC EPA Screen	ORG17-EM	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ALS is closed during public holidays in April: Good Friday, Easter Monday and ANZAC Day Tuesday (7th, 10th and 25th April).

ALS Springvale will be transitioning our telephony services to a different provider. During this time you may notice that the number that we call you on is not consistent with the details listed above. All of our existing numbers are being routed through temporary numbers during this time and will remain active for the entire process. Please continue to contact us via the numbers listed above, we would recommend not saving the temporary numbers to your records as they will be deleted once the transition is complete.

Subject: [EXTERNAL] - AECOM - Macquarie Point samples arriving tomorrow for 24h TAT analysis

CAUTION: This email originated from outside of ALS. Do not click links or open attachments unless you recognize the sender and are sure content is relevant to you.

HI Peter and team, there is one esky arriving from Hobart tomorrow with two sample batches.
24 Hr TAT requested: Compass COC 50528 has 22 primary and duplicate samples to be analyses for EPA Tasmania IB105 minus TBT (30%) and TRH BTEXN PAH Phenol Pb (70%), one trip blank and one rinsate blank (TRH BTEXN PAH Phenol Pb) and one on hold + 2 triplicate samples to forward to Eurofins
Standard TAT: Compass 50529 has 11 primary and duplicate samples to be analyses for TRH BTEXN PAH Phenol Pb + 1 triplicate sample to forward to Eurofins

Please let us know if this is a realistic request.
Thanks in advance.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- This is a rebatch of EM2305901.

QUALITY CONTROL REPORT

Work Order	: **EM2306516**	Page	: 1 of 5
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 04-Apr-2023
Order number	: 60693007-2	Date Analysis Commenced	: 17-Apr-2023
C-O-C number	: ----	Issue Date	: 19-Apr-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 20		
No. of samples analysed	: 20		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC 0	Regular	Actual	Expected	
Matrix Spikes (MS)					
PAH/Phenols (GC/MS - SIM)	0	20	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Leachable Metals by ICPAES	EG005C	SOIL	In house: referenced to APHA 3120; USEPA SW 846 - 6010: The ICPAES technique ionises leachate sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- This is a rebatch of EM2305901.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Company name:	AECOM Aust Pty Ltd Melbourne
Contact name:	Robert Crowe
Project name:	MACQUARIE POINT
Project ID:	Not provided
Turnaround time:	5 Day
Date/Time received	Apr 5, 2023 9:10 AM
Eurofins reference	978719

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 9.7 degrees Celsius.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✗ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- ✓ Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Michael Morrison on phone : 03 8564 5933 or by email: MichaelMorrison@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general AECOM Aust Pty Ltd Melbourne email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Apr 06, 2023	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Apr 06, 2023	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Apr 06, 2023	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
BTEX	Melbourne	Apr 06, 2023	14 Days
- Method: LTM-ORG-2010 BTEX and Volatile TRH			
Benzo(a)pyrene - low level	Melbourne	Apr 06, 2023	0 Days
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water (trace)			
Chromium (hexavalent)	Melbourne	Apr 06, 2023	28 Days
- Method: LTM-INO-4100 Hexavalent Chromium by Spectrometric detection			
Cyanide (total)	Melbourne	Apr 06, 2023	14 Days
- Method: LTM-INO-4020 Total Free WAD Cyanide by CFA			
Fluoride	Melbourne	Apr 11, 2023	28 Days
- Method: LTM-INO-4150 Determination of Total Fluoride PART A – CIC			
Polycyclic Aromatic Hydrocarbons	Melbourne	Apr 06, 2023	14 Days
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Organochlorine Pesticides	Melbourne	Apr 06, 2023	14 Days
- Method: LTM-ORG-2220 OCP & PCB in Soil and Water (USEPA 8270)			
Polychlorinated Biphenyls	Melbourne	Apr 06, 2023	28 Days
- Method: LTM-ORG-2220 OCP & PCB in Soil and Water (USEPA 8082)			
Phenols (Halogenated)	Melbourne	Apr 06, 2023	14 Days
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Phenols (non-Halogenated)	Melbourne	Apr 06, 2023	14 Days
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Heavy Metals	Melbourne	Apr 06, 2023	28 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	Yes
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	N/A
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
MINNIE TRAN	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Tim Kuo	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2309346 #8 Poor duplicate precision for total Lead due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2309346 #12 results for total Lead have been confirmed by re-digestion and re-analysis. It's been noted that the repeated results vary greatly. Repeated results are as follows: Lead: 1220 mg/kg, 831 mg/kg, and 783 mg/kg.
- EG005-T : EM2309346 #13 results for total Lead have been confirmed by re-digestion and re-analysis. It's been noted that the repeated results vary greatly. Repeated results are as follows: Lead: 523 mg/kg, 6630 mg/kg, and 1420 mg/kg.
- **EA200 Legend**
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: Analysis of asbestos from swabs and tapes is not covered under the current scope of NATA accreditation.
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

- EA200: N/A - Not Applicable

No. of samples received	: 27		
No. of samples analysed	: 26		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
MINNIE TRAN	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Tim Kuo	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Project	: Macquarie Point	Date Samples Received	: 24-May-2023
Site	: ----	Issue Date	: 01-Jun-2023
Sampler	: ----	No. of samples received	: 27
Order number	: Macquarie Point	No. of samples analysed	: 26

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	EM2309346--008	OL_EX_SP4_01	**Lead**	7439-92-1	39.0 %	0% - 20%	**RPD exceeds LOR based limits**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	SOIL	In house: Referenced to APHA 4500-CN C / ASTM D7511 / ISO 14403. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Cyanide has not been logged for sample 025 due to container non-compliance.**
- **Samples 008-013 and 027 placed on hold pending confirmation of whether samples are to be analysed (COC lists these samples for both analysis and hold).**
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

EM2309346-027 : [23-May-2023] : OL_EX_SP4_01 - Solid

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

HI Peter, no those samples should not be on hold. Analysis should be TRH BTEXN PAH Phenols and Pb, with additional ACM in soil and ACM ID at SP4 samples. Additionally samples from SP6 should include cyanide in the analysis

Hi Tim

Can you please confirm if the following samples are on hold or for analysis

SP4_01 through to SP5_03

Thanks

M2

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 6.5 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG005T: EM2310229 #4, the LOR has been raised for cadmium due to sample matrix interferences.
- EG005T: EM2310229 #7, sample heterogeneity has been observed for Zinc, with the following results obtained: 1230 mg/kg, 2790 mg/kg and 3600 mg/kg.
- EG005T: EM2310229 #7, sample heterogeneity has been observed for Lead, with the following results obtained: 380 mg/kg, 502 mg/kg and 932 mg/kg.
- EG005T: EM2310229 #31, sample heterogeneity has been observed for Zinc, with the following results obtained: 1590 mg/kg, 758 mg/kg and 691 mg/kg.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP075(SIM): EM2310229_001 Poor duplicate precision due to sample heterogeneity. Confirmed via visual inspection.
- EG035T: EM2310229#24 Poor matrix spike recovery for total mercury due to sample matrix. Confirmed by re-extraction and re-analysis.

Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 07-Jun-2023
Order number	: 60693007-2	Date Analysis Commenced	: 09-Jun-2023
C-O-C number	: 53213	Issue Date	: 15-Jun-2023
Sampler	: TIM SMITH		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 29		
No. of samples analysed	: 28		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Lu	VOC Section Supervisor	Melbourne Inorganics, Springvale, VIC
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

SAMPLE RECEIPT NOTIFICATION (SRN)

Work Order : **EM2310229**

Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic

Dates

Date Samples Received	: 07-Jun-2023 11:45	Issue Date	: 08-Jun-2023
Client Requested Due Date	: 15-Jun-2023	Scheduled Reporting Date	: **15-Jun-2023**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Intact.
No. of coolers/boxes	: 1	Temperature	: 5.6°C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 29 / 28

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Order number	: 60693007-2	Date Analysis Commenced	: 10-Jun-2023
C-O-C number	: 53213	Issue Date	: 22-Jun-2023 16:48
Sampler	: TIM SMITH		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 18		
No. of samples analysed	: 18		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- This is a rebatch of EM2310229.

Work Order	: **EM2310878**	Page	: 1 of 5
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 07-Jun-2023
Order number	: 60693007-2	Date Analysis Commenced	: 10-Jun-2023
C-O-C number	: 53213	Issue Date	: 22-Jun-2023
Sampler	: TIM SMITH		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 18		
No. of samples analysed	: 18		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 07-Jun-2023
Site	: Macquarie Point Oil and Diesel Line removal	Issue Date	: 22-Jun-2023
Sampler	: TIM SMITH	No. of samples received	: 18
Order number	: 60693007-2	No. of samples analysed	: 18

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Volatile Hydrocarbon Speciation (TPH CWG & RIVM fractions)	EP079-CWG	SOIL	In house: Conventional TPH and MAH data are determined by Purge and Trap GCMS analysis. TIC data (as fractions) and target aromatics (or groups of aromatics) are used to compute aliphatic and aromatic hydrocarbon fractions by addition or difference. Fractions conform to those outlined in TPHCWG, 1998, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021/2004, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons)

Preparation Methods	Method	Matrix	Method Descriptions
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids (Option B - Non-concentrating)	ORG17-SP	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 20mL 1:1 DCM/Acetone by end over end tumble. The solvent is transferred directly to a GC vial for analysis.

Hi Peter,

Can I request the following additional analysis on this batch? Would you also be able to give me a quick call if any issues – unfortunately just moved house and having some fun IT teething issues at the moment.

Cheers, and hope you have a good weekend ahead,

Rob

Deliverables for ALS Workorder EM2310094

Project: Macquarie Point

Overall Description: Macquarie Point - This is a rebatch of EM2309607.

Dear ROBERT CROWE,

Please find enclosed the following deliverables for **EM2310094**:

- Macquarie Point.ESDAT_EM2310094_0.Chemistry2e.CSV
- Macquarie Point.ESDAT_EM2310094_0.Header.XML
- Macquarie Point.ESDAT_EM2310094_0.Sample2e.CSV
- EM2310094_0_QC.pdf
- EM2310094_0_QCI.pdf
- EM2310094_0_COA.pdf
- EM2310094a.Macquarie Point.AECOM.zip
- 1151728282_INV.pdf
- EM2310094_COC.pdf

Report Recipients

- ROBERT CROWE
  - Macquarie Point.ESDAT_EM2310094_0.Chemistry2e.CSV
  - Macquarie Point.ESDAT_EM2310094_0.Header.XML
  - Macquarie Point.ESDAT_EM2310094_0.Sample2e.CSV
  - EM2310094_0_QC.pdf (Email)

- EM2310094_0_QCI.pdf (Email)
- EM2310094_0_COA.pdf (Email)
- EM2310094a.Macquarie Point.AECOM.zip
- 1151728282_INV.pdf (Email)
- EM2310094_COC.pdf (Email)

- ACCOUNTS PAYABLE
  - 1151728282_INV
  - EM2310094_COC

CERTIFICATE OF ANALYSIS

Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point Stockpile Sampling	Date Samples Received	: 04-Sep-2023 11:35
Order number	: Macquarie Point Stockpile Sampling	Date Analysis Commenced	: 05-Sep-2023
C-O-C number	: ----	Issue Date	: 08-Sep-2023 13:54
Sampler	: Annette Heath		
Site	: ----		
Quote number	: EN/004/23		
No. of samples received	: 41		
No. of samples analysed	: 36		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Lu	VOC Section Supervisor	Melbourne Inorganics, Springvale, VIC
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG048G: EM2315815 #4 poor matrix spike recovery for hexavalent chromium due to matrix effects. Confirmed by re-preparation and re-analysis.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005T: EM2315815-001 Poor duplicate precision for total tin due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005T: EM2315815-004 Poor spike recovery for total lead due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005T: EM2315815-010 Poor duplicate precision for total lead due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005T: EM2315815-021 Poor duplicate precision for total copper due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005T: EM2315815-022 Poor spike recovery for total chromium, lead, and zinc due to sample matrix. Confirmed by re-digestion and re-analysis.
- EP068: EM2315815_004 Poor matrix spike recovery for aldrin due to matrix effects.

Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point Stockpile Sampling	Date Samples Received	: 04-Sep-2023
Order number	: Macquarie Point Stockpile Sampling	Date Analysis Commenced	: 05-Sep-2023
C-O-C number	: ----	Issue Date	: 08-Sep-2023
Sampler	: Annette Heath		
Site	: ----		
Quote number	: EN/004/23		
No. of samples received	: 41		
No. of samples analysed	: 36		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

				Method Blank (MB) Report	Laboratory Control Spike (LCS) Report

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: Macquarie Point Stockpile Sampling	No. of samples analysed	: 36

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Leachable Metals by ICPAES	EG005C	SOIL	In house: referenced to APHA 3120; USEPA SW 846 - 6010: The ICPAES technique ionises leachate sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Hexavalent Chromium by Alkaline Digestion and DA Finish	EG048G	SOIL	In house: Referenced to USEPA SW846, Method 3060. Hexavalent chromium is extracted by alkaline digestion. The digest is determined by photometrically by automatic discrete analyser, following pH adjustment. The instrument uses colour development using dephenylcarbazide. Each run of samples is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	SOIL	In house: Referenced to APHA 4500-CN C / ASTM D7511 / ISO 14403. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3).
Total Fluoride	EK040T	SOIL	(In-house) Total fluoride is determined by ion specific electrode (ISE) in a solution obtained after a Sodium Carbonate / Potassium Carbonate fusion dissolution.
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Benzo(a)pyrene- Waste Classification (TAS requirements)	EP075-TAS	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.

Preparation Methods	Method	Matrix	Method Descriptions
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Alkaline digestion for Hexavalent Chromium	EG048PR	SOIL	In house: Referenced to USEPA SW846, Method 3060A.
Total Fluoride	EK040T-PR	SOIL	In house: Samples are fused with Sodium Carbonate / Potassium Carbonate flux.
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Tumbler Extraction of Solids - VIC EPA Screen	ORG17-EM	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Good morning,

Could I please request the following analysis for the samples on this CoC on two day turnaround?

Please let me know if you need any additional information,

Cheers,

General Comments

This guideline comparison report **only** provides comparison of reported result against limit thresholds for the 'Fill Material', 'Low Level Contaminated Soil', and 'Contaminated Soil' categories in Table 2 of EPA Tasmania Information Bulletin No. 105.
This guideline comparison report is **NOT** a compliance report. Classification of soils requires consideration of a number of other factors including preliminary site investigation, sampling density and statistical calculations and measurement uncertainty.
This guideline comparison report only provides comparison data for parameters, specifically listed within Table2 of the EPA Tasmania Information Bulletin No. 105, that are analysed by ALS.
Only results in the 'Analytical Results' section have been compared to the guideline.

Additional information pertinent to this report will be found in the following separate attachments: Certificate of Analysis, Quality Control Report, QA/QC Compliance Assessment to Assist with Quality Review and Sample Receipt Notification.

Summary of Thresholds Reached or Exceeded

Project	: Macquarie Point Stockpile Sampling	Date Samples Received	: 04-Sep-2023
Order number	: Macquarie Point Stockpile Sampling	Date Analysis Commenced	: 09-Sep-2023
C-O-C number	: ----	Issue Date	: 13-Sep-2023
Sampler	: ----		
Site	: ----		
Quote number	: EN/004/23		
No. of samples received	: 2		
No. of samples analysed	: 2		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Arenie Vijayaratnam	Senior Inorganic Chemist	Melbourne Inorganics, Springvale, VIC
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Leachable Metals by ICPAES	EG005C	SOIL	In house: referenced to APHA 3120; USEPA SW 846 - 6010: The ICPAES technique ionises leachate sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Hexavalent Chromium by Alkaline Digestion and DA Finish	EG048G	SOIL	In house: Referenced to USEPA SW846, Method 3060. Hexavalent chromium is extracted by alkaline digestion. The digest is determined by photometrically by automatic discrete analyser, following pH adjustment. The instrument uses colour development using dephenylcarbazide. Each run of samples is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	SOIL	In house: Referenced to APHA 4500-CN C / ASTM D7511 / ISO 14403. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3).
Total Fluoride	EK040T	SOIL	(In-house) Total fluoride is determined by ion specific electrode (ISE) in a solution obtained after a Sodium Carbonate / Potassium Carbonate fusion dissolution.
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Benzo(a)pyrene- Waste Classification (TAS requirements)	EP075-TAS	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.

Preparation Methods	Method	Matrix	Method Descriptions
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Alkaline digestion for Hexavalent Chromium	EG048PR	SOIL	In house: Referenced to USEPA SW846, Method 3060A.
Total Fluoride	EK040T-PR	SOIL	In house: Samples are fused with Sodium Carbonate / Potassium Carbonate flux.
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Tumbler Extraction of Solids - VIC EPA Screen	ORG17-EM	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Afternoon Peter,

I'm just looking at the data for this batch – two samples (FD02 and FD03) had a discrepancy between the field notes and the electronic CoC sent through earlier this week. Apologies as I missed this on the SRN.

Could these two samples be analysed at two day TAT for:

- P20/1 – Tasmanian EPA Bulletin No. 105 (Soil) excluding TBT
- TCLP (Lead, PAHs)

Cheers,

Robert Crowe

Good morning,

Could I please request the following analysis for the samples on this CoC on two day turnaround?

Please let me know if you need any additional information,

Cheers,

Good morning,

Could I please request the following analysis for the samples on this CoC on two day turnaround?

Please let me know if you need any additional information,

Cheers,

Sample Receipt Advice

Company name:	AECOM Aust Pty Ltd Melbourne
Contact name:	Lee Taylor
Project name:	MACQUARIE POINT STOCKPILE SAMPLING
Project ID:	JN23482
Turnaround time:	2 Day
Date/Time received	Sep 6, 2023 9:00 AM
Eurofins reference	1023335

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 7.3 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Michael Morrison on phone : +61 3 8564 5933 or by email: MichaelMorrison@eurofins.com

Results will be delivered electronically via email to Lee Taylor - lee.taylor@aecom.com.

Note: A copy of these results will also be delivered to the general AECOM Aust Pty Ltd Melbourne email address.

eurofins | Environment Testing

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**µg/L:** micrograms per litre
ppm: parts per million	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit		

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR: RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Temperature of Chilled samples on receipt	7.3°C
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
C01	Leachate Fluid Key: 1 - pH 5.0; 2 - pH 2.9; 3 - pH 9.2; 4 - Reagent (DI) water; 5 - Client sample, 6 - other
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR: RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Temperature of Chilled samples on receipt	7.3°C
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Data Validation

Data Validation

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the data considered in this report are presented in **Section 3.1** of the main report. Quality assurance (QA) and quality control (QC) assessment of the sampling methodology and analytical data against the DQIs has been undertaken in this data validation.

ALS Laboratories (ALS) Melbourne was selected as the primary laboratory and Eurofins was selected as the secondary laboratory for the majority of the investigations. Both laboratories were accredited by the National Association of Testing Authorities (NATA) for the analyses selected.

The sampling events and relevant laboratory reports pertaining to the stockpiles considered in this report are summarised in below **Table 1**.

Table 1 Stockpile Data Considered

Date	Stockpiles Sampled	Sampling Personnel	Lab Report Numbers	Comments
7 March 2023	DL_SP	AECOM – Timothy Smith	EM2304035 EM2304580 EM2305511 970404*	
28 March 2023	DL_SP	AECOM – Timothy Smith	EM2305446	Second sampling event to assess lead impacts.
3 April 2023	OL_EX_SP1	AECOM – Timothy Smith	EM2305901 EM2306516 978719*	
23 May 2023	OL_EX_SP2 OL_EX_SP3 OL_EX_SP4 OL_EX_SP5 OL_EX_SP6	AECOM – Timothy Smith	EM2309346 993445*	
6 June 2023	OL_EX_SP7 OL_EX_SP8	AECOM – Timothy Smith	EM2310229 EM2310878	
1 September 2023	PS-Pb-SP1 PS-Pb-SP2	Elgin – Annette Heath	EM2315815 EM2316192 1023335*	

*Note: * – Laboratory reports from the secondary laboratory.*

The stockpiles sampled were combined by BlackCap into two final stockpiles, PS-Pb-SP1 and PS-Pb-SP2 as summarised on **Table 2** below.

Table 2 Source Stockpiles

Source Stockpile	Estimated Volume	Comment
PS-Pb-SP1		
OL_EX_SP1	250 m^3	Initial excavation of known area of lead above Site Specific Remediation Criteria.
OL_EX_SP2	100 m^3	
OL_EX_SP3	40 m^3	
OL_EX_SP6	60 m^3	Minor blue flecks noted in one portion as potential “Prussian Blue” by field staff.
OL_EX_SP7	15 m^3	

Source Stockpile	Estimated Volume	Comment
OL_EX_SP8	80 m^3	
PS-Pb-SP2		
OL_EX_SP4	50 m^3	Minor potential ACM fragments noted and removed by field staff
OL_EX_SP5	40 m^3	
DL_SP	205 m^3	Soil removed surrounding pipeline with ACM cladding.

Copies of the laboratory documentation including chain of custody (CoC) documentation, sample receipt notification (SRN) reports, QC reports, and certificates of analysis are attached in **Appendix A**. It is noted that results for other analytical samples not discussed in this report are included in the laboratory documentation which relate to other site assessment works conducted.

1.0 Assessment of Field Data Quality

1.1 Sample Collection

Soil samples from stockpiles were collected by GES or AECOM field personal with environmental sampling experience. Sample collection was conducted with reference to the methodology described in **Section 4.0** of the report text. Samples were collected in laboratory supplied sample containers and placed in eskies prior to transportation to the selected laboratories.

1.2 Intra- and Inter-Laboratory Duplicate Samples

A total of six intra-laboratory duplicate and nine inter-laboratory duplicate sample pairs were collected and analysed against 96 primary samples collected from the stockpiles assessed in this report, at a rate of approximately one intra-laboratory sample per 16 primary samples, and one inter-laboratory sample per 11 primary samples, which exceeds the rate specified in the sample methodology (one duplicate per 20 primary samples). The rate of collection of duplicate samples is considered satisfactory.

Duplicate samples have been compared to primary samples and Relative Percentage Differences (RPDs) were calculated. Results of duplicate samples and RPDs are presented in **Table B1**.

The following acceptance criteria have been applied for RPDs:

- RPD less than 30% for high level laboratory duplicates (i.e. concentrations >20 x LOR)
- RPD less than 50% for medium level laboratory duplicates (i.e. concentrations 10 – 20 x LOR)
- RPD less than 200% for low level laboratory duplicates (i.e. concentrations 1 – 10 x LOR)

Of a total of 883 RPD values, 56 RPD values (~6%) were reported above the adopted acceptable RPD DQO limits. The RPD exceedances were predominantly associated with concentrations of PAHs and metals. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

As approximately 94% of duplicate RPD values were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.

1.3 Trip Blanks

One trip blank was submitted for each cooler box transported to the laboratory. A total of ten trip blanks, consisting of either laboratory supplied deionised water or clean inert sand, were analysed as part of the work orders relevant to this report.

Trip blanks were analysed for select volatile compounds, including TPH C_6-C_9, TRH C_6-C_{10}, and BTEXN. All trip blank samples had concentrations of target compounds reported below the LOR, indicating that cross contamination of samples occurring in transit is unlikely to have occurred. Trip blank results are reported on **Table B2a** and **Table B2b** attached.

1.4 Rinsate Blanks

A total of five rinsate blanks were analysed as part of the work orders relevant to this report. Rinsate blanks were prepared by pouring laboratory supplied rinsate water over non-dedicated sampling equipment following decontamination procedures to assess the potential for cross-contamination. At least one rinsate blank was collected for each day of sampling which occurred. A

All rinsate blank results were reported below the laboratory LOR, with the exception of DL_QCB06, collected during sampling of DL_SP on 7 March 2023, which reported detections of PAHs (naphthalene and phenol). This detection is not considered to affect the outcomes of assessment as sample results were not used to delineate impacts, PAH impacts were known to be present throughout DL_SP above criteria, and if cross-contamination occurred resulting in higher detections of PAHs in samples it would not affect the outcomes of assessment.

No exceedances of LOR were reported in any other rinstate blanks, indicating that field decontamination procedures were appropriately adopted and that the risk of cross contamination of samples through field equipment is acceptably low. Rinsate results are reported on **Table B2a** attached.

2.0 Assessment of Laboratory Data Quality

A summary of the assessment of laboratory data quality for soil, leachate and QA/QC samples relevant to the report is provided in **Section 2.1** – **Section 2.9** below.

Soil samples were analysed for a combination of analytes including metals (including lead), cyanide, TPH/TRH, BTEX, PAH, MAH, phenols, PCBs and pesticides. As these analytes include the CoPC identified in **Section 1.4** (in the main report) for the areas in which the stockpiles were generated, based on available Site history and uses, and previous investigations conducted, soil analytical program is considered appropriate for the purposes of this report.

2.1 Sample Receipt Temperature

Soil samples were kept chilled during storage and transportation with ice in portable coolers until received by the laboratory for analysis. Ice or attempts to chill was noted as present in coolers in the Sample Receipt Notification (SRN) documentation by ALS and Eurofins on receipt of the sample batches.

All samples were received by the primary laboratory ALS at or below 6ºC. Exceedances of the target sample receipt temperature were reported for the follow sample batches received by the secondary laboratory, Eurofins:

- 978719 – 9.7ºC (inter-laboratory duplicates from OL_EX_SP1)
- 993445 – 6.5ºC (interlaboratory duplicate from OL_EX_SP2)
- 1023335 – 7.3ºC (interlaboratory duplicates from PS-Pb-SP1 and PS-Pb-SP2)

The sample receipt temperature exceedances are not considered to affect the results of interpretation as:

- The soil samples considered were taken from stockpiles which were excavated and moved several times under ambient Hobart conditions. CoPC which were vulnerable to degradation from temperature are considered likely to have already degraded within stockpiles during exposure to atmospheric air or movement prior to sampling.
- Samples were close to recommended temperature and attempts to chill were noted, and the period of time and degree to which samples exceeded 6ºC is limited.

- Secondary laboratory results have not been used for interpretative purposes.
- The CoPCs considered in the main report text with exceedances of criteria consist of PAHs (Sum of PAHs and benzo(a)pyrene) and metals (lead). These CoPC are not considered likely to suffer significant degradation due to temperature.

2.2 Sample Holding Times

Samples were generally received by the laboratories within the holding times for sample extraction and/or analysis, with the exception of the exceedances reported for the samples shown in **Table 3** below.

Table 3 Holding Time Exceedances

Work Order	Sample ID	Analytes	Days Overdue
EM2021588	QCB01_24/11/20	TRH - Semivolatile Fraction, PAH/Phenols	6
EM2019057 *	FH-SP23-003, FH-SP23-005, FH-SP23-007, FH-SP23-009, FH-SP23-011, FH-SP23-014, FH-SP23-016, FH-SP23-017, FH-SP23-018, FH-SP23-020	Moisture content, TRH - Semivolatile Fraction, PAH/Phenols, TRH Volatiles/BTEX	3
EM2020860 *	FH-SP23-005, FH-SP23-007, FH-SP23-009, FH-SP23-011, FH-SP23-014, FH-SP23-017, FH-SP23-020	TCLP leach for non- and semi-volatile organic analytes	15
	FH-SP23-022 to FH-SP23-030		31
ES2018414	Trip Blank 10	TRH Volatiles/BTEX	10

*Note: * - Samples from these batches were rebatched*

Eurofins reported samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

These exceedances were not considered to affect the overall usability of the datasets, with consideration given to the following:

- Some samples were re-batched during the soil investigations causing exceedance of holding times.

These exceedances are not expected to materially affect the outcomes of assessment, as:

- The stockpiles potentially affected by this exceedance (RH-SP07 and FH-SP23) were subject to mixing and mechanical turning, which is expected to have encouraged volatilisation of volatile organic compounds from the stockpiles.
- The stockpiles were stored on-Site for over nine months prior to treatment. Volatilisation of VOC would have occurred naturally during this time and reduced VOC concentrations.
- VOC levels in excess of the assessment criteria were not reported in samples collected from these stockpiles.

The results are considered suitable for interpretation. Proactive holding time assessments completed by the analytical laboratory are provided in the SRN reports in **Appendix A**.

2.3 Limits of Reporting

All laboratory LORs were either lower than or equal to the screening criteria applied to the samples analysed, to adequate assessment.

2.4 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix A**.

Matrix spike recoveries were noted to be within the data quality objective range of 70% - 130%, or laboratory-derived limits for the methods used, with the exceptions of the outliers noted in **Table 4** below.

Table 4 Matrix Spike Outliers

Work Order	Sample ID	Analyte	Matrix Spike	Limits
EM2305901	OL_EX_SP1_03	Zinc	3.0%	80.0-120%
		Hexavalent Chromium	23.9-25.8%	58.0-114%
		Aldrin	16.0%	38.4-135%
EM2310229	OL_EX_SP7_02	Mercury	132%	76.0-116%
EM2315815	PS-Pb-SP1-4	Lead	57.4&	80.0-120%
		Hexavalent Chromium	0.04%	58.0-114%
		Aldrin	7.9%	38.4-135%
	PS-Pb-SP1-9	Pyrene	ND	N/A[1]
	PS-Pb-SP1-22	Chromium	165%	79.0-121%
		Lead	61.5%	80.0-120%
		Zinc	127%	80.0-120%
EM2316192	FD03	Lead	161%	80.0-120%
		Zinc	ND	N/A[1]
		Aldrin	12.5%	38.4-135%

Note: [1]MS recovery not determined, background levels greater than or equal to 4x spike level; ND – Not Determined; NA – Not Applicable

Matrix spike recovery outliers, either lower than or higher than the acceptable limits, are likely attributed to the heterogeneity of the soil samples submitted to the laboratory, or due to matrix interference with samples. The presence of varied fill material is well documented across the Site, including areas where these stockpiles were generated. Moreover, a significant number of the outliers are associated with samples not relevant to the stockpiles considered in this report, including anonymous samples, or samples from other stockpiles that were included in the above laboratory batches.

