CERTIFICATE OF ANALYSIS

Work Order	: **EM2307275**	Page	: 1 of 13
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023 11:15
Order number	: 60693007-3	Date Analysis Commenced	: 01-May-2023
C-O-C number	: ----	Issue Date	: 03-May-2023 16:48
Sampler	: TIM SMITH02		
Site	: Macquarie Point		
Quote number	: EN/004/21		
No. of samples received	: 23		
No. of samples analysed	: 23		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- This is a rebatch of EM2305209.
- EN33a-G: EM2307275 #001 Due to limited sample for leach analysis, a scaled down amount of 30g into 600mL was used.
- EN33a-G: EM2307275 #002, #003, #009 Due to limited sample for leach analysis, a scaled down amount of 50g into 1000mL was used.

Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023
Order number	: 60693007-3	Date Analysis Commenced	: 01-May-2023
C-O-C number	: ----	Issue Date	: 03-May-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point		
Quote number	: EN/004/21		
No. of samples received	: 23		
No. of samples analysed	: 23		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Leachable Metals by ICPAES	EG005C	SOIL	In house: referenced to APHA 3120; USEPA SW 846 - 6010: The ICPAES technique ionises leachate sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- This is a rebatch of EM2305209.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Morning Dai, Peter,

Thanks for the help with this last week – files have been received and imported OK.

Can I please request TCLP PAH leachate assessment and lead leachate assessment for the samples in batch EM2305209-AB as per the table below?

Please let me know if any additional information is needed,

Cheers, Rob

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005T: EM2309607 #2, Poor matrix spike recovery for Lead due to sample matrix. Confirmed by re-extraction and re-analysis.
- EP075(SIM): EM2309607_023 Poor matrix spike recovery for pyrene due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EG035T: EM2309607#27 Poor matrix spike recovery for total mercury due to sample matrix. Confirmed by re-extraction and re-analysis.
- EN33: Where leachable PFAS analysis is requested, centrifugation rather than pressure filtration is used as the default approach for removal of particulates, in line with AS 4439.3.

Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 26-May-2023
Order number	: 60693007-2	Date Analysis Commenced	: 30-May-2023
C-O-C number	: 52798	Issue Date	: 02-Jun-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 36		
No. of samples analysed	: 35		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Leachable Metals by ICPAES	EG005C	SOIL	In house: referenced to APHA 3120; USEPA SW 846 - 6010: The ICPAES technique ionises leachate sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Leachable Mercury by FIMS	EG035C	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the TCLP solution. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
TCLP for Non & Semivolatile Analytes - Plastic Leaching Vessel	EN33a-P	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

No. of coolers/boxes	: 2	Temperature	: 1.2°C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 36 / 35

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

My regular work days are Monday to Thursday

One email is estimated to produce 10^{-6} T of CO_2 equivalent. Not much? But, considering the average person sends ten unactionable, unnecessary emails per week, the cumulative carbon footprint mounts substantially. Please don't be offended if you don't receive acknowledgement emails from me. I appreciate deeply those I work for and with.

Project	: Macquarie Point	Date Samples Received	: 26-May-2023 11:00
Order number	: 60693007-2	Date Analysis Commenced	: 31-May-2023
C-O-C number	: ----	Issue Date	: 13-Jun-2023 16:42
Sampler	: TIM SMITH		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 7		
No. of samples analysed	: 7		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP070-CWG: EM2310094-006 Higher than expected surrogate recovery due to matrix interference.
- This is a rebatch of EM2309607 .

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

				Laboratory Duplicate (DUP) Report

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

				Method Blank (MB) Report	Laboratory Control Spike (LCS) Report			
					Spike	Spike Recovery (%)	Acceptable Limits (%)	
Method: Compound	CAS Number	LOR	Unit	Result	Concentration	LCS	Low	High

EP070-CWG: Aromatic >C12-C16	TPHCWG-AR E2	50	mg/kg	<50	1365 mg/kg	86.1	55.2	142

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2310094**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 26-May-2023
Site	: Macquarie Point Oil and Diesel Line removal	Issue Date	: 13-Jun-2023
Sampler	: TIM SMITH	No. of samples received	: 7
Order number	: 60693007-2	No. of samples analysed	: 7

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Regular Sample Surrogates

Sub-Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP079/EP070S:TPH Surrogates - semivolatile speciatio	EM2310094-006	OL_EX_BF_08_0.5	**2-Fluorobiphenyl**	321-60-8	174 %	64.0-128 %	**Recovery greater than upper data quality objective**

Outliers : Frequency of Quality Control Samples

Matrix: **SOIL**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
	0				
Matrix Spikes (MS)					
TPH Speciation (TPH CWG & RIVM fractions)	0	7	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Tumbler Extraction of Solids (Option B - Non-concentrating)	ORG17-SP	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 20mL 1:1 DCM/Acetone by end over end tumble. The solvent is transferred directly to a GC vial for analysis.

CAUTION: This email originated from outside of ALS. Do not click links or open attachments unless you recognize the sender and are sure content is relevant to you.

Afternoon Peter,

Hope you had a great weekend. Could I please request aliphatic/aromatic speciation (C10-C16) for the following samples from this batch?

Lab ID	Field ID	Additional Analytical Suite
EM2309607003	OL_EX_BF_01_1.5	Aliphatic/Aromatic Speciation (TRH C10-C16)
EM2309607004	OL_EX_BF_02_0.5	Aliphatic/Aromatic Speciation (TRH C10-C16)
EM2309607011	OL_EX_BF_04_1.0	Aliphatic/Aromatic Speciation (TRH C10-C16)
EM2309607012	OL_EX_BF_04_1.5	Aliphatic/Aromatic Speciation (TRH C10-C16)
EM2309607017	OL_EX_BF_06_1.0	Aliphatic/Aromatic Speciation (TRH C10-C16)
EM2309607020	OL_EX_BF_08_0.5	Aliphatic/Aromatic Speciation (TRH C10-C16)
EM2309607023	OL_EX_BF_09_1.0	Aliphatic/Aromatic Speciation (TRH C10-C16)

Thanks, and please let me know if you need any additional information,

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 8.2 degrees Celsius.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- **N/A** Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Michael Morrison on phone : 03 8564 5933 or by email: MichaelMorrison@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general AECOM Aust Pty Ltd Melbourne email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference.

This is that same problem with Compass – it does not appear to have updated/sync'd the sample names when the COC is finalised.

My regular work days are Monday to Thursday

One email is estimated to produce 10^{-6} T of CO_2 equivalent. Not much? But, considering the average person sends ten unactionable, unnecessary emails per week, the cumulative carbon footprint mounts substantially. Please don't be offended if you don't receive acknowledgement emails from me. I appreciate deeply those I work for and with.

Sample Receipt Advice

Company name:	AECOM Aust Pty Ltd Melbourne
Contact name:	Tim Smith
Project name:	AECOM AU COMPASS
Project ID:	52798
Turnaround time:	5 Day
Date/Time received	May 31, 2023 9:00 AM
Eurofins reference	994827

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 9.4 degrees Celsius.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- **N/A** Custody Seals intact (if used).

Notes

EXTRA TRIP BLANK SAMPLE RECEIVED

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Michael Morrison on phone : 03 8564 5933 or by email: MichaelMorrison@eurofins.com

Results will be delivered electronically via email to Tim Smith - tim.smith02@aecom.com.

Note: A copy of these results will also be delivered to the general AECOM Aust Pty Ltd Melbourne email address.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**µg/L:** micrograms per litre
ppm: parts per million	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit		

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Data Validation

Data Validation

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the data considered in this report are presented in **Section 3.5** of the main report. Quality assurance (QA) and quality control (QC) assessment of the sampling methodology and analytical data against the DQIs has been undertaken in this data validation.

ALS Laboratories (ALS) Melbourne was selected as the primary laboratory and Eurofins was selected as the secondary laboratory for chemical analysis of soil samples. Asbestos identification assessment was undertaken by HSR Consulting.

All laboratories used are accredited by the National Association of Testing Authorities (NATA) for the analyses selected.

The sampling events and relevant laboratory reports pertaining to the analytical data considered in this report are summarised in below **Table 1**.

Table 1 Laboratory Data Considered

Sample Source / ID	Sampling Event	Sampling Personnel	Lab Report Numbers
Oil Line Excavation Validation	27 February 2023 – Oil Line Excavation remediation validation sampling	Timothy Smith (AECOM	EM2303516 EM2304091 968430*
	27 February 2023 – Oil Line cladding sampling	Randall Stafford (BlackCap)	ID23101
UST_SP_0.5-1.0 UST_SP_0.5-1.0	21 March 2023 – Pre-remediation sampling	Timothy Smith (AECOM)	EM2305209-AB EM2307275
OL_EX_BF	25 May 2023 – *In situ* sampling of backfill area	Timothy Smith (AECOM	EM2309607 EM2310095 994827*

*Note: * – Laboratory reports from the secondary laboratory.*

Copies of the laboratory documentation including chain of custody (CoC) documentation, sample receipt notification (SRN) reports, QC reports, and certificates of analysis are attached in **Appendix A**. Results of Asbestos Identification are attached as **Appendix E**.

1.0 Assessment of Field Data Quality

1.1 Sample Collection

Soil samples from stockpiles, excavation walls, and *in situ* test pits were collected by AECOM field personal with appropriate environmental sampling experience. Sample collection was conducted with reference to the methodology described in **Section 4.2** of the main report. Samples were collected in laboratory supplied sample containers and placed in chilled eskies prior to transportation to the selected laboratories.

Cladding samples were cut from the Oil Line by BlackCap staff with suitable experience in asbestos assessment and handling, with AECOM staff onsite to supervise removal. Samples were appropriately packed in sealed containers for transport to the analytical laboratory.

1.2 Intra- and Inter-Laboratory Field Duplicate Samples

Four intra-laboratory and three inter-laboratory field duplicate sample pairs were collected from the 44 primary soil samples assessed as part of these works.

Intra- and inter-laboratory duplicate samples were collected at a rate greater than or equal to one per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples) and the duplicate sample rate is considered satisfactory for assessment of data reliability.

Duplicate samples have been compared to primary samples and Relative Percentage Differences (RPDs) were calculated. Results of field duplicate samples and RPDs are presented in **Table B1**.

The following acceptance criteria have been applied for RPDs:

- RPD less than 30% for high level laboratory duplicates (i.e., concentrations >20 x LOR)
- RPD less than 50% for medium level laboratory duplicates (i.e., concentrations 10 – 20 x LOR)
- RPD less than 200% for low level laboratory duplicates (i.e., concentrations 1 – 10 x LOR)

Of a total of 374 RPD values calculated, 58 RPD values (15.5%) were reported above the adopted acceptable RPD DQO limits. RPD exceedances were reported for lead, TRH and PAHs. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and soil sampled, and the variability of soil composition is likely to have resulted in these exceedances.

It is noted that of the 156 RPD pairs calculated for duplicates collected from *in situ* samples, only 9 RPD values (<6%) were reported above the acceptable DQO limits. The *in situ* samples are considered more indicative of potential future risks associated with the soil considered in this report, and the lower level of RPD exceedances may reflect a degree of homogenisation which occurred during stockpile generation and backfilling.

As 84.5% of duplicate RPD values for all samples were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.

1.3 Trip Blank

One trip blank consisting of clean, laboratory supplied distilled water was submitted with each cooler box transported to the laboratory.

Trip blanks were analysed for select volatile compounds, including TPH C_6-C_9, TRH C_6-C_{10}, and BTEXN. Concentrations of target compounds reported below the LOR for all trip blanks, indicating that cross contamination of samples occurring in transit is unlikely to have occurred.

Trip blank results are reported on **Table B2** attached.

1.4 Rinsate Blank

A rinsate blank was prepared for each day of sampling by pouring laboratory supplied water over non-dedicated sampling equipment (a trowel or clean glove) following decontamination procedures to assess the potential for cross-contamination.

A total of three rinsate blank was analysed as part of these works, one for each day on which sampling occurred.

All rinsate blanks reported concentrations of CoPC below LOR, indicating cross contamination is unlikely to have occurred during sampling.

Rinsate blanks results are reported on **Table B2** attached.

2.0 Assessment of Laboratory Data Quality

A summary of the assessment of laboratory data quality for soil, leachate and QA/QC samples relevant to the report is provided in **Section 2.1** – **Section 2.6** below.

Soil samples were analysed for a combination of analytes including metals, cyanide, fluoride, TPH/TRH, BTEX, PAH, MAH, phenols, PCBs and pesticides. As these analytes include the CoPC identified in **Section 1.4** (of the main report) for the areas in which the stockpiles were generated, based on available Site history and uses, and previous investigations conducted, soil analytical program is considered appropriate for the purposes of this report. The adequacy of the analytical suite selected is further detailed in in **Section 4.2** of the main report.

2.1 Sample Receipt Temperature

Soil samples were kept chilled during storage and transportation with ice in portable coolers until received by the laboratory for analysis. Samples were reported to be received in good condition in appropriately preserved sample containers.

Samples were reported received by ALS (the primary laboratory) between 1.2 and 4.3ºC, and by Eurofins (the secondary laboratory) between 8.2 and 9.4ºC. Primary samples were within the acceptable target range of 0 – 6°C, and while secondary laboratory samples were received up to 3.4ºC above the recommended range, these samples have not been relied on for assessment of stockpile status and have been used for comparison of analytical methodologies only. Receipt at higher than expected temperatures may contribute to discrepancies in calculated RPDs.

Leachate or aliphatic/aromatic speciation analysis was conducted on samples previously extracted and do not have sample receipt temperatures reported.

2.2 Sample Holding Times

All primary samples were received by laboratories within the recommended holding times for the requested analyses.

Proactive holding time assessments completed by the analytical laboratories are provided in **Appendix A**.

2.3 Limits of Reporting

For a number of the primary samples analysed, the laboratory reported a LOR of 0.5 mg/kg for benzo(a)pyrene, which is higher than the IB105 TCC Level 1 screening criterion (0.08 mg/kg), however is lower than the Level 2 (2 mg/kg) and Level 3 (20 mg/kg) screening criteria for benzo(a)pyrene. Considering the LOR allows for adequate characterisation of Level 2 to Level 4 soils based on TCC, and LCC of benzo(a)pyrene was relied upon for characterisation, the LOR is not considered to impact the usability of the data for the purposes of soil characterisation.

2.4 Laboratory Method Blanks

All soil laboratory method blanks, detailed in **Appendix A**, were reported within the acceptable range, i.e., below the laboratory LORs.

2.5 Laboratory Control Spikes

Laboratory control spikes, detailed in **Appendix A**, were within the laboratory-derived control limits for the methods used, and no outliers were reported.

2.6 Frequency of Quality Control Spike

Frequency of quality control spikes, detailed in **Appendix A**, were at the rate expected by applicable QC specifications, and no outliers were reported.

2.7 Laboratory Duplicates and RPDs

The RPD between analytical results for primary samples collected from the stockpiles and their corresponding laboratory duplicates were within acceptable limits, with the exception of the duplicate outliers listed below in Error! Not a valid bookmark self-reference..

Table 2 Laboratory Duplicate RPD Exceedances

Work Order	Sample ID	Analyte	RPD	Limits
EM2303516	OL_05_1.0	Zinc	25.4%	0 - 20%
	OL_65_0.6E	Naphthalene	99.9%	0 - 50%
		Phenanthrene	107%	0 - 20%
		Fluoranthene	85.9%	0 - 20%
		Pyrene	80.7%	0 - 20%
		Benz(a)anthracene	71.0%	0 - 20%
		Chrysene	77.7%	0 - 20%
		Benzo(b+j)fluoranthene	71.6%	0 - 20%
		Benzo(a)pyrene	61.5%	0 - 20%
		Benzo(g.h.i)perylene	54.5%	0 – 50%
EM2305209AB	UST_SP_0.5-1.0_01	Arsenic	51.3%	0 - 20%

RPD exceedances are attributed to the heterogeneity of the soil samples submitted to the laboratory. The presence of varied fill material is well documented across the Site, including areas where these stockpiles were generated. These exceedances are not considered to impact interpretation of the results.

2.8 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix A**. Matrix spike recoveries were noted to be within the data quality objective range of 70% - 130%, or laboratory-derived limits for the methods used, with the exceptions of the outliers noted in **Table 3** below.

Table 3 Matrix Spike Outliers

Work Order	Sample ID	Analyte	Matrix Spike	Limits
EM2305209AB	UST_SP_1.0-1.5_03	Zinc	172%	80-120%
		Hexavalent Chromium	46.0%	58.0-114%
EM2309607	OL_EX_BF_01_1.0	Lead	133%	80.0-120%
	OL_EX_BF_09_1.0	Pyrene	18.7%	65.5-136%

Matrix spike recovery outliers reported are due to matrix interference with samples. The presence of varied fill material is well documented across the Site, including areas where these stockpiles were generated. Overall, these outliers are not considered to impact interpretation of the results.

2.9 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory quality control reports provided in **Appendix A**. All surrogate spike recoveries for regular sample matrices were within the surrogate control limits adopted for the methods used. No surrogate recovery outliers were reported.

3.0 Summary

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- Four intra-laboratory and three inter-laboratory field duplicate sample pairs were collected from the 44 primary soil samples assessed as part of these works.

  Intra- and inter-laboratory duplicate samples were collected at a rate greater than or equal to one per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples) and the duplicate sample rate is considered satisfactory for assessment of data reliability.

- Of a total of 374 RPD values calculated, 58 RPD values (15.5%) were reported above the adopted acceptable RPD DQO limits. RPD exceedances were reported for lead, TRH and PAHs. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and soil sampled, and the variability of soil composition is likely to have resulted in these exceedances.

  It is noted that of the 156 RPD pairs calculated for duplicates collected from *in situ* samples, only 9 RPD values (<6%) were reported above the acceptable DQO limits. The *in situ* samples are considered more indicative of potential future risks associated with the soil considered in this report, and the lower level of RPD exceedances may reflect a degree of homogenisation which occurred during stockpile generation and backfilling.

  As 84.5% of duplicate RPD values for all samples were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.

- Trip blank and rinsate blank analytical results were reported below the laboratory LORs.

- All samples were received by the primary analytical laboratory (ALS) at between 0 and 6ºC. While secondary laboratory (Eurofins) samples were received between 8.2 and 9.4ºC, up to 3.9ºC above the recommended range, these samples have not been relied on for assessment of stockpile status and have been used for comparison of analytical methodologies only. Receipt at higher than recommended temperatures may contribute to discrepancies in calculated RPDs noted above.

- All analysis was conducted within the recommended holding time.

- For a number of the primary samples analysed, the laboratory reported a LOR of 0.5 mg/kg for benzo(a)pyrene, which is higher than the IB105 TCC Level 1 screening criterion (0.08 mg/kg), however is lower than the Level 2 (2 mg/kg) and Level 3 (20 mg/kg) screening criteria for benzo(a)pyrene. Considering the LOR allows for adequate characterisation of Level 3 and Level 4 soils based on TCC, and LCC of benzo(a)pyrene was relied upon for characterisation, the LOR is not considered to impact the usability of the data for the purposes of soil characterisation.

- Laboratory QA/QC sampling procedures including analysis of matrix spike recoveries, surrogate spike recoveries, laboratory control spike recoveries, laboratory duplicates and frequency of QA/QC reported some minor variances from recommended limits or ranges, indicating minor possibility of under- or over-reporting for some chemicals. These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of stockpiles.

14 September 2022

Mr James Puustinen
Project Manager, Capital Works
Macquarie Point Development Corporation
GPO Box 51
HOBART TAS 7001

Email: james@macquariepoint.com

Dear Mr Puustinen

Environmental Approval No. 10512/2 – Reuse of Low-Level Contaminated Soil at Macquarie Point Development Site

On 1 September 2022 your consultant, AECOM requested that the re-use of low-level contaminated soil at the Macquarie Point Development Site, currently authorised under Environmental Approval 10512/1, be authorised to continue for a further 2-year period, beyond 7 October 2022.

I enclose Environmental Approval No. 10512/2 for the re-use of low-level contaminated soil from stockpile at the Macquarie Point site. This authorisation is valid for a period of two (2) years from 7 October 2022. This authorisation is provided under Regulation 21 of the Regulations, subject to conditions. Please find attached Environmental Approval No. 10512/2 containing the conditions to be complied with.

Please take note that evidence of compliance with these conditions must be made available to an Authorised Officer on request.