Overall, these outliers are not considered to impact interpretation of the results.

2.5 Laboratory Method Blanks

All soil laboratory method blanks were reported within the acceptable range, i.e., below the laboratory LORs.

2.6 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory quality control reports provided in **Appendix A**. All surrogate spike recoveries for

regular sample matrices were within the surrogate control limits adopted for the methods used, and no outliers were reported.

2.7 Laboratory Control Spikes

Laboratory control spikes, presented in **Appendix A**, were within the laboratory-derived control limits for the methods used, and no outliers were reported.

2.8 Frequency of Quality Control Spike

Frequency of quality control spikes, presented in **Appendix A**, were at the rate expected by applicable QC specifications, with the exceptions of the outliers listed in **Table 5** below.

Table 5 Frequency of Quality Control Samples

Work Order	Type	Analyte	Rate (%)		Quality Control Specification
			Actual	Expected	
EM2008727	Matrix Spikes	Total Mercury by FIMS	0	5	NEPM 2013 B3 & ALS QC Standard

It is noted that analytes for which the actual rate of control spikes were below the expected frequency, there were not sufficient samples assessed for that analytical suite to complete quality control spike sampling. These outliers are not considered to impact interpretation of the results. Frequency of control spikes for water samples (i.e. rinsate and trip blanks) are not listed due to the low numbers of these samples analysed.

2.9 Laboratory Duplicates and RPDs

The RPD between analytical results for primary samples and their corresponding laboratory duplicates were within acceptable limits, with the exception of the duplicate outliers listed below in **Table 6**.

Table 6 Laboratory Duplicate RPD Exceedances

Work Order	Sample ID	Analyte	RPD	Limits
EM2304035	DL_SP_05	Arsenic	33.1	0% - 20%
		Lead	122	0% - 20%
	DL_SP_07	Fluoranthene	26.4	0% - 20%
		Pyrene	23.7	0% - 20%
		Benz(a)anthracene	21.1	0% - 20%
EM2309346	OL_EX_SP4_01	Lead	39.0	0% - 20%
EM2315815	PS-Pb-SP1-1	Tin	107%	0% - 20%
	PS-Pb-SP1-10	Lead	43.9%	0% - 20%
	PS-Pb-SP1-21	Copper	21.3%	0% - 20%
EM2316192	FD02	Lead	72.7%	0% - 20%

RPD exceedances are attributed to the heterogeneity of the soil samples submitted to the laboratory. The presence of varied fill material is well documented across the Site, including areas where these stockpiles were generated. These exceedances are not considered to impact interpretation of the results.

3.0 Summary

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- Of a total of 883 RPD values, 56 RPD values (~6%) were reported above the adopted acceptable RPD DQO limits. The RPD exceedances were predominantly associated with concentrations of PAHs and metals. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

  As approximately 94% of duplicate RPD values were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.

- Detectable concentrations of naphthalene and phenol were present in rinsate blank DL_QCB06, collected during sampling of DL_SP on 7 March 2023. The detected concentrations are not considered to affect the outcomes of interpretation of this data.

- Three secondary laboratory sample batches (978719, 993445, and 1023335) were received between 6.5 and 9.7^{o}C above the recommended temperature of 6°C. The higher than recommended receipt temperatures are not expected to affect interpretation due to the attempts to chill noted and the periods of exposure to atmosphere and movement of stockpiles prior to sampling.

- Other laboratory QA/QC sampling procedures including analysis of matrix spike recoveries, laboratory duplicates and frequency of QA/QC reported some minor variances from recommended limits or ranges, indicating minor possibility of under- or over-reporting for some chemicals.

These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of stockpiles.

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 200 (1-10 x EQL); 50 (10-20 x EQL); 30 (> 20 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

analysis includes 1B1ϕ5 + Asbestos presence absence in soil

6/3

Roundhouse stockpile sample mixed fill from stabilisation trial

7/3

~~Diesel~~ Diesel line stockpile sampling + some mixed with oil line

$\approx$ 200 m^3 bulked.

Mixed fill gravelly clayey sand/ gravelly sandy clay. f-c sand, m-h plas fines moist / $\leq$PL, f-c gravel, cobbles + trace boulders.

bricks, glass, ceramics, leather metal - iron, silver, copper, bones slag, wood/organic ash + cinders coal; occasional fragments of pipe lagging (ACM), bitumen

- note approximate locations of samples along $\approx$65m long windrow. approximately equally spaced!

0.5 m^3 cut into stockpile + sample from spoil - 2x jars each.

28/3

Stockpile combined UST 0.5 - 2.0 + ch 77-80

Stockpile DL + some OL mix - Pb + ACM
≈ 9 x 15 x 2.5 = 135 x 2.5 = 270 + 67.5 = 340 m³
340 x 0.6 = 205 m³

Stockpile relocated from window beside DL trench. Mixing of some OL material with DL meant that material has all been combined into a single stockpile. ACM fragments (bonded bitumen pipe wrap) observed on surface of stockpile. IPM to assess AECOM resample for Pb. due to mixing of very high sample from OL_53

The State governments through EPA are increasing the waste levy imposed on the metal recycling industry again from 1st July 2021. This is a charge imposed on metal recyclers when they dispose of waste that comes out of the process of metal recycling. It is important to note that only a small fraction of these levies are returned to the general recycling industry and most of this money goes direct to the governments consolidated revenue pool.
As you would be aware, a significant and increasing proportion of materials contain an ever increasing amount of non-metal materials. While we use our best endeavours to recycle these materials it is not always technically possible to do so.
We continue to make representation to governments regarding these cost increases and just how they impact our industry. Be assured that if the government changes its approach to our industry we will review the waste levy accordingly.

Mr Greg Cooper
Chief Operating Officer
Company Secretary
Macquarie Point Development Corporation
41 Evans Street, Hobart, TAS, 7001

Dear Greg,

Macquarie Point - Review of Site Specific Remediation Criteria 2025

1.0 Introduction

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of a remediation strategy for the Macquarie Point site, and adjacent Regatta Point (intended to be added to the overall Macquarie Point site) in Hobart, Tasmania. Macquarie Point and Regatta Point are referred to as “the Site” herein, and the location of the Site is shown on **Figure F1** in **Appendix A**.

As part of the assessment and remediation of Macquarie Point, Remediation Criteria (RC) specific to the Macquarie Point site were developed and presented in *Derivation of Remediation Criteria* (AECOM, 2016), and have been used as part of environmental investigations to identify remediation requirements to remove or mitigate any unacceptable risks to current and future users of the Site.

Since the RC were derived, updates in the vision for development of the Site, including changes in proposed uses and expansion of the area considered for development, have occurred, and the potential exists for changes in relevant Australian or international guidance used to assess potential risks and derive criteria.

As a result of the potential for changes identified, AECOM has prepared this review of the RC to assess if they are still suitable for use in the ongoing assessment and remediation of the Site.

2.0 Background

Historically, Hobart and surrounding areas (Nipaluna), including the Site, were inhabited by the Muwinina people, descended from those who arrived in Tasmania approximately 40,000 years ago. Following European settlement circa 1804, the Site has been subject to a variety of potentially contaminating land uses, including land reclamation, gasworks, bulk fuel storage, and rail and freight transport and maintenance.

In 2012, the Corporation was formed by the *Macquarie Point Development Corporation Act 2015* (the MPDCA) in order to plan, facilitate and manage the remediation and development of Macquarie Point. The MPDCA was amended in 2015 to enable the accreditation of a Contaminated Land Auditor, which for the first time in Tasmania allows for a statutory audit of contaminated land (the Audit) to be undertaken, and Mr David Lam of Tetra Tech Coffey Pty Ltd (Coffey) was engaged by the Corporation as an independent Contaminated Land Auditor (the Auditor).

For the purpose of assessment and completion of the Environmental Audit, the Site has been divided into seven sub-areas for assessment based on the nature of identified contamination, historic activity, and the intended future uses of each area. The location and boundaries of sub-areas of the Site used in the most recent assessments, remediation and reports are shown on **Figure 1** below.

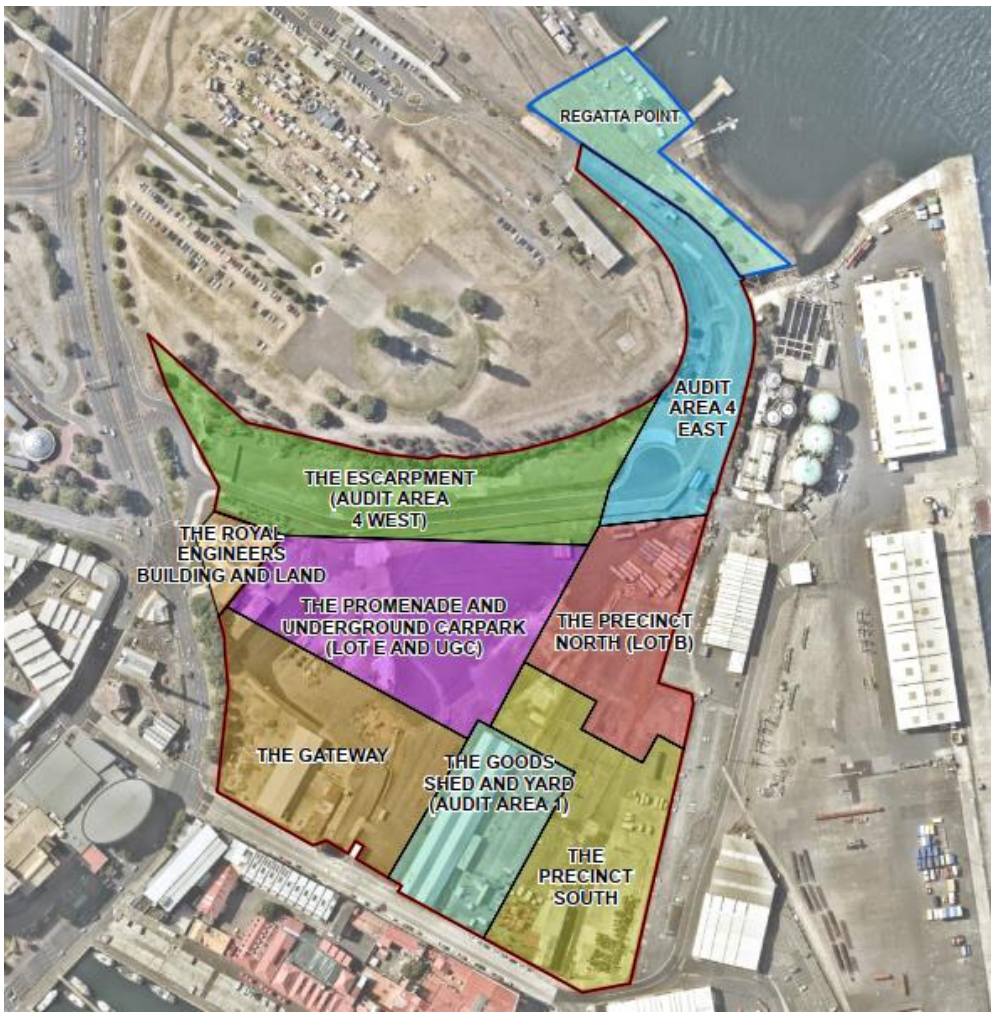

Figure 1 Site Assessment Areas

Early reports (prior to 2020) also referred to Audit Areas 1 to 7, based on possible Site uses prior to issue of an initial site development strategy (discussed in **Section 2.1**), which may be referenced in earlier report names.

The Corporation is currently in the process of negotiating land transfer for the addition of Regatta Point, located to the north, to the overall Site and for inclusion in the Audit. The Royal Engineers Building and Land to the west of the Site is included in the overall planned development of the area, however no changes in use are planned and it is not intended to be included in the Audit at this time.

2.1 Proposed Future Development

The RC were derived, and the assessment and remediation of Macquarie Point prior to 2023 was conducted, with reference to the previous vision for development of Macquarie Point, *New Territory from Old Ground – Macquarie Point Strategic Framework and Masterplan 2015-2030* (MPDC, 2015).

The Tasmanian Government Department of State Growth announced in September 2022 that the Site is the preferred location for a mixed-use precinct, including a multipurpose stadium. As a result, in August 2024, the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024) was finalised by the corporation as the planned future development of the Site as a mixed-use precinct comprised of interconnected discrete zones, including, but not limited to those summarised in **Table 1** below.

Table 1 Precinct Plan - Proposed Development Precincts

Precinct	Land Use
Aboriginal culturally informed zone	Open space and commercial
Multipurpose stadium and associated concourse zone	Open space and commercial
Royal Engineers building and land	Open space and commercial
Complementary integrated mixed use zone, including restraints, cafes, hotels, medical facilities and commercial office space	Open space and commercial
Antarctic facilities zone including commercial spaces and connections with the complementary integrated mixed use zone	Commercial and underground car parking
Residential development and public foreshore zone accommodating a variety of tenures and housing opportunities, along with a new public promenade and food and beverage offerings	High density residential, commercial and open space
A transport corridor and roadway linking Regatta Point to the main areas of the Site	Open space
A vegetated area along the northern boundary of the Site, where the slope of the escarpment below the Hobart Cenotaph would prevent development or construction	Open space

Subsurface utilities and maintenance activities are anticipated to occur in all Site areas.

The concept layout of the Site in the Precinct Plan is shown in **Figure 2** below.

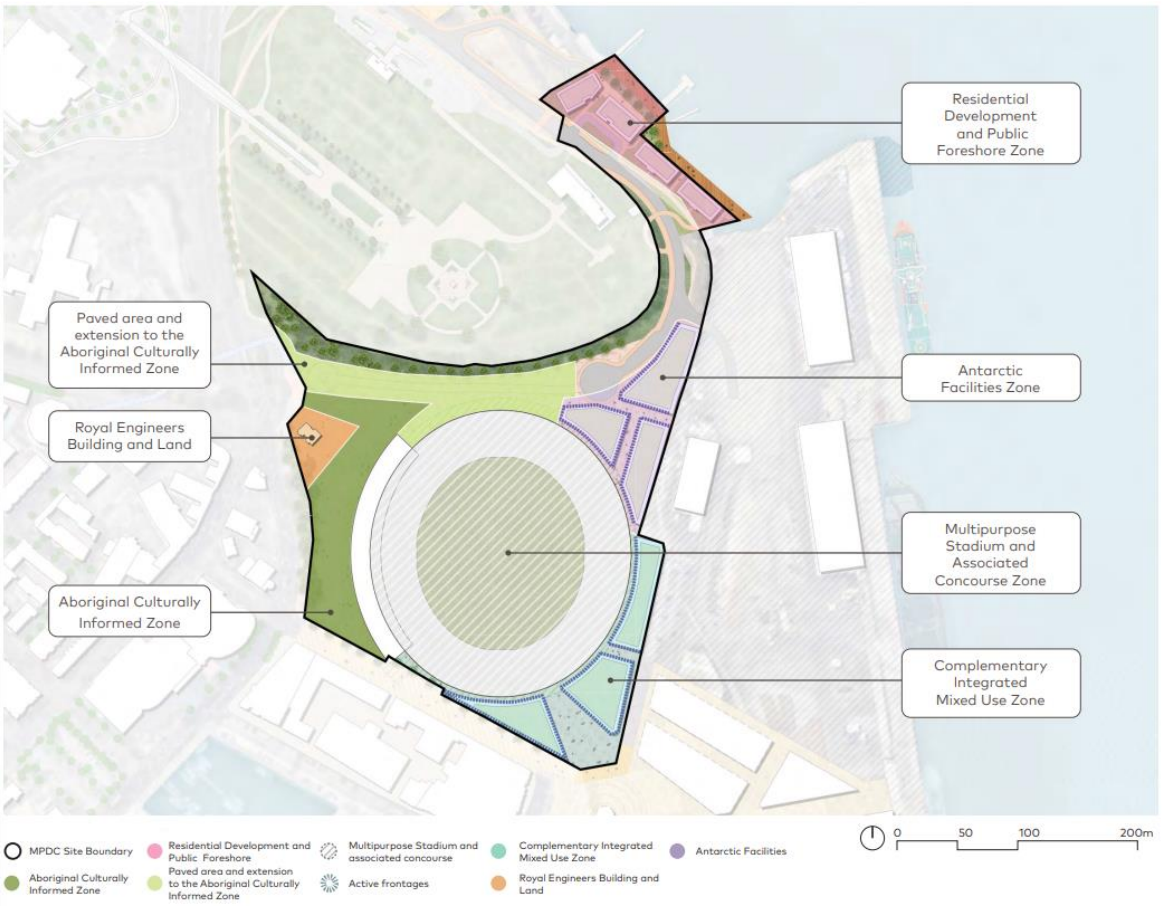

Figure 2 Proposed Development Layout (MPDC, 2024)

2.2 Site Specific Remediation Criteria

The risk-based site-specific RC presented in *Derivation of Remediation Criteria* (AECOM, 2016) were prepared for soil and groundwater in order to inform remediation and management works required at the Site for the protection of human health. Potential risks to ecological receptors were not considered in the RC and have been separately assessed (AECOM, 2020a). Review and, if required, update of the assessment of potential risks to ecological receptors is planned as a separate assessment, and it is not considered necessary to include ecological receptors in the RC as part of this review on this basis.

The RC consider the following scenarios and land uses based on the initially proposed development of Macquarie Point (MPDC, 2015)*:*

- High density residential development (slab-on-grade buildings and buildings with a communal basement car park)
- Recreation / open space
- Multi-storey car park
- Commercial/light industrial (slab-on-grade buildings and working within a basement car park).

The risk-based Site RC were derived based on generic, conservative exposure assumptions protective of on-Site and off-Site human health under the above-mentioned potential future land use conditions at the Site, and incorporated the following key assumptions:

- Non-Aqueous Phase Liquid (NAPL) impacts at the Site will be remediated to the extent practicable and therefore risks associated with exposure to NAPL, and volatile contaminants derived from NAPL were not considered in the derivation of the RC. If residual NAPL is present at the Site following completion of remediation works, the associated potential risks to human health should be assessed at that time.
- Intrusive maintenance work at up to 1 m bgl may be undertaken in all land uses.
- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of maintenance workers) to have direct contact with soils.
- A reticulated water supply will be available, based on the urban setting of the Site, and abstraction of groundwater for any purposes other than remediation or monitoring will not be required for long term use.
- A Site Environment Management Plan (SEMP) will be prepared and put in place to maintain/manage surface cover.
- With regard to basements:
    - Use of any future basements is assumed to be limited to car parking. If basements are constructed for other purposes, a risk assessment specific to the intended use should be conducted.
    - Where basements are associated with future residential or commercial buildings, it is assumed that these will be communal areas for multiple properties, for example, as part of a strata scheme that is managed by a body corporate. Private basements will therefore not be associated with individual residences.
    - Where there is access to a basement car park, it is assumed that any groundwater seepage collects in floor drains and a physical barrier is present, and therefore, groundwater will not be directly contacted by basement users, with the exception of maintenance workers. It is assumed that individual tenants will not be involved in the maintenance of any associated services, including drainage pumps or sumps.
- For potential future multi-storey car park users, the most sensitive receptor in this scenario would be considered to be a parking attendant present at the Site for a typical eight hour working day. It is considered that RC derived for potential future commercial/light industrial workers (working within a basement) would be protective of all other basement users. This includes multi-storey car park users and residential tenants who access basement car parks and are likely to have lower

frequency and duration of exposure, therefore the multi-storey car park users scenario is not evaluated separately in this assessment.

- Adjacent off-Site land uses include open space, commercial/industrial, and residential areas. As these potential land uses have been considered on-Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g. via groundwater migration beyond the Site boundary).
- It is considered that potential exposure to workers undertaking remediation and/or development activities can effectively be mitigated through the implementation of an appropriate Construction Environmental Management Plan (CEMP). The CEMP should be prepared during the planning stage for any future remediation and/or development activities.
- A separate assessment of the potential risks to on-Site visitors was not undertaken as it was considered that the chronic exposure duration assessment of commercial/light industrial workers or residents is sufficiently protective of the shorter exposure duration visitor scenario.

3.0 Key Site Assessments Completed Following Derivation of the Remediation Criteria

Information regarding the current environmental condition of the Site, which has been used in this report, is presented in the key reports listed below.

All reports listed below have been provided to the Auditor, who has provided comments or questions on any aspects where he required more information or clarification in order to assess environmental outcomes. In some cases, Auditor review, or response to Auditor comment or questions, has not yet been completed. Reports where this is the case are noted on the list below.

Reviewed and Accepted by the Auditor

- *Derivation of Remediation Strategy* (AECOM, 2016)
- *Audit Area 1 – Detailed Site Investigation* (AECOM, 2019a)
- *Audit Area 1, Clean Up to the Extent Practicable Report* (AECOM, 2019b)
- *Audit Area 4 – Detailed Site Investigation* (AECOM, 2020a)
- *Audit Area 4 West – Clean Up to the Extent Practicable Report* (AECOM, 2020b)
- *Assessment of LNAPL Remediation Endpoints* (AECOM, 2020c*)*
- *Audit Area 2 – Detailed Site Investigation* (AECOM, 2020d)
- *Audit Area 7 – Detailed Site Investigation* (AECOM, 2020e)
- *Audit Area 5 – Detailed Site Investigation* (AECOM, 2021a)
- *Lot E and Underground Carpark – Clean Up to the Extent Practicable Report* (AECOM, 2021b)
- *Lot B – Clean Up to the Extent Practicable Report* (AECOM, 2021c)
- *Audit Area 3 – Detailed Site Investigation* (AECOM, 2022)
- *Preliminary Site Investigation – Regatta Point* (AECOM, 2023)
- *The Gateway – Detailed Site Investigation* (AECOM, 2024a)

Undergoing Auditor Review

- *Site Remediation Strategy Update 2024* (AECOM, 2024b)
- *The Precinct South – Clean Up to the Extent Practicable Report* (AECOM, 2024c)
- *Site Environment Management Plan* (AECOM, 2024d)
- *Remediation Validation Report, The Gateway* (AECOM, 2025a)
- *Acid Sulfate Soil Investigation* (AECOM, 2025b)
- *Review of Site Suitability Statements 2025* (AECOM, 2025d)

Details of the review are provided in the sections below.

4.0 Conceptual Site Model Review

A Conceptual Site Model (CSM) is a site-specific qualitative description of the source(s) of contamination, the pathway(s) by which contaminants may migrate through the environmental media, and the populations (human or ecological) that may potentially be exposed. This relationship is commonly known as a Source-Pathway-Receptor (SPR) linkage. Where one or more elements of the SPR linkage are missing, the exposure pathway is considered to be incomplete and no further assessment is required.

The previous CSM used to derive RC (AECOM, 2016) has been reviewed and the current CSM is presented as **Sections 4.1** to **4.3**, with the SPR linkage assessment provided in **Section 4.4**.

4.1 Sources of Contamination and Chemicals of Potential Concern

Table 2 below presents a summary of the Chemicals of Potential Concern (CoPC) identified as part of previous investigations, that may be present based on known historical activities or uncovered during investigation of the Site, and may have impacted soil and groundwater, with secondary impacts/exposure pathways via generation of soil vapour. Actual detections of CoPC are discussed by medium in **Sections 4.1.1** to **4.1.3** below the table.

Identified CoPC are consistent with those considered in 2016, with the following exceptions which have been identified and assessed as part of ongoing investigation and remediation:

- Per- and Poly-fluoroalkyl Substances (PFAS) are a contaminant class for which the environmental interest and approach has matured significantly over the past 10+ years, and PFAS was identified as a CoPC, primarily associated with historic bulk fuel storage off-Site to the east, and extending onto the eastern portion of Macquarie Point.

  Sampling and analysis for PFAS in soil and groundwater was conducted between 2015 and 2017, and detected no concentrations in excess of the human health investigation levels (HILs) provided in the *PFAS National Environmental Management Plan, Version 3.0* (the PFAS NEMP 3.0) (HEPA, 2025), with the exception of:

  - Soil sampled at 1.1 m bgl at BH70, located in the Precinct South, reported perfluorooctane sulfonic acid (PFOS) in excess of the HIL-A – Residential with garden/accessible soil. As this land use is not intended anywhere on the Site and is not considered in the RC scenarios, adoption of an RC for PFOS is not considered required.

  In general, PFAS are non-volatile and exposure to humans primarily occurs via ingestion. The controls and assumptions inherent to the RC and documented in the SEMP include maintenance of a barrier layer and prohibition on extractive use of groundwater which prevent contact with soil and groundwater by Site users, with the exception of intrusive maintenance workers. However, detected concentrations do not indicate any unacceptable risk to intrusive maintenance workers.

  Ecological impacts, including any ecological impacts relating to PFAS, are not considered in the RC and will be assessed as part of separate investigations.

- Acid Sulfate Soil (ASS) was identified as requiring assessment based on the *Tasmanian Acid Sulfate Soil Management Guidelines* (TASSMG) (DPIPWE, 2009), based on the elevation of the Site and level of potential soil disturbance which is proposed as part of future development.

  Potential Acid Sulfate Soil (PASS), with potential to acidify to hazardous levels, was identified as present primarily within submerged natural estuarine sands in the central, eastern and southern portions of Macquarie Point, or within some reworked sands, which may be imported dredged material, in fill (AECOM, 2025b). No PASS with potential to acidify was detected in Regatta Point, and no Actual Acid Sulfate Soil (AASS) was detected at either Macquarie Point or Regatta Point.

  While an ASS Management Plan will be required for future development of the Site, and recommendations relating to this are made in *Acid Sulfate Soil Investigation* (AECOM, 2025b), remediation of the detected PASS would require high cost effort to either excavate soil to bedrock, or add large quantities of neutralising agents to soil which could have unintended environmental impacts, and identification of RC for ASS/PASS is not considered practicable or required.

AECOM

Table 2 Sources of Contamination and Chemicals of Potential Concern

Former Land Use/ Potential Contaminating Activity	Chemicals of Potential Concern	Potential Impacted Media
Macquarie Point and Adjacent Areas		
Land Reclamation	Metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs, ASS[4]	• Soil • Groundwater • Soil Vapour
Freight Handling	Metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, pH	
Fuel and Oil Storage and Transfer	LNAPL, lead, TRH, PAH, BTEX, phenolic compounds, ACM	
Railyards and freight handling (including locomotive and vehicle maintenance, and refuelling and fuel storage)	Metals[1], TRH, BTEXN, PAHs, phenolic compounds, chlorinated hydrocarbons, SVOC, VOC	
Port Operations	Metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC	
Gasworks	Metals[1], TRH, PAH, BTEX, phenolic compounds, cyanide, ammonia, ACM	
Fuel Storage and Bulk Fuel Terminals	LNAPL, lead, TRH, PAH, BTEX, PFAS[2], ACM, methane[3]	
Former Hobart Rivulet	Metals[1], TRH, PAH, BTEX, phenolic compounds, cyanide, ammonia, SVOC, VOC, OCPs	
Sewer (Main Hobart Pipeline) and adjacent waste water treatment plan	Metals[1], TRH, PAH, BTEX, VOC, SVOC, nitrate, ammonia, faecal coliforms [Escherichia coli (E. coli)]	
Regatta Point and Surrounding Areas		
Public Boating, Yachting and Port Activities	Metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, TBT, asbestos/ACM	• Soil • Groundwater • Soil Vapour
Rail Corridor	Metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs	
Land Reclamation	Metals[1], TRH, PAH, BTEX, phenolic compounds, SVOCs, VOCs, OCPs, cyanide, ammonia, asbestos/ACM	
Hobart Rivulet	Metals[1], TRH, PAH, BTEX, phenolic compounds, SVOCs, VOCs, OCPs, cyanide, ammonia	
Fuel Pipeline	LNAPL, lead, TRH, PAH, BTEX	

Former Land Use/ Potential Contaminating Activity	Chemicals of Potential Concern	Potential Impacted Media
Wastewater Treatment Plant	Metals[1], OCPs, nitrate, ammonia, faecal coliforms [Escherichia coli (E. coli)]	
Helipad	TRH, PAH, BTEX, phenolic compounds, SVOC, VOC	
Former Cattle Jetties	Ammonia, nitrate, sulfate	
Former Military and Battery Operations	Metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, nitrate, sulfate	
Former Rail Yards and Freight Handling	Metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCPs	
Former Bulk Fuel Terminals	Lead, TRH, PAH, BTEX, PFAS[2]	

Notes: TRH: total recoverable hydrocarbons, PAH: polycyclic aromatic hydrocarbons, BTEX: benzene, toluene, ethylbenzene and xylenes; SVOC: Semi-Volatile Organic Compounds; VOC: Volatile Organic Compounds; OCP: Organochlorine Pesticides; PFAS: Per and Poly-fluoroalkyl Substances; ACM: Asbestos Containing Material; ASS: Acid Sulfate Soil; TBT: tributyltin; 1: aluminium, arsenic, cadmium, chromium, copper, lead, manganese, nickel and zinc;; 2: A review of historical information has not identified the use of products containing PFAS, however there is potential for firefighting foams containing PFAS to have been applied as part of emergency response operations or for training purposes during bulk fuel storage in the short period between the adoption of PFAS-containing firefighting foam in the USA in 1967, and the cessation of bulk fuel storage in the 1970s; 3: The source of methane in soil vapour and groundwater is no known, but is considered likely to be due to the anaerobic degradation of hydrocarbon contamination or organic materials in buried estuarine material or fill; 4: Potential Acid Sulfate Soil (PASS) has been identified in buried estuarine sands in the central, southern and eastern portion of Macquarie Point (AECOM, 2025b), and may be due to either latent conditions (i.e., former sea- or riverbed covered by land reclamation), or to reworked dredged material in fill.

4.1.1 Extent of Contamination - Soil

In the absence of specific Tasmanian guidance regarding the protected environmental values (PEVs) of land, the Victorian Environment Reference Standard (the ERS), (Victorian Government, 2021) has been referenced to identify potential PEVs at the Site relating to land. The ERS replaces and supersedes Victorian *State Environment Protection Policy - Prevention and Management of Contamination of Land* (PMCL SEPP, 2002), which was also used in some assessments of the Site prior to 2021.