Section 39F of the *Macquarie Point Development Corporation Act 2012* requires that an accredited environmental auditor has certified the remediation of any part of the site prior to redevelopment of that part of the site. I recommend that you discuss with your auditor the suitability of the above referenced material for the intended land use.

Pursuant to Regulation 21(7) I have decided to waive the application fee in relation to this Environmental Approval.

If you require any further information regarding this correspondence, please contact the EPA at the contact details at the head of this correspondence.

Yours sincerely

Joe Tranter
MANAGER, CONTAMINATED LAND AND WASTE REGULATION
Delegate for the Director, Environment Protection Authority

Cc: Robert Crowe, robert.crowe@aecom.com

Encl: Draft Environmental Approval No. 10512/2

ENVIRONMENTAL APPROVAL No. 10512/2

Approval under the *Environmental Management and Pollution Control (Waste Management) Regulations 2020*

I, Joseph Tranter, Delegate for the Director, Environment Protection Authority, hereby grant approval in accordance with Regulation 21(4)(a) of the *Environmental Management and Pollution Control (Waste Management) Regulations 2020* for the reuse of the waste material described below provided the following requirements are complied with:

Approval issued to:
MACQUARIE POINT DEVELOPMENT CORPORATION

ABN
92 657 409 841

Waste description and quantity (the waste):
Low Level Contaminated Soil
No limit set

NEPM code and description:
N120: Soils contaminated with a controlled waste

Location (the land):
MACQUARIE POINT, 10 EVANS ST, HOBART TAS 7000

Producer of the waste:
Macquarie Point Development Corporation

Period for which approval is valid:
7 October 2022 to 7 October 2024

Requirements:

1. Where stockpiled soil, derived from the land, has been classified as Low Level Contaminated Soil (Level 2 Soil), in accordance with Information Bulletin No. 105, and contaminant concentrations are below the Site Specific Remediation Criteria defined in the document; 'Derivation of Remediation Criteria, Macquarie Point Redevelopment Project', prepared by AECOM and dated 9 August 2016, the stockpiled soil may be reused on the land, subject to the conditions of this approval.

2. The site environmental auditor, as accredited by Section 39F(3) of the Macquarie Point Development Corporation Act 2012, must endorse the reuse of each soil stockpile prior to the reuse occurring.

3. The reuse must be undertaken in accordance with the document titled 'Site Environment Management Plan, Macquarie Point Development Project', prepared by AECOM and dated 14 November 2018.

DELEGATE FOR THE DIRECTOR, ENVIRONMENT PROTECTION AUTHORITY Date of issue: 14 September 2022

4. The activity must be conducted in such a manner as to prevent environmental nuisance and environmental harm resulting from escape of the materials, spillage, or emission of dust.

5. Unless otherwise approved in writing by the Director, waste material must not be removed from the storage site for any reason, including disposal.

6. If an incident causing or threatening environmental nuisance, serious environmental harm, or material environmental harm from pollution occurs in the course of the approved activity, then the person responsible for the activity must immediately take all reasonable and practicable action to minimise any adverse environmental effects from the incident.

7. A record of the soil reuse must be kept from the date of issue of this approval. This record must be provided to the Director annually no later than 14 days after the anniversary of the issue date of this approval and include, as a minimum, all records for the 12 months preceding the anniversary. Records must also be made available to an Authorized Officer on request in writing, within the timeframe and for the reporting period specified within the request.

8. For each soil stockpile that is reused the record of soil reuse must include:
   a. A description of the soil.
   b. Results of soil classification, in accordance with Information Bulletin No. 105.
   c. The quantity of soil that was reused.
   d. The location at which the soil was reused.
   e. The endorsement from the site environmental auditor for the reuse.
   f. Any certification required under section 39F of the Macquarie Point Development Corporation Act 2012.

Signed: _____

DELEGATE FOR THE DIRECTOR, ENVIRONMENT PROTECTION AUTHORITY

Date: 14 September 2022

~~**1446**~~	~~24/07/2023~~	~~Section 1.5 – Stockpile Descriptions, Table 2 – Stockpiles~~	~~Stockpile sources~~	~~AECOM~~	~~In Table 2, there is a description of the stockpile sources – can you clarify what occurred with any material that was shallower than 0.5 m or deeper than 1.5 m? It may not be relevant to the volumes in the stockpiles but would help to confirm that such material was excluded. The later Table 4 does not really provide clarification.~~	~~Please clarify~~	~~The paragraph under Table 2 has been updated to read:~~ ~~*UST_SP_0.5-1.0 and UST_SP_1.0-1.5 were generated by the excavation of an area of reported Total Recoverable Hydrocarbon (TRH) impact beneath the Site road to the west of the SeaRoad Shed*~~ ~~*referred to as the Former UST Excavation Area. Soil excavated from this area at depths of less that 0.5 m bgl and greater than 1.5 m bgl was stockpiled and assessed separately and is not discussed in this report.*~~	~~12/04/2024~~	~~Yes~~
~~**1447**~~	~~24/07/2023~~	~~Section 1.5 – Stockpile Descriptions, Table 2 – Stockpiles~~	~~Unfinished sentence~~	~~AECOM~~	~~The source for Oil Line Stockpile OL_SP has an unfinished sentence: "*Soil surrounding remnant Oil Line, north of the former* "~~	~~Please complete~~	~~Description of OL_SP updated to read~~ ~~*Soil surrounding remnant Oil Line*~~ ~~*, from estimated chainage 0 to 77 m.*~~	~~12/04/2024~~	~~Yes~~
~~**1448**~~	~~24/07/2023~~	~~Section 1.5 – Stockpile Descriptions~~	~~Chainage~~	~~AECOM~~	~~The second paragraph under Table 2 says the following – "*surrounding soil between chainage 77 to 80 was separated based on staining and field PID readings as a separate stockpile (UST_SP_ch77-82)* ".~~ ~~It's a bit unclear the chainage in the stockpile name faithfully explains the source location (80 versus 82?).~~	~~Please clarify~~	~~Apologies - this was a typo. The correct stockpile name is UST_SP_ch77-80~~	~~12/04/2024~~	~~Yes~~
~~**1449**~~	~~24/07/2023~~	~~Section 1.5 – Stockpile Descriptions~~	~~Figure F2~~	~~AECOM~~	~~Can the chainage please be shown on Figure F2?~~	~~Please update~~	~~Figure F2 has been updated to show the chainage to 77 and 80 m from the northern end of the Oil Line. Additional text has been added to Section 1.5 and Figure F2 noting that locations of excavation and measure of chainage are based on field estimates which have not been surveyed at this time, and should be treated as approximations.~~	~~12/04/2024~~	~~Yes~~
~~**1450**~~	~~24/07/2023~~	~~Section 1.5 – Stockpile Descriptions~~	~~Field notes~~	~~AECOM~~	~~In the third paragraph under Table 2, we note that verbal notations should be recorded in writing in the field in order to be more reliable (absence of notation of something is not the same as notation of its absence).~~	~~Please consider~~	~~Noted and has been communicated to field staff~~	~~12/04/2024~~	~~Yes~~
~~**1451**~~	~~24/07/2023~~	~~Section 3.2 – Soil Excavation and Handling~~	~~Mention of 'backfilling'~~	~~AECOM~~	~~Please clarify that the "backfilling" in the last paragraph is to do with the backfilling at the UST/Oil Line areas, and not backfilling using the stockpiles at the Lead Excavation Area – it's not clear.~~	~~Please clarify~~	~~Text updated to read~~ ~~*BlackCap has reported that backfilling*~~ ~~*in the Lead Excavation Area*~~ ~~*was conducted using an excavator and compacting soil was compacted with the excavator bucket in layers.*~~	~~12/04/2024~~	~~Yes~~
~~**1452**~~	~~24/07/2023~~	~~Section 3.3 – In Situ Test Pitting~~	~~Lead Excavation Area~~	~~AECOM~~	~~Please clarify that this text below is to do with the Lead Excavation Area:~~ ~~*"Test pits were advanced using an excavator bucket until imported clean fill (shown on Plate 5) was encountered at between 1 and 1.5 m bgl."*~~ ~~It might seem obvious given the whole point of the letter, but it could be made clearer.~~	~~Please clarify~~	~~Additional text has been added to the last paragraph of Section 3.2 (above this section) stating:~~ ~~*An initial layer of imported clean fill of between 0.5 to 1 m thickness was placed at the base of the excavation following collection of validation samples due to groundwater into the excavation, which was assessed by BlackCap as a potential hazard which could erode the walls of the excavation and led to collapse or present a hazard if unauthorised access to the area occurred. Material from the stockpiles described in Section 1.5 was placed on top of the clean fill.*~~ ~~*Additional text has been added to Section 3.3 as below for context:*~~ ~~*Test pits were advanced using an excavator bucket until imported clean fill (shown on Plate 5),*~~ ~~*which was visually distinct from the backfill material being assessed and represented the maximum depth at which the potentially impacted material was used*~~ ~~*, was encountered at between 1 and 1.5 m bgl.*~~	~~12/04/2024~~	~~Yes~~