Soil samples collected during the investigation of the Site have been assessed against adopted Tier 1 Criteria (presented in the assessment reports listed in **Section 3.0**) for the following PEVs:

- Human Health
  - Low and Medium/High Density Residential
  - Recreation/Open Space
  - Commercial Industrial
  - Shallow Trench Worker
- Other PEVs:
  - Maintenance of Modified/Highly Modified Ecosystems
  - Buildings and Structures
  - Aesthetics.

The following CoPC have been detected in excess of one or more of the adopted Tier 1 Criteria adopted for Human Health PEVs in soil samples collected from the Site:

- TRH – >C6–C10, >C10-C40 (assessed/reported as TPH in some reports)
- Benzene
- PAHs – benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, naphthalene, Sum of PAHs
- Metals – arsenic, cadmium, chromium, copper, lead, nickel, zinc
- Cyanide (total)

In addition:

- Asbestos containing material (ACM) has been previously identified or suspected on Site as:
  - Small, isolated fragments in fill
  - Cladding of remnant fuel pipelines (removed)
  - Buried in a hillside in the Escarpment area
  - Anecdotally, may be present in former rail service pits in the Promenade and Underground Carpark Area, although no buried ACM has been observed in this area during previous excavation and investigation.
- Although not a contaminant, PASS has been detected in submerged estuarine sands or in limited quantities in reworked fill.

4.1.2 Extent of Contamination - Groundwater

PEVs for groundwater at the Site have been identified with reference to the Tasmanian Government *State Policy on Water Quality Management* (1997) (the SPoWQM), and measured Total Dissolved Solids (TDS) concentrations during monitoring events. Additional PEVs, not included in the SPoWQM, have also been considered based on identified potential risks to future users.

The PEVs considered in assessment of the Site are:

- Human Health:
  - Drinking water
  - Recreational water use (primary and secondary contact)[1]
  - Vapour Intrusion[1]
- Other PEVs:
  - Irrigation
  - Industry
  - Stock Watering
  - Irrigation[1]
  - Ecosystems Protection
  - Aesthetics[1]
  - Buildings and Structures[1]

The following CoPC have been detected in excess of one or more of the adopted Tier 1 Criteria for Human Health PEVs in groundwater samples collected from the Site:

- TRH C10-C40 (reported as TPH C10-C36 in earlier investigations)
- Benzene
- PAHs – anthracene, benz(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, chrysene, pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, phenanthrene, fluoranthene, naphthalene, dibenzofuran
- Metals – arsenic, lead, manganese, vanadium
- Cyanide
- E. Coli, (noting that this is not a chemical, but has adopted criteria for assessment of PEVs and has been treated similar to a CoPC in previous assessments).

In addition, LNAPL has been detected on groundwater in the centre of the Site, and on the south-eastern boundary.

4.1.3 Extent of Contamination - Soil Vapour

Soil vapour is considered a secondary impact from soil and groundwater. However, the Tasmanian *Environment Protection Policy (Air Quality) 2004* (the Air Quality EPP) identifies the following PEVs which require protection:

- Human Health
- Ecosystems
- Aesthetics.

Based on Tier 1 screening for human health (AECOM, 2021d) the following exceedances have been reported:

- Concentrations of benzene and naphthalene in excess of adopted residential criteria in the central portion of the Site.
- Methane in soil vapour in excess of adopted sub-slab action levels in the central and south-eastern portion of Macquarie Point.

[1] PEV not listed in SPoWQM

These impacts are considered to be derived from soil and groundwater impacts.

4.2 Potential Receptors

AECOM (2016) derived RC to be protective of the health of the following groups of land users (referred to as “receptors”), with specific RC derived for each group of receptors:

- Residents of a high density development with minimal opportunities for soil access (slab-on-grade) – assumed to be multiple dwellings in a communal scheme that is managed by a body corporate.
- Residents of a high density development with minimal opportunities for soil access (upper floors of a building with a communal basement car park).
- Commercial/light industrial workers (slab-on-grade)
- Commercial/light industrial workers (working within a basement car park)
- Outdoor maintenance workers (undertaking ground works including excavation to depths of up to 1 m bgl).
- Recreational open space users
- Users of a multi-storey car park (noting that this scenario has not been evaluated separately as discussed in the assumptions below).

It is noted that the RC do not consider ecological receptors. Potential risks from contamination to ecological receptors have been assessed in separate reports. In addition, the assumptions made when assessing receptors in 2016 and listed in **Section 2.2** are considered still applicable and have been included in this assessment.

As described in **Table 1**, the future land uses proposed in the Precinct Plan include:

- High density residential
- Commercial (including the Aboriginal culturally informed zone, multipurpose stadium and associated concourse zone, Royal Engineers building and land, complementary integrated mixed use zone, and Antarctic facilities zone)
- Open space (including the Aboriginal culturally informed zone, multipurpose stadium and associated concourse zone, Royal Engineers building and land, complementary integrated mixed use zone, transport corridor, and northern boundary along the slope of the escarpment)
- Underground car parking. Construction details have not been finalised, but the AECOM (2016) assumption that basements would be sufficiently deep to intersect groundwater is considered likely to remain valid.

Therefore, the land use scenarios (and associated receptors) proposed as part of the Precinct Plan were all previously considered in the development of the RC. There are no new receptor groups anticipated as part of the Precinct Plan that would warrant new RC to be derived. Off-Site uses (medium to high density residential, commercial/industrial, and open space) have not changed since the initial derivation of RC.

Table 3 summarises how the receptors considered in the RC are relevant to each of the future land uses proposed in the Precinct Plan.

Table 3 Potential Human Receptors – RC Scenarios

Derivation of Remediation Criteria (AECOM, 2016)	Precinct Plan (MPDC, 2024)			
	High Density Residential	Commercial	Open Space	Underground Carpark
High Density Residential (slab-on-grade)	✓	×	×	×
High Density Residential (shared basement)	✓	×	×	✓[1]
Commercial (slab-on-grade)	×	✓	×	×
Commercial (shared basement)	×	✓	×	✓[1]
Maintenance Workers	✓	✓	✓	×
Open Space Users	×	×	✓	×
Off-Site	✓	✓	✓	✓[2]

Notes: ✓ - RC corresponds to proposed future Site use; × - RC does not correspond to proposed future Site use; 1. The RC derived for commercial land uses with a basement are suitable to apply to a separate underground carpark scenario, as the most sensitive potential receptor was assumed to be a parking attendant present in the basement for 8 hours per day.; 2. No underground carparks have been identified in the vicinity of the Site. However, the potential exists for future external developments, beyond the control of the Corporation, to include underground carparks.

4.3 Potential Exposure Pathways

AECOM (2016) derived RC based on the following exposure pathways for each group of receptors:

- Residents of high density residential buildings (with or without underground car parking) would only have potential exposure via indoor and outdoor inhalation of vapours derived from soil and groundwater. An engineered break layer will be present at the ground surface to mitigate potential direct contact with soils, or generation of dust in indoor air environments.
- Groundwater will not be abstracted for beneficial uses on-Site and there will be a barrier to prevent direct contact with any groundwater seepage into drains in an underground car park.
- Workers in commercial/industrial buildings (with or without basements) would have potential exposure via indoor and outdoor inhalation of vapours derived from soil and groundwater, and via contact with groundwater seepage in basements during infrequent maintenance of the drains. An engineered break layer will be present at the ground surface to mitigate potential direct contact with soils. Groundwater will not be abstracted for beneficial uses on-Site.
- Users of recreational open space would only have potential exposure via outdoor inhalation of vapours derived from soil and groundwater. An engineered break layer will be present at the ground surface to mitigate potential direct contact with soils. Groundwater will not be abstracted for beneficial uses on-Site.
- Outdoor maintenance workers would have potential exposure via direct contact with soils (incidental ingestion, dermal contact, and outdoor dust inhalation), and outdoor inhalation of vapours derived from soil and groundwater. Groundwater will not be abstracted for beneficial uses on-Site and is too deep to be contacted during routine utilities maintenance excavations.
- Migration of groundwater beyond the Site boundary, and secondary pathways which may arise from groundwater such as extraction and direct contact, vapour generation, or discharge to surface water bodies, is considered to be the only pathway for exposure to Site contamination following development, with other pathways (such as inhalation of dust from Site soil) controlled via the SEMP or by CEMPs during construction works. With regards to groundwater migration:
    - Off-Site extractive use of groundwater is not considered likely to occur or to be occurring as the metropolitan setting of the surrounding area (Hobart) has a reticulated water supply

available for irrigation (i.e., park lands or gardens), and washing. Review of registered groundwater bores on the Tasmanian Groundwater Information Access Portal in November 2024 only identified one bore within 2 km of the Site (approximately 2 km north-north-west) (AECOM, 2024c), which was drilled to 54 m bgl in 1983 by the Tasmanian Department of Mines. Based on the age, depth, distance and direction, and originator of the bore, it is not considered likely that extractive use of groundwater is occurring from this bore, or that if extractive use is occurring, groundwater conditions in this area would be affected by the Site. The SEMP will include a requirement that the outcomes of any Site Suitability Statement or future assessments, including potential impacts to groundwater which may affect neighbouring Sites, be communicated to neighbours who may be affected and advise them not to use groundwater without checking its suitability for use.

  - No basement structures are known to exist to the inferred hydraulic downgradient (south and east), and are considered unlikely to be constructed in future due to the relatively shallow elevation of groundwater and likely tidal influence in these directions.

- Potential hazards associated with accumulation of methane in buildings and structures have been assessed separately, based on direct soil vapour data, and have not been considered in the RC.

The above exposure pathways remain relevant to the receptors identified in association with the future land uses proposed in the Precinct Plan, assuming the continued implementation of physical control measures (including an engineered break layer at the ground surface, no on-site abstraction of groundwater for beneficial uses, and a physical barrier to prevent direct contact with groundwater seepage in basements by receptors other than maintenance workers). No additional exposure pathways have been identified in association with the future land uses proposed in the Precinct Plan.

4.4 Source-Pathway-Receptor Linkage Assessment

Based on the review of sources, pathways, and receptors presented in **Sections 4.1** to **4.3**, informed by the Site investigations completed since the RC were first derived in 2016 and the future land uses proposed in the Precinct Plan, the SPR linkages that were included for derivation of the RC remain relevant. There are no new SPR linkages identified that would warrant inclusion in the RC.

Table 4 summarises how the SPR linkages considered in the RC are relevant to each of the future land uses proposed in the Precinct Plan.

This assessment has been conducted with the assumption that the control measures included in the initial *Derivation of Remediation Criteria* (AECOM, 2016), noted in **Section 2.2**, will be implemented as part of the future development.

Table 4 SPR Linkage Assessment

Exposure Pathway	Potential Future Residents – Slab on Grade Buildings		Potential Future Residents –Buildings with Communal Basements *		Potential Future Recreational Open Space Users		Potential Future Commercial/Light Industrial Workers – Slab on Grade Buildings		Potential Future Commercial/Light Industrial Workers – Buildings with Basements *		Potential Future Outdoor Maintenance Workers	
	2016	2025	2016	2025	2016	2025	2016	2025	2016	2025	2016	2025
Soil												
Incidental Ingestion of Contaminated Site Soils	x (a)		x (a)		x (a)		x (a)		x (a)		✓	
Dermal Contact with Contaminated Site Soils	x (a)		x (a)		x (a)		x (a)		x (a)		✓	
Inhalation of Contaminated Soil-Derived Dust in Indoor Air	x (a)		x (a)		x (a & b)		x (a)		x (a)		x (b)	
Inhalation of Contaminated Soil-Derived Dust in Outdoor Air	x (a)		x (a)		x (a)		x (a)		x (a)		✓	
Inhalation or Accumulation of Contaminated Soil-Derived Vapours in Indoor Air	✓		✓		x (b)		✓		✓		x (b)	
Inhalation of Contaminated Soil-Derived Vapours in Outdoor Air	(✓)		(✓)		✓		✓		✓		✓	
Groundwater(e)												
Incidental Ingestion of Contaminated Groundwater	x (c)		x (c)		x (c)		x (c)		✓ (c)		x (c)	
Dermal Contact with Contaminated Groundwater	x (c)		x (c)		x (c)		x (c)		✓ (c)		x (c)	
Inhalation of Contaminated Groundwater-Derived Vapours in Indoor Air	✓		✓		x (b)		✓		✓		x (b)	
Inhalation of Contaminated Groundwater-Derived Vapours in Outdoor Air	(✓)		(✓)		✓		✓		(✓)		✓	
Ingestion of Contaminated Groundwater used as Potable Water Supply	x (d)		x (d)		x (d)		x (d)		x (d)		x (d)	
Inhalation of Contaminated Groundwater Vapours during Irrigation/Showering	x (d)		x (d)		x (d)		x (d)		x (d)		x (d)	
Ingestion of Vegetables Irrigated with Contaminated Groundwater	x (d)		x (d)		x (d)		x (d)		x (d)		x (d)	

Notes:
x: incomplete pathway
✓: potentially complete pathway
(✓): outdoor inhalation of vapours is considered potentially complete for future residential and commercial receptors, however not likely to contribute significantly to inhalation risks in comparison to indoor vapour inhalation.
: Refer to discussion of assumptions regarding basements in **Section 4.2.*
(a) Potential future Site users, with the exception of maintenance workers, are not considered likely to have direct contact with soils during daily activities as the SEMP requires that an engineered break layer will be present at the ground surface, which will also mitigate dust generation from Site soils.
(b) It is assumed that recreational open space users and maintenance workers will spend their day outdoors.
(c) It is assumed that on-site commercial workers in a slab-on-grade building will not be exposed to groundwater directly during daily activities. However, workers in a basement car park may have infrequent direct contact with groundwater seepage while maintaining basement drainage infrastructure. It is assumed that any groundwater seepage collects in floor drains and a physical barrier is present and therefore it is unlikely that groundwater will be directly contacted by other basement users. This review has identified that this assumption is not currently documented in the SEMP, and should be incorporated into the next version of the SEMP.
(d) No on-Site or down-gradient off-Site bores used for agricultural / domestic purposes have been identified in previous investigations. The current SEMP restricts the use of Site groundwater to monitoring or remediation purposes. Based on the land use off-Site and downgradient, and the reticulated water supply available, use or handling of groundwater off-Site is considered unlikely, but the SEMP will include a requirement that the outcomes of any Site Suitability Statement or future assessments, including potential impacts to groundwater which may affect neighbouring Sites, be communicated to neighbours who may be affected and advise them not to use groundwater without checking its suitability for use.
*(e) As discussed in **Section 4.3**, groundwater migration is considered as a potential pathway for exposure to off-Site receptors. Based on the surrounding land uses being consistent with the land uses assessed on-Site, groundwater RC are considered protective of off-Site users.*

5.0 Derivation Review

5.1 Derivation Methodology

The AECOM (2016) RC were derived in accordance with the methodology recommended in the following Australian guidance:

- *Environmental Health Risk Assessment: Guidelines for Assessing Human Health Risks from Environmental Hazards*. Department of Health and Ageing and enHealth Council, Commonwealth of Australia (enHealth, 2012a)
- *National Environment Protection (Assessment of Site Contamination) Measure 1999*, as amended in May 2013 (ASC NEPM, 2013):
  - Schedule B4, Guideline on Site-Specific Health Risk Assessment Methodology
  - Schedule B7, Guideline on Derivation of Health-Based Investigation Levels.

There have been no subsequent revisions or amendments to these guidance documents. Therefore, the methodology followed for the derivation of the RC remains current.

It is noted that in the selection of the final RC for each land use, AECOM (2016) made the following adjustments:

- Where the soil criteria calculated using the infinite source model were more conservative than the CRC CARE (2011) screening values based on a finite source model, the CRC CARE (2011) HSL values were proposed for adoption.

  This adjustment remains appropriate and the HSLs remain current for use in Australian risk assessments. It is noted that this approach should have been applied for the aliphatic TPH >C8-10 soil RC for residential and commercial/light industrial buildings with basements, and that the previously adopted RC for this contaminant were overly conservative. The summary of RC attached in **Appendix C** includes this update for future assessment.
- RC for the following groundwater contaminants, based on the vapour inhalation pathway, exceeded the water solubility limit in the AECOM (2016) RC:
  - Toluene
  - Ethylbenzene
  - Xylenes (total)
  - TPH C6-C8 (Aliphatic)
  - TPH >C8-C10 (Aliphatic)
  - TPH >C10-C12 (Aliphatic)
  - TPH >C10-C12 (Aromatic)
  - TPH >C12-C16 (Aliphatic)
  - TPH >C12-C16 (Aromatic)

  Under these conditions it is not possible for unacceptable risks to occur, and the RC should be listed as “not limiting” (NL).

A summary of recommended RC, attached in **Appendix C**, includes updated values recommended for future assessment. It is noted that the 2016 RC previously used in Site assessment reports were conservative based on the update derivation methodology, and therefore more likely to have over-estimated than under-estimated potential risks.

5.2 Exposure Assessment

In the exposure assessment stage of a human health risk assessment (HHRA), the CSM is used to generate a numerical representation of the exposure pathways which are the inputs for an exposure assessment. This involves quantifying assumptions relating to human behaviour and the environmental setting. To account for variability in the population and to be protective of more

sensitive sub-groups, exposure assumptions are typically selected that cumulatively reflect a reasonable maximum exposure scenario.

The exposure assumptions adopted by AECOM (2016) for the RC were obtained from the following recognised Australian and international resources:

- ASC NEPM, 2013
- enHealth, 2012b. *Australian Exposure Factor Guide*
- CRC CARE, 2011. Cooperative Research Centre for Contamination Assessment and Remediation of the Environment (CRC CARE) *Technical Report No.10 - Health Screening Levels for Petroleum Hydrocarbons in Soil and Groundwater*.

Where specific guidance was not available from the sources listed above (or other literature sources), conservative estimates for exposure parameters were adopted based on AECOM's professional judgement as noted on **Table 5** to **Table 9** below.

The adopted exposure assumptions were reviewed to confirm whether they are consistent with current Australian risk assessment practice. The findings of the review are summarised below:

- The majority of exposure assumptions were the Australian recommended default assumptions for assessment of residential, recreational, commercial worker, or maintenance worker receptors. There have been no revisions or amendments to the associated guidance documents since the RC were derived in 2016, hence the adopted exposure assumptions remain current.
- Four exposure parameter assumptions were based on professional judgement because there were no Australian or international recommended default assumptions (time spent indoors in a basement car park, incidental water ingestion rate during maintenance of basements drains, exposure time for dermal contact with water during maintenance of basements drains, and frequency of maintenance of basements drains). No new Australian or international guidance has been published on these aspects. The AECOM (2016) assumptions for these parameters, listed on **Table 5** and **Table 8** below, are considered to remain appropriate and are conservatively based on a reasonable maximum exposure scenario that is more likely to over-estimate than under-estimate potential risk).

The default exposure assumptions recommended in Australian guidance are conservative generic assumptions that cumulatively represent a reasonable maximum exposure scenario and are intended to be protective of a wide range of potential development scenarios. They are not dependent on the building internal layout or detailed development plan. Therefore, the exposure assumptions adopted for the derivation of the RC in 2016 remain appropriate for the specific development design envisioned under the Precinct Plan, despite differences in configuration to the land uses envisioned at the time of derivation of the RC in 2016 (e.g., the configuration of commercial premises as part of a stadium development).

The outcomes of the exposure assessment review are detailed in **Table 5** to **Table 9** below.

Table 5 Exposure Parameters – Potential Future Residents of a High Density Development

Parameter (Units)	Adopted Value		Reference	Comment
	Adult	Child		
Body Weight (kg)	70	15	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Exposure Duration (years)	29	6	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Averaging Time – Carcinogens (years)	70	70	*ASC NEPM*, 2013: Schedule B7, Appendix C	Consistent with current guidance
Averaging Time – Non-Carcinogens (years)	29	6	*ASC NEPM*, 2013: Schedule B7, Appendix C	Consistent with current guidance

Parameter (Units)	Adopted Value		Reference	Comment
	Adult	Child		
Exposure Time – Indoors (hours/day)	20	20	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Exposure Time – Indoors in a basement car park (hours/day)	1	1	Professional judgement	No new Australian guidance on this aspect. The AECOM (2016) assumption for this parameter is considered to remain appropriate and conservative, and was selected to deliberately over-estimate the time required for a person to drive to/from a parking spot, and walk to/from the exit, even if this is done multiple times per day.
Exposure Frequency (days/year)	365	365	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance

Table 6 Exposure Parameters – Potential Future Recreational Open Space Users

Parameter (Units)	Adopted Value		Reference	Comment
	Adult	Child		
Body Weight (kg)	70	15	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Exposure Duration (years)	29	6	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Averaging Time – Carcinogens (years)	70	70	*ASC NEPM*, 2013: Schedule B7, Appendix C	Consistent with current guidance
Averaging Time – Non-Carcinogens (years)	29	6	*ASC NEPM*, 2013: Schedule B7, Appendix C	Consistent with current guidance
Exposure Time – Outdoors (hours/day)	2	2	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Exposure Frequency (days/year)	365	365	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance

Table 7 Exposure Parameters – Potential Future Commercial/Light Industrial Worker

Parameter (Units)	Adopted Value	Reference	Comment
Body Weight (kg)	70	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Exposure Duration (years)	30	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance

Parameter (Units)	Adopted Value	Reference	Comment
Averaging Time – Carcinogens (years)	70	*ASC NEPM*, 2013: Schedule B7, Appendix C	Consistent with current guidance
Averaging Time – Non-Carcinogens (years)	30	*ASC NEPM*, 2013: Schedule B7, Appendix C	Consistent with current guidance
Exposure Time – Indoors (including within a basement) (hours/day)	8	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Exposure Time – Outdoors (hours/day)	1	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Exposure Frequency (days/year)	240	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance

Table 8 Exposure Parameters – Potential Future Commercial/Light Industrial Worker undertaking drain maintenance in a basement

Parameter (Units)	Adopted Value	Reference	Comment
Body Weight (kg)	70	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Exposure Duration (years)	30	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance
Averaging Time – Carcinogens (years)	70	*ASC NEPM*, 2013: Schedule B7, Appendix C	Consistent with current guidance
Averaging Time – Non-Carcinogens (years)	30	*ASC NEPM*, 2013: Schedule B7, Appendix C	Consistent with current guidance
Exposure Time – Indoors Within a Basement (hours/day)	8	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance This assumption would be conservatively protective of visitors in other underground spaces that may be constructed as part of the proposed development e.g. stadium access tunnels.

Parameter (Units)	Adopted Value	Reference	Comment
Incidental water ingestion rate for groundwater seepage during maintenance activities (mL/day)	5	Professional judgement	No new Australian guidance on this aspect. The AECOM (2016) assumption for this parameter is considered to remain appropriate. This volume represents approximately one quarter of a mouthful which is conservative as an estimated volume workers may ingest (i.e., from minor splashes or on hands) during maintenance activities.
Event time – dermal contact with groundwater (hours/day)	1	Professional judgement	No new Australian guidance on this aspect. The AECOM (2016) assumption for this parameter is considered to remain appropriate and conservative, and was selected to deliberately over-estimate the time over which a person undertaking drain maintenance activities would have their hands and forearms submerged in water in a drain, as it is likely that tools will be used and/or tasks such as preparation and installation of replacement parts will not involve contact with water in drains.
Exposure frequency – incidental ingestion and dermal contact with groundwater (days/year)	12	Professional judgement – monthly drainage maintenance	No new Australian guidance on this aspect. The AECOM (2016) assumption for this parameter is considered to remain appropriate and conservative, and was selected to deliberately over-estimate the frequency of drain maintenance activities in a new building constructed to the relevant Australian Standard.
Exposed Skin Surface Area for Groundwater Contact (cm^2)	2,600	Assumes hands and forearms exposed, conservatively based on values reported for males in enHealth (2012) Table 3.2.3	Consistent with current guidance

Table 9 Exposure Parameters – Potential Future Intrusive Maintenance Worker

Parameter (Units)	Adopted Value	Reference	Comment
Body Weight (kg)	70	*ASC NEPM*, 2013: Schedule B7, Table 5 (Commercial/Industrial Worker)	Consistent with current guidance
Exposure Duration (years)	30	CRC CARE 2011	Consistent with current guidance
Averaging Time – Carcinogens (years)	70	*ASC NEPM*, 2013: Schedule B7, Appendix C	Consistent with current guidance
Averaging Time – Non-Carcinogens (years)	30	*ASC NEPM*, 2013: Schedule B7, Appendix C (equal to Exposure Duration)	Consistent with current guidance
Exposure Time – Outdoors (hours/day)	8	CRC CARE, 2011: Part 1, Table 6	Consistent with current guidance
Exposure Frequency (days/year)	20	CRC CARE, 2011: Part 1, Table 6	Consistent with current guidance
Daily Soil Ingestion Rate (mg/day)	330	USEPA (2002) value for construction worker, as adopted by CRC CARE (2011) Part 1, Table 6	Consistent with current guidance
Exposed Skin Surface Area for Soil Contact (cm^2)	6,800	CRC CARE (2011) Part 1, Table 6, conservatively assumes head, hands, forearms and lower legs exposed to dirt through clothing	Consistent with current guidance
Soil to Skin Adherence Factor (mg/cm^2)	0.5	*ASC NEPM*, 2013: Schedule B7, Table 5 (Commercial/Industrial Worker)	Consistent with current guidance

Parameter (Units)	Adopted Value	Reference	Comment
Particulate Emission Factor m^3/kg)	2.6×10^7	*ASC NEPM*, 2013: Schedule B7, Appendix C, value for Recreational Receptor adopted as it assumes poor ground cover and activities that involve the generation of dust. A dust in air concentration of 39 $\mu g/m^3$ (95th percentile from Australian data as presented in enHealth, 2012a) has been used, where 100% is assumed to be derived from the contaminated Site.	Consistent with current guidance
Lung Retention Factor	0.375	*ASC NEPM*, 2013: Schedule B7, Table 5	Consistent with current guidance

5.3 Vapour Attenuation Modelling

The AECOM (2016) RC were derived using theoretical modelling of vapour attenuation in the subsurface based on the approach adopted by CRC CARE (2011) and originally described in:

- Johnson, 2002. *Identification of Critical Parameters for the Johnson and Ettinger (1991) Vapor Intrusion Model*. American Petroleum Institute May 2002, No 17.
- USEPA, 2004. *User's Guide for Evaluating Subsurface Vapour Intrusion into Buildings*. Office of Emergency and Remedial Response. Revised February 22, 2004.

As a conservative approach, a number of the vapour attenuation modelling assumptions were set to the CRC CARE (2011) generic assumptions for residential or commercial buildings which were used to derive the health screening level (HSLs) adopted in the ASC NEPM 2013. The vapour emissions from groundwater seepage into basements was assessed based on CRC CARE (2011) generic building assumptions and additional guidance from CRC CARE (2013) Technical Report 23. There have been no revisions or amendments to the associated Australian guidance documents since the RC were derived in 2016, hence the adopted generic exposure assumptions remain current. However, the following site-specific assumptions required review:

- The 2106 derivation of soil RC for all land use scenarios assumed a minimum thickness of 60 cm clean fill/capping (required to meet the ASC NEPM HSL/HIL relevant for the proposed land use) would be placed across the Site as part of the final condition. Based on current available information this assumption remains valid for the development proposed in the Precinct Plan, and is retained as a condition for risk assessment based on the RC to be applicable.
- The groundwater RC for a future slab-on-grade building (residential or commercial) assumed groundwater would be no shallower than 2 m below the building slab. This was adopted as a conservative representation of site-wide groundwater levels and assumed that the final ground surface level would not be lowered as a result of the site redevelopment works. Based on the preliminary designs associated with the Precinct Plan this assumption appears to remain valid, except for the following:
    - The *Site-wide Soil Vapour Bore and Groundwater Well Inspection and Gauging Event, February 2025* letter (AECOM, 2025c) reported two wells within Regatta Point where the depth to groundwater was 1.025 and 1.145 m below ground level, which is significantly less than the 2 m distance assumed in the derivation of the RC. Regatta Point was not part of the

Site when the RC were derived in 2016 and hence the shallower depth to groundwater in this area was not previously taken into account.

- The proposed stadium design indicates the playing field and associated buildings will be constructed at +3 m AHD. Groundwater elevation beneath the proposed stadium footprint as measured in wells during February 2025 ranges between 2.9 and 0.6 m AHD, with the majority of wells. Therefore, groundwater may be present at less than 2 m below the final ground level in the eastern and northern portions of the stadium footprint. However, AECOM understands that for ground stability purposes the stadium design will include engineered subsurface barriers to divert groundwater around the stadium footprint and reduce groundwater levels beneath the stadium.

The AECOM (2016) RC are therefore considered appropriate with regards to vapour attenuation modelling in areas where groundwater is greater than 2 m below the surface.

A sensitivity analysis has been conducted to assess the impact on the RC if groundwater is present at 1 m below a future residential or commercial building slab and is attached as **Appendix B**. This is representative of the shallowest depth to groundwater reported on the site within the Regatta Point area and likely to be conservative in relation to the anticipated future groundwater elevation beneath the stadium, considering the engineering measures planned to manage groundwater flow in this area.

The sensitivity analysis concluded that the RC would not change materially (less than 20% variation) based on a depth of 1 m to groundwater. Therefore, the AECOM (2016) RC are appropriate for assessment of potential human health risks which may arise from the land uses proposed in the Precinct Plan, including stadium construction, in all areas of the site where groundwater is present at 1 m bgl or deeper.

Where groundwater is shallower than 2 m below the surface, the AECOM (2016) assumption that basements would be sufficiently deep to intersect the groundwater table remains valid. Therefore, the RC for buildings with basements do not require revision to account for the shallower depth to groundwater encountered in Regatta Point compared to other areas of the Site.

If future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, additional assessment of the potential vapour intrusion risk to building users, based on data representative of that part of the Site, will be required.