~~Strikethrough indicates issue has been resolved.~~ No items to be deleted

Issue No.	Date Flagged	Reference/ Section	Audit Issue	Action Owner	Comments	Action Required (and by whom)	Action undertaken by Consultant (consultant to add comments)	Date Closed (Auditor Use Only)	Issue closed? (Auditor Use Only)
~~**1453**~~	~~24/07/2023~~	~~Section 3.3 – In Situ Test Pitting~~	~~Use of the term '*in situ*'~~	~~AECOM~~	~~The word '*in situ*' is unusual in this context – soils that used to be in stockpiles but are now emplaced/re-used in the Lead Excavation Area is what it means, but '*in situ*' implies soil that has not been disturbed, so a few words to explain this would make it clearer. The heading for Section 3.3 might be clearer if it was 'Test Pit Sampling Of Re-Used OL and UST Excavation Spoil in the Lead Excavation Area'. That would make the following clearer – a reader could easily be confused by a description of excavating to sample '*in situ*' soils by digging through them until imported clean fill was encountered – for typical remediation activities it makes no sense (although it's what has happened here).~~	~~Please clarify~~	~~Section title has been updated to " Test Pitting of Backfill in the Lead Excavation Area" Parts of this section have been reworded or expanded to clarify that soil samples considered were collected from the material reused from the Oil Line and UST Area excavation.~~	~~12/04/2024~~	~~Yes~~
~~**1454**~~	~~24/07/2023~~	~~Section 3.5 – Oil Line Cladding Sampling~~	~~Use of field photos~~	~~AECOM~~	~~Regarding the absence of photos – can we request that the requirement for photos is passed to all parties involved in field works?~~	~~Please notify~~	~~Noted and passed on to field staff.~~	~~12/04/2024~~	~~Yes~~
~~**1455**~~	~~24/07/2023~~	~~Section 4.1.3 – In Situ Sampling~~	~~Use of the term '*in situ*'~~	~~AECOM~~	~~Again – please clarify the context of '*in situ*' and maybe change the sub-heading title.~~	~~Please clarify~~	~~Subheading has been updated to "Sampling of Backfill Soil from the Oil Line and UST Excavation Area in the Lead Excavation Area"~~ ~~Text has been reworded where "in situ" has been used to remove this phrase.~~	~~12/04/2024~~	~~Yes~~
~~**1456**~~	~~24/07/2023~~	~~Section 4.2.3 – In Situ Soil Sampling~~	~~Analytical suite~~	~~AECOM~~	~~A few words on justification of the analytical suite for sampling would be useful for context – e.g. only lead for metals. E.g. results of stockpile sampling including screen analyses.~~	~~Please clarify~~	~~The following has been added to this section:~~ ~~*Section 2 of IB105 includes the following guidance on selection of analytical suites for classification of waste:*~~ ~~*It is not necessary to sample for all contaminants listed in Table 2 for soil classification. However, all contaminants that are reasonably likely to be present in the soil above background levels should be included in the sample analysis.*~~ ~~*Based on the CoPC reported in soil prior to use as backfill, samples collected from material used as backfill within the Lead Excavation Area were submitted to analytical laboratories for the following analytical suites which have had previously reported exceedances or are considered to have the potential to be present based on previous investigations:*~~	~~12/04/2024~~	~~Yes~~
~~**1457**~~	~~24/07/2023~~	~~Section 4.3.1 – Soil Categorisation (IB105)~~	~~OL_77_0.6W and OL_77_1.0~~	~~AECOM~~	~~Regarding TPH C10-C36 fraction (sum) – OL_77_0.6W and OL_77_1.0. This material went into the stockpile indicated to come from chainage 77 to 80 - what about the material from chainage 74-77?~~	~~Please clarify~~	~~As noted in Section 1.5, material from the southern end of the Oil Line excavation was field screened and separated based on visual and PID indicators of potential hydrocarbon impact. Text has been added to Section 1.5 to note that UST_SP_Ch77-80 may have included soil from the oil line excavation from less than chainage 77.~~	~~12/04/2024~~	~~Yes~~
~~**1458**~~	~~24/07/2023~~	~~Section 4.3.1 – Soil Categorisation (IB105)~~	~~Terminology~~	~~AECOM~~	~~The mention of 'pre- and post-remediation'. This deserves a few words as to what these terms mean.~~	~~Please clarify~~	~~This text has been updated to read:~~ ~~*Both prior to and following use as backfill in the Lead Excavation Area…*~~	~~12/04/2024~~	~~Yes~~
~~**1459**~~	~~24/07/2023~~	~~Section 4.3.1 – Soil Categorisation (IB105)~~	~~TCLP~~	~~AECOM~~	~~Minor issue, but TCLP stands for 'Toxicity Characteristic Leaching Procedure'.~~	~~Please correct~~	~~Text updated~~	~~12/04/2024~~	~~Yes~~
~~**1460**~~	~~24/07/2023~~	~~Section 4.3.1 – Soil Categorisation (IB105)~~	~~Stockpiles and surface water runoff~~	~~AECOM~~	~~Where the following is stated, it doesn't describe what the inference is.~~ ~~*"The volume in these stockpiles corresponds to approximately 55% of the soil used as backfill based on the estimated field volumes listed on Table 2"*. ~~A reader might say reasonably – so there's nearly half the soil unrepresented by testing?~~	~~Please clarify~~	~~Text has been added to the dot point below (discussing soil excavated from the pipeline trench). Sub-points in this section discuss the available data for why PAH leachate is not considered likely to occur from this soil.~~ ~~The 55% represents soil which was not assessed for TCLP leachate - all soil was sampled and assessed at or exceeding IB105 requiremetns (1 sample per 25m3) for total concentrations of CoPC, and >30% of samples were assessed for the fill IB105 suite.~~	~~12/04/2024~~	~~Yes~~

~~1461~~	~~24/07/2023~~	~~Section 4.3.1 – Soil Categorisation (IB105)~~		~~AECOM~~	~~We find the following text unclear:~~ ~~*"Leachate assessment was not conducted on excavation validation sample s used to assess OL_SP or on in situ samples collected. However:*~~ ~~*The source area of this soil is close and in contact with the area UST_SP_0.5-1.0 and UST_SP_1.0-1.5 were excavated from, and it is considered likely to PAH leaching in these soils will be similar."*~~ ~~Jusitify the comparison of validation results to results from the 'source area of this soil'.~~	~~Please clarify~~	~~This text has been modifed as below:~~ ~~*he source area of t he soil in OL_SP is close and in contact with the area UST_SP_0.5-1.0 and UST_SP_1.0-1.5 were excavated from, and it is considered likely that concentrations of PAH leachate in these soils will be similar to UST_SP_0.5-1.0 and UST_SP_1.0-1.5 (which reported below LOR) and unlikely to exceed the PAH leachate criteria, as the source of soil in both areas is identical (historic backfilling) and it is not considered likely to have been exposed to additional contaminants (in particular PAHs). No indications of additional contamination (such as staining/odours or breakage in the Oil Line) were observed during removal of the Oil Line or collection of validation samples.*~~	~~12/04/2024~~	~~Yes~~
~~1462~~	~~24/07/2023~~	~~Section 4.3.1 – Soil Categorisation (IB105)~~	~~Similarity~~	~~AECOM~~	~~*"...and it is considered likely to PAH leaching in these soils will be similar."*~~ ~~Similar to something that shows what?~~	~~Please clarify~~	~~Please see repsonse to comment 1461, above, which includes modification to this text.~~	~~12/04/2024~~	~~Yes~~
~~1463~~	~~24/07/2023~~	~~Section 4.3.1 – Soil Categorisation (IB105)~~	~~Leachability data superseding actual TCC data~~	~~AECOM~~	~~In the last two paragraphs the text is really hard to follow – it appears to imply that (for some soils at least) use of non-existent leachability data could supersede actual TCC data, because of what such leachability data would be expected to show (but isn't available because it wasn't done). The Auditor is happy for this to be explained if this is not the case, but it's just unclear.~~	~~Please clarify~~	~~The text had been amended to clarify that while TCLP leachate assessment was not conducted on all samples, based on the availabile data from the area, and the broader context of the Site where leachable TCLP has not been detected in soil at any point, it is considered of sufficiently low probability for the purpose of assessing the risks presented by the backfilled soil. This approach has been previously been accepted by EPA Tasmania in disposal of soil off-Site where there has been gaps in the characteristation data available.~~ ~~Additional text has been added to include discussion of the overall risks of leachate, which are considered low as soil is not in contact with groundwater and the SEMP controls for future development include maintenance of hardstand over this soil.~~	~~12/04/2024~~	~~Yes~~
~~1464~~	~~24/07/2023~~	~~Section 4.3.2 – Site Specific Remediation Criteria~~	~~Pre-backfill~~	~~AECOM~~	~~Regarding the wording: *"soil from the locations OL_77_0.6W and OL_77_1.0 were collected from was stockpiled separately and was not used as backfill material*".~~ ~~As an observation – it's not clear why you mention these results as 'pre backfill' (see the heading) for material that wasn't apparently backfilled? As a general comment: 'pre backfill' is a term that is not clearly explained. This seems to mean samples taken to represent soils in stockpiles (whether based on validation samples (in some instances) or stockpile soils). We think this needs to be re-stated – a reader could reasonably think 'pre backfill' might mean the condition of soils in the base/edges of the Lead Excavation Area prior to it being backfilled.~~	~~Please clarify~~	~~Data from OL_77 was included for presentation of results from the entire Oil Line excavation. Based on Auditor comment, this text and reference to these results have been removed, with exception to reference of impacts in these samples discussed in Section 1.5.~~ ~~Definition of pre-backill, indicating results of samples collected before backfilling in the Lead Excavation Area, and post-backfill, indicating results of samples collected from the material as described in Section 3.3, have been added at the start of this section.~~	~~12/04/2024~~	~~Yes~~
~~1465~~	~~24/07/2023~~	~~Section 4.3.2 – Site Specific Remediation Criteria~~	~~Grammar~~	~~AECOM~~	~~Regarding the unclear wording: "*While not* ***actively remediation*** *or reassessed prior to backfilling...".~~	~~Please clarify~~	~~This text should have read "*actively remediat ed* ". However, this line has been removed as part of rewording of this paragraph in response to comment 1466 nelow.~~	~~12/04/2024~~	~~Yes~~
~~1466~~	~~24/07/2023~~	~~Section 4.3.2 – Site Specific Remediation Criteria~~	~~Grammar~~	~~AECOM~~	~~Also, the rest of the dot point is really hard to follow. (Try reading this to anyone in the office (pausing only at the commas), and see if they can describe back to you what it is saying.) Has the letter wording been run through a spell and grammar check?~~	~~Please clarify~~	~~This paragraph has been reworded.~~	~~12/04/2024~~	~~Yes~~
~~1467~~	~~24/07/2023~~	~~Section 4.3.2 – Site Specific Remediation Criteria~~	~~Stockpiles~~	~~AECOM~~	~~Regarding the following text - it is unclear how this supersedes results actually recovered in situ – the argument would seem to be why you wouldn't find the results that were found.~~ ~~*"In addition, the remaining samples from stockpile UST_SP_1.0-1.5 were below LOR for this CoPC, and as the stockpile was exposed to atmosphere for approximately two months prior to backfilling, it is considered likely that the concentration at this sample point would have reduced due to volatilisation/oxidation of TRH."*~~	~~Please clarify~~	~~This paragraph has been removed as upon review it is speculative and the inference is superceded by the actual data from the soil used as backfill within the Lead Excavation Area.~~	~~12/04/2024~~	~~Yes~~