5.4 Toxicity Assessment

The toxicity assessment stage of a HHRA examines the capacity of a chemical agent to cause adverse health effects in humans and includes a dose−response assessment, which is the process of making a quantitative link between the degree of exposure to a chemical and the adverse effect that may be realised. The toxicity reference values (TRV) adopted by AECOM (2016) for the RC derivation were reviewed to confirm whether they are consistent with current Australian risk assessment practice as outlined in the ASC NEPM 2013. The outcomes of this review are detailed in **Table 10** and **Table 11**, and summarised below:

- The tolerable concentration in air (TC) adopted for ethylbenzene (0.26 mg/m^3) was more conservative than the TC (1.3 mg/m^3) adopted for the derivation of the HSLs in the ASC NEPM, 2013. The RC for the vapour inhalation pathway are proportional to the TC and therefore the impact of adopting the TC of 1.3 mg/m^3 on the adopted RC for ethylbenzene would be:
  - Increase in the soil RC for slab-on-grade low-rise residential and commercial/ light industrial buildings to 81 mg/kg and 990 mg/kg (respectively).
  - Increase in the soil RC for residential buildings with a basement from 24 mg/kg to 120 mg/kg.
  - Increase in the soil RC for commercial/ light industrial buildings with a basement from 110 mg/kg to 570 mg/kg.
  - No change in the RC for other scenarios, because these already exceeded the soil saturation limit or solubility limit for the vapour inhalation pathway based on the more conservative TC.

- All other adopted TRV remain current and were selected in a manner consistent with the guidance in ASC NEPM 2013, Schedule B4.

It is recommended to update the RC tables to adopt the higher ethylbenzene RC, and the updated values have been included in the summary of RC in **Appendix C**.

Table 10 Review of threshold toxicity reference values adopted by AECOM (2016)

Analyte	Tolerable concentration in air (mg/m^3)	Tolerable daily intake (mg/kg/day)	Reference	Comment
Naphthalene	0.0037	0.02	CRC CARE (2011)	Consistent with current guidance
Benzene	0.024	0.004	CRC CARE (2011)	Consistent with current guidance

Benzene	6E-06	1.00E+00	CRC CARE (2011), based on TPHCWG (1999)	Consistent with current guidance

6.0 Conclusions

This review of the AECOM (2016) RC has identified the following conclusions:

- Although the land development plans have evolved since 2016, there have been no material changes to the CSM that would warrant the RC to be revised to account for additional groups of human receptors or SPR linkages for soil or groundwater contamination at the site. The land uses proposed within the Precinct Plan are adequately accounted for by the land use scenarios for which the RC were originally developed.
- Although additional soil and groundwater investigations have been conducted at the Site since 2016, there are no new CoPC identified which would warrant RC to be derived. There was no data available for PFAS at the site in 2016, but the concentrations subsequently detected at the site have not exceeded relevant Tier 1 human health screening assessment criteria, and do not have any pathway to human exposure for future residents, recreational open space users, or commercial/industrial workers under the controls and development restrictions, including maintenance of barrier layers and prohibition on extractive use of groundwater, included in the RC and documented in the SEMP. Detected concentrations do not indicate any unacceptable risk to intrusive maintenance workers. Tier 1 criteria can continue to be used for screening purposes if additional PFAS data are collected at the Site.
- The methodology adopted for derivation of the RC in consistent with Australian guidance for conducting HHRA and remains current. However, RC for the following CoPC were based on the vapour inhalation pathway exceeded the water solubility limit:
    - Toluene
    - Ethylbenzene
    - Xylenes (total)
    - TPH C6-C8 (Aliphatic)
    - TPH >C8-C10 (Aliphatic)
    - TPH >C10-C12 (Aliphatic)
    - TPH >C10-C12 (Aromatic)
    - TPH >C12-C16 (Aliphatic)
    - TPH >C12-C16 (Aromatic)

  Under these conditions it is not possible for unacceptable risks to occur, and the RC should be listed as “not limiting”.
- The adoption of the CRC CARE (2011) HSLs as soil RC remains appropriate where the soil criteria calculated using the infinite source model were more conservative than the CRC CARE (2011) HSL based on a finite source model. It is noted that this approach should have been applied for the aliphatic TPH >C8-10 soil RC for residential and commercial/light industrial buildings with basements.
- The exposure assumptions made in the derivation of the RC were generic, conservative values commonly adopted for HHRA in Australia and remain current.
- The toxicity assumptions made in the derivation of the RC were selected in a manner consistent with the guidance in ASC NEPM 2013, Schedule B4 and remain current, with the exception of the TC for ethylbenzene.
    - Adopting the current TC for ethylbenzene would increase the soil RC for residential and commercial/ light industrial buildings but not change the RC for other land use scenarios.
- The vapour attenuation modelling assumptions made in the derivation of the RC were primarily generic, conservative values commonly adopted for HHRA in Australia and remain current, except for the site-specific depth to groundwater:

- The depth to groundwater was assumed in AECOM (2016) to be 2 m beneath a slab-on-grade building. However, shallower groundwater levels of approximately 1 m bgl had subsequently been measured in the Regatta Point area and could potentially be present due to a planned decrease in ground level beneath the stadium.
- A sensitivity analysis was performed which concluded that the RC would not change materially based on a depth of 1 m to groundwater. Therefore, the AECOM (2016) RC are appropriate for assessment of potential human health risks which may arise from the land uses proposed in the Precinct Plan, including stadium construction, in all areas of the site where groundwater is present at 1 m bgl or deeper.

- The SEMP should be updated to include:
  - Any drains in basements or buried structures should include a physical barrier to prevent direct contact with any groundwater infiltration.
  - While off-Site extraction and use of groundwater is considered unlikely, neighbouring sites should be informed of the outcomes of any Site Suitability Statement or future assessments, including potential impacts to groundwater which may affect neighbouring Sites, and advise them not to use groundwater without checking its suitability for use.

Based on the findings of this review, the AECOM (2016) RC are overall appropriate for ongoing assessment of potential human health risks which may arise from the land uses proposed in the Precinct Plan, including stadium construction, in areas where groundwater will be 1 m below the final surface or deeper. If future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building becomes less than 1 m bgl, additional assessment of the potential vapour intrusion risk to building users, based on data representative of that part of the Site, will be required.

Minor updates to the RC have been recommended, to align with the TC adopted for ethylbenzene in the HSLs from the ASC NEPM 2013 and to clarify where RC based on the vapour inhalation pathway exceed theoretical soil saturation limits or water solubility limits and therefore this pathway is not limiting. The RC recommended for ongoing assessments at the site are tabulated in **Appendix C**.

As all recommended changes increase adopted RC values, the results of previous assessments using the AECOM (2016) RC are considered conservative and applicable for assessment of potential risks for development under the Precinct Plan (MPDC, 2024).

When development plans are finalised, the CSM should be revisited to confirm that there are no changes which would materially affect the RC.

If you have any queries, please do not hesitate to contact the undersigned.

Yours faithfully

Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation (the Corporation) and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract *Macquarie Point Development Project – Review of Site Specific Remediation Criteria and of issued Site Suitability Statements,* dated 18 February 2025.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 28 February and 9 July 2025, and is based on the information reviewed at the time of preparation, as referenced in the text of this report. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

Appendix B
Groundwater RC Sensitivity Analysis

Groundwater Depth Sensitivity Analysis

Methodology

The derivation of groundwater RC utilised a theoretical model to estimate the concentration in the breathing zone (i.e., indoor air, or outdoor air in a trench excavation), based on concentrations in the groundwater. The model adopts a number of assumptions about the subsurface and human exposure that cumulatively represent a reasonable maximum exposure scenario that is intended to over-estimate rather than under-estimate potential risk. Sensitivity analysis involves adjusting one of these assumptions at a time and quantifying the impact on the calculated RC. If the RC varies by less than 20-30%, the sensitivity to the adjusted assumption is considered to be low because it is within the typical range of precision associated with field sampling and laboratory analysis techniques.

The groundwater RC for a future slab-on-grade building (residential or commercial) assumed groundwater would be no shallower than 2 m below the building slab. This was adopted as a conservative representation of Site-wide groundwater levels and assumed that the final ground surface level would not be lowered as a result of the Site redevelopment works. Based on the currently available data and preliminary designs associated with the Precinct Plan this assumption appears to remain valid, except for the following:

- The *Site-wide Soil Vapour Bore and Groundwater Well Inspection and Gauging Event, February 2025* letter (AECOM, 2025) reported two wells within Regatta Point where the depth to groundwater was 1.025 and 1.145 m below ground level, which is significantly less than the 2 m distance assumed in the derivation of the RC. Regatta Point was not part of the Site when the RC were derived in 2016 and hence the shallower depth to groundwater in this area was not previously taken into account.
- The proposed stadium design indicates the playing field and associated buildings will be constructed at +3 m AHD. Groundwater elevation beneath the proposed stadium footprint as measured in wells during February 2025 ranges between 2.9 and 0.6 m AHD, with the majority of wells. Therefore, groundwater may be present at less than 2 m below the final ground level in the eastern and northern portions of the stadium footprint. However, AECOM understands that for ground stability purposes the stadium design will include engineered subsurface barriers to divert groundwater around the stadium footprint and reduce groundwater levels beneath the stadium.

The groundwater RC for future residential or commercial developments with basement car parking assumed that the basement would be sufficiently deep to intersect the groundwater table and hence remain appropriate if the final ground surface level is lowered as a result of the Site redevelopment works.

The sensitivity analysis has therefore assessed the impact on the RC if groundwater is present at 1 m below a future residential or commercial building slab. This is representative of the shallowest depth to groundwater reported on the site within the Regatta Point area and likely to be conservative in relation to the anticipated future groundwater elevation beneath the stadium, considering the engineering measures planned to manage groundwater flow in this area.

Two sets of RC were presented in AECOM (2016) for future residential or commercial buildings:

- RC for slab-on-grade multi-storey buildings, or buildings with unknown construction, were adopted from CRC CARE (2011) based on generic default assumptions for residential or commercial land use
- RC for low rise one to two storey slab-on-grade buildings were derived assuming these buildings would have lower rates of vapour entry.

The sensitivity analysis has considered the RC for each of these building types.

The sensitivity analysis has only been performed for volatile chemicals, because the depth to groundwater only affects the vapour inhalation pathway for these RC.

Sensitivity Analysis

The outcomes of the sensitivity analysis are detailed in **Table B1** to **Table B4** below and calculations are included at the end of this Appendix.

Table B1 Sensitivity Analysis – Groundwater RC for residential slab-on-grade low-rise building (mg/L)

Chemical	AECOM (2016) RC	RC (groundwater at 1 m bgl)
Naphthalene	2.7	2.4
Benzene	0.8	0.7
Toluene	>Sol	>Sol
Ethylbenzene	250 *	>Sol
Xylenes (total)	>Sol	>Sol

TPH >C12-C16 (Aliphatic)	>Sol	>Sol
TPH >C12-C16 (Aromatic)	>Sol	>Sol
Styrene	>Sol	>Sol

Notes: >Sol = calculated RC exceeds theoretical pure phase solubility limit

Table B4 Sensitivity Analysis – Groundwater RC for commercial slab-on-grade multi-storey building (mg/L)

Chemical	AECOM (2016) RC *	RC (groundwater at 1 m bgl)
Naphthalene	12	11
Benzene	5	4.8
Toluene	>Sol	>Sol
Ethylbenzene	>Sol	>Sol
Xylenes (total)	>Sol	>Sol
TPH C6-C8 (Aliphatic)	>Sol	>Sol
TPH >C8-C10 (Aliphatic)	4 (>Sol)	>Sol
TPH >C8-C10 (Aromatic)	190 (>Sol)	>Sol

Chemical	AECOM (2016) RC *	RC (groundwater at 1 m bgl)
TPH >C10-C12 (Aliphatic)	5 (>Sol)	>Sol
TPH >C10-C12 (Aromatic)	>Sol	>Sol
TPH >C12-C16 (Aliphatic)	6 (>Sol)	>Sol
TPH >C12-C16 (Aromatic)	>Sol	>Sol
Styrene	>Sol	>Sol

*Notes: * Source = CRC CARE (2011) Appendix F; >Sol = calculated RC exceeds theoretical pure phase solubility limit*

Conclusions

This sensitivity analysis identified that adopting a depth of 1 m to groundwater would change the RC by less than 20%. This is within the typical range of precision for environmental investigations due to field and laboratory precision and therefore not significant in terms of assessing potential risk. This is consistent with the reasoning adopted in the ASC NEPM 2013 which concluded that HILs did not require updating in 2013 if they varied by less than 20% based on updated assumptions.

Therefore, the AECOM (2016) groundwater RC are appropriate for ongoing assessment of potential human health risks which may arise from the land uses proposed in the Precinct Plan, including stadium construction, in all areas of the site where groundwater is present at 1 m bgl or deeper.

Appendix C
Updated RC Tables

Table C1 Residential Land Use RC for Soil (mg/kg)

Chemical	Potential Future Residents (slab-on-grade with unknown construction or multi-storey building) *	Potential Future Residents (low rise slab-on-grade)	Potential Future Residents (building with a basement car park)
Naphthalene	2.7	13	20
Benzene	0.5	0.5 *	0.5 *
Toluene	160	200	290
Ethylbenzene	57	81 (57)[1,2]	120 (24)[1,2]
Xylenes (total)	40	67	93
TPH C6-C8 (Aliphatic)	54	94	120
TPH >C8-C10 (Aliphatic)	88	88 *	88 * (24)[1,3]
TPH >C8-C10 (Aromatic)	12	27	36
TPH >C10-C12 (Aliphatic)	51	140	NL
TPH >C10-C12 (Aromatic)	25	130	170
TPH >C12-C16 (Aliphatic)	330	NL	NL
TPH >C12-C16 (Aromatic)	110	NL	NL

Notes:

** Source = CRC CARE (2011) Appendix F*

1. Previous adopted RC (AECOM, 2016)

*2. Ethylbenzene RC modified based on toxicity assessment (see **Section 5.4**)*

*3. TPH >C8-C10 (aliphatic) RC modified to CRC CARE (2011) HSL (see **Section 5.1**)*

NL = Not limiting. The calculated RC exceeds the theoretical soil saturation limit and therefore unacceptable risks via vapour inhalation will not occur.

Table C2 Commercial Land Use RC for Soil (mg/kg)

Chemical	Potential Future Commercial (slab-on-grade with unknown construction or multi-storey building) *	Potential Future Commercial/Light Industrial Workers (low-rise slab-on-grade)	Potential Future Commercial/Light Industrial Workers (Working within a basement car park)

Executive Summary

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of remediation at the Macquarie Point Site in Hobart, Tasmania (the Site).

As part of proposed development of Macquarie Point, staged excavation of up to ~191,123 m^3 of soil and rock (WSP, 2024) is proposed, consisting of a mixture of anthropogenic fill from historic land reclamation, estuarine sediments from the former river- and sea-bed, and dolerite (ranging from fresh to extremely weathered) bed rock. At the request of the Corporation, AECOM has conducted an *in situ* waste categorisation of the proposed Stage 1 and Stage 2 excavation area, which has involved:

- Review of historic environmental data for the Site.
- Advancement of 125 boreholes across the Stage 1 and Stage 2 excavation areas.
- Collection and laboratory analysis of 518 primary soil samples.
- Screening and assessment of soil data against the waste categorisation data presented in *Information Bulletin No. 105 – Classification and Management of Contaminated Soil for Disposal* (IB105) (EPA, 2018) and the Health Investigation Level (HIL) D – Commercial/Industrial Land use from the *National Environment Protection (Assessment of Site Contamination) Measure 1999* (as amended in 2013) (ASC NEPM).
- Preparation of this Soil Categorisation and Waste Management Plan to recommend disposal of this material following excavation.

Sampling design and statistical assessment of contaminant concentrations in assessed material was undertaken using *Industrial Waste Resource Guidelines 702 - Soil Sampling* (IWRG 702) (EPA Victoria, 2024), which provides statistical methodologies for assessment of large (>250 m^3) quantities of soil for disposal. While no equivalent guidelines have been issued by EPA Tasmania, the approach presented by IWRG 702, and an earlier version of this document (EPA Victoria, 2009), have been previously accepted by EPA Tasmania in assessments of soil from the Site for waste disposal.

A total soil volume of ~104,000 m^3 *in situ* (138,300 m^3 *ex situ* with a bulking factor of 1.33 applied [IWRG 702]) has been estimated to be within the area of soil assessed in this report. Based on results of assessment:

- The majority of the material assessed is categorised as Level 2 – Low Level Contaminated Soil, consisting of 93,900 m^3 (*in situ*) - 85,100 m^3 of anthropogenic fill and 8,800 m^3 of moderately to extremely weather dolerite.

  The Level 2 material is considered suitable for disposal to landfill, under the conditions detailed later in this document. It is noted that specific landfill site or sites have not yet been proposed as the ultimate destination for excavated Level 2 material. However, handling and disposal requirements for any disposal site have been identified and included in this assessment.
- 9,800 m^3 (*in situ*) of anthropogenic fill in three hot spots is considered to be potential Level 3 – Contaminated Soil or higher, and is recommended for *ex situ* assessment and potential remediation following excavation.
- An estimated 327 m^3 (*in situ*) of fresh to mildly weathered dolerite in the proposed Stage 1 and Stage 2 excavation area is categorised as Level 1 – Fill Material, Type 1.

Field Assessment and Sample Analysis

Field work conducted as part of this assessment, completed between 25 November and 11 December 2024, was conducted in accordance with the methodology proposed in *Stadium Footprint In Situ Soil Characterisation – Sampling, Analysis and Quality Plan* (the SAQP) (AECOM, 2024a), and consisted of:

- Advancement of boreholes in a 20 x 20 m grid across the Stage 1 and Stage 2 excavation areas. Some minor deviations from grid occurred due to accessibility at some locations.

- Boreholes were advanced to a target depth below the proposed depth of excavation (2.4 m below ground level [bgl]), based on Site surface surveys conducted in 2024.
- Soil samples were collected every 0.5 m, or if a change in lithology or feature of interest was noted by field staff, and analysed as follows:
  - 168 soil samples (33% of total) were assessed for total contaminant concentration (TCC) of all Chemicals of Potential Concern (CoPC) listed on Table 2 of IB105, excluding tributyltin (TBT), which has not been detected on the Site as part of previous investigations.
  - 350 soil samples (67% of total) were assessed for TCC of targeted CoPC selected based on previous soil investigations and historical Site uses, consisting of benzene, toluene, ethylbenzene, xylenes and naphthalene (BTEXN), total petroleum hydrocarbons (TPH), lead, arsenic and polycyclic aromatic hydrocarbons (PAH).
  - 179 samples (35% of total) were additionally analysed for leachate contaminant concentration (LCC) of metals (primarily lead, but also including mercury, arsenic, cadmium, chromium and/or zinc) and/or PAHs, based on TCC concentrations.
- Key observations recorded during borehole advancement were:
  - Anthropogenic material (such as fragments of brick, metal, plastic, glass, wood, bitumen, ceramics, concrete and coal noted in various locations) were noted in anthropogenic fill at the surface to between 1 and >3.5 m bgl, and is considered likely to be the material introduced to the Site during progressive historical land reclamation events.
  - Odours and elevated vapour levels (recorded by photo-ionisation detector [PID]) were detected in locations in the former gasworks area, and are attributed to gasworks operations, and in one location (~3 m bgl in H10) close the water table, and is attributed to groundwater fluctuation.
  - One fragment of Asbestos Containing Material (ACM) was observed at 0.5 m bgl in borehole E13. The ACM was non-friable and no asbestos fibres were detectable at the Limit of Reporting (LOR) of 0.01%$^{w}/_{w}$ in the soil surrounding the fragment.
- No samples were collected from fresh or slightly weathered dolerite, as the low hydraulic conductivity of dolerite limits any potential penetration of contamination into the rock mass.

Sampling density, spacing, and analytical suites are considered suitable for assessment and interpretation, based on applicable standard and guidance documents.

Based on the depth of boreholes and the surface area assessed, the following *in situ* volumes have been estimated as included in the volume sampled for this assessment:

- Anthropogenic fill – 94,900 m^3
- Weathered dolerite – 8,800 m^3

It is noted that the estimated *in situ* volume assessed has minor variations from the earlier modelling of the excavation area (WSP, 2024), which is considered to be due to a variation in the area assessed as “Stage 1” of excavation, where the area assessed in this report includes a strip of land to the north, previously considered part of the “Balance of the Site” in earlier modelling, and on natural minor differences which may arise from different calculation methods.

Assessment of fresh or slightly weathered dolerite has also been conducted, based on a modelled volume of 327 m^3 (WSP, 2024).

Soil Assessment

Waste classification of soil has been conducted with reference to the total contaminant concentration (TCC) and leachate contaminant concentration (LCC) criteria provided on Table 2 of IB105.

Exceedances of the IB105 Level 1 TCC criteria were detected for TPH C10-C36, metals (arsenic, barium, beryllium, cadmium, chromium (VI and total), copper, lead, mercury, silver, tin, and/or zinc), fluoride, and/or PAHS (benzo(a)pyrene or sum of PAHs), which were detected in multiple locations

within the anthropogenic fill, and it is considered that this material should be categorised as Level 2 at a minimum based on these results.

Table E1 summarises assessment of exceedances of the IB105 Level 2 (or higher) criteria in the material proposed for excavation

Table E1 Summary of Soil Waste Categorisation – Level 2 or Higher

Lithology	Volume (*in situ*)		IB105 Category
Anthropogenic Fill	9,800 m^3	Soil with potentially higher levels of contamination, which is recommended for *ex situ* sampling and further investigation following excavation, has been identified: • ~7,000 m^3 proposed to be excavated from the former gasworks footprint in the south-west corner of the proposed excavation (grid references E15-E16, F15-16, G15-G18 and H15-H18). • ~1,300 m^3, to be excavated to an average of approximately 2.5 m bgl in an 18 m radius around sample point J06, noting that only approximately half of this hotspot is within the proposed Stage 1 and Stage 2 excavation area. • ~1,500 m^3, to be excavated to approximately 1.5 m bgl in an 18 m radius around sample point M13.	Level 3 or higher – further assessment recommended.
Anthropogenic Fill	85,100 m^3	Concentrations of TPH C10-C36, metals (arsenic, cadmium, chromium (total), lead, tin, and zinc) and PAHs (benzo(a)pyrene and Sum of PAHs) were detected above the Level 2 criteria in some samples for this volume. However, following calculation of 95% upper confidence limits (95% UCLs) for these CoPC: • 95% UCL TCC of TPH C10-C36, metals (arsenic, cadmium, chromium (total), tin and zinc) are below the Level 1 TCC criteria. • 95% UCL TCC and LCC of lead are below the Level 2 TCC criteria. • 95%UCL TCC of benzo(a)pyrene and Sum of PAHs in excess of the Level 2 TCC criteria. However, the 95% UCL LCC for these CoPC are below the Level 2 LCC criteria, which has been used to determine waste category.	Level 2 – Low Level Contaminated Soil
Weathered (moderately to extremely) Dolerite	8,800 m^3	• Copper and manganese were detected above the Level 1 TCC criteria. These CoPC are considered likely to be natural constituents of the dolerite. • Benzo(a)pyrene and Sum of PAHs were detected above the Level 2 TCC criteria. However, 95%UCL TCC of these CoPC were below the Level	Level 2 – Low Level Contaminated Soil

Lithology	Volume (*in situ*)		IB105 Category
		criteria, and LCC of benzo(a)pyrene and benzo(a)pyrene TEQ(LOR) were below the Level 2 LCC criteria, and as recommended in IB105, LCC will be used as sole determinant of waste category.	

In addition:

- Modelling of the excavation area (WSP, 2024) estimated 327 m^3 of fresh to weathered dolerite, forming natural bedrock below the Site, is within the volume proposed for Stage 1 and State 2 of excavation.

  While not sampled as part of this assessment, the low conductivity of the dolerite limits potential penetration of contamination into the rock interior. Small amounts of contaminated soil (i.e., fill material which has settled into fractures within the dolerite, or contamination transported by surface water running over the dolerite surface) may be present, however any such volumes would consist of only a small overall portion of the volume to be removed, and are not considered to likely represent overall contamination of the material when excavated.

- Two areas of possible Potential Acid Sulfate Soil (PASS) (BH-004 and ABH-004) have been identified within the proposed excavation area in an acid soil investigation (AECOM, 2025a). Further investigation to assess if PASS is present, and, if so, what management requirements will be required for safe excavation and neutralisation, are planned and will be completed prior to excavation.

- As part of assessment of soil for off-Site disposal to landfill, potential environmental risks to landfill workers while handling and placing the soil were assessed against the ASC NEPM HIL-D criteria for commercial/industrial land use. While exceedances of the HIL-D criteria for lead and benzo(a)pyrene TEQ TCC were reported in some samples in anthropogenic fill, these exceedances are not considered represent a risk of environmental harm at the proposed disposal site under the conditions considered (presented in recommendations below) as:

  - Benzo(a)pyrene TEQ and lead present a risk via physical contact (ingestion/inhalation). The proposed disposal methodology includes controls to limit contact with soil/dust during handing of the material (via use of Personal Protective Equipment (PPE), soil handing and enclosed equipment) and as part of long term management (via cover material to limit contact with the soil).
  - The HIL-D criteria contain an assumption of up to one hour per day of contact with soil over a 30 year period, which is considered conservative and unlikely to occur under the proposed disposal methodology, as no contact with the soil is considered likely to occur once placed and covered.
  - 95% UCL concentrations of the CoPC were below the adopted ASC NEPM HIL-D criteria, and exceedances of criteria are likely limited throughout the material. The small areas of exceedance are not considered to be representative of the overall condition or expected exposure of the soil during handling and disposal.

Recommendations

Based on the assessment provided in this report, it is recommended that the following additional works be conducted during or prior to excavation:

- Anthropogenic fill at the following locations is considered to potentially be Level 3 or higher, and should be resampled and assessed *ex situ* following excavation:

- ~7,000 m^3 proposed to be excavated from the former gasworks footprint in the south-west corner of the proposed excavation (grid references E15-E16, F15-16, G15-G18 and H15-H18).
- ~1,300 m^3, to be excavated to an average of approximately 2.5 m bgl in an 18 m radius around sample point J06, noting that only approximately half of this hotspot is within the proposed Stage 1 and Stage 2 excavation area.
- ~1,500 m^3, to be excavated to approximately 1.5 m bgl in an 18 m radius around sample point M13.

Results of the *ex situ* investigation should be assessed and a separate waste management assessment for disposal or remediation be prepared for soil from these areas.

- Planned additional investigation to determine if PASS is present in anthropogenic fill in two locations (BH-004 and ABH-004) must be completed prior to excavation. If PASS is present, an Acid Sulfate Soil Management Plan for excavation of these areas must be prepared detailing handling and neutralisation measures, with reference to the *Tasmanian Acid Sulfate Soil Management Guidelines* (DPIPWE, 2009), which must be implemented to allow safe handling and disposal of this material.
- During excavation, any areas of potential elevated contamination (such as odours, staining, or high concentrations of anthropogenic material), and any bulk buried materials or infrastructure encountered (such as buried slabs or pipes) must be noted and segregated for further *ex situ* assessment, similar to the areas of potential elevated contamination noted above.

Following excavation, it is recommended that 93,900 m^3 of Level 2 – Low Level Contaminated Soil, consisting of anthropogenic fill and weathered dolerite, and any fresh to mildly weathered dolerite removed from the Stage 1 and Stage 2 excavation areas must be disposed of using the following methods:

- Any excavation or handling of soil should be conducted in accordance with the Site Environment Management Plan (the SEMP) (AECOM, 2024a), or any future updates of the SEMP.
- Beneficial on-Site re-use: – Any on-Site beneficial re-use of soil should meet the following criteria:
  - Soil must be categorised as either Level 1 – Fill, or Level 2 – Low Level Contaminated Soil, in accordance with IB105.
  - Contaminant concentrations in the soil must not represent an environmental risk to human or ecological health on the Site or in surrounding areas under the proposed re-use scenario. Potential environmental risks must be assessed with reference to the Site specific Remediation Criteria (AECOM, 2025b).
  - Re-use must be undertaken in such a way to prevent environmental nuisance or harm from escape of materials, spillage, or emission of dust or odours.
  - All soil must be handed in accordance with practices presented within the Site Environment Management Plan (the SEMP) (AECOM, 2024a).

  Any on-Site re-use scenario must be presented to an independent Environmental Auditor, as accredited by Section 39F(3) of the *Macquarie Point Development Corporation Act 2012*, for review and endorsement.

  If the on-Site beneficial re-use is endorsed by the Environmental Auditor, re-use will proceed, and a record of the re-use scenario, including the volume and characteristics of the soil, the location of re-use, the assessment of environmental risks and mitigations, and the Auditor's endorsement must be provided to EPA no later than one year after re-use has occurred.
- Off-Site disposal to landfill under the following conditions:
  - The excavated material will be transported off-Site by a contractor on behalf of the Corporation or the receiving Site. Reasonable precautions will be undertaken to ensure that no environmental or human health harm results from the movement of potentially contaminated materials between the sites. All truckloads will be tracked.

- Material will be immediately disposed of using an enclosed excavator or other mechanical methods. No manual works outside the machine are to be planned as part of the soil placement.
- The receiving landfill will have developed a Safe Work Method Statement (SWMS) for the placement of the soil which will include handling measures and PPE requirements. The minimum PPE requirements for the work are gloves, long sleeves and pants, eye protection and face mask, and will include procedures (such as washing of hands before eating, drinking, or smoking to remove any material) to reduce any potential exposure by receiving site staff while handling and placing material.
- The receiving site will have mitigation methods to prevent dust generation during soil placement or long term.
- The areas of disposal will be remote from members of the public or any staff outside excavators/machines.
- The area of disposal must be unsaturated (i.e., above the water table).
- The material will not be stored by the receiving site prior to use.
- No further excavation or disturbance of the area of use will take place following import of the material.
- The receiving site will have an EPA certified leachate capture and treatment system. Leachate from the area of reuse will be captured in a silt trap/holding basin prior to discharge to sewer.