Issue No.	Date Flagged	Reference/ Section	Audit Issue	Action Owner	Comments	Action Required (and by whom)	Action undertaken by Consultant (consultant to add comments)	Date Closed (Auditor Use Only)	Issue closed? (Auditor Use Only)
~~**1468**~~	~~24/07/2023~~	~~Section 4.3.2 – Site Specific Remediation Criteria~~	~~Lead exceedence~~	~~AECOM~~	~~Regarding the lead exceedance for UST_SP_1.0-1.5_03: The exceeding result should be discussed in terms of quantum in relation to the criterion – and this given context when discussing likely representativeness. The whole argument to dismiss the result appears to be based on subjective consideration that the result isn't representative, while noting that sampling to conduct a statistical analysis aren't available. That's the whole basis of a maximum concentration approach versus a 95% UCL approach. If you say you don't think an exceedance is likely to be representative – you need to say why.~~	~~Please clarify~~	~~Text in this section has been updated to discuss the density of sampling at greater than double the rate for soil classification in IB105 within the material following use as backfill, and to demonstrate that a degree of homogenisation as part of stockpile movements and placement is likely to have occurred based on comparision of statistical characteristics of soil pre- and post-backfilling. Based on these factors, the reported concentration prior to backfilling is not considered to represent an unacceptable risk to future intrustive maintenance workers.~~	~~12/04/2024~~	~~Yes~~
~~**1469**~~	~~24/07/2023~~	~~Section 4.3.3 – Environmental Approval 10512/2~~	~~Auditor approval~~	~~AECOM~~	~~Regarding the recommendation that "*Auditor approval for the reuse be sought* ." There is probably no issue with seeking Auditor approval, but the comments noted herein (within this Issues Register) will need to be addressed satisfactorily.~~	~~Please consider~~	~~Noted and provided in this iteration of the AIR.~~	~~12/04/2024~~	~~Yes~~
~~**1470**~~	~~24/07/2023~~	~~Section 4.4 – Quality Assurance / Quality Control (QA/QC) Data Validation~~	~~Use of QC samples~~	~~AECOM~~	~~Regarding this text:~~ ~~*"While secondary laboratory samples were received at 6.2 – 6.5oC, up to 0.5oC above the recommended range, these samples have not been relied on for assessment of stockpile status and have been used for comparison of analytical methodologies only."*~~ ~~QC samples aren't there to assess the conditions. They are there to support the validity of the primary data set which is used to characterise the conditions. You need arguments about the expected validity of the primary data set based on the QC data.~~	~~Please clarify~~	~~This section and Appendix B has been amended to note:~~ ~~- Sample receipt temperature is not expected to affect assessment of metals, such as lead.~~ ~~- Attempts to chill and zero headspace were noted upon receipt by the secondary laboratory, which limits the potential for degredation.~~ ~~- The CoPC of key concern (TRH) consist of longer chain semi-volatile components which are less sensitive to temperature fluctuations.~~ ~~It is noted that the text noted in the comment was in error in the intial issue of this letter – one inter-laboratory batch was received at 3°C, and one was received at 9.4°C. The text in the report have been updated to note this.~~	~~12/04/2024~~	~~Yes~~
~~**1471**~~	~~24/07/2023~~	~~Section 4.4 – Quality Assurance / Quality Control (QA/QC) Data Validation~~	~~Leachable v total~~	~~AECOM~~	~~Regarding the mention of LCC in this text below – see our above comment on absence of some LCC data.~~ ~~*"Considering the LOR allows for adequate characterisation of Level 3 and Level 4 soils based on TCC, and LCC of benzo(a)pyrene was relied upon for characterisation…* "~~	~~Please clarify~~	~~This text has been reworded as follows:~~ ~~*Considering the LOR allows for adequate characterisation of Level 2 and higher based on TCC, a nd benzo(a)pyrene was typically detected above the LOR in the majority of samples analysed , the LOR is not considered to impact the usability of the data for the purposes of soil characterisation.*~~	~~12/04/2024~~	~~Yes~~
~~**1472**~~	~~24/07/2023~~	~~Section 5 – Conclusions and Recommendations~~	~~General~~	~~AECOM~~	~~See comments above, and revise conclusions accordingly.~~	~~Please update~~	~~Conclusions have been updated in line with the comments above~~	~~12/04/2024~~	~~Yes~~
~~**1473**~~	~~24/07/2023~~	~~Section 5 – Conclusions and Recommendations~~	~~Missing text~~	~~AECOM~~	~~Is there missing content here? "*Pre-backfill - TRH C6-C10 (minus BTEX) (+ TRH >C10-C16 (minus naphthalene) (F2)* "~~	~~Please clarify~~	~~No - this was a typo. Please note that the exceedance of TRH >C6-C10 has been removed as this was reported in soil which was not used as backfill discussed in this report.~~	~~12/04/2024~~	~~Yes~~
~~**1474**~~	~~24/07/2023~~	~~Section 5 – Conclusions and Recommendations~~	~~Stockpile concentrations~~	~~AECOM~~	~~Regarding the following text:~~ ~~*"had long periods of atmospheric exposure during which volatilisation and oxidation of TRH is expected to have occurred to reduce the reported concentrations,"*~~ ~~This argument should not be used as a rationale as to why risk is low. That needs to be made first and this might reasonably be mentioned as support (but not a primary part of the rationale, which should be based on data, not expectation of likely data). (See also this issue in Section 4.3.)~~	~~Please clarify~~	~~As noted in response to Comment1467, this text has been removed.~~	~~12/04/2024~~	~~Yes~~

Mr James Puustinen
Senior Project Officer
Macquarie Point Development Corporation
GPO Box 51
Hobart, Tasmania, 7001

Dear James

Soil Categorisation and Waste Management Plan - Stockpile RH_SP
Macquarie Point Development Project

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of remediation at the Macquarie Point Site in Hobart, Tasmania (the Site). The Site location is shown on **Figure F1**

The Site has historically been used for mixture of commercial and industrial purposes. As part of the development works undertaken at the Site, a soil stockpile (RH_SP) was generated as part of the assessment of the southwestern corner of the Site (referred to as either “the Gateway” or “Audit Area 6”) which includes the excavation of soils from fill material overburden placed under a former Cold Store warehouse, that are under consideration for beneficial reuse as backfill on Site.

At the request of the Corporation, AECOM has prepared this soil categorisation and waste management plan for the soil stockpile RH_SP that is currently present on Site. This report is intended to assess the current status of, and act as a Waste Management Plan, for this stockpile.

It is currently proposed that the stockpile will be reused as fill material in excavations in the area of the Site referred to as the Precinct South under existing Environmental Approval No. 10512/2 (EA10512/2), included as **Appendix C**.

1.1 Objectives

The objectives of this letter are:

- To provide characterisation of RH_SP in accordance with EPA Tasmania *Information Bulletin No. 105 - Classification and Management of Contaminated Soil for Disposal* (IB105).
- To assess suitability of the stockpile for beneficial Site reuse as backfill material in accordance with EA10512/2.

It is intended that this document can act as a Waste Management Plan for the reuse of the stockpiled material in accordance with Section 3 and Section 5 of IB105.

1.2 Scope of Work

The following scope of work has been undertaken by AECOM:

- Field activities, including soil excavation works and soil sampling from the stockpile RH_SP.
- Review and screening of sample results from the stockpiles against the criteria within IB105 for categorisation.
- Evaluate sample results against appropriate screening criteria to assess the suitability of the stockpile for beneficial reuse as fill material without unacceptable risk.
- Provision of this Soil Categorisation and Waste Management Plan for the disposal or reuse of the stockpile RH_SP.

1.3 Background

The Site, and surrounding area, largely located on reclaimed land within the Hobart port, has a history of mixed industrial use including the former Hobart Gasworks, rail freight and bulk fuel storage. Former

industrial activities have been ceased at the Site. The Site is currently undergoing an Environmental Audit by Mr David Lam of Coffey under the *Macquarie Point Development Act 2012*.

The Gateway area of the Site has had various uses, including as part of the former Hobart Gasworks and as the site of a cold storage warehouse for freight transport. As part of the development and remediation of the Site, a pilot scale trial of *in situ* solidification (ISS) of soil to remediate contamination associated with the former Gasworks was conducted in June/July 2022 under Development Approval PLN-21-714 issued by City of Hobart. Cleaner materials (placed over gasworks infrastructure to allow construction of the former cold storage unit) was excavated to allow access to the subsurface as part of the pilot trial.

The remediation process undertaken produced some swell in the subsurface. Some fill was not able to be reinstated, and approval for disposal of this material is sought in this letter.

1.4 Chemicals of Potential Concern

Based on available Site history and uses, and previous investigations conducted, the Chemicals of Potential Concern (CoPC) summarised in **Table 1** below have been identified for the areas in which the stockpiles were generated.

Table 1 Chemicals of Potential Concern

Former Land Use/ Potential Contaminating Activity	Contaminant of Potential Concern	Potentially Impacted Media
Gasworks	TRH, BTEXN, PAHs, phenolic compounds, ammonia, cyanide, asbestos, metals[1]	• Soil • Groundwater • Soil Vapour
Roundhouse (Locomotive maintenance and refuelling)	TRH, BTEXN, PAHs, phenolic compounds, chlorinated hydrocarbons, SVOC, VOC	
Land Reclamation	Heavy metals[1], TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, OCP, cyanide, ammonia, asbestos	

Notes: TPH – Total Petroleum Hydrocarbons; TRH – Total Recoverable Hydrocarbons; PAH - Polycyclic aromatic Hydrocarbons; BTEXN – Benzene, Toluene, Ethylbenzene, Xylenes, Naphthalene; SVOC – Semi-Volatile Organic Compounds; Volatile Organic Compounds; OCP – Organochlorine Pesticides; 1 – arsenic, chromium, manganese, aluminium, cadmium, chromium, copper, lead, nickel and zinc;

Previous investigations of the area from which the stockpiles in the assessment were excavated have typically identified notable concentrations of TPH, PAHs and lead in soil.

1.5 Stockpile Description

The stockpile to be considered in this report is:

- RH_SP, consisting of approximately 20 m^3 of soil and fill material.

The stockpile volume has not been surveyed and therefore the above figure is an estimate, based on the dimensions of the stockpile measured on site by the AECOM field staff.

The stockpile generally consists of fill material comprised of a mixture of brown sandy gravelly clay and sandy clayey gravel with a slight phenolic odour.

1.6 Proposed Reuse Scenario

Beneficial reuse of RH_SP as fill material within the area of the Site referred to as the Precinct South is proposed. Remediation works currently being undertaken in this area have generated excavations, and the use of RH_SP as fill material is considered advantageous as it reduces the import of clean fill to the Site, and the use of landfill as an alternative disposal of this material.

Reuse of RH_SP would be undertaken under the conditions assumed to prepare the Site Specific Remediation Criteria (RC) discussed in **Section 2.3**. The future uses of the Precinct South considered for this assessment are:

- Commercial / Industrial Use
- Intrusive Maintenance Workers
- Open Space

2.0 Assessment Criteria

2.1 Data Quality Indicators

The laboratory data, including copies of the chain of custody (CoC) documentation, sample receipt notification (SRN) reports, quality control (QC) reports, and certificates of analysis are attached in **Appendix A**.

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the laboratory and field data include:

- Assessment of field duplicate sampling rates and reproducibility of the data by calculation of the relative percentage difference (RPD) for laboratory and field duplicate samples (both intra- and inter-laboratory) to provide an indication of the precision of the data.
- Assessment of the analytical results for laboratory quality control samples to provide an indication of the accuracy of the data.
- Assessment of a range of QC and quality assurance (QA) measures generated from both the field sampling and laboratory analytical programs.

Assessment criteria for DQIs for soil samples are listed below in **Table 2**. Assessment against DQIs is provided in **Section 4.3**, and in **Appendix B**.

Table 2 Acceptance Criteria for Data Quality Indicators

Data Quality Indicator	Acceptance Criteria
Rinsate, Field and Trip blanks	Less than the laboratory Limit of Reporting (LOR)
Intra and inter laboratory field duplicates (1) (3)	RPD less than ± 30%
Laboratory duplicates (2) (3)	RPDs Less than: • 30% for high level laboratory duplicates (i.e. >20 x LOR) • 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR) • 200% for low level laboratory duplicates (i.e. 1 to 10 x LOR)
Matrix spikes (3) (4)	Recoveries between 70-130% of the theoretical recovery
Method blanks	Less than the laboratory LOR
Laboratory control samples (5)	Recoveries between 70-130%.
Surrogate spikes	Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for tests but are within the criteria described in USEPA Method SW846.

Notes:

1. *Potential exceptions to these criteria may occur where the results are close to the LOR. This typical RPD range is obtained Schedule B3 of the National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM Schedule B3).*
2. *If the results are close to the LOR, then higher results will be accepted.*
3. *Assumes that samples are homogeneous, and the background analyte level is less than 20% of the spike level (refer to USEPA Method 8000B). Note that there is no requirement for matrix spikes to pass as certain matrices may preclude recovery of spiked compounds. In this case data will be accepted if LCS data meets the acceptance criteria.*

4. *80% of the compounds tested must fall within the control limits. Control limits are dynamic and vary for individual tests as per USEPA Method 8000B.*
5. *Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for individual tests but are within the criteria described in USEPA Method SW846.*

2.2 Soil Categorisation (IB105 Guideline Values)

To assess and categorise the soil within the stockpiles, soil analytical results were screened against the criteria in Table 2 of TAS EPA IB105, which uses four categories to classify contaminated soil as:

- Level 1 (Fill Material)
- Level 2 (Low Level Contaminated Soil)
- Level 3 (Contaminated Soil)
- Level 4 (Contaminant Soil for Remediation).

Analytical data for soil total contaminant concentration (TCC) and leachable contaminant concentration (LCC), compared to the criteria presented in Table 2 of IB105, are presented in **Table T1** and **Table T2**, respectively.

Excavated materials are required to be classified as Level 1 or Level 2 soils in accordance with IB105 to be considered for reuse.

2.3 Site Specific Remediation Criteria

AECOM has prepared Site Derived Remediation Criteria (RC) for soil and groundwater to inform potential remediation/ management works required at the Site for the protection of human health (*Derivation of Remediation Criteria, Macquarie Point Development Project*, AECOM, 2016). The following scenarios have been considered based on the potential future land uses:

- Recreational Open Space Users
- Residents:
  - Slab-on-grade unknown construction or multi-storey building
  - Low rise slab-on grade
  - Building with basement car park.
- Commercial:
  - Slab-on-grade unknown construction or multi-storey building.
- Commercial/ Light Industrial Workers:
  - Working within a basement car park
  - Low rise slab-on-grade.
- Maintenance Workers (including excavation to depths of up to 1 m bgl).

The RC is based on generic assumptions regarding future land use including:

- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of Intrusive Maintenance Workers [IMW]) to have direct contact with soils. Agreement with the Site Contaminated Land Auditor will likely be required when specifying an appropriate engineered break layer to mitigate potential direct contact with underlying soils. The engineered break layer may consist of, but not be limited to:
  - Paved surfaces (e.g. concrete, asphalt, etc.)
  - Building footings
  - Sufficient clean soil to mitigate potential direct access to underlying soil during incidental digging (e.g. 0.5 – 1.0 m topsoil)

- Other suitable materials; e.g. geosynthetic materials that may provide a suitable physical barrier and may be able to be used as alternative to a thicker earthen layer.

- A Site Environment Management Plan (SEMP) will be in place in the future to maintain/manage the surface cover and to specify the requirement for a Work Health and Safety Plan (WHSP) for ground breaking activities, including Intrusive Maintenance Workers.
- Adjacent off-Site land uses include open space, commercial/industrial and residential areas. As these potential land uses have been considered on Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g. via groundwater migration beyond the Site boundary).

For current and proposed future uses of the proposed area of reuse (the Precinct South) residential use is not planned or considered likely to occur due to the planned future uses of the Site, and zoning controls and limitations for this area due to proximity to port facilities.

The Site has recently been announced as a preferred location for development of a future sports stadium. While no details of stadium design have been provided and specific RC for this use have not been developed, exceedances of the RC with respect to future Commercial/Light Industrial and Intrusive Maintenance Worker use of this area are considered as the most appropriate for a sporting/culture area.

It is noted that a future risk assessment of site data and completed remediation against stadium requirements will be required in the future and additional remediation may be required if specific risk scenarios not considered by the existing RC are identified.

2.4 Environmental Approval No. 10512/2

On 14 September 2022, Environmental Approval No. 10512/2 (attached as **Appendix C**) was issued by the Environment Protection Authority (EPA) Tasmania detailing the requirements under which beneficial reuse of waste material (excavated soil) which had been produced from on the Site was allowable. EA 10512/2 was issued to renew previous EA 10512/1, which was issued on 7 October 2020 for a two year period.

EA 10512/2 states (among other requirements):

1. Where stockpiled soil, derived from the land, has been classified as Low Level Contaminated Soil (Level 2 Soil), in accordance with Information Bulletin No. 105, and contaminant concentrations are below the Site Specific Remediation Criteria defined in the document; 'Derivation of Remediation Criteria, Macquarie Point Redevelopment Project', prepared by AECOM and dated 9 August 2016, the stockpiled soil may be reused on the land, subject to the conditions of this approval.
2. The site environmental auditor, as accredited by Section 39F(3) of the Macquarie Point Development Corporation Act 2012, must endorse the reuse of each soil stockpile prior to the reuse occurring.
3. The reuse must be undertaken in accordance with the document titled 'Site Environment Management Plan, Macquarie Point Development Project', prepared by AECOM and dated 14 November 2018.

Reuse of soil under EA 10512/2 must meet these requirements.

3.0 Field Methodology and Data

3.1 Field Activities

The following field activities associated with these stockpiles have been conducted by Wagstaff Piling Pty Ltd (Wagstaff) and AECOM:

Table 3 Field Activities

Date	Activity
27 to 28 June 2022	Stockpiles generated during excavation activities in the Gateway.
6 March 2023	RH_SP sampled by AECOM field staff

A description of each activity carried out is provided below.

3.2 Soil Excavation and Stockpile Handling

RH_SP was generated as part of the site preparation for an *in situ* pilot trial to immobilise deeper contamination.

Stockpiles were excavated and moved using a mechanical excavator and stored on existing hardstand (i.e. bitumen or concrete slabs) when moved away from the point of excavation to prevent mixing with surface soils.

3.3 Sample Collection

Validation and categorisation sampling of individual stockpiles was undertaken by AECOM field staff following the procedures in the *Precinct South Remediation Work Plan* (AECOM, 2022) prepared for works. The general sampling methodology is summarised below:

- Nitrile gloves were used for the collection of each soil sample, and a new pair donned between each sample location.
- Samples were collected at a minimum rate of 1 per 25 m^3 of soil as per IB105. Field estimates of stockpile volumes were collected by AECOM. No survey data was collected.
- Sample locations were uniformly distributed throughout the excavated material.
- Soil samples were collected manually using a hand auger/trowel or similar from a depth of >0.2 m below the stockpile surface.
- Soil samples were stored in laboratory supplied 150 mL decontaminated glass jars with Teflon™ lined lids, and immediately placed in an 'esky' cooler with ice during sample storage and transport to the selected analytical laboratory under chain of custody procedures.

4.0 Assessment of Results

4.1 Sample Density

The number of samples analysed, i.e. sample density, is assessed against the estimated stockpile volume as summarised in **Table 4** below.

Table 4 Sample Density Assessment

Date	Stockpile ID	Volume (m^3)	Number of Primary Samples	Sample Density
6 March 2022	RH_SP	20	5	1 primary sample per 4 m^3

The following is noted:

- Sampling density in stockpile RH_SP was higher that the sampling frequency of one primary sample per 25 m^3 recommended in IB105 for all sampling events. On this basis, the sampling density is considered to be adequate to characterise these stockpiles.

Samples were collected based on a grid distribution within the stockpiles. Overall, the sampling density is considered acceptable for the categorisation and assessment of the stockpile.

4.2 Laboratory Analysis

Initial soil characterisation samples were submitted by AECOM to the laboratories for the following analytical suites:

- EPA Tasmania IB105 analytical suite [excluding tributyltin (TBT)]
- TPH/TRH, BTEXN, PAHs, phenols and metals (lead)

It is noted that, due to a computer error, samples were not initially selected for the IB105 analytical suite. Additional assessment of samples was conducted to meet sample density requirements.