Approval from EPA is required prior to the disposal of any material, and all material must be transported off Site by an appropriately licensed waste transporter. It is noted that the receiving site is still to be determined by the Corporation, and will need to be nominated, and compliance to the terms above received, prior to disposal, and any additional requirements (i.e., which may arise from the licence conditions at the receiving Site) or changes in handling and disposal methodology will require review and may require amendment of any disposal approvals.

Assessment of soil waste categories and suitability for proposed disposal routes has been undertaken as a statistical assessment of the entire volume of soil proposed for excavation. In the event that an alternative disposal methodology or Site be proposed, or further treatment required, this Waste Management Plan should be updated to separately assess each volume of soil proposed for different disposal methods, or a new plan be prepared, by a suitably experienced environmental practitioner.

1.0 Introduction

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of remediation at the Macquarie Point Site in Hobart, Tasmania (the Site). The Site location is shown on **Figure F1**, in the **Figures** section.

The redevelopment of Macquarie Point aims to restore and energise a Site that has long been associated with industrial, freight and rail use into a significant hub for the people of Hobart. In August 2024, the Corporation released the latest design concepts for the Macquarie Point Precinct within the *Mac Point Final Precinct Plan* (the Precinct Plan) (MPDC, 2024). To facilitate the Precinct Plan, excavation of soil is required to prepare the Site for proposed future development, and is currently planned to be conducted in three stages, Stage 1 to Stage 3, shown on **Figure 1** below.

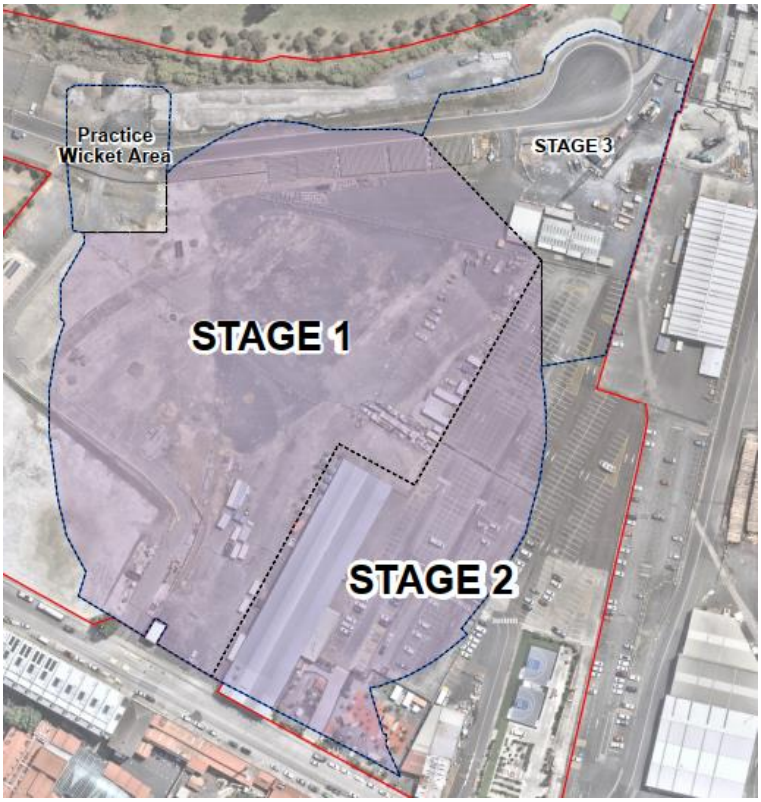

Figure 1: Proposed Bulk Excavation Stages

At the request of the Corporation, AECOM has conducted sampling in the Stage 1 and Stage 2 excavation areas to assess and characterise the unsaturated soil, consisting of anthropogenic fill, weathered dolerite, and fresh dolerite, to be excavated for future removal from Site and disposal. This Soil Characterisation and Waste Management Plan has been prepared to provide the outcomes of this investigation.

1.1 Background

Previous environmental investigations at the Site have identified environmental impacts resulting from historical activities undertaken on and in proximity to the Site, including land reclamation, locomotive maintenance and refuelling, bulk fuel and oil storage and transfer, and the former Hobart Gasworks.

Contaminated soil has been identified in previous investigations and has been assessed as being between waste categories Level 1 – Fill Material, and Level 4 – Contaminated Soil Requiring Remediation, in accordance with the Tasmanian guidelines, regulations and legislation relating to soil waste, including the *Environmental Management and Pollution Control Act 1994* (the EMPCA), the *Environmental Management and Pollution Control (Waste Management) Regulations 2020* (the

Regulations) and EPA Tasmania *Information Bulletin No. 105 - Classification and Management of Contaminated Soil for Disposal* (IB105) (EPA, 2018).

Based on the Site history and previous investigations, and in accordance with the Site Environment Management Plan (the SEMP) (AECOM, 2024a), which directs environmental management procedures at the Site, all soil excavated from the Site should be considered potentially contaminated and requires assessment prior to removal and reuse or disposal.

1.2 Objectives

The objectives of this report are to:

- Record the outcomes of the field investigation in the Stage 1 and Stage 2 excavation areas conducted between 25 November and 11 December 2024.
- Assess and characterise the waste category of unsaturated soil within the Stage 1 and Stage 2 excavation areas in accordance with EPA Tasmania IB105.
- Assess the potential for excavated unsaturated soil (fill and dolerite) to be disposed off-Site to landfill.

It is intended that this document can act as a Waste Management Plan for the off-Site disposal or reuse of the soil material in accordance with Section 3 and Section 5 of IB105. *In situ c*ategorisation has been undertaken to assist in reducing the time and costs associated with bulk excavation to allow material to be excavated and transferred to the receiving waste site without stockpiling and sampling on-Site.

Review and approval from the Environment Protection Authority (EPA) of Tasmania is required prior to any disposal of soil.

1.3 Scope of Work

The following scope of work has been undertaken by AECOM:

- Advancement, and collection of soil samples, from 125 bore holes within a gridded pattern, shown on **Figure F2**, in the Stage 1 and Stage 2 excavation areas.
- Review and screening of sample results from bore hole works and historical sample results against the adopted criteria (described in **Section 5.0**) to determine the waste category of soil and assess potential disposal options
- Preparation of this Soil Categorisation and Waste Management Plan.

The methodology and assessment criteria adopted were defined in the *Stadium Footprint In Situ Soil Characterisation – Sampling, Analysis and Quality Plan* (SAQP; AECOM, 2024b).

2.0 Site Details

The Site details are provided in **Table 1** below.

Table 1 Site Details

Item	Description
Site Identification	Macquarie Point.
Site Address	41 Evans Street, Hobart, Tasmania.
Site Area	Approximately 9.3 ha.
Site Layout	**Figure F2**
Current Site Owners	State of Tasmania (Crown Land).
Title Details	Land title 179192/1 (also recorded as 45404/1), 179192/2, 179192/3, 179192/4 (formerly 113521/1, formerly CT 114462/1) and land title 129483/6 cover the overall Site.
Current Zoning	The *Sullivans Cove Planning Scheme 1997* [amended on 10 May 2023] (HCC, 2023) notes that the Site falls within the *Sullivans Cove 'Gateway & Transport'/Activity Area 3.0 (Macquarie Point Mixed Use Zone)* and is subject to the following three use areas as per Clause 32.5 under Part F of the Scheme: • Arts and Institutional Area • Mixed Use Area (including residential) • Open Space Area. It is noted that the *Macquarie Point Development Corporation Amendment Bill 2018* passed the parliament in November 2018. The Bill allows the Corporation to update the vision for the Site.
Current Uses	The following is noted with regard to Site use and features: • The majority of the Site is currently vacant and is covered with a combination of asphalt, concrete and gravel surfacing, as well as backfill and clean fill material from previous soil remediation works. Portions of the north, west and south-east of the Site are currently in use for remediation activities, including stockpiling of excavated materials. • The remnant concrete slab associated with the former SeaRoads Shed is being used for temporary storage of the plantings of the former Edible Precinct (in planter boxes) and for two basketball half-courts. • The Corporation's office building is located in 8A Evans Street on the western boundary of the Site. • The Goods Shed was previously used by the Corporation as office space, and is subject to intermittent uses including public events. • The "Red Shed", located in the south eastern portion of Macquarie Point, is currently used by a microbrewer and includes a public bar. • Small retail outlets are located in the area adjacent to the Red Shed (Red Square) which is also used for markets, music and other outdoor events with food vans. • A public carpark is present in the south-eastern and eastern portion of the Site.

Item	Description
	• Public events including markets and concerts have intermittently occurred at the Site. • A range of short-term tenants (6 – 12 months) utilise the western and central portions of the Site to support local construction activities, including a lease by the Tasmanian Water and Sewage Corporation (TasWater) during construction of a Sewage Pumping Station (SPS) off-Site to the east. • An access road (the Northern Vehicular Access) is located in the northern section of the Site. • Access stairs to the adjacent Hobart Cenotaph are present in the northwest corner of the Site
Future Land Uses	The current development plans for the Site are proposed to revitalise the Macquarie Point Precinct with a mix of uses, as detailed within the *Mac Point Final Precinct Plan* (the Precinct Plan) (MPDC, 2024), which includes (but is not limited to): • Retail and Port Commercial. • Residential Development and Public Foreshore. • Multipurpose Stadium. • Transport/ Vehicle Access.
Closest Surface Water Body(s)	• Sullivans Cove, approximately 170 m to the south • River Derwent, approximately 350 m southeast (inferred direction of groundwater flow) and 25 m to the northeast.
Site Geology	The Site is underlain by a combination of reclaimed land, Quaternary aged sediments and Dolerite of Jurassic age. Micaceous quartz sandstone and white felspathic sandstone and micaceous mudstone of Triassic age are located to the north and west of the Site. *Tasmanian Department of Resources and Energy Engineering Geology Greater Hobart Area, Map 1 (1990)*
Site Hydrogeology	The Site is underlain by a single aquifer unit extending to greater than 25 m below ground level (bgl). Groundwater beneath the Site is generally encountered in anthropogenic fill material, extending into the underlying natural estuarine sediments and fractured dolerite bedrock.

3.0 Assessment Approach

The following considerations was given when planning this investigation in the SAQP (AECOM, 2024b), prior to work commencing, and during sampling and assessment of results.

3.1 Chemicals of Potential Concern (CoPC)

Based on available Site history and uses, previous investigations has been conducted on eight sub-areas, shown on **Figure F2** in the **Figures** section, located across the Site and off-Site at Regatta Point, a parcel of land to the north which is currently undergoing land transfer to the control of the Corporation.

The proposed extents of the Stage 1 and Stage 2 excavation includes land within the Escarpment, the Goods Shed and Yard, the Promenade and Underground Carpark, the Precinct North, the Precinct South, and the Gateway areas.

Table 2, below, summarises the CoPC identified for these areas, based on historic land uses. While previous remediation has been conducted to remove areas of known contamination associated with these CoPC within the Bulk Excavation Area (BEE), the potential exists for them to be present within other areas of Site soil.

Table 2 CoPC

Assessment Areas and Potential Contaminating Activity	CoPC
The Escarpment • Locomotive refuelling • Railway maintenance • Fuel transfer infrastructure • Concrete batching plant	• TPH, BTEXN, PAHs, phenolic compounds, chlorinated solvents, metals[1], phosphorus, sulphur, ACM, SVOC, VOC, OCPs
Goods Shed and Yard • Freight storage and handling • Vehicle maintenance • Fuel storage and handling	• TPHs, BTEXN, PAHs, phenolic compounds, chlorinated solvents
The Promenade and Underground carpark • Locomotive refuelling and maintenance • Freight storage and handling	• TPHs, BTEXN, PAHs, phenolic compounds, chlorinated solvents, metals[1], ACM
The Precinct North • Freight storage and handling	• TPHs, BTEX, PAHs, phenolic compounds, chlorinated solvents, metals[1], SVOC, VOC
The Precinct South • Freight storage and handling	• TPHs, BTEX, PAHs, phenolic compounds, chlorinated solvents, metals[1], SVOC, VOC
The Gateway • Former Hobart Gasworks • Locomotive refuelling • Railway maintenance	• TPHs, BTEX, PAHs , phenols, metals[1], chlorinated solvents, phosphorus, sulphur, ACM, complex cyanides, free cyanides

Notes: TPH – Total Petroleum Hydrocarbons; TRH – Total Recoverable Hydrocarbons; PAH - Polycyclic aromatic Hydrocarbons; BTEXN – Benzene, Toluene, Ethylbenzene, Xylenes, Naphthalene; ACM – Asbestos containing material, SVOC – Semi-Volatile Organic Compounds; VOC - Volatile Organic Compounds; OCPs – Organochlorine Pesticides; 1 – arsenic, chromium, manganese, aluminium, cadmium, chromium, copper, lead, nickel, and zinc.

It is also noted that Potential Acid Sulfate Soil (PASS) has been detected beneath the Site and assessed in *Acid Sulfate Soil Investigation* (AECOM, 2025a), and is discussed with reference to the proposed excavation in **Section 7.5.1.1.1**.

3.2 Previous Soil Data

Soil data has been collected from across the areas intended for excavation as part of previous environmental investigations at the Site. While these samples were not specifically targeting the

excavation areas, or intended to be used for soil waste categorisation, it is considered appropriate to use them as additional data points and to support waste categorisation assessed, as:

- The data reviewed was obtained within the past 10 years, and collected using suitable sampling methodologies consistent with applicable guidance documents and practices.
- Samples were assessed for the applicable Site CoPC, based on identified historic uses and contaminants of the excavation area, which may be present in concentrations which would indicate a higher waste category.
- Samples were obtained from within the proposed excavation area, with inclusion of a 10 m buffer, within unsaturated soil.
- Sample locations have not been excavated and the soil removed from the Site.

The review identified 405 soil samples from within the excavation area which are appropriate for consideration as part of this assessment. The locations of previous soil sampling is shown on **Figure F5**, and analytical data collected is presented in attached **Table T6**.

Assessment of soil data from prior investigations reported exceedances of the IB105 Level 2 criteria for:

- Metals (arsenic, lead).
- TPH (C10-C36 fraction). It is noted that detected exceedances of criteria in soil remaining on Site have only been reported in samples collected from below the water table, and may be influenced by groundwater impacts.
- PAHs (benzo(a)pyrene, Sum of PAHs).
- Cyanide.

For exceedances of the Level 2 criteria noted:

- No exceedances of Level 2 criteria were detected in the Practice Wicket Area.
- While limited exceedances of lead and arsenic were detected, these metals (particularly lead) have been key soil CoPC for earlier soil remediation programs at the Site.
- TPH exceedances were typically below or close to the water table, near known Light Non-Aqueous Phase Liquid (LNAPL) plumes, which will not be removed by excavation, and are considered likely to be due to groundwater impacts. This included all exceedances of the Level 3 criteria, with the exception of:
    - RHTP_07_BASE_1.3-1.3, which was collected from a thin (~2 mm) layer of grease-impacted soil beneath a geofabric layer at the base of a buried service pit associated with former rail operations. The small volume of soil in this pit would be removed with the service pit and is not considered to affect overall waste classification.
    - BH127/0.5, in the footprint of the Underground Carpark area. This soil is not included in assessment of the Stage 1 and Stage 2 soil excavation, and management or disposal assessment of this area will be undertaken as part of future work.
- Multiple locations reported benzo(a)pyrene concentrations above the Level 2 criteria, and Sum of PAH concentrations above the Level 2 or Level 4 criteria, and these are considered key CoPC for soil assessment.
- Only one sample reported an exceedance of the Level 2 criteria for cyanide, BH116/3 in the Stage 1 and Stage 2 excavation area. Soil at this location is deeper than the proposed extent of excavation, which is 1.5 m in this area, and is delineated vertically at 1 m bgl (within the proposed excavation volume) and 3.5 m bgl. As other assessments for cyanide were below the laboratory limit of reporting (LOR) in 90 locations, below Level 1 in 15 locations, and below Level 2 in two locations, cyanide is not considered a key CoPC for soil assessment.

3.3 Analytical Suites

Based on the CoPC identified from historical land uses discussed in **Section 3.1**, and results of previous investigations of soil at the Site (**Section 3.2**), the following analytical suites and frequency were selected in the SAQP for soil assessment:

- A minimum of 30% of primary soil samples were to be analysed for total contaminant concentrations (TCC) of the full suite of chemical listed on Table 2 of IB105, excluding tributyltin (TBT).
- The remaining primary soil samples were to be analysed for a targeted suite consisting of TCC of:
  - BTEXN
  - TPH C6-C40
  - Metals (lead and arsenic)
  - PAHs.
- Based on TCC results, targeted analysis for leachate contaminant concentration (LCC) would be conducted using Toxicity Characteristic Leaching Procedure (TCLP).

The selected suites and densities were based on:

- While IB105 does not require analysis for all chemicals for which criteria are provided (on Table 2 of IB105), based on the long industrial history of the Site and varied potentially contaminating uses, assessment of a subset (30%) of samples for a broad suite of chemicals is considered appropriate and conservative.

  TBT was excluded as it has not been identified as a CoPC for any previous Site uses and has not been detected in previous soil sampling programs.
- The targeted CoPC analysed in the majority of samples are based on previous soil stockpiles removed from Site and assessment of previous Site soil data (attached as **Table T6**), where these CoPC have been detected in excess of the Level 2 – Low Level Contaminated Soil criteria within IB105.
- Section 2.2.4 of IB105 notes that, where a leachable concentration is prescribed in IB105, it generally takes precedence over the total concentration and will be used as at sole determinant of final classification for disposal. It is noted that the TCC has been considered when assessing disposal options and suitability of the proposed receiving site, however.
- Two other potential soil considerations mentioned in IB105 are Acid Sulfate Soil (ASS) and Per- and Poly-Fluoroalkyl Substances (PFAS).
  - ASS has been assessed in a separate investigation and is discussed in **Section 7.5.1.1.1**.
  - No records of any historic use or storage of PFAS on the Site have been located, and activities which have occurred on Site and may generally be associated with PFAS (i.e., fire prevention systems for bulk fuel storage), were completed in the 1970s, which predates widespread adoption of PFAS in Australia.

    Previous soil samples from the Site collected and analysed for PFAS between 2015 and 2017 were non-detect for locations within the proposed excavation area (see **Table T7** and **Figure F7**). Detectable concentrations of perfluorooctane sulfonic acid (PFOS) were present in soil along the eastern boundary of the Site (outside the proposed excavation) (AECOM, 2024c), and may be associated with historic off-Site bulk fuel storage. However, the highest reported concentration of PFOS in Site soil, 0.0132 mg/kg at 1.1 m bgl in soil bore BH70, is:
    - Three orders of magnitude below the unlined landfill acceptance criteria provided in the *PFAS National Environmental Plan* (the PFAS NEMP) (HEPA, 2025), which is the most conservative landfill criteria presented in the PFAS NEMP.
    - Outside the proposed area of excavation considered in this report.
    - Delineated into the excavation area by bores BH61 and BH67.

Within the proposed excavation area, the highest detected concentration of PFOS was 0.002 mg/kg at 2.0 to 2.1 m bgl, in bore TW02 to the north. This detected concentration is 4 orders of magnitude below the unfilled landfill acceptance criteria in the PFAS NEMP (HEPA, 2025)

All data related to PFAS in soil at the Site (inside and outside the excavation area) is attached on **Table T7**, **Appendix B**. Locations of previous PFAS soil sampling results are presented on **Figure F7**, **Appendix A**.

On this basis, ASS or PFAS are not considered CoPC in the soil proposed for excavation, and no analysis for these compounds was considered required for categorisation of bulk soil.

- Asbestos Containing Material (ACM) has been identified in previous soil investigations (AECOM 2021b) and during remediation works at the Site to remove soil and remnant pipelines (AECOM 2020).

  The ACM in pipe cladding was intact and removed with the pipe, as was surrounding soil, and disposed off-Site. The area where pipelines with ACM cladding were removed were inspected and certified by an asbestos hygienist as part of validation of remediation.

  Fragments of ACM, similar to the fragment observed in this investigation and discussed in **Section 7.5**, have been observed in four locations during previous assessments. In each case, the fragment has been small (<5 cm) and isolated, and consisted bonded, non-friable ACM, and no risk from ACM or of potential impact from soil has been identified.

  The SEMP (AECOM, 2024a) contains procedures for excavation and handling soil, including for management of any observed ACM or asbestos. In the event that potential ACM is observed in soil, all activities are to cease immediately in the immediate work area. A suitably experienced environmental practitioner should be consulted to provide advice regarding the removal and management of ACM in soils prior to works re-commencing.

  Any work plans or procedures for excavation of soil from the Site will be required to conform to the SEMP and will contain this procedure.

3.4 Extent of Excavation and Soil Volume for Disposal

A model of the proposed volume of excavation was developed by WSP using *LeapFrog Works*® (WPS, 2024). The model utilised available surface elevation data, groundwater monitoring survey data, and geological descriptions which had been recorded in bore logs from previous soil investigations at the Site, and divided the excavation into three stages:

- Stage 1 and Stage 2: Proposed to be excavated to a depth of 2.4 m Australian Height Datum (m AHD). The edge of the excavation will be benched or sloped in order to allow safe access and maintain excavation stability, assumed within the model to have a slope of 2 units horizontal for every 1 unit of vertical drop.
- Stage 3 will consist of two areas:
  - Basement Carpark, located to the north-east, which was modelled for excavation to a depth of - 3.9 m AHD, which is anticipated to be below the water table. A vertical excavation extent was assumed in the model for this area for excavation stability and where it meets the Site boundary to the east.

    It is noted that design of the proposed Basement Carpark has not been finalised and may be modified prior to development.
  - The ‘Balance of Site’ area, located to the north-west, which includes the practice wicket area and an area north of Stage 1, Stage 2, and the Basement Carpark. The practice wicket area is proposed to be excavated to a depth of 4.2 m AHD.

The model estimated that 191,123 m^3 of *in situ* material is identified for excavation, as summarised in **Table 3** and presented on **Figure 2** below.

Table 3 Summary of *In Situ* Soil Volume Estimates (WSP 2024, Table 3)

Geotechnical Unit	Stage 1 (m^3)	Stage 2 (m^3)	Basement Car Park (m^3)	Balance of Site (m^3)	Total (m^3)
Anthropological Fill	73,695	20,150	47,556	6,979	148,380
Estuarine Sediments	0	0	6,915	0	6,915
Dolerite (Extremely Weathered)	191	0	55	419	665
Dolerite (Moderately Weathered)	8,085	0	14,165	7,638	29,888
Dolerite (Slightly Weathered to Fresh)	327	0	4,181	767	5,275
TOTAL	**82,298**	**20,150**	**72,872**	**15,803**	**191,123**

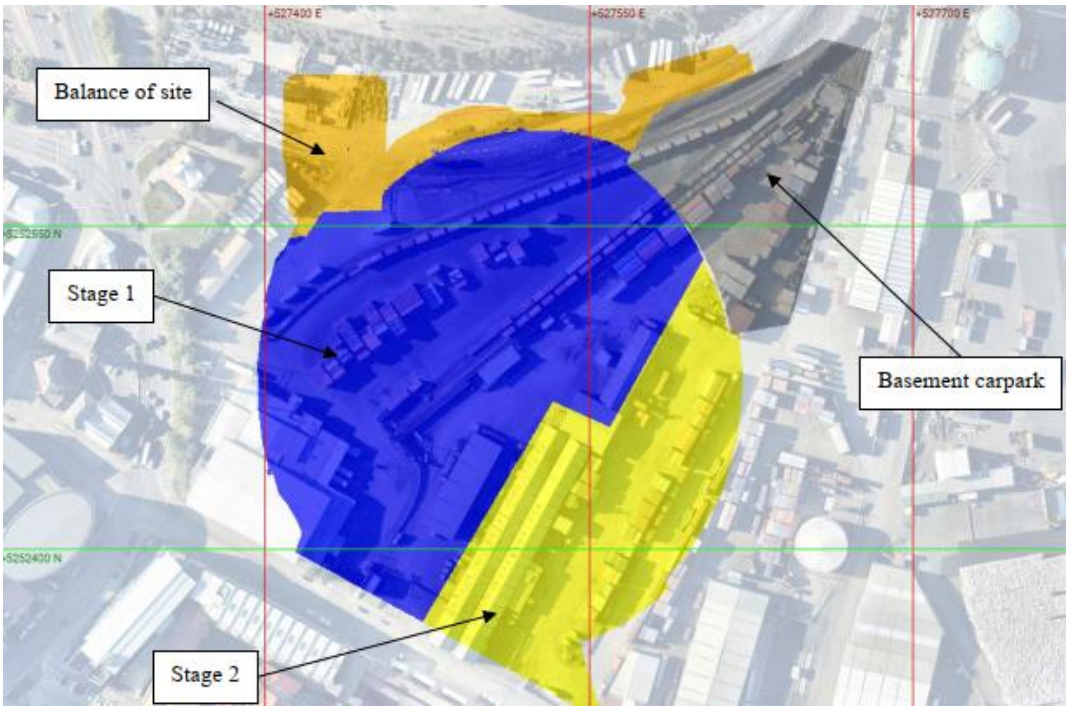

Figure 2 Proposed extent of *in situ* classification assessment area (WSP 2024)

Assessment of the volume of soil assessed by this investigation, including consideration of volume changes which may occur during excavation, is provided in **Section 7.2** It is noted that the proposed staging of excavations used in WSP (2024) modelling, as shown on **Figure 2** and summarised on **Table 3,** has been modified slightly (see **Figure 1**), with the eastern portion of the "Balance of Site" area now included in the Stage 1 excavation.

3.5 Sample Density and Distribution

IB105 notes that, in the event *in situ* classification of soil is conducted, AS4482.1 should be consulted to obtain a representative number of samples. Table E1 in Appendix E of AS4482.1 suggests that the minimum of 55 sample points using a square grid are required to characterise an area of 5.0 ha, and that sites greater than this area should be subdivided into smaller areas. The proposed excavation extent is approximately 5.8 ha, and a greater number of sample points was required.

The SAQP (AECOM, 2024b) divided the proposed excavation area in three zones based on staging and proposed excavation depth, consisting of the Stage 1 and Stage 2 (4.7 ha), the Basement Car Park (0.8 ha) and the Practice Wickets (0.3 ha), shown on **Figure F2** in the **Figures** section. Based on these

areas, and with reference to Table E1 in Appendix E of AS4482.1, the following minimum number of sample points were required for each excavation zone:

- Stage 1 / Stage 2 – 55 sample points
- Basement Carpark – 19 sample points
- Practise Wickets – 9 sample points

IB105 also recommends a sample density of 1 sample per 25 m^3 of material for soil classification purposes. Sampling at this density was not considered practicable as, based on the estimated in situ soil volume in the WSP model, a minimum of 7,644 samples would be required to categorise the soil, without accounting for any changes in density and volume due to loss of compaction during excavation.

Industrial Waste Resource Guidelines 702 - Soil Sampling (IWRG 702) (EPA Victoria, 2024) provides statistical methodologies for assessment of large (>250 m^3) quantities of soil for disposal. While no equivalent guidelines have been issued by EPA Tasmania, the approach presented by IWRG 702, and an earlier version of this document (EPA Victoria, 2009), have been previously accepted by EPA Tasmania in assessments of soil from the Site for waste disposal.

For volumes greater than 250 m^3, IWRG 702 requires sampling at a minimum density of one primary sample per 250 m^3 of soil, combined with statistical assessment using 95% Upper Confidence Limits (95% UCL), to assess soil volumes for disposal. IWRG 702 also recommends a bulking factor of 1.33 be applied to *in situ* volumes to assess volume of soil when excavated.

Based on this approach, the SAQP proposed that:

- Sample points be aligned on a 20 x 20 m grid, allowing for minor variations for surface features or access limitations. This sample point frequency exceeds the minimum numbers provided in AS4482.1.
- Samples be collected at 0.5 m bgl, and every 0.5 m until the target depth was reached, based on the estimated excavation depths presented in the WSP model (**Section 3.4**). **Figure F3**, attached, shows the estimated depth per grid section based on surveys of the Site surface conducted in 2024.

Additional samples were collected at any change in lithology recorded.

At this density, each sample collected corresponded to 200 m^3 of *in situ* soil. While this provides a ratio of 1 primary sample to every 266 m^3 of *ex situ* soil, extensive soil data from previous investigations is also available and is assessed and discussed when sample density is considered in **Section 7.2**

3.6 Hotspot Detection and Identification of Areas of Potential Higher Contamination

Contaminated Land Guidelines – Sampling Design Part 1 – Application (EPA NSW, 2022) provides Equation 1, below, to estimate the maximum size of "hotspots" of contaminated soil which may not be detected by grid based sampling:

$$r = k \times G$$

Equation 1 – Critical Size of Hotspots

Where:

- *r* is the radius of a circular hotspot, or half the length of the major axis for an intermediate or elliptical hotspot.
- *k* is a statistical constant, depending on the shape and required confidence level of the hotspot detection. For 95% confidence levels, *k* has values of 0.59 for a hotspot which is circular, 0.69 for one which is "intermediate" (axis ratio of ~4:3), and 0.9 for an elliptical (axis ration of ~2:1) hotspot.
- *G* is the grid size, or distance between sample points.

Using Equation 1, and conservatively assuming elliptical hotspots, which approximate irregular hotspot shapes considered more likely to be present in anthropogenic fill, the 20 x 20 sampling grid is able to locate hotspots above to 18 m radius along the major axis with 95% confidence. Previous hotspots identified and removed by excavation (AECOM, 2024b) have been greater than this distance (see previous remediation excavation areas shown on **Figure F5**), and the sampling density is considered suitable for detection of areas of potentially higher contamination.

The 95%UCL approach adopted from IWRG702 (discussed in **Section 3.5**) considers a statistical average concentration of CoPC likely to be encountered by future contact with the soil being assessed. However, the potential exists for areas of higher contamination to exist within soil, particularly within the heterogenous fill material present at the Site.

As part of this assessment, the following indicators of areas of potential higher contamination have been noted and further considered in **Section 7.0**:

- Staining, discolouration, or odours
- High levels of anthropogenic materials
- Analytical results more than 250% of the adopted criteria
- The presence of LNAPL.