40% of the initial samples collected from the stockpile were analysed for the IB105 suite of contaminants, excluding TBT, with the remaining samples analysed for key CoPC which have been identified as part of previous Site works or as likely to occur due to previous Site uses. The analytical suite selected is considered to be adequate for the assessment of these stockpiles. Toxicity Characteristic Leaching Procedure (TCLP) analysis was conducted for targeted samples as discussed in **Section 4.4.1**

The laboratory certificates of analysis and QC reports, as well as copies of the CoC and SRN documentation are attached in **Appendix A**.

The laboratory analytical results are presented in **Table T1** and **Table T2**.

4.3 Quality Assurance / Quality Control (QA/QC) Data Validation

The objective of the QA/QC program is to provide an assessment of the reliability of the data presented for interpretation. QA/QC assessment of the analytical data and sampling methodology has been conducted by AECOM following data collection by AECOM field staff. Samples were assessed against the DQIs discussed in **Section 2.1**. The detailed data validation report is presented in **Appendix B** and results are summarised below.

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- Intra- and inter-laboratory field duplicate sample pairs assessed as part of this data validation were collected from stockpile DL_SP, which is not being assessed as part of this report. However, for the purposes of assessing data reliability, these duplicate sample pairs are considered suitable for assessment of laboratory performance.
- Of a total of 168 RPD values calculated, 2 RPD values (<2.5%) were reported above the adopted acceptable RPD DQO limits. RPD exceedances were reported for lead, Sum of PAHs and phenanthrene. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

  As greater than 97.5% of duplicate RPD values were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.
- Trip blank analytical results were reported below the laboratory LORs.
- Concentrations of Sum of Naphthalene (2.1 µg/L) and phenol (14.2 µg/L) were detected in the rinsate blank collected during works and may indicate that there was an error or cross-contamination in field decontamination procedures.

  However, no exceedances of criteria for naphthalene or phenols were detected in samples collected from RH_SP, and if cross-contamination occurred it is not considered likely to affect outcomes of assessment.

  Field staff conducting sample collection have been informed of results and instructed to ensure that decontamination is being undertaken with care and to the extent required in the Precinct South Remediation Work Plan.
- For a number of the primary samples analysed, the laboratory reported a LOR of 0.5 mg/kg for benzo(a)pyrene, which is higher than the IB105 TCC Level 1 screening criterion (0.08 mg/kg), however is lower than the Level 2 (2 mg/kg) and Level 3 (20 mg/kg) screening criteria for benzo(a)pyrene. Considering the LOR allows for adequate characterisation of Level 3 and Level 4 soils based on TCC, and LCC of benzo(a)pyrene was relied upon for characterisation, the LOR is not considered to impact the usability of the data for the purposes of soil characterisation.
- Laboratory QA/QC sampling procedures including analysis of matrix spike recoveries, surrogate spike recoveries, laboratory control spike recoveries, laboratory duplicates and frequency of QA/QC reported some minor variances from recommended limits or ranges, indicating minor

possibility of under- or over-reporting for some chemicals. These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of stockpiles.

4.4 Soil Assessment

4.4.1 Soil Categorisation

The soil analytical data collected, including soil TCC and LCC concentrations, compared to the guideline values presented in Table 2 of IB105 for categorisation are presented on **Table T1** and **Table T2**, attached.

Exceedances of the Level 2 IB105 TCC criteria were reported for benzo(a)pyrene and Sum of PAHs for all samples collected from RH_SP. However, Toxicity Characterisation Leaching Procedure (TCLP) assessment conducted on all samples reported a leachate contaminant concentration for benzo(a)pyrene and for benzo(a)pyrene Toxicity Equivalence Quotient (TEQ) below the Level 2 Leachate Contaminant Concentration (LCC) for all samples.

Section 2.2.4 of IB105 states that "*Where a leachable concentration is proscribed in Table 2, generally that value will take precedence over the total concentration value and will be used as the sole determinant of final classification for disposal*".

On this basis, RH_SP is considered suitable to classify as Level 2 – Low Level Contaminated Soil.

4.4.2 Reuse Assessment

Results of stockpile sampling have been assessed against the Site Specific RC for proposed reuse as fill material in the Precinct South.

The results are presented in **Table T1**. Concentrations of all analytes were reported below the Site Specific RC for all analytes.

On this basis, stockpile RH_SP considered to be suitable for reuse as fill material under the conditions and assumptions of the Site Specific RC described in **Section** Error! Reference source not found..

5.0 Conclusions and Recommendations

Soil categorisation sample data results for one soil stockpile, generated by removal of shallow soil to undertake remediation trials of deeper contamination, have been considered in this report:

- RC_SP, consisting of 20 m^3 of soil and fill material.

The following conclusions have been drawn from this assessment:

- Level 2 TCC exceedances for benzo(a)pyrene and Sum of PAHs were reported in the stockpile. However, TCLP leachate concentrations for benzo(a)pyrene and benzo(a)pyrene TEQ were reported below the IB105 Level 2 criteria for all samples.
- No exceedances of Site Specific RC were detected in any samples collected from this stockpile.
- Sampling of the stockpile was conducted at sufficient density to allow assessment of potential contaminants, and no irregularities in DQIs were reported which may render results unsuitable for interpretation

Based on this assessment, RH_SP can be classified as **Level 2 – Low Level Contaminated Soil** and is suitable for reuse as fill material on the Macquarie Point site, under the conditions assumed in the RC.

Reuse of the soil is proposed under the conditions described in EA10512/2. Endorsement of reuse by the Site Environmental Auditor is required prior to reuse.

In the event that an alternative disposal methodology be proposed or further treatment required, this waste management plan should be updated, or a new plan be prepared, by a suitably experienced environmental professional.

Yours faithfully

Robert Crowe

CERTIFICATE OF ANALYSIS

Work Order	: **EM2304035**	Page	: 1 of 18
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 08-Mar-2023 11:15
Order number	: 60693007-2	Date Analysis Commenced	: 09-Mar-2023
C-O-C number	: 49293	Issue Date	: 14-Mar-2023 22:30
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 21		
No. of samples analysed	: 19		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP080: Particular samples EM2304035_019 & 020, LOR has been raised for Toluene, meta- & para-Xylene due to possible contamination. Confirmed by re-analysis.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2304035 #10 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EP075(SIM): EM2304035_012 Poor duplicate precision due to sample heterogeneity. Confirmed by re-extraction and re-analysis.

Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 08-Mar-2023
Order number	: 60693007-2	Date Analysis Commenced	: 09-Mar-2023
C-O-C number	: 49293	Issue Date	: 14-Mar-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 21		
No. of samples analysed	: 19		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

Sampler	: TIM SMITH02	No. of samples received	: 21
Order number	: 60693007-2	No. of samples analysed	: 19

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	EM2304035--010	DL_SP_05	**Arsenic**	7440-38-2	33.1 %	0% - 20%	**RPD exceeds LOR based limits**
EG005(ED093)T: Total Metals by ICP-AES	EM2304035--010	DL_SP_05	**Lead**	7439-92-1	122 %	0% - 20%	**RPD exceeds LOR based limits**
EP075(SIM)B: Polynuclear Aromatic Hydrocarbons	EM2304035--012	DL_SP_07	**Fluoranthene**	206-44-0	26.4 %	0% - 20%	**RPD exceeds LOR based limits**
EP075(SIM)B: Polynuclear Aromatic Hydrocarbons	EM2304035--012	DL_SP_07	**Pyrene**	129-00-0	23.7 %	0% - 20%	**RPD exceeds LOR based limits**
EP075(SIM)B: Polynuclear Aromatic Hydrocarbons	EM2304035--012	DL_SP_07	**Benz(a)anthracene**	56-55-3	21.1 %	0% - 20%	**RPD exceeds LOR based limits**
Matrix Spike (MS) Recoveries							
EP075(SIM)B: Polynuclear Aromatic Hydrocarbons	EM2304035--002	RH_SP_02	**Pyrene**	129-00-0	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
MINNIE TRAN	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG005T: EM2304580 #10, sample heterogeneity has been observed for lead, with the following results obtained: 5140 mg/kg, 7620 mg/kg and 11500 mg/kg.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP068: EM2304580_001 Poor matrix spike recovery for heptachlor due to matrix effects.
- This is a rebatch of EM2304035.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 08-Mar-2023
Order number	: 60693007-2	Date Analysis Commenced	: 17-Mar-2023
C-O-C number	: ----	Issue Date	: 22-Mar-2023
Sampler	: TIM SMITH02		
Site	: ----		
Quote number	: ME/386/22		
No. of samples received	: 16		
No. of samples analysed	: 16		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
MINNIE TRAN	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2304580**	Page	: 1 of 8
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 08-Mar-2023
Site	: ----	Issue Date	: 22-Mar-2023
Sampler	: TIM SMITH02	No. of samples received	: 16
Order number	: 60693007-2	No. of samples analysed	: 16

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **SOIL**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Matrix Spikes (MS)

Matrix Spikes (MS)					
PAHs (GC/MS - SIM) Low-Level	0	16	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	SOIL	In house: Referenced to APHA 4500-CN C / ASTM D7511 / ISO 14403. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3).
Total Fluoride	EK040T	SOIL	(In-house) Total fluoride is determined by ion specific electrode (ISE) in a solution obtained after a Sodium Carbonate / Potassium Carbonate fusion dissolution.
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
PAHs (GC/MS - SIM) Low-Level	EP075(SIM)B-LL	SOIL	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Total Fluoride	EK040T-PR	SOIL	In house: Samples are fused with Sodium Carbonate / Potassium Carbonate flux.

Preparation Methods	Method	Matrix	Method Descriptions
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

Hi Peter,

I'm looking at the results for batch EM2304035 which came through last night. There were a few analytical suites missed in assessment we'll need – Tim believes he included them in the additional notes for the samples on Compass, but it's my fault for not looking at the CoC too closely however.