Where areas of high contamination were considered to be present, and not suitable for inclusion in the overall bulk volume to be excavated, they excluded from the overall assessment of soil and are recommended for *ex situ* assessment, following excavation, for future remediation or disposal under a higher waste classification. Assessment and identification of such areas is included in **Section 7.5.1**.

4.0 Data Quality Objectives

Setting data quality objectives (DQOs) is a process used to define the type, quantity and quality of data needed to support decisions relating to the environmental condition of a site. The process of establishing appropriate DQOs is defined by the seven-step planning approach presented in the *National Environment Protection (Assessment of Site Contamination) Measure 1999* (as amended in 2013) (ASC NEPM).

Outputs from the DQO review process undertaken in the SAQP (AECOM, 2024b) are summarised in **Table 4** below.

Table 4 Data Quality Objectives

DQO	Data Quality Objective Step Summary
Step 1 - State the Problem	Waste characterisation of the proposed Stage 1 and Stage 2 excavation areas is required to inform adequate off-site management options for re-use / disposal as part of the Stadium development works, and to identify any areas of soil which may require additional management, such as additional assessment, remediation/ stockpiling and/or *ex situ* classifications.
Step 2 - Identify the Goal of the Study	The decision identification component of the DQO process represents the key issues that have been considered to resolve the problems identified in Step 1. These include: • Will the investigation approach be suitable and scientifically defensible, at an adequate sample density across each soil sub-cell, and consistent with relevant guidelines (e.g. ASC NEPM, AS4482.1, AS4482.2, IWRG702 and IB105) (**Sections 7.2** to **7.4)**? • Do the concentrations identified exceed the relevant adopted criteria for waste categorisation and assessment of off-Site disposal (**Sections 5.0**)?
Step 3 - Identify Information Inputs	To allow assessment of the data against the goals listed in **Step 2**, various inputs have been considered as follows: • Identification of the CoPC, based on the assessment areas across the proposed excavation area, which includes review of area-specific history, aerial photograph information, records, site and area specific practices, anecdotal information and previous investigation data, where available. • Concentrations and distribution of chemicals and aesthetic impacts, relative to the investigation criteria, based on the field investigations detailed in this report and historic assessments. • Data collected during field investigation and borehole advancement.
Step 4 - Define the Boundaries of the Study	The spatial boundaries (geographical limits) applied for data collection and decision making for the purpose of the *in situ* soil characterisation sampling are limited to Stage 1 and Stage 2 excavation areas (**Figure 1**). A 10 m buffer has been considered to classify soil where over-excavation may occur, to account for adequate sloping and benching and where soil may be taken to provide access into areas of the excavation. The maximum depth of assessment is determined by the proposed extent of excavation at each area of the stadium footprint. For the Stage 1 and Stage 2 excavation areas, soil is proposed to be excavated to a maximum depth of 2.2 m AHD, which is 0.2 m below the design excavation depth for application of surface covering, with soil bores advanced to down to ~1.9 m AHD to capture this volume. Temporal boundaries include available soil data obtained from previous soil investigations undertaken within the spatial boundaries above, up to a period of 10 years prior to the *in situ* soil investigation (i.e. 2014), which were reviewed and

DQO	Data Quality Objective Step Summary
	considered appropriate for supplementing the dataset, and provided in the SAQP (AECOM, 2024b).
Step 5 - Develop the Analytical Approach	The decision rule for this investigation is to assess the representativeness of collected data to further inform the understanding of: • Waste classification in accordance with IB105. • Suitability for landfill disposal. The analytical approach was informed by identified CoPC, and sample density requirements to achieve results suitable for statistically significant interpretation.
Step 6 - Specify Performance or Acceptance Criteria	A decision error in the context of the decision rule presented in Step 5 would lead to either underestimation or overestimation of the potential risk level associated with a particular site. Decision errors may include: • Limitations in available site history information; • Constraints associated with the ability to access certain areas of the site; • Errors in the sampling plan; and • Data not representative of site conditions. Performance criteria are defined by the assessment criteria in **Section 5.0**.
Step 7 - Develop the Plan for Obtaining Data	The methodology, developed in the SAQP (AECOM, 2024b) and summarised in **Section 6.0**, presents a sampling plan which has been designed to meet the objectives of the assessment, and also to achieve the nominated DQOs in **Section 5.4**. Optimisation of the data collection process was based on data available from previous investigations. The investigation is to be carried out to a level of accuracy and confidence presented in the ASC NEPM (2013).

5.0 Assessment Criteria

5.1 Soil Characterisation

Under the relevant Tasmanian regulations and guidelines for disposal of soil, the EMPCA, the Regulations and IB105, all contaminated soil and clean fill material greater than 100 tonnes, must be classified and approved for disposal or reuse by EPA.

To assess and categorise the soil within the soil bore assessment, soil analytical results were screened against the criteria in Table 2 of TAS EPA IB105, which uses four categories to classify contaminated soil as:

- Level 1 - Fill Material. Two categories of Fill Material were introduced by amendment of the EMPCA and the Regulations in 2021.
- Level 2 - Low Level Contaminated Soil
- Level 3 - Contaminated Soil
- Level 4 - Contaminant Soil for Remediation.

Waste classification has been conducted for the likely assessment volume of soil to be excavated as a whole, using statistical assessment of concentrations of CoPC which will be present in soil. In the event that this volume is sub-divided (i.e., if a portion of soil is identified for beneficial reuse), each such sub-division will require re-assessment and classification.

5.2 Soil Disposal Scenarios

The following soil disposal scenarios have been previously implemented for soil excavated from the Site:

- Beneficial re-use (either on- or off-Site).
- Off-Site disposal to a landfill or contaminated waste facility.

On-Site remediation has also been successfully applied as an interim step to reduce contaminant concentrations or risk profiles, prior to either on-Site beneficial reuse or off-Site disposal.

5.2.1 Beneficial Re-use

Beneficial re-use is considered of greater environmental value than landfill disposal of soil, and is allowable under IB105 for waste soil classified as Level 1 or Level 2 with the following guidelines:

IB105 provides the following guidelines for consideration of re-use of Level 1 and Level 2 waste soils:

- Section 4.1.3 – *The re-use of Fill Material* (Level 1 material) *must not result in environmental harm.*
- Section 4.2.3 - *Low Level Contaminated Soil* (Level 2 material) *might be suitable for re-use as fill or levelling material on an industrial or commercial site, but will be judged on a case by case basis.*"

On-Site beneficial reuse has been previously approved for Level 2 material by EPA as Environmental Approvals No. 10512 and No. 10512/2, with the most recent approval (EA 10512/2) expiring on 7 October 2024. EPA indicated at the time that future on-Site beneficial re-use would be considered by them if, and when, a specific scenario was identified, and if a scenario is identified a submission should be made to EPA. Off-Site beneficial reuse of Level 1 (Type 1) material has been previously approved by EPA under EA No. 12066/1, and of Level 2 material as cover material at landfill under numerous EAs.

While no beneficial re-use scenarios have been identified at this time, in the event that any such re-use is proposed for Level 1 or Level 2 soils, the following approach is recommended:

- On-Site beneficial re-use – Any on-Site beneficial re-use of soil should meet the following criteria:
  - Soil should be categorised as either Level 1 – Fill, or Level 2 – Low Level Contaminated Soil, in accordance with IB105.
  - Contaminant concentrations in the soil should not represent an environmental risk to human or ecological health on the Site or in surrounding areas under the proposed re-use scenario.

Potential environmental risks should be assessed with reference to the Site specific Remediation Criteria (AECOM, 2025b).

- Re-use must be undertaken in such a way to prevent environmental nuisance or harm from escape of materials, spillage, or emission of dust or odours.
- All soil must be handed in accordance with practices presented within the Site Environment Management Plan (the SEMP) (AECOM, 2024a).

Previous EPA approvals for on-Site re-use required that any on-Site re-use scenario must be presented to an independent Environmental Auditor, as accredited by Section 39F(3) of the *Macquarie Point Development Corporation Act 2012*, for review and endorsement. Environmental Auditor endorsement is considered a requirement for any re-use of the soil proposed for excavation.

If the on-Site beneficial re-use is endorsed by the Environmental Auditor, a record of the re-use scenario, including the volume and characteristics of the soil, the location of re-use, the assessment of environmental risks and mitigations, and the Auditor's endorsement must be provided to EPA no later than one year after re-use has occurred.

- Off-Site beneficial re-use - Any off-Site re-use scenario will require additional assessment and consideration of the proposed re-use and conditions of the accepting site. If an off-Site reuse is proposed, a separate assessment must be conducted, and environmental approval sought from EPA prior to any transport of material from the Site and/or re-use.

5.2.2 Landfill Disposal

If no beneficial re-use scenario of the material proposed for excavation is identified, it will be disposed of under the receiving site's licence conditions.

In addition, IB105 provides criteria for both Total Contaminant Concentration (TCC) and Leachate Contaminant Concentration (LCC), and notes in Section 2 that "*Generally, where a leachable concentration is prescribed in Table 2* [of IB105] *that value takes precedence over the total concentration and is used as the sole determinant of the final classification for disposal…*"

While LCC may determine waste category for some CoPC, consideration of potential environmental risks from TCC at the receiving Site is considered to require additional controls and assessment. As such, selection and handing if any Level 2 material soil proposed for landfill disposal will be conducted with the following requirements:

- The excavated material will be transported off-Site by a contractor on behalf of the Corporation or the receiving Site. Reasonable precautions will be undertaken to ensure that no environmental or human health harm results from the movement of potentially contaminated materials between the sites. All truckloads will be tracked.
- Material will be immediately disposed of using an enclosed excavator or other mechanical methods. No manual works outside the machine should be conducted as part of the soil placement.
- The receiving site must develop a Safe Work Method Statement (SWMS) for the placement of the soil which will include handling measures and personal protective equipment (PPE) requirements. The minimum PPE requirements for the work are gloves, long sleeves and pants, eye protection and face mask, and will include procedures (such as washing of hands before eating, drinking, or smoking to remove any material) to reduce any potential exposure by receiving site staff while handling and placing material.
- The receiving site will have mitigation methods to prevent dust generation during soil placement or long term.
- The areas of disposal will be remote from members of the public or any staff outside excavators/machines.
- The area of disposal will be unsaturated (i.e., above the water table).
- The material will not be stored by the receiving site prior to use.

- No further excavation or disturbance of the area of use will take place following import of the material.
- The receiving site will have an EPA certified leachate capture and treatment system. Leachate from the area of reuse will be captured in a silt trap/holding basin prior to discharge to sewer.
- The receiving site will not have ecological receptors (i.e., plants/trees/wildlife) in the final disposal location.
- The receiving site will be within Tasmania. Additional approvals will be required transport to and disposal at non-Tasmanian sites.

Based on the off-Site disposal scenario described above, which are intended to minimise the potential for contact between the soil and site workers and lack of ecological receptors at the proposed disposal location, the ASC NEPM (2013) *National Environment Protection Council, National Environment Protection (Assessment of Site Contamination) Measure 1999* (as amended May 2013) Heath Investigation Levels (HILs) for Commercial / Industrial use (HIL-D) are considered appropriate for assessment of the soil proposed for excavation for this scenario.

Any soil categorised as potential Level 3 – Contaminated Soil or Level 4 – Contaminated Soil Requiring Remediation is excluded from the proposed disposal at McRobies, and will be subject to further *ex situ* assessment following excavation to determine if:

- Remediation to reduce CoPC concentrations and future environmental risks associated with the soil is practicable and can be implemented.
- The soil can be disposed to an alternative waste site licensed to receive this category of waste. It is noted that the Southern Waste Solutions facility located at Copping is the only facility in Tasmania currently licenced to receive Level 3 waste soils.

The following is also noted regarding off-Site disposal:

- If any alternative waste disposal sites or methodologies are identified, the conditions at the site and licence conditions will be reviewed and additional approval from EPA may be required for transport and disposal of waste. Some sites may have alternative approval processes which should be complied with on a site-by-site basis.
- Any disposal should comply with the licence conditions of the receiving waste site, which will include estimated annual volumes. Additional approvals or actions may be required if any variation to these conditions is sought, for example to allow additional volume to be accepted in a one year period.

5.3 Sample Density

The requirements for sample density and distribution to collect data suitable for statistically significant interpretation are derived from AS4482.1 and IWRG 702, discussed in **Section 3.5**, and consist of:

- A minimum of 55 sample locations (i.e., soil bores) in the Stage 1 and Stage 2 excavation area (4.7 ha)
- A minimum of 1 primary sample per 250 m^3 (*ex situ*).

5.4 Assessment of Data Quality

The quality of the data collected will be assessed on a range of factors including:

- Documentation and data completeness.
- Reference to relevant guidance documents.
- Consistency of methodology.
- Data quality including comparability, representativeness, and accuracy for data collection and analysis.

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the laboratory and field data include:

- Assessment of field duplicate sampling rates and reproducibility of the data by calculation of the relative percentage difference (RPD) for laboratory and field duplicate samples (both intra- and inter-laboratory) to provide an indication of the precision of the data.
- Assessment of the analytical results for laboratory quality control samples to provide an indication of the accuracy of the data.
- Assessment of a range of quality control (QC) and quality assurance (QA) measures generated from both the field sampling and laboratory analytical programs.

Assessment criteria for data quality indicators for the soil samples to be collected during the assessment are listed below in **Table 5**.

Table 5 Acceptance Criteria for Data Quality Indicators

Data Quality Indicator	Acceptance Criteria
Rinsate blanks	Less than the laboratory limit of reporting (LOR)
Intra and inter laboratory field duplicates (1) (3)	Relative Percent Difference (RPD) less than ± 30%
Laboratory duplicates (2) (3)	RPDs Less than: 20% for high level laboratory duplicates (i.e. >20 x LOR) 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR)
Matrix spikes (3) (4)	Recoveries between 70-130% of the theoretical recovery
Method blanks	Less than the laboratory LOR
Laboratory control samples (5)	Recoveries between 70-130%.
Surrogate spikes	*See Note 5*

Notes:

1. *Potential exceptions to these criteria may occur where the results are close to the LOR. This typical RPD range is obtained from Schedule B2 of the ASC NEPM.*
2. *If the results are close to the LOR, then higher results will be accepted.*
3. *Assumes that samples are homogeneous, and the background analyte level is less than 20% of the spike level (refer to USEPA Method 8000B). Note that there is no requirement for matrix spikes to pass as certain matrices may preclude recovery of spiked compounds. In this case data will be accepted if LCS data meets the acceptance criteria.*
4. *80% of the compounds tested must fall within the control limits. Control limits are dynamic and vary for individual tests as per USEPA Method 8000B.*
5. *Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for individual tests but are within the criteria described in USEPA Method SW846.*

6.0 Field Methodology

In order to assess the waste category of soil within the Stage 1 and Stage 2 excavation areas, 518 primary soil samples were collected and submitted for laboratory analysis from 125 boreholes between 25 November and 11 December 2024, at the locations shown on **Figure F2**.

The methodology of assessment was developed and is presented in the SAQP (AECOM, 2024b), and is summarised in **Table 6**, below.

Table 6 Summary of Field Methodology

Activity	Methodology
Date of Field Works	• 25 November to 11 December 2024
Field Personnel	• Jacob Muller, Taya Gerstel, Andrew Christensen (AECOM) • South-West Drilling (SWD)
Borehole Advancement	• Clearance for potential sub-surface infrastructure (i.e. pipelines, conduits etc) was conducted in accordance with AECOM Service Identification for Excavation (SIE) procedures at all bore locations. • Bore holes were advanced using non-destructive drilling (NDD) to a depth of 1.5 m below ground level (bgl). If refusal occurred prior to 1.5 m bgl, the borehole was relocated, or an SIE variation was conducted to determine if mechanical drilling could be safety conducted. • For locations where the target depth was greater than 1.5 m bgl, the borehole was completed via Sonic drill rig. • All soil bores were backfilled and sealed at the surface with grout following sample collection. Bore logs for all locations are provided in **Appendix D**.
Field Soil Screening	• The soil profile of each bore was recorded by AECOM staff with training and experience in soil investigation, noting the presence of anthropogenic materials, olfactory evidence of contamination (i.e. staining and/ or odour), or any other features of interest. • For each sample collected, additional soil was placed in a sealed plastic bag and screened for head space vapours and the presence of VOCs using a calibrated photoionisation detector (PID). • The headspace reading was taken at ambient temperature (not in sun) and was recorded on the field log sheets. The PID readings were used in consideration of sample analysis. • The PID was calibrated with isobutylene gas at 100 ppm at the start of each day of sampling. Field records, including calibration records for PIDs, are included in **Appendix F**
Soil Sample Collection	• Soil samples were either: - Collected from hand augers. - Retrieved from plastic sleeves generated by each ~0.9 m core run using the sonic drill rig.

Activity	Methodology
	• Samples were collected at 0.5 m bgl, and at every 0.5 m thereafter until conditions are met to end the borehole. Additional samples were collected if a change in lithology was recorded. • All soil samples were collected by AECOM staff with training and experience in soil sampling and handling, and transferred into laboratory supplied glass sample containers. A new pair of nitrile gloves will be worn for each sample collected, and any reuseable equipment (i.e., trowels) were decontaminated as described below between each sample collected. • Field inter and intra-laboratory duplicates were prepared in the field by splitting soil samples. • In order to minimise the loss of volatiles, samples were not mixed or homogenised during collection or splitting, and sample containers were filled to minimise the amount of headspace. • Soils were immediately placed in chilled containers following collection and kept in low temperature until delivered to the analytical laboratory. • Sample IDs, and the IDs of any QA/QC samples collected, were recorded on standard AECOM Chain of Custody (CoC) documentation, which was included with samples when transported. A copy of all CoCs were retained by field staff and are included in **Appendix E**.
Decontamination	• Decontamination procedures were performed before initial use of re-useable equipment and after each subsequent use (i.e. hand auger). • All re-usable sampling equipment (i.e. trowel or hand auger) was decontaminated between each sample by scrubbing with a solution of Decon90 (a phosphate-free detergent) followed by a double rinse with potable water. • For each day of sampling, following decontamination procedures, one rinsate blank was completed by running laboratory prepared deionised water over the re-usable sampling equipment for collection directly into laboratory prepared sampling containers for analysis.

6.1 Deviations to Methodology

Deviations to the soil assessment methodology proposed in the SAQP occurred during soil works and are described below:

- The SAQP contemplated sampling and categorisation of all three proposed stages of excavation. This assessment has considered only Stage 1 and Stage 2.
- The SAQP excluded areas where Level 2 soil had been beneficially reused on Site as part of previous remediation works, with sampling to occur beneath the backfill material. However, this backfilled soil was sampled, as well as the underlying soil, and is included in this assessment.
- The following borehole locations required minor relocation based on access restrictions identified during field works:
    - Boreholes K13 to K18 were proposed within the footprint of the existing Site building known as the Goods Shed, and was moved approximately 8 m west to the exterior of this structure as the interior was not accessible by drill rig. No highly contaminating activities have been recorded for this section of the Site, and the movement of these boreholes is not considered to represent an unacceptable risk of unidentified contamination.

  - H14 was moved ~1-2 m north due to the presence of scrap waste on the surface at the proposed location. The amount of movement is minor and is not considered to represent an unacceptable risk of unidentified contamination.
  - Borehole location F17 was covered by a large puddle of surface water from rain and was not accessible to sample during works. This grid location is on the boundary of excavation and consists primarily of the area allowed for shelving/sloping of the excavation, and has been identified for further *ex situ* investigation and assessment following excavation (see **Section 7.5.1.1**), and the absence of data from this borehole is not considered to affect the assessment conducted in this report.

- Samples collected from soil bore I06 between 1.5 and 3.0 m bgl were incorrectly labelled by field staff as I16. Correct sample IDs were identified based on recorded sample date and depths, and have been associated with the correct point on data tables and in assessment of results.
- Samples at 1.5, 2.5 and 3.5 m bgl from location H07 were not analysed due to a laboratory error. No exceedances of Level 2 criteria were detected for any CoPC in the four samples from 0.5, 1.0, 2.0 and 3.0 collected and analysed from this borehole, and no historic activities considered high risk of contamination (i.e., gasworks, fuel storage) are known to have occurred at this location. As such, it is considered unlikely that contamination which would affect the assessment of soil for disposal may not have been detected by these omissions.
- A sample was not collected at 1.5 m bgl in borehole H14 due to the presence of a large dolerite boulder in fill. Samples were collected at 1.0 m bgl and 2.0 m bgl, either side of the boulder and it is not considered that the sample not collected at this location and depth represents a risk of unidentified contamination.
- Boreholes N18 and O18 were advanced to 1.5 m bgl, greater than the proposed excavation depth of 1.0 m bgl in these areas. The lithology and sample results from the deeper sample locations were consistent with higher samples and the additional data collected is not considered to affect the outcomes of the investigation.

None of the deviations to the methodology identified are considered to represent unacceptable risks of unidentified contamination based on the extent of movement or historic uses of the areas, or identified future investigation to be conducted in the area where the deviation occurred.

7.0 Assessment of Results

7.1 Soil Description and Field Observations

Records of the lithology encountered in soil bores is attached as **Appendix D**. In general, observed soil characteristics were consistent with previous investigations of the Site and consisted of:

- Brown to black fill soil, consisting of sands, clays and gravels with some anthropogenic materials (fragments of brick, metal, plastic, glass, wood, bitumen, ceramics, concrete and coal noted in various locations) at the surface to between 1 and >3.5 m bgl. This fill material is considered likely to be the material introduced to the Site during progressive historical land reclamation events.
- Dolerite, with or without an initial layer of weathered dolerite, starting at between 1 m bgl, to greater than 3.5 m bgl in the southern and eastern areas of investigation where dolerite was not encountered.

The following key features were observed during borehole advancement:

- In general, dolerite bedrock was shallower in the western and northern sections of the Site, and increased in depth to the east and south, consistent with previous investigations.
- No estuarine sands were encountered during borehole advancement, which is consistent with the modelling provided by WSP (2024) (**Section 3.4**) for soil in the areas considered.
- Water was noted at one location only, at 3 m bgl in borehole E12. Based on previous gauging at the Site, it is inferred that this may have been groundwater, but this borehole reached the target depth (3.5 m bgl) shortly after and the observed water was not confirmed to be groundwater.
- Odours were noted at:
  - A slight hydrocarbon odour in G06 at 0.6 m bgl. PID readings of 8.1 ppm were recorded at 1.3 m bgl in this borehole, however no notable concentrations of BTENX or TRH were detected in samples from this borehole.
  - Hydrocarbon odours were recorded between 1.5 and 3 m bgl in H10, increasing with depth, with a PID reading of 43.8 ppm recorded at 3 m bgl. H10 is located near historic fuel storage and LNAPL impacts to groundwater, and the increase in odour and PID readings with depth may indicate historic groundwater fluctuations and impacts to soil.
  - A strong “gasworks/hydrocarbon” odour was noted at 0.5 m bgl in bore G16 and at 0.3 m bgl in bore G18. Elevated BTEXN and TRH was also reported for the soil samples collected from these bores (**Section 7.5.1.1**), and elevated PID readings of up to 109.6 ppm were recorded from bagged soil samples from G18. Both these bores are located within the footprint of historic gasworks operations at the Site.
  - A faint hydrocarbon odour was noted at 1 m bgl in L18, but no elevated hydrocarbon concentrations or PID readings were detected in soil from this bore.
- Railway sleepers, either intact or as fragments, were observed in boreholes H13 (0.9 m bgl), H16 (0.5 m bgl), J07 (2.0 m bgl), and M09 (0.1 m bgl).

  Buried railway lines and isolated sleepers have been encountered in fill on Site as part of previous investigations. The sleepers encountered previously have been sampled and determined not to have been treated with creosote, and have been previously considered inert waste.
- The majority of recorded PID readings from bagged soil samples were below 2 ppm. Elevated PID readings (>10 ppm) were detected only in soil from:
  - The footprint of the historic gasworks in the south-west corner of the Site.
  - Close to the vadose zone (i.e., ~3 m bgl) near historic fuel storage and handing operations in the central and norther portion of the Site. It is noted that previous assessment of soil vapour in these areas (AECOM, 2021a) have not identified any inhalation risk in these areas, including for intrusive maintenance workers digging in soil for installation of conduits/service trenches.

- A fragment of Asbestos Containing Material (ACM), described as cement sheeting approximately 50 x 40 x 5 mm in size and weighing 16 g, was identified in soil excavated at 0.5 m bgl in borehole E13. The fragment, and the soil surrounding it, was analysed for asbestos presence/absence, and while the sample contained chrysolite and amosite asbestos in a cement matrix, no crumbling or degradation was observed by field staff or the analytical laboratory, and asbestos fibres were not detected in the surrounding soil at the LOR (0.01% w/w).

  As such, the fragment of ACM is considered non-friable, and it is noted that this fragment has been removed from the Site when submitted to the laboratory for analysis. No other ACM or potential ACM was noted in soil.

7.2 Soil Volume and Sampling Density

The volumes to be excavated for future development have been previously estimated based on existing soil data as discussed in **Section 3.4**.

In order to determine the volume of soil considered for assessment by the soil sampling undertaken in November and December 2024, discussed in the report, the following methodology has been used:

- Each soil bore has been assumed to cover 20 x 20 m of surface area (400 m^2) based on the grid sampling undertaken.
- The maximum depth in each borehole has been assumed as the base of soil assessed.

For example, borehole C12 was sampled every 0.5 m to a maximum depth of 2.5 m bgl. The volume of soil considered for excavation is therefore 1,000 m^3 (20 m x 20 m x 2.5 m).

Soil bores, observed lithology, and maximum depth of sampling are provided in the boreholes in **Appendix D** and presented on **Table T1**. Based on the recorded data, approximately:

- ~94,900 m^3 (*in situ*) of anthropogenic fill material was included in the assessment volume. 471 primary samples were collected and analysed from fill.
- ~8,800 m^3 (*in situ*) of weathered dolerite was included in the assessment volume. 47 primary samples were collected and analysed from weathered dolerite.

Table 7 summarises volumes and sampling density in each recorded lithology.

Table 7 Assessed Volumes and Sample Density

Parameter		Anthropogenic Fill	Weathered Dolerite	Total
Volume	*in situ*	94,900 m^3	8,800 m^3	103,700 m^3
	ex situ[1]	126,200 m^3	11,800 m^3	138,000 m^3
Number of Primary Samples		471	47	518
Sample Density	*in situ*	202 m^3/primary sample	188 m^3/primary sample	200 m^3/primary sample
	ex situ	268 m^3/primary sample	250 m^3/primary sample	266 m^3/primary sample

Notes: 1. Bulking factor of 1.33 applied as recommended by IWRG 702 (see **Section 3.5**)

Fresh or mildly weathered dolerite within the proposed excavation area was not sampled as the low hydraulic conductivity of dolerite limits any potential penetration of contamination into the rock mass. 327 m^3 of mildly weathered to fresh dolerite was estimated within the excavation area by WSP (2024) (**Section 3.4**), and assessment of this volume is discussed in **Section 7.5.1.3**.

The following is noted regarding sample volumes and density:

- AS4482.1, referenced in IB105 for consideration during *in situ* sampling, recommends 55 sample points (i.e., boreholes) for a 5 ha area (noting that this frequency is for contaminated land assessment). 125 boreholes were advanced in the 4.8 ha Stage 1 and Stage 2 excavation areas as part of this investigation, exceeding the recommended amount.

- The weathered dolerite was sampled at the density recommended by IWRG702 (250 m^3 (*ex situ*) per primary sample) and is considered a suitable density for assessment.

  While anthropogenic fill was sampled at a lower density than recommended in IWRG702 when a bulking factor is included, sample data from an additional 331 primary samples, collected from 160 bores or test pits within the excavation area is available from previous investigations and is provided as **Table T6**.

  These data points, which were collected as part of previous investigations, were generally:

  - Targeting areas of suspected higher contamination, rather than grid based sampling.
  - Analysed for targeted CoPC based on historic uses and known or suspected contaminants in the areas of interest, not broad IB105 suites.

  Assessment of the previous data in the SAQP, discussed in **Section 3.2**, reported results consistent with sample results collected in November and December 2024 and did not identify any other potential hotspots. While the sample density from the November and December field program is less than 1 primary sample per 250 m^3 (*ex situ*), inclusion of historical data (an additional 405 primary samples), the sample density is one primary sample per 144 m^3 (*ex situ*), exceeding the IWRG 702 recommendation.

On this basis, the sampling density is considered suitable for assessment and interpretation.

It is noted that the estimated *in situ* volume assessed has minor variations from the model outputs provided by WSP (2024) (**Table 3**). The primary source of any difference is considered to be the inclusion of soil along the northern area of the proposed excavation (between the practice wicket and basement carpark areas), which was included in the “Balance of Site” in the WSP model, but has been included in the Stage 1 and Stage 2 excavation areas in this assessment. Other minor differences may arise based on differing model and estimate assumptions or data (i.e., depth of dolerite), however the variance is not considered to affect the overall outcomes of assessment and is attributed to inherent variability in pre-excavation estimation.

7.3 Analytical Suites

Analytical suites selected for the 518 primary soil samples collected between 25 November and 11 December 2024 consisted of:

- 168 samples (33%) were analysed for IB105 Table 2 (excluding TBT) TCC.
- 350 samples (67%) were analysed for the targeted TCC suite of BTEXN, TPH, lead, arsenic and PAHs.
- 179 samples (35%) were analysed for LCC using TCLP, consisting of:
  - 75 samples analysed for metal LCC, primarily lead, but also including mercury, arsenic, cadmium, chromium, and zinc in targeted locations.
  - 139 samples analysed for PAHs

  LCC analysis was conducted where exceedances of the Level 2 – Low Level Contaminated Soil criteria for TCC were detected and LCC criteria are provided by IB105.
- One fragment of potential ACM, identified at 0.5 m bgl in borehole E13, and the sample of soil surrounding it, were submitted for asbestos identification/detection analysis.

The selected suites are consistent and meet the requirements proposed in the SAQP and summarised in **Section 3.2**, and are considered suitable for assessment of soil properties.

7.4 Quality Assurance / Quality Control

The data validation procedure employed in the assessment of the field and laboratory QA/QC data were assessed in **Appendix C.**

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, no data quality non-conformances were

identified which would indicate that the collected data is not suitable for interpretative use and assessment of the *in situ* soil volume.

7.5 Soil Assessment

Laboratory-reported soil analytical data, including soil TCC and LCC, is presented and compared to the adopted assessment criteria (**Section 5.0**) in **Table T2** and **Table T3** attached. The lithology and proposed excavation stage has been noted for each sample.

Benzo(a)pyrene Toxic Equivalency Quotient (TEQ) was reported by the primary analytical laboratory for TCC only. For leachate, TEQ has been calculated for the congeners and using the Toxic Equivalence Factors (TEFs) provided in *Advisory Note – Classification of Polycyclic Aromatic Hydrocarbons* (EPA, 2021) and are reported on **Table T4** for TCC, and **Table T5** for LCC, as follows:

- TEQ(LOR) – non-detect results have been treated as being at the Limit of Reporting (LOR) for the purpose of calculation.
- TEQ(half) – non-detect results have been treated as being half of the LOR for the purpose of calculation.
- TEQ(zero) – non-detect results have been treated as being zero for the purpose of calculation.

95% UCL values, where reported, were calculated using *ProUCL 5.1.001 – Statistical Software for Environmental Applications for Data Sets with and without Nondetect Observations* (ProUCL). Outputs from ProUCL are attached as **Appendix G**.

It is noted that for some samples, benzo(a)pyrene was initially reported with a higher LOR than adopted criteria, and samples were re-analysed for this CoPC. Both the initial and reissued results are provided in data tables attached to this report. However, for the purposed of calculating TEQs and 95% UCL values:

- Actual results (i.e., results reported above LOR) have been preferentially used.
- If two results above LOR have been reported, the higher result has been used.

7.5.1 Waste Classification

7.5.1.1 Anthropogenic Fill

Soil analytical data collected from anthropogenic fill has been compared to the guideline values provided on Table 2 of IB105 on **Table T2** and **Table T3** attached.

Exceedances of IB105 criteria anthropogenic fill are summarised on **Table 8** below.

Table 8 Exceedances of IB105 Criteria in Anthropogenic Fill

CoPC	IB105 Exceedances				
	Level 1	Level 2		Level 3	
		TCC	LCC	TCC	LCC
TPH C10-C36	Yes	Yes	N/A	Yes	N/A
Arsenic	Yes	Yes	No	No	No
Barium	Yes	No	Not analysed	No	Not analysed
Beryllium	Yes	No	Not analysed	No	Not analysed
Cadmium	Yes	Yes	Yes	No	No
Chromium (VI)	Yes	No	Not analysed	No	Not analysed
Chromium (Total)	Yes	Yes	No	No	No
Copper	Yes	No	Not analysed	No	Not analysed
Lead	Yes	Yes	Yes	Yes	Yes
Mercury	Yes	No	No	No	No

CoPC	IB105 Exceedances				
	Level 1	Level 2		Level 3	
		TCC	LCC	TCC	LCC
Nickel	Yes	No	Not analysed	No	Not analysed
Silver	Yes	No	Not analysed	No	Not analysed
Tin	Yes	Yes	N/A	No	N/A
Zinc	Yes	Yes	Yes	No	No
Benzo(a)pyrene	Yes	Yes	Yes	Yes	No
Sum of PAHs	Yes	Yes	Yes[1]	Yes	N/A
Fluoride	Yes	No	N/A	No	N/A

Notes: N/A – Not applicable / no criteria is set in IB105; 1. Benzo(a)pyrene TEQ(LOR) used to assess LCC from Sum of PAH data.

Based on review of the analytical data:

- Exceedances of IB105 Level 1 TCC criteria were detected in multiple sample locations across the proposed excavation area, and for multiple CoPC, and it is not considered that the anthropogenic fill is suitable to categorise as Level 1 material.
- Samples collected from the former gasworks area, in the south-west corner of the proposed excavation, appeared to have continuous areas of higher concentration impacts of some CoPC, including TPH C10-C36 and naphthalene. Odour and elevated PID readings were also noted by field staff during sample collection in this area (**Section 7.1**).

  Based on the analytical results, field observations, and known potentially contaminating historical use of this area (gasworks), soil contamination in this area is considered likely to be distinct from the remainder of the Site and not suitable for including in a statistical assessment of the whole volume. As such, soil proposed for excavation within the footprint of gasworks activities (consisting of grid references E15-E16, F15-16, G15-G18 and H15-H18) has not been included in the assessment, and it is recommended that the estimated soil volume to be excavated from this area (approx. 7,000 m^3) be assessed *ex situ* following excavation. The proposed area for *ex situ* assessment is shown on **Figure F4**.

  Based on the CoPC detected in this soil, remediation (on- or off-Site) may be suitable to reduce contaminant concentrations, however separate environmental approval should be sought if this is proposed.
- Section 2 of IB105 notes that "*Generally, where a leachable concentration is prescribed in Table 2* [of IB105] *that value takes precedence over the total concentration and is used as the sole determinant of the final classification for disposal…*"

  Where exceedances of the IB105 TCC Level 2 criteria were detected for CoPC with a prescribed LCC criteria, TCLP leachate analysis was requested. LCC of arsenic and chromium (total) were below the Level 2 LCC criteria, and the TCC above the Level 2 TCC criteria are not considered to cause the anthropogenic fill to be categorised as Level 3 or higher material. However, the TCC of these CoPC has been considered when assessing potential risks associated with the disposal of soil.

  Concentrations of LCC for cadmium, lead, zinc, benzo(a)pyrene, and benzo(a)pyrene TEQ(LOR) (used to assess leachate risks from Sum of PAHs) were reported in excess of the Level 2 criteria. The cadmium and zinc LCC exceedances (detected in one sample J10_1.0) are considered to be associated with a limited area of impact which may be associated with a small spill, and not characteristic of the properties of the soil to be excavated as a whole (discussed on **Table 9** below), while the exceedances of LCC criteria for lead, benzo(a)pyrene, and benzo(a)pyrene TEQ(LOR) have been assessed using 95%UCL, presented on **Table 12** and discussed below.

- Sample results (excluding the gasworks area discussed above) were assessed for potential hotspots, i.e., areas of elevated contamination not suitable for inclusion in 95% UCL, based on locations where CoPC concentrations greater than 250% of the IB105 Level 2 criteria were detected. Potential hotspots were identified based on LCC concentrations if available and if there was a relevant Level 2 LCC criteria, or on TCC if not.

  Table 9 below presents identified potential hotspots and assessment of whether they are considered to indicate of an area of soil requiring excavation and *ex situ* assessment.

Table 9 Potential Hotspot Assessment - Anthropogenic Fill

Location and Depth	CoPC	Detected Concentration	Assessment
Potential Hotspot			
J06_1.5	Lead (LCC)	5.1 – 5.2 µg/L	**Hotspot J06** Lead leachate concentration in excess of the Level 2 LCC criteria was detected in adjacent sample K05_1.5, and benzo(a)pyrene and benzo(a)pyrene TEQ in I07_2.5, K07_1.0, and K07_1.5
	Benzo(a)pyrene TEQ(LOR) (LCC)	3.15 µg/L	
M13_1.0	Lead (LCC)	39-120 µg/L	**Hotspot M13** The elevated lead leachate concentration at this location (confirmed by retesting of the sample), and elevated lead LCC in adjacent sample M12_1.0 indicate a potential hotspot.
Not Considered a Hotspot			
J10_1.0	TPH C10-C36 (TCC)	59,092 mg/kg	Samples collected vertically (J10_0.5 and J10_1.5) and laterally (samples from J09 and J11, I09-I11, and K09-K11) from J10_1.0 did not report any exceedances of Level 2 TCC criteria for TPH C10-C36, and it is considered that the exceedance detected is limited in extent and may be due to a minor spill or patch of historic release. Metals exceedances of criteria at this location (cadmium, lead and zinc) are considered to potentially be associated with this release and are not considered characteristic of the soil proposed for excavation as a whole, and are unlikely to represent a source of impact or risk at the disposal site as part of the bulk removal. Sample results from this location have been included in the 95%UCL calculations (below).
H13_2.0	Lead (LCC)	2.3 µg/L	Samples collected vertically (H13_1.0 to H12_1.5 and H12_2.5) and laterally (samples from H12 and H14, G12 to G14, and I12 to I14) from J10_1.0 did not report any exceedances of Level 2 LCC criteria for lead, and it is considered that the exceedance detected is limited in extent, not characteristic of the soil proposed for excavation as a whole, and is unlikely to represent a source of impact or risk at the disposal site as part of the bulk removal. Sample results from this location have been included in the 95%UCL calculations (below)

Based on this assessment, two potential hotspots, consisting of J06 in the northeastern portion of the proposed excavation area, and M13, in the south-eastern area, were identified and are not included in assessment of bulk soil to be excavated, and will be reassessed *ex situ* following excavation.

As noted in **Section 3.6**, the adopted grid spacing of sampling is considered suitable to detect an elliptical hotspot of 18 m radius (along the major axis). As the potential orientation of hotspots is not known, soil in an 18 m radius in all directions (~1,020 m^2) around the potential hotspot will be excavated and assessed *ex situ*.

The location and estimated extent of these hotspots are shown on **Figure F4**, and the volume of soil within each hotspot proposed for excavation is presented on **Table 10** below.

Table 10 Estimated Potential Hotspot Volumes

Parameter	J06	M13
Surface Area within Proposed Excavation[1]	510 m^2	1020 m^2
Proposed Depth of Excavation	2.5 m	1.5 m
Estimated Volume (*in situ*)	~1,300 m^3	~1,500 m^3
Estimated Volume (*ex situ*)[2]	~2,000 m^3	~1,700 m^3

Notes: 1. Approximately 50% of the area around J06 is outside the proposed excavation area. 2. A bulking factor of 1.33 has been adopted for estimation of *ex situ* volume (see **Section 3.5**)

Based on the assessment of the data above, 95% UCL for the concentrations of CoPC which reported an exceedances of the Level 2 criteria in anthropogenic fill were calculated using ProUCL, excluding data from areas which are proposed for *ex situ* assessment following excavation, consisting of the former gasworks area (E15-E16, F15-16, G15-G18 and H15-H18) and potential hotspots (J06 and M13).

It is noted that LCC was not analysed for all samples and a lower proportion of sample points have been used to calculate the 95% UCLs for lead, benzo(a)pyrene and benzo(a)pyrene TEQ(LOR). As leachate analysis was conducted at targeted locations with elevated TCC of these CoPC, the 95% UCL for LCC are considered likely to be biased high, and it is considered conservative to use them for assessment of overall LCC from the soil.

Calculated 95% UCLs are attached in **Appendix G**, and are summarised in **Table 11** and **Table 12** below.

Table 11 95% UCL Summary - Anthropogenic Fill TCC (excluding ex situ assessment areas)

CoPC	No. of Primary Samples	IB105 Criteria (mg/kg)			95% UCL (mg/kg)
		Level 1	Level 2	Level 3	
TPH C10-C36	429	1,000	5,000	10,000	512.8
Arsenic	429	20	200	750	14.5
Cadmium	138	3	40	400	2.7
Chromium (Total)	429	50	500	5,000	43.2
Lead	429	300	1,200	3,000	343.4
Tin	138	50	500	900	34.7
Zinc	138	200	20,000	50,000	87.8
Benzo(a)pyrene	430	0.08	2	20	4.3
Sum of PAHs	430	20	40	200	41.6

Table 12 95% UCL Summary - Anthropogenic Fill LCC (excluding ex situ assessment areas)

CoPC	No. of Primary Samples	IB105 Criteria (µg/kg)		95% UCL (µg/kg)
		Level 2	Level 3	
Lead	60	0.5	5	0.137
Benzo(a)pyrene	120	0.5	5	0.126
Benzo(a)pyrene TEQ(LOR)[1]	120	0.5	No Criteria	0.253

Notes: 1. Benzo(a)pyrene TEQ used to assess leachate risks from Sum of PAH total concentrations.

Based on calculated 95% UCL values, the anthropogenic fill material proposed for excavation (excluding the former gasworks area and potential hotspots):

- 95% UCL TCC of TPH C10-C36, metals (arsenic, cadmium, chromium (total), tin and zinc) are below the Level 1 TCC criteria.
- 95% UCL TCC and LCC of lead are below the Level 2 TCC criteria.
- 95% UCL TCC of benzo(a)pyrene and Sum of PAHs in excess of the Level 2 TCC criteria. However, the 95% UCL LCC for these CoPC are below the Level 2 LCC criteria, which has been used to determine waste category.

While exceedances of the Level 2 criteria for some TCC and LCC may be present in the overall soil volume, they are not considered to represent the overall characteristics of the soil and do not represent the potential risks and impacts which may arise from the soil volume.

Based on the assessment of anthropogenic fill material within the Stage 1 and Stage 2 excavation areas:

- Approximately 9,800 m^3 (*in situ*) is considered potential Level 3 or higher waste soil, and is recommended to be excavated, stockpiled on-Site and assessed for potential remediation options. The soil considered potential Level 3 consists of:
  - ~7,000 m^3 proposed to be excavated from the former gasworks footprint in the south-west corner of the proposed excavation (grid references E15-E16, F15-16, G15-G18 and H15-H18).
  - ~1,300 m^3, to be excavated to an average of approximately 2.5 m bgl in an 18m radius around sample point J06, noting that only approximately half of this hotspot is within the proposed Stage 1 and Stage 2 excavation area.
  - ~1,500 m^3, to be excavated to approximately 1.5 m bgl in an 18 m radius around sample point M13.
- Approximately 85,100 m^3 (*in situ*), consisting of the balance of anthropogenic fill material proposed for excavation as part of Stage 1 and Stage 2 excavation areas, is categorised as **Level 2 – Low Level Contaminated Soil**. It is noted that ACM and PASS in this soil may require additional consideration, and are discussed in **Section 7.5.1.1.1** and **Section 7.5.1.1.2** below.

7.5.1.1.1 Potential Acid Sulfate Soil (PASS) in Anthropogenic Fill

The *Acid Sulfate Soil Investigation* (AECOM, 2025a) has made an assessment of acid sulfate soil (ASS) which may be present beneath the Site. This assessment, conducted in accordance with the *Tasmanian Acid Sulfate Soil Management Guidelines* (TASSMG) (DPIPWE, 2009), concluded that:

- No Actual Acid Sulfate Soil (AASS) was present beneath the Site.
- PASS was present in submerged estuarine soil (primarily sands/clays) and would require management if disturbed. No excavation of such material is proposed as part of the Stage 1 and Stage 2 excavation.
- PASS may be present in anthropogenic fill at two locations (shown on **Figure F6**):
  - At 2.9 to 3 m bgl in borehole BH-004 (within *in situ* assessment cell I17).
  - At 1.5 to 1.6 m bgl in borehole ABH-004 (within *in situ* assessment cell M12).

Samples collected at these locations and depths reported the potential to acidify to harmful pH levels. However, surrounding soil samples (vertically and laterally), and all other samples from anthropogenic fill collected as part of the investigation, did not demonstrate the same potential, and the detected acidification volume may be limited in extent, or caused by other soil constituents reacting to reagents during assessment.

The proposed depth of excavation at both BH-004 and ABH-004 is 1.5 m bgl. While the possible PASS at BH-004 will not be disturbed excavation, possible PASS at ABH-004 may be exposed. Further investigation to determine the cause of acidification and level of neutralisation, if any, required at these locations is planned and will be completed prior to bulk excavation, and if PASS is present, soil at these locations will be handled in accordance with an Acid Sulfate Soil Management Plan developed for the work.

7.5.1.1.2 Asbestos Containing Material

One fragment of ACM was detected during sample collection at 0.5 m bgl in borehole E13. Analysis of asbestos in the fragment and surrounding soil, provided in laboratory report 1171413 (**Appendix E**), reported that:

- Chrysotile asbestos and organic fibres were present in the fragment.
- Asbestos in the surrounding soil was below the reporting limit of 0.01% $^{w}/_{w}$.

Encountering small, isolated fragments of ACM in fill materials is not uncommon on historical industrial sites, and the fragment encountered in this case was removed as part of the sampling program and is no longer *in situ*. In addition, the ASC NEPM provides risk-based guidelines for asbestos concentrations in soil, with the Health Investigation Level (HIL) D provided for commercial and industrial land uses, which are considered appropriate for the proposed future uses of the Site and the proposed disposal site.

The ASC NEPM HIL-D for asbestos in soil is 0.05%$^{w}/_{w}$. Based on this criteria, the fragment encountered would not have represented a risk of harm for commercial/industrial uses, even if it had not been removed, and it is not considered that if other fragments are present, they are likely to be substantially different or represent a risk of harm.

The SEMP (AECOM, 2024a) contains procedures for excavation and handling soil, including for management of any observed ACM or asbestos. In the event that potential ACM is observed in soil, all activities are to cease immediately in the immediate work area. A suitably experienced environmental practitioner should be consulted to provide advice regarding the removal and management of ACM in soils prior to works re-commencing.

Any work plans or procedures for excavation of soil from the Site will be required to conform to the SEMP and will contain this procedure, in the event that ACM is observed during bulk removal.

7.5.1.2 Weathered Dolerite

Soil analytical data collected from weathered dolerite has been compared to the guideline values provided on Table 2 of IB105 on **Table T2** and **Table T3** attached.

Exceedances of IB105 criteria in weathered dolerite are summarised on **Table 13** below.

Table 13 Exceedances of IB105 Criteria in Weathered Dolerite

CoPC	IB105 Exceedances				
	Level 1	Level 2		Level 3	
		TCC	LCC	TCC	LCC
Copper	Yes	No	No	No	No
Manganese	Yes	No	No	No	No
Benzo(a)pyrene	Yes	Yes	No	No	No
Sum of PAHs	Yes	Yes	No[1]	No	No

Notes: 1. Benzo(a)pyrene TEQ(LOR) used to assess LCC from Sum of PAH data.

Based on the review of the analytical data for weathered dolerite:

- Copper and manganese were detected above the Level 1 TCC criteria. These CoPC are considered likely to be natural constituents of the dolerite.
- Benzo(a)pyrene and Sum of PAHs were detected above the Level 2 TCC criteria. However, LCC of benzo(a)pyrene and benzo(a)pyrene TEQ(LOR) were below the Level 2 LCC criteria, and as recommended in IB105, LCC will be used as sole determinant of waste category. The presence of benzo(a)pyrene and PAHs will be considered in assessment of disposal site.

The 95% UCL for the concentrations of CoPC which reported exceedances of the Level 2 criteria in weathered dolerite were calculated using ProUCL, and are attached in **Appendix G**. **Table 11** below provides a summary of the results.

Table 14 95% UCL Summary – Weathered Dolerite TCC

CoPC	No. of Primary Samples	IB105 Criteria (mg/kg)			95% UCL (mg/kg)
		Level 1	Level 2	Level 3	
Benzo(a)pyrene	46	0.08	2	20	0.52
Sum of PAHs	46	20	40	200	6.5

While sample results from weathered dolerite were predominantly below Level 1 criteria, or had CoPC present (copper and manganese) which are considered likely to be naturally sourced, the 95% UCL for benzo(a)pyrene was greater than the Level 1 TCC criteria, and the presence of benzo(a)pyrene and PAHs indicates that some mixing with anthropogenic fill, or contamination from historic Site uses, into weathered dolerite occurred. As such, the ~8,800 m^3 (*in* situ) of weathered dolerite is categorised as **Level 2 – Low Level Contaminated Soil**.

7.5.1.3 Fresh to Mildly Weathered Dolerite

The WSP (2024) modelling (**Section 3.4**) estimates excavation and removal of approximately 327 m^3 (*in situ*) of fresh to mildly weathered dolerite.

While not sampled as part of these works, this material, when excavated, is considered suitable to categorised as **Level 1 – Fill Material Type 1** as the fresh and mildly weathered dolerite:

- Is the natural bedrock of the Site and is not imported material which may have been impacted off-Site.
- Has a low hydraulic conductivity, with a typical range of 8x 10^{-9} to 2x10^{-4} m/s (Domenico and Schwartz, 1990). Aquifer testing in Site dolerite in 2015 reported an average hydraulic conductivity of 6.2x10^{-8} m/s (AECOM, 2016).
- Is likely to be encountered and excavated from the north-western portion of the Stage 1 and Stage 2 areas, and is not considered likely to be encountered and removed from areas with higher contamination such as the presence of LNAPL.

The low hydraulic conductivity of the dolerite limits any potential penetration of contamination in groundwater into the rock interior. Small amounts of contaminated soil (i.e., fill material which has settled into fractures within the dolerite, or contamination transported by surface water running over the dolerite surface) may be present, however any such volumes would consist of only a small overall portion of the volume to be removed, and are not considered to likely represent overall contamination of the material when excavated.

7.5.2 Disposal

7.5.2.1 Beneficial Re-Use

While no beneficial re-use is proposed at present, and no assessment of soil data has thus occurred, if any re-use scenarios are identified:

- On-Site re-use will be submitted to the Environmental Auditor for endorsement prior to proceeding. Records of any on-Site re-use will be provided to EPA within one year of occurring.

- Off-Site re-use will require a separate assessment, with consideration of the characteristics and environmental risks associated with the proposed re-use Site. Separate approval will be sought for any off-Site re-use.

The presence of asbestos contamination in soil has been identified in previous soil investigations at the Site, however, it is not considered to impact on potential re-use scenarios for Level 2 material, based on the following summary of observations and control procedures for asbestos removal:

- The one asbestos sample identified in E13 of the in situ soil sampling program was within the close vicinity of the former Roundhouse service trenches, anecdotally noted as having been backfilled with asbestos-containing building rubble in the 1980s (AECOM, 2021b). This material has been removed as part of remediation works to remove the roundhouse turntable and associated impacted soil material within the former Roundhouse footprint.
- No bulk asbestos or ACM has been encountered in investigations to date, with only non-friable fragments observed. During remediation of the former Roundhouse and associated service trenches between 2019 and 2020, fragments were confirmed as a similar non-friable composition (chryosite), suggesting the ACM identified in E13 is likely a remnant fragment from soil remediation in the area, and not evidence toward bulk asbestos contamination (AECOM, 2020).
- Other sources of asbestos contamination across the site align with historical information, such as bituminous pipe lagging with asbestos within the South Precinct Remediation works (AECOM, 2020). This former diesel transfer pipeline has been removed and a visual clearance certificate obtained by a certified hygienist for the entire length. It is noted this pipeline run was situated east of the proposed bulk excavation areas.
- An Asbestos Register has been prepared for the Site, and the Site Environment Management Plan (SEMP) (AECOM, 2024a) outlines the requirement for all potential ACM identified at the Site, including inspection by a suitably experienced occupational hygienist to provide advice regarding the removal and management of ACM in soils prior to works re-commencing.
- All ACM materials identified during soil investigation have been removed from the Site.
- The SEMP (AECOM, 2024a) includes as a requirement that a surface barrier between Site soil and users. This barrier would also prevent exposure to isolated ACM fragments, if present in soil.

Further detail on the requirements and process to be implemented for any re-use scenarios is provided in **Section 5.2**.

7.5.2.2 Off-Site Disposal to Landfill

Soil analytical data from the anthropogenic fill material (excluding the areas identified for future *ex situ* assessment) and weathered dolerite has been compared to the adopted criteria (the ASC NEPM HIL-D) for landfill disposal on **Table T2**.

Exceedances of the NEPM HIL-D criteria were reported for:

- Lead in seven samples (G11_1.5, H13_2.0, J08_1.5, J10_1.0, K06_1.5, M12_1.0, and N10_1.5)
- Benzo(a)pyrene TEQ(LOR) in eight samples (G10_2.0, H09_3.0, I07_2.5, I08_1.0, I13_1.5, I14_1.0. J14_0.5, and K09_1.5).

All samples with exceedances of the ASC NEPM HIL-D were collected from anthropogenic fill soil.

95% UCL values were calculated for these CoPC are attached in **Appendix G**. **Table 15** below provides a summary of the results.

Table 15 95% UCL Summary – ASC NEPM HIL-D

CoPC	No. of Primary Samples	ASC NEPM HIL-D (mg/kg)	95% UCL (mg/kg)
Lead	519	1,500	300.9
Benzo(a)pyrene TEQ(LOR)	476	40	5.5

The exceedance of the ASC NEPM HIL-D in some samples is not considered to represent an unacceptable risk to workers at the proposed receiving site under the disposal scenario described in **Section 5.2**, however, as:

- Benzo(a)pyrene TEQ and lead present a risk via physical contact (ingestion/inhalation). The proposed disposal methodology includes controls to limit contact with soil/dust during handing of the material (via use of PPE, soil handing and enclosed equipment) and as part of long term management (via cover material to limit contact with the soil).
- The HIL D criteria contain an assumption of up to one hour per day of contact with soil over a 30 year period, which is considered conservative and unlikely to occur under the proposed disposal methodology. No contact with the soil is considered likely to occur once placed and covered.
- 95% UCL concentrations of the CoPC were below criteria, and exceedances of criteria are likely limited throughout the material. The small areas of exceedance are not considered to be representative of the overall condition or expected exposure of the soil during handling and disposal.

On this basis, the assessed material is considered suitable for disposal to landfill under the conditions described in **Section 5.2**.

8.0 Conclusions and Recommendations

As part of proposed development of the Site, excavation of up to ~191,123 m^3 material (WSP, 2024) is proposed, consisting of a mixture of anthropogenic fill, estuarine sediments, and dolerite (ranging from fresh to extremely weathered). Excavation is planned to be conducted in a staged manner and, at the request of the Corporation, AECOM has conducted an *in situ* waste categorisation of the first proposed stages (Stage 1 and Stage 2).

For this assessment, the following activities have been completed:

- Review of historic environmental data for the Site.
- Advancement of 125 boreholes across the Stage 1 and Stage 2 excavation area.
- Collection and laboratory analysis of 518 primary soil samples.
- Screening and assessment of soil data against the waste categorisation data presented in IB105 and the ASC NEPM HIL-D.
- Preparation of this Soil Categorisation and Waste Management Plan to recommend disposal of this material following excavation.

Assessment of waste category was undertaken using IWRG 702, which provides statistical methodologies for assessment of large (>250 m^3) quantities of soil for disposal. While no equivalent guidelines have been issued by EPA Tasmania, the approach presented by IWRG 702, and an earlier version of this document (EPA Victoria, 2009), have been previously accepted by EPA Tasmania in assessments of soil from the Site for waste disposal.

A total soil volume of ~104,000 m^3 *in situ* (138,300 m^3 *ex situ* with a bulking factor of 1.33 applied [IWRG 702]) has been estimated to be within the area of soil assessed in this report, consisting of:

- 93,900 m^3 (*in situ*), consisting of 85,100 m^3 of anthropogenic fill and 8,800 m^3 of moderately to extremely weather dolerite, is categorised as Level 2 – Low Level Contaminated Soil.

  The Level 2 material is considered suitable for disposal to landfill, under the conditions detailed later in this document. It is noted that specific landfill site or sites have not yet been proposed as the ultimate destination for excavated Level 2 material. However, handling and disposal requirements for any disposal site have been identified and included in this assessment.
- 9,800 m^3 (*in situ*) of anthropogenic fill in three hot spots is considered to be potential Level 3 – Contaminated Soil or higher, and is recommended for *ex situ* assessment and potential remediation following excavation.
- An estimated 327 m^3 (*in situ*) of fresh to mildly weathered dolerite in the proposed Stage 1 and Stage 2 excavation area is categorised as Level 1 – Fill Material, Type 1.

Based on the assessment provided in this report, it is recommended that the following additional works be conducted during or prior to excavation:

- Anthropogenic fill at the following locations is considered to potentially be Level 3 or higher, and should be resampled and assessed *ex situ* following excavation:
  - ~7,000 m^3 (*in situ*) proposed to be excavated from the former gasworks footprint in the south-west corner of the proposed excavation (grid references E15-E16, F15-16, G15-G18 and H15-H18).
  - ~1,300 m^3 (*in situ*) to be excavated to an average of approximately 2.5 m bgl in an 18 m radius around sample point J06 noting that only approximately half of this hotspot is within the proposed Stage 1 and Stage 2 excavation area.
  - ~1,500 m^3 (*in situ*), to be excavated to approximately 1.5 m bgl in an 18 m radius around sample point M13.

  Results of the *ex situ* investigation should be assessed and a separate waste management assessment for disposal or remediation be prepared for soil from these areas.

- Planned additional investigation to determine if PASS is present in anthropogenic fill in two locations (BH-004 in *in situ* assessment cell I17 and ABH-004 in *in situ* assessment cell M12) must be completed prior to excavation. If PASS is present, an Acid Sulfate Soil Management Plan for excavation of these areas should be prepared detailing handling and neutralisation measures, with reference to the *Tasmanian Acid Sulfate Soil Management Guidelines* (DPIPWE, 2009), which must be implemented to allow safe handling and disposal of this material.
- During excavation, any areas of potential elevated contamination (such as odours, staining, or high concentrations of anthropogenic material), and any bulk buried materials or infrastructure encountered (such as buried slabs or pipes) should be noted and segregated for further *ex situ* assessment, similar to the areas of potential elevated contamination noted above.

Following excavation, it is recommended that 93,900 m^3 (*in situ*) of Level 2 – Low Level Contaminated Soil, consisting of anthropogenic fill and weathered dolerite, and any fresh to mildly weathered dolerite removed from the Stage 1 and Stage 2 excavation areas, should be disposed of using the following methods:

- Any excavation or handling of soil should be conducted in accordance with the Site Environment Management Plan (the SEMP) (AECOM, 2024a), or any future updates of the SEMP.
- Beneficial on-Site re-use: – Any on-Site beneficial re-use of soil should meet the following criteria:
  - Soil should be categorised as either Level 1 – Fill, or Level 2 – Low Level Contaminated Soil, in accordance with IB105.
  - Contaminant concentrations in the soil should not represent an environmental risk to human or ecological health on the Site or in surrounding areas under the proposed re-use scenario. Potential environmental risks should be assessed with reference to the Site specific Remediation Criteria (AECOM, 2025b).
  - Re-use must be undertaken in such a way to prevent environmental nuisance or harm from escape of materials, spillage, or emission of dust or odours.
  - All soil must be handed in accordance with practices presented within the Site Environment Management Plan (the SEMP) (AECOM, 2024a).

  Any on-Site re-use scenario must be presented an independent Environmental Auditor, as accredited by Section 39F(3) of the *Macquarie Point Development Corporation Act 2012*, for review and endorsement.

  If the on-Site beneficial re-use is endorsed by the Site Environmental Auditor, re-use will proceed, and a record of the re-use scenario, including the volume and characteristics of the soil, the location of re-use, the assessment of environmental risks and mitigations, and the Auditor's endorsement must be provided to EPA no later than one year after re-use has occurred.
- Off-Site disposal to landfill, under the following conditions:
  - The excavated material will be transported off-Site by a contractor on behalf of the Corporation or the receiving Site. Reasonable precautions will be undertaken to ensure that no environmental or human health harm results from the movement of potentially contaminated materials between the sites. All truckloads will be tracked.
  - Material will be immediately disposed of using an enclosed excavator or other mechanical methods. No manual works outside the machine should be conducted as part of the soil placement.
  - The receiving site must develop a Safe Work Method Statement (SWMS) for the placement of the soil which will include handling measures and personal protective equipment (PPE) requirements. The minimum PPE requirements for the work are gloves, long sleeves and pants, eye protection and face mask, and will include procedures (such as washing of hands before eating, drinking, or smoking to remove any material) to reduce any potential exposure by receiving site staff while handling and placing material.
  - The receiving site will have mitigation methods to prevent dust generation during soil placement or long term.

- The areas of disposal will be remote from members of the public or any staff outside excavators/machines.
- The area of disposal will be unsaturated (i.e., above the water table).
- The material will not be stored by the receiving site prior to use.
- No further excavation or disturbance of the area of use will take place following import of the material.
- The receiving site will have an EPA certified leachate capture and treatment system. Leachate from the area of reuse will be captured in a silt trap/holding basin prior to discharge to sewer.
- The receiving site will not have ecological receptors (i.e., plants/trees/wildlife) in the final disposal location.
- The receiving site will be within Tasmania. Additional approvals will be required transport to and disposal at non-Tasmanian sites.

Approval from EPA is required prior to the disposal of any material, and all material must be transported off Site by an appropriately licensed waste transporter.

Assessment of soil waste categories and suitability for proposed disposal routes has been undertaken as a statistical assessment of the entire volume of soil proposed for excavation. In the event that an alternative disposal methodology or Site be proposed, or further treatment required, this Waste Management Plan should be updated to separately assess each volume of soil proposed for different disposal methods, or a new plan be prepared, by a suitably experienced environmental practitioner.

10.0 Statement of Limitations

This document was prepared for the purpose described herein and as agreed to by AECOM Australia Pty Ltd (AECOM) and the Macquarie Point Development Corporation Pty Ltd (the Principal).

This document was prepared for the sole use of the Principal, the only intended beneficiaries of our work. AECOM accepts no duty of care or liability to any third parties who may use or rely on this report, other than as expressly agreed by AECOM. Without limiting the foregoing sentence in any way, in no circumstances will AECOM be liable to any third party whether that liability arises in contract, tort (including negligence or breach of statutory duty) or otherwise for any loss whatsoever arising out of or in any way related to this report.

For the purposes of this report, AECOM has relied upon previous detailed investigations carried out and a review of available reports as referenced in the text of this document. It is assumed by AECOM that all relevant information and reports have been provided by those persons from whom it has been requested and that such information provided is accurate. AECOM does not assume any liability for misrepresentation of items not visible, accessible or present at the Site during Site inspections.

This report is not intended as a substitute for legal advice, nor is it an exhaustive review of the Site conditions. AECOM makes no warranties about the condition of the Site or the operations occurring at the Site.

From a technical perspective, the subsurface environment at any Site may present substantial uncertainty. It is a heterogeneous, complex environment, in which small subsurface features or changes in geologic conditions can have substantial impacts on water and chemical movement. Uncertainties may also affect source characterisation assessment of chemical fate and transport in the environment, assessment of exposure risks and health effects and remedial action performance.

There is no investigation that is thorough enough to preclude the presence of material, which presently or in the future, may be considered hazardous at the Site. Because regulatory evaluation criteria change from time to time, concentrations of contaminants presently considered low may, in the future, fall under different regulatory standards that may require a change in action.

Any advice, opinions or recommendations contained in this document should be read and relied upon only in the context of the document as a whole and are considered current to the date of this document. AECOM believes that its opinions are reasonably supported by the testing and analysis that have been done and that those opinions have been developed according to the professional standard of care for the environmental consulting profession in this area at this time. That standard of care may change, and new methods and practices of exploration, testing, analysis and remediation may develop in the future, which might produce different results. AECOM’s professional opinions contained in this document are subject to modification if additional information is obtained through further investigation, observations, or testing and analysis during any future assessment or remedial activities.

This document may only be reproduced in its entirety.

Comments
#1 Chrysotile asbestos detected.Organic fibres detected.
#2 50 x 40 x 5
#3 Organic fibres detected.
#4 Chrysotile and amosite asbestos detected in fibre cement fragments and in the form of loose fibre bundles.Approximate raw weight of asbesto
#5 Nil
#6 No trace asbestos detected.
#7 Reported Analyte LOR is higher than Requested Analyte LOR
#8 Sample accidently labelled as "I18" not "I08". Correct location determined by sample date and depths

Comments
#1 Individual compounds have been assessed through the sum of PFOS+PFHxS

Appendix C

Data Validation

Data Validation Total Contamination Samples

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the data considered in this report are presented in **Section 5.3** of the main report. Quality assurance (QA) and quality control (QC) assessment of the sampling methodology and analytical data against the DQIs has been undertaken in this data validation.

Eurofins Environment Testing (Eurofins) was selected as the primary laboratory and ALS Laboratories (ALS) Melbourne was selected as the secondary laboratory for chemical analysis. Both laboratories are accredited by the National Association of Testing Authorities (NATA) for the analyses selected.

The relevant laboratory reports pertaining to the primary soil bore samples considered in this report are summarised in below **Table 1**. Copies of the laboratory documentation including chain of custody (CoC) documentation, sample receipt notification (SRN) reports, QC reports, and certificates of analysis are attached in **Appendix E**, and field records collected during works are attached as **Appendix F**.

Table 1 Primary Soil Bore Data Considered

Laboratory Report	Sample Date	Sample Locations or IDs

*Note: * – Laboratory reports from the secondary laboratory.*

1.0 Assessment of Field Data Quality

1.1 Sample Collection

Soil samples were collected by Jacob Muller, Andrew Christensen and Taya Gerstel field personal with appropriate environmental sampling experience. Sample collection was conducted with reference to the methodology described in **Section 6.0** of the main report. Samples were collected in laboratory supplied sample containers and placed in chilled eskies prior to transportation to the selected laboratories.

1.2 Intra- and Inter-Laboratory Field Duplicate Samples

A total of 29 intra-laboratory and inter-laboratory field duplicate sample pairs were collected alongside the 498 primary samples analysed for Contaminants of Potential Concern and IB105.

Duplicate samples were collected at a rate greater than one intra-laboratory sample and one inter-laboratory sample per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples).

Duplicate samples have been compared to primary samples and Relative Percentage Differences (RPDs) were calculated. Results of field duplicate samples and RPDs are presented in **Table B1**.

The following acceptance criteria have been applied for RPDs:

- RPD less than 30% for high level laboratory duplicates (i.e. concentrations >20 x LOR)
- RPD less than 50% for medium level laboratory duplicates (i.e. concentrations 10 – 20 x LOR)
- RPD less than 200% for low level laboratory duplicates (i.e. concentrations 1 – 10 x LOR)

532 RPD values (~ 15% of the 3,389 values calculated) were reported above the adopted acceptable RPD DQO limits.

While this is a relatively high proportion of the total number of RPDs, The majority of non-conforming RPD values were reported for polycyclic aromatic hydrocarbons (PAHs). These CoPC are typically of low mobility, or immobile in soil, and sensitive to variation across short distances in the sample matrix. Non-conformance numbers may also be elevated as:

- Benzo(a)pyrene was sampled using multiple techniques for low level and standard results, and discrepancies within the data may arise from the inconsistency of method analysis.
- Benzo(a)pyrene toxic equivalence factor (TEQ) values reported were included in RPD calculations. If there is variance in initial results (due to sample heterogeneity, LORs adopted by different laboratories, or potential analytical method error) RPD non-conformances can be elevated by calculated benzo(a)pyrene TEQ values.
- Samples exceeding RPD and Level 2 waste classification criteria for Benzo(a)pyrene are below. These samples were tested for leachable concentrations and were below the level 2 TCLP waste classification criteria, with the exception of sample H16_2.0

Sample Location	Duplicate ID
J14_0.5	QC104
J14_0.5	QC103
L16_0.5	QC115
L16_0.5	QC116
N16_1.5	QC127
N16_1.5	QC128
I10_1.0	QC149 – not exceed

Sample Location	Duplicate ID
I10_1.0	QC152 – not exceeded
K11_2.0	QC147
K11_2.0	QC148
E13_1.5	QC171
E13_1.5	QC172
G12_1.0	QC163
G12_1.0	QC164
G14_1.5	QC173
G14_1.5	QC174
H16_2.0	QC183
H16_2.0	QC184
H14_3.0 – not exceeded	QC196
H14_3.0 – not exceeded	QC197
I06_0.5	QC190 – not exceeded
I06_0.5	QC191 – not exceeded

A number of RPD non-conformances were also reported for metals and TPH/TRH but are low compared to conforming RPD values and considered likely to be due to soil heterogeneity.

The RPD results are not considered to have compromised the interpretive use of the data. However, the higher concentration will be considered for interpretation.

1.3 Trip Blanks

Trip blanks, consisting of either clean inert silicate or deionised water supplied by the analytical laboratory, were collected at a rate of one per esky cooler delivered to the laboratory and were analysed for select volatile compounds, including TPH C_6-C_9, TRH C_6-C_{10}, and BTEXN. Trip blank samples QC138 and QC187 were not delivered to the laboratory on 6 December 2024, and 10 December 2024 respectively.

All trip blank analytes had concentrations of target compounds reported below the LOR, and it is considered unlikely that any cross contamination occurred in transit.

Trip blank results are reported on **Table B3** and **Table B4** attached.

1.4 Rinsate Blanks and Field Blanks

Rinsate blanks were prepared by pouring laboratory supplied water over non-dedicated sampling equipment following decontamination procedures to assess the potential for cross-contamination. Field blank samples were prepared by pouring laboratory supplied water in sampling containers in the field during sampling to assess whether contamination may have occurred in the field during sampling.

11 rinsate blanks and 11 field blanks were collected as part of field work, at a rate of one rinsate blank per day and one field blank day. Rinsate blanks were analysed for the same analytes as the corresponding primary sample, and field blanks were submitted on hold for assessment if any rinsate blank discrepancies were reported. All rinsate blank analytes had concentrations below the laboratory LOR, indicating that field decontamination procedures were appropriately adopted and that the risk of cross contamination of samples through field equipment or during field sampling is acceptably low.

Rinsate results are reported on **Table B3** and **Table B4** attached.

2.0 Assessment of Laboratory Data Quality

A summary of the assessment of laboratory data quality for soil, leachate and QA/QC samples relevant to the report is provided in **Section 2.1** – **Section 2.9** below.

Soil samples were analysed for a combination of analytes including metals, cyanide, fluoride, ammonia, TPH/TRH, BTEX, PAH, MAH, phenols, and asbestos. As these analytes include the CoPC identified in **Section 3.1** (of the main report) for the areas from which the stockpile was generated, based on available Site history and uses, and previous investigations conducted, the soil analytical program is considered appropriate for the purposes of this report. The adequacy of the analytical suite selected is further detailed in in **Section 7.3** of the main report.

2.1 Sample Receipt Temperature

Soil samples were kept chilled during storage and transportation with ice in portable coolers until received by the laboratory for analysis. Samples were reported to be received in good condition in appropriately preserved sample containers.

Samples were reported received by the primary analytical laboratory (Eurofins) as chilled with ice present. Sample batches 1165428 (10°C), 1168041 (10°C), 1169377 (10°C), 1171413 (21.6°C), 1171417 (21.6) were reported as being received above the acceptable temperature range of 0 – 6°C.

Sample receipt temperature discrepancies at the primary analytical laboratory are not considered to potentially affect interpretation of results, as samples were delivered directly to the analytical laboratory, located within 10 minutes' drive of the Site, on the same day as collected by field staff and were noted to be chilled upon receipt, and the temperature discrepancy is considered to be due to insufficient time for samples to cool between collection and receipt.

Samples were received outside the acceptable temperature range of 0 – 6°C by the secondary lab (ALS) in batch EM2421016 (13.3°C), EM2421150 (9.1°C), EM2421657 (15.4°C), EM2422260 (11.2°C), EM2422322 (20.1°C), EM2422568 (12.2°C) although ice bricks were noted to be present. Some degradation of volatile hydrocarbons may have occurred on transit to the secondary laboratory.

2.2 Sample Holding Times

All primary samples were received by laboratories within the recommended holding times for the requested analyses.

Proactive holding time assessments completed by the analytical laboratories are provided in **Appendix C**.

2.3 Limits of Reporting

All LORs were sufficiently low enough to ensure reliability of data when compared to assessment criteria. There is no other impact from LORs to the usability of the data for the purposes of soil characterisation.

2.4 Laboratory Method Blanks

All laboratory method blanks, detailed in **Appendix C**, were reported within the acceptable range, i.e. below the laboratory LORs.

2.5 Laboratory Control Spikes

Laboratory control spikes, detailed in **Appendix C**, were within the laboratory-derived control limits for the methods used.

2.6 Frequency of Quality Control Spike

Frequency of quality control spikes, detailed in **Appendix C**, were at the rate expected by applicable QC specifications.

2.7 Laboratory Duplicates and RPDs

The RPD between analytical results for primary samples and their corresponding laboratory duplicates are reported in **Appendix C** and were within acceptable limits for all samples, with the exception of the below reports and associated analytical groups:

1165428 – PAH and heavy metals

- 1166213 – Heavy metals
- 1168041 – PAH
- 1169377 – TRH, and PAH
- 1171413 - PAH
- 1171417 – PAH, fluoride, heavy metals

The elevated RPDs should be taken into consideration when using the data quantitatively. Although some minor variances from recommended limits or ranges occurred, indicating minor possibility of under- or over-reporting for some chemicals. These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

2.8 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix C**. Matrix spike recoveries were noted to be within the data quality objective ranges.

2.9 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory quality control reports provided in **Appendix C**. All surrogate spike recoveries for regular sample matrices were within the surrogate control limits adopted for the methods used. No surrogate recovery outliers were reported.

3.0 Summary

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- eleven intra-laboratory and one inter-laboratory field duplicate sample pair was collected alongside the 148 primary samples.

  Duplicate samples were collected at a rate greater than one intra-laboratory sample and one inter-laboratory sample per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples).

- 532 RPD values (~ 15% of the 3389 values calculated) were reported above the adopted acceptable RPD DQO limits as highlighted in red in Table B1.

- While this is a relatively high proportion of the total number of RPDs, the majority of non-conforming RPD values were reported for polycyclic aromatic hydrocarbons (PAHs). These CoPC are typically of low mobility, or immobile in soil, and sensitive to variation across short distances in the sample matrix. Non-conformance numbers may also be elevated as:

  - Benzo(a)pyrene was sampled using multiple techniques for low level and standard results, and discrepancies within the data may arise from the inconsistency of method analysis.
  - Benzo(a)pyrene toxic equivalence factor (TEQ) values reported were included in RPD calculations. If there is variance in initial results (due to sample heterogeneity, LORs adopted by different laboratories, or potential analytical method error) RPD non-conformances can be elevated by calculated benzo(a)pyrene TEQ values.
  - Samples exceeding RPD and level 2 waste classification criteria for Benzo(a)pyrene are below. These samples were tested for leachable concentrations and were below the level 2 TCLP waste classification criteria, with the exception of sample H16_2.0

- A number of RPD non-conformances were also reported for metals and TPH/TRH but are low compared to conforming RPD values and considered likely to be due to soil heterogeneity.

- The RPD results are not considered to have compromised the interpretive use of the data. However, the higher concentration will be considered for interpretation.

- Trip blank and rinsate blank samples were collected on each day primary samples were collected. All analytical results for trip and rinsate blanks were reported below the laboratory LORs.

- Samples were reported received by the primary analytical laboratory as chilled and suitable for assessment. Some samples were reported outside the acceptable temperature range of 0 – 6°C, although ice bricks were noted to be present, and this temperature discrepancy is believed to be due to the short period between sample collection and delivery to the laboratory.

  Samples were received by the secondary laboratory outside the acceptable temperature range of 0 – 6°C, although ice bricks were noted to be present. Some degradation of volatile components may have occurred in transit.

- All LORs were sufficiently low enough to ensure reliability of data when compared to assessment criteria. There is no other impact from LORs to the usability of the data for the purposes of soil characterisation.

- Laboratory QA/QC sampling procedures including analysis of laboratory duplicates and frequency of QA/QC reported some minor variances from recommended limits or ranges, indicating minor possibility of under- or over-reporting for some chemicals. These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of excavation validation and overall Site condition at the completion of remediation.

Data Validation Leachate Analysis Samples

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the data considered in this report are presented in **Section 5.3** of the main report. Quality assurance (QA) and quality control (QC) assessment of the sampling methodology and analytical data against the DQIs has been undertaken in this data validation.

Eurofins Environment Testing (Eurofins) was selected as the primary laboratory and ALS Laboratories (ALS) Melbourne was selected as the secondary laboratory for chemical analysis. Both laboratories are accredited by the National Association of Testing Authorities (NATA) for the analyses selected.

The relevant laboratory reports pertaining to the leachate analysis samples considered in this report are summarised in below **Table 1**. Copies of the laboratory documentation including chain of custody (CoC) documentation, sample receipt notification (SRN) reports, QC reports, and certificates of analysis are attached in **Appendix E**, and field records collected during works are attached as **Appendix F**.

*Note: * – Laboratory reports from the secondary laboratory.*

1.0 Assessment of Field Data Quality

1.1 Sample Collection

Soil samples were collected by Jacob Muller, Andrew Christensen and Taya Gerstel field personal with appropriate environmental sampling experience. Sample collection was conducted with reference to the methodology described in **Section 6.0** of the main report. Samples were collected in laboratory supplied sample containers and placed in chilled eskies prior to transportation to the selected laboratories.

1.2 Intra- and Inter-Laboratory Field Duplicate Samples

A total of 11 intra-laboratory and inter-laboratory field duplicate sample pairs were analysed for TCLP PAH leachate alongside the 206 primary samples analysed for TCLP PAH leachate

Duplicate samples were collected at a rate greater than one intra-laboratory sample and one inter-laboratory sample per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples).

Duplicate samples have been compared to primary samples and Relative Percentage Differences (RPDs) were calculated. Results of field duplicate samples and RPDs are presented in **Table B1**.

The following acceptance criteria have been applied for RPDs:

- RPD less than 30% for high level laboratory duplicates (i.e. concentrations >20 x LOR)
- RPD less than 50% for medium level laboratory duplicates (i.e. concentrations 10 – 20 x LOR)
- RPD less than 200% for low level laboratory duplicates (i.e. concentrations 1 – 10 x LOR)

67 RPD values (~ 19% of the 349 values calculated) were reported above the adopted acceptable RPD DQO limits as highlighted in red in **Table B2**.

While this is a relatively high proportion of the total number of RPDs, The non-conforming RPD values were reported for polycyclic aromatic hydrocarbons (PAHs). These CoPC are typically of low mobility, or immobile in soil, and sensitive to variation across short distances in the sample matrix. All non-conforming RPDs were reviewed against TCLP waste classification criteria. No samples exceeded the level 2 TCLP waste classification criteria, with the exception of H16_2.0 for benzo(a)pyrene – the respective intra and inter-laboratory duplicates QC183 and QC184 did not exceed the criteria.

1.3 Trip Blanks

Trip blanks, consisting of either clean inert silicate or deionised water supplied by the analytical laboratory, were collected at a rate of one per esky cooler delivered to the laboratory with the primary samples and were analysed for select volatile compounds, including TPH C_6-C_9, TRH C_6-C_{10}, and BTEXN. Trip blank samples QC138 and QC187 were not delivered to the laboratory on 6 December 2024, and 10 December 2024 respectively. Trip Blanks QC185 and QC186 were sent in laboratory batch 1174347 and 1171413.

All trip blank analytes had concentrations of target compounds reported below the LOR, and it is considered unlikely that any cross contamination occurred in transit.

Trip blank results are reported on **Table B3** and **Table B4** attached.

1.4 Rinsate Blanks and Field Blanks

Rinsate blanks were prepared by pouring laboratory supplied water over non-dedicated sampling equipment following decontamination procedures to assess the potential for cross-contamination. Field blank samples were prepared by pouring laboratory supplied water in sampling containers in the field during sampling to assess whether contamination may have occurred in the field during sampling.

11 rinsate blanks and 11 field blanks were collected as part of field work, at a rate of one rinsate blank per day and one field blank day. Rinsate blanks were analysed for the same analytes as the corresponding primary sample, and field blanks were submitted on hold for assessment if any rinsate blank discrepancies were reported. All rinsate blank analytes had concentrations below the laboratory LOR, indicating that field decontamination procedures were appropriately adopted and that the risk of cross contamination of samples through field equipment or during field sampling is acceptably low.

Rinsate results are reported on **Table B3** attached.

2.0 Assessment of Laboratory Data Quality

A summary of the assessment of laboratory data quality for leachate and QA/QC samples relevant to the report is provided in **Section 2.1** – **Section 2.9** below.

Soil samples were re-analysed for a combination of analytes including PAH (trace level), and USA leaching procedure. As these analytes include the CoPC identified in **Section 1.3** (of the main report), based on available Site history and uses, and previous investigations conducted, the soil analytical program is considered appropriate for the purposes of this report. The adequacy of the analytical suite selected is further detailed in in **Section 4.2** of the main report.

2.1 Sample Receipt Temperature

Soil samples were kept chilled during storage and transportation with ice in portable coolers until received by the laboratory for analysis. Samples were reported to be received in good condition in appropriately preserved sample containers.

Samples were reported received by the primary analytical laboratory (Eurofins) as chilled with ice present. Sample batches 1170315, 1172368, 1173784, 1176785, 1174347, 1174332, 1179861 and 1182411 did not provide temperature on the sample receipts. This is due to the samples being re-analysed and were sent to the laboratory through different laboratory batches.

Samples were received outside the acceptable temperature range of 0 – 6°C by the secondary lab (ALS) in batch EM2421657 (15.4°C), although ice bricks were noted to be present. Some degradation of volatile hydrocarbons may have occurred on transit to the secondary laboratory.

Sample batches EM2421847, EM2422063, EM2422444, EM2422713, EM2422754 did not provide temperature on the sample receipts. This is due to the samples being re-analysed and were sent to the laboratory through different laboratory batches.

2.2 Sample Holding Times

All primary and secondary samples were received by laboratories within the recommended holding times for the requested analyses, with the exception of the following:

Laboratory	Sample	Analyte	Days overdue
EM2421847	QC103	Non-Volatile Leach: 14 day HT(e.g. SV organics)	4
EM2422063	QC116	Non-Volatile Leach: 14 day HT(e.g. SV organics)	5
EM2422713	QC148	Non-Volatile Leach: 14 day HT(e.g. SV organics)	10
EM2422754	QC174, QC172, QC164, QC184	Non-Volatile Leach: 14 day HT(e.g. SV organics)	6
	QC187	Non-Volatile Leach: 14 day HT(e.g. SV organics)	5

Samples were extracted and analysed marginally outside recommended holding times for non-volatile leach method groups. There is the potential for these analytes to have degraded over time and not be truly representative of field conditions. This potential under reporting should be taken into consideration when interpreting data for these analytes.

Proactive holding time assessments completed by the analytical laboratories are provided in **Appendix C**.

2.3 Limits of Reporting

All LORs were sufficiently low enough to ensure reliability of data when compared to assessment criteria. There is no other impact from LORs to the usability of the data for the purposes of soil characterisation.

2.4 Laboratory Method Blanks

All laboratory method blanks, detailed in **Appendix C**, were reported within the acceptable range, i.e. below the laboratory LORs.

2.5 Laboratory Control Spikes

Laboratory control spikes, detailed in **Appendix C**, were within the laboratory-derived control limits for the methods used.

2.6 Frequency of Quality Control Spike

Frequency of quality control spikes, detailed in **Appendix C**, were at the rate expected by applicable QC specifications.

2.7 Laboratory Duplicates and RPDs

The RPD between analytical results for primary samples and their corresponding laboratory duplicates are reported in **Appendix C** and were within acceptable limits for all samples, with the exception of the below reports and associated analytical groups:

1172378 – PAH (trace level)

1173784 – PAH (trace level)

1174347 – PAH (trace level)

The elevated RPDs should be taken into consideration when using the data quantitatively. Although some minor variances from recommended limits or ranges occurred, indicating minor possibility of under- or over-reporting for some chemicals. These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

2.8 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix C**. Matrix spike recoveries were noted to be within the data quality objective ranges.

2.9 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory quality control reports provided in **Appendix C**. All surrogate spike recoveries for regular sample matrices were within the surrogate control limits adopted for the methods used. No surrogate recovery outliers were reported.

3.0 Summary

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- 11 intra-laboratory and inter-laboratory field duplicate sample pairs were analysed for TCLP PAH leachate alongside the 206 primary samples analysed for TCLP PAH leachate

  Duplicate samples were collected at a rate greater than one intra-laboratory sample and one inter-laboratory sample per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples).

- 67 RPD values (~ 19% of the 349 values calculated) were reported above the adopted acceptable RPD DQO limits as highlighted in red in **Table B2**.

- While this is a relatively high proportion of the total number of RPDs, The non-conforming RPD values were reported for polycyclic aromatic hydrocarbons (PAHs). These CoPC are typically of low mobility, or immobile in soil, and sensitive to variation across short distances in the sample matrix. All non-conforming RPDs were reviewed against TCLP waste classification criteria. No samples exceeded the level 2 TCLP waste classification criteria, with the exception of H16_2.0 for benzo(a)pyrene – the respective intra and inter-laboratory duplicates QC183 and QC184 did not exceed the criteria.

- The RPD results are not considered to have compromised the interpretive use of the data. However, the higher concentration will be considered for interpretation.

- Trip blank and rinsate blank samples were collected on each day primary samples were collected. All analytical results for trip and rinsate blanks were reported below the laboratory LORs.

- Samples were reported received by the primary analytical laboratory (Eurofins) as chilled with ice present. Sample batches 1170315, 1172368, 1173784, 1176785, 1174347, 1174332, 1179861 and 1182411 did not provide temperature on the sample receipts. This is due to the samples being re-analysed and were sent to the laboratory through different laboratory batches.

  Samples were received outside the acceptable temperature range of 0 – 6°C by the secondary lab (ALS) in batch EM2421657 (15.4°C), although ice bricks were noted to be present. Some degradation of volatile hydrocarbons may have occurred on transit to the secondary laboratory.

  Sample batches EM2421847, EM2422063, EM2422444, EM2422713, EM2422754 did not provide temperature on the sample receipts. This is due to the samples being re-analysed and were sent to the laboratory through different laboratory batches.

- All LORs were sufficiently low enough to ensure reliability of data when compared to assessment criteria. There is no other impact from LORs to the usability of the data for the purposes of soil characterisation.

- Laboratory QA/QC sampling procedures including analysis of laboratory duplicates and frequency of QA/QC reported some minor variances from recommended limits or ranges, indicating minor possibility of under- or over-reporting for some chemicals. These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of excavation validation and overall Site condition at the completion of remediation.

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 200 (1 - 10 x EQL); 50 (10 - 20 x EQL); 30 (> 20 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

Unverified Sender: The sender of this email has not been verified. Review the content of the message carefully and verify the identity of the sender before acting on this email: replying, opening attachments or clicking links.

Please update analysis for the following samples in Batch 1165428: (and refer to annotated SRN)

Not on COC samples:

- J15_0.5 (B1 – TRH/BTEXN; Metals (Pb, As); PAH trace-level)
- J15_1.0 (B1 – TRH/BTEXN; Metals (Pb, As); PAH trace-level)
- J15_1.5 (IB105 suite)

Remove analysis and place on Hold:

- N18_1.5
- O18_1.5

Remove full PAH trace level suite and only complete IB105 suite (only B(a)P trace level required initially):

- J12_0.5
- J13_0.5
- J14_1.5
- K14_0.5
- K15_1.0
- K16_0.5
- K16_1.5
- I17_0.5
- J17_1.0
- J18_0.5
- K18_1.5
- J16_1.0
- K17_0.5

COC IDs:

- 018_0.5, 1.0 and 1.5; it should be the letter O18_0.5, 1.0 and 1.5

Company name: Aecom Aust Pty Ltd Tasmania
Contact name: Robert Crowe
Project name: MACQUAIRE POINT
Project ID: 60693007 7
Turnaround time: 5 Day
Date/Time received Nov 27, 2024 11:31 AM
Eurofins reference 1165428

Sample Information

✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 10 degrees Celsius.

✓ All samples have been received as described on the above COC.

✓ COC has been completed correctly.

✓ Attempt to chill was evident.

✓ Appropriately preserved sample containers have been used.

✓ All samples were received in good condition.

✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

✓ Appropriate sample containers have been used.

✓ Sample containers for volatile analysis received with zero headspace.

✓ Split sample sent to requested external lab.

✗ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Extra samples received J15_0.5, J15_1.0, J15_1.5 samples have been placed on hold. Please advise for analysis.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.