Can you organise the following additional assessment? Sample suites are summarised below the table of samples. A few small notes:

- For lead analysis of DL_SP05 – could the second sample jar provided for this sample be used? The initial report was very high (55,500 mg/kg) and may indicate some lead metal in the sample.
- When calculating the benzo(a)pyrene TEQ, is it possible for this to be determined using the 16 congeners on the third table provided, rather than the 8 ALS normally uses? This is the range used by Tasmanian EPA - I have previously been calculating manually if needed, but it's always preferable for the values we talk about to be on the COA.

Thanks, and please let me know if you have any questions or need any additional information.

Sample Receipt Advice

Company name:	AECOM Aust Pty Ltd Melbourne
Contact name:	Robert Crowe
Project name:	MACQUARIE POINT OIL AND DIESEL LINE REMOVAL
Project ID:	Not provided
Turnaround time:	5 Day
Date/Time received	Mar 9, 2023 8:30 AM
Eurofins reference	970404

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 3.8 degrees Celsius.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Michael Morrison on phone : 03 8564 5933 or by email: MichaelMorrison@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general AECOM Aust Pty Ltd Melbourne email address.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Appendix B

Data Validation

Data Validation

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the data considered in this report are presented in **Section 5.1** of the main report. Quality assurance (QA) and quality control (QC) assessment of the sampling methodology and analytical data against the DQIs has been undertaken in this data validation.

ALS Laboratories (ALS) Melbourne was selected as the primary laboratory and Eurofins was selected as the secondary laboratory for chemical analysis. Both laboratories are accredited by the National Association of Testing Authorities (NATA) for the analyses selected.

The sampling events and relevant laboratory reports pertaining to the stockpiles considered in this report are summarised in below **Table 1**.

Table 1 Stockpile Data Considered

Stockpile ID	Categorisation Sampling Event	Sampling Personnel	Lab Report Numbers
RH_SP	6 March 2023	Timothy Smith (AECOM)	EM2304035 EM2304580 970404*

*Note: * – Laboratory reports from the secondary laboratory.*

Copies of the laboratory documentation including chain of custody (CoC) documentation, sample receipt notification (SRN) reports, QC reports, and certificates of analysis are attached in **Appendix A**.

1.0 Assessment of Field Data Quality

1.1 Sample Collection

Soil samples from stockpiles were collected by AECOM field personal with appropriate environmental sampling experience. Sample collection was conducted with reference to the methodology described in **Section 3.2** of the main report. Samples were collected in laboratory supplied sample containers and placed in chilled eskies prior to transportation to the selected laboratories.

1.2 Intra- and Inter-Laboratory Field Duplicate Samples

One intra-laboratory and one inter-laboratory field duplicate sample pairs were collected from the 15 primary samples collected on 6 March 2023.

It is noted that intra- and inter-laboratory field duplicate sample pairs were collected from stockpile DL_SP, which is not being assessed as part of this report. However, for the purposes of assessing data reliability, these duplicate sample pairs are considered suitable for assessment of laboratory performance.

Intra-laboratory duplicate samples were collected at a rate greater than or equal to one per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples) and the duplicate sample rate is considered satisfactory for assessment of data reliability.

Duplicate samples have been compared to primary samples and Relative Percentage Differences (RPDs) were calculated. Results of field duplicate samples and RPDs are presented in **Table B1**.

The following acceptance criteria have been applied for RPDs:

- RPD less than 30% for high level laboratory duplicates (i.e. concentrations >20 x LOR)
- RPD less than 50% for medium level laboratory duplicates (i.e. concentrations 10 – 20 x LOR)
- RPD less than 200% for low level laboratory duplicates (i.e. concentrations 1 – 10 x LOR)

Of a total of 168 RPD values calculated, 2 RPD values (<2.5%) were reported above the adopted acceptable RPD DQO limits. RPD exceedances were reported for lead, Sum of PAHs and phenanthrene. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

As greater than 97.4% of duplicate RPD values were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.

1.3 Trip Blank

One trip blank consisting of clean, laboratory supplied distilled water was submitted iwith cooler box transported to the laboratory.

The trip blanks was analysed for select volatile compounds, including TPH C_6-C_9, TRH C_6-C_{10}, and BTEXN. The trip blank sample had concentrations of target compounds reported below the LOR, indicating that cross contamination of samples occurring in transit is unlikely to have occurred.

Trip blank results are reported on **Table B2** attached.

1.4 Rinsate Blank

A rinsate blank was prepared by pouring laboratory supplied water over non-dedicated sampling equipment (a trowel) following decontamination procedures to assess the potential for cross-contamination.

A total of one rinsate blank was analysed as part of these works, which occurred on one day of sampling.

Concentrations of Sum of Naphthalene (2.1 µg/L) and phenol (14.2 µg/L) were in the rinsate blank and may indicate that there was an error or cross-contamination in field decontamination procedures. However, no exceedances of criteria for naphthalene or phenols were detected in samples collected from RH_SP, and if cross-contamination occurred it is not considered likely to affect outcomes of assessment.

Field staff conducting sample collection have been informed of results and instructed to ensure that decontamination is being undertaken with care and to the extent required in the Precinct South Remediation Work Plan.

Rinsate blanks results are reported on **Table B2** attached.

2.0 Assessment of Laboratory Data Quality

A summary of the assessment of laboratory data quality for soil, leachate and QA/QC samples relevant to the report is provided in **Section 2.1** – **Section 2.6** below.

Soil samples were analysed for a combination of analytes including metals, cyanide, fluoride, TPH/TRH, BTEX, PAH, MAH, phenols, PCBs and pesticides. As these analytes include the CoPC identified in **Section 1.4** (of the main report) for the areas in which the stockpiles were generated, based on available Site history and uses, and previous investigations conducted, soil analytical program is considered appropriate for the purposes of this report. The adequacy of the analytical suite selected is further detailed in in **Section 5.2** of the main report.

2.1 Sample Receipt Temperature

Soil samples were kept chilled during storage and transportation with ice in portable coolers until received by the laboratory for analysis. Samples were reported to be received in good condition in appropriately preserved sample containers.

Samples were reported received by ALS (the primary laboratory) at 3.5ºC, and by Eurfoins (the secondary laboratory) at 3.8 ºC, within the acceptable target range of 0 – 6°C.

Leachate analysis was conducted on samples previously extracted and do not have sample receipt temperatures reported.

2.2 Sample Holding Times

All primary samples were received by laboratories within the recommended holding times for the requested analyses.

Proactive holding time assessments completed by the analytical laboratories are provided in **Appendix A**.

2.3 Limits of Reporting

For a number of the primary samples analysed, the laboratory reported a LOR of 0.5 mg/kg for benzo(a)pyrene, which is higher than the IB105 TCC Level 1 screening criterion (0.08 mg/kg), however is lower than the Level 2 (2 mg/kg) and Level 3 (20 mg/kg) screening criteria for benzo(a)pyrene. Considering the LOR allows for adequate characterisation of Level 2 to Level 4 soils based on TCC, and LCC of benzo(a)pyrene was relied upon for characterisation, the LOR is not considered to impact the usability of the data for the purposes of soil characterisation.

2.4 Laboratory Method Blanks

All soil laboratory method blanks, detailed in **Appendix A**, were reported within the acceptable range, i.e. below the laboratory LORs.

2.5 Laboratory Control Spikes

Laboratory control spikes, detailed in **Appendix A**, were within the laboratory-derived control limits for the methods used, and no outliers were reported.

2.6 Frequency of Quality Control Spike

Frequency of quality control spikes, detailed in **Appendix A**, were at the rate expected by applicable QC specifications, and no outliers were reported.

2.7 Laboratory Duplicates and RPDs

The RPD between analytical results for primary samples and their corresponding laboratory duplicates were within acceptable limits, with the exception of the duplicate outliers listed below in **Table 2**.

Table 2 Laboratory Duplicate RPD Exceedances

Work Order	Sample ID	Analyte	RPD	Limits
EM2304035	DL_SP_05	Arsenic	33.1%	0% - 20%
		Lead	122%	
		Fluoranthene	26.4%	
		Pyrene	23.7%	
		Benzo(a)pyrene	51.1%	

RPD exceedances are attributed to the heterogeneity of the soil samples submitted to the laboratory. The presence of varied fill material is well documented across the Site, including areas where these stockpiles were generated. These exceedances are not considered to impact interpretation of the results.

2.8 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix A**. Matrix spike recoveries were noted to be within the data quality objective range of 70% - 130%, or laboratory-derived limits for the methods used, with the exceptions of the outliers noted in **Table 3** below.

Table 3 Matrix Spike Outliers

Work Order	Sample ID	Analyte	Matrix Spike	Limits
EM2304035	RH_SP_02	Pyrene	Not Determined	MS recovery not determined – background level greater than or equal to 4x spike level

Matrix spike recovery outliers reported are due to matrix interference with samples. The presence of varied fill material is well documented across the Site, including areas where these stockpiles were generated. Overall, these outliers are not considered to impact interpretation of the results.

2.9 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory quality control reports provided in **Appendix A**. All surrogate spike recoveries for regular sample matrices were within the surrogate control limits adopted for the methods used. No surrogate recovery outliers were reported.

3.0 Summary

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- Intra- and inter-laboratory field duplicate sample pairs assessed as part of this data validation were collected from stockpile DL_SP, which is not being assessed as part of this report. However, for the purposes of assessing data reliability, these duplicate sample pairs are considered suitable for assessment of laboratory performance.
- Of a total of 168 RPD values calculated, 2 RPD values (<2.5%) were reported above the adopted acceptable RPD DQO limits. RPD exceedances were reported for lead, Sum of PAHs and phenanthrene. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

  As greater than 97.4% of duplicate RPD values were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.
- Trip blank analytical results were reported below the laboratory LORs.
- Concentrations of Sum of Naphthalene (2.1 µg/L) and phenol (14.2 µg/L) were detected in the rinsate blank collected during works and may indicate that there was an error or cross-contamination in field decontamination procedures.

  However, no exceedances of criteria for naphthalene or phenols were detected in samples collected from RH_SP, and if cross-contamination occurred it is not considered likely to affect outcomes of assessment.

Field staff conducting sample collection have been informed of results and instructed to ensure that decontamination is being undertaken with care and to the extent required in the Precinct South Remediation Work Plan.

- For a number of the primary samples analysed, the laboratory reported a LOR of 0.5 mg/kg for benzo(a)pyrene, which is higher than the IB105 TCC Level 1 screening criterion (0.08 mg/kg), however is lower than the Level 2 (2 mg/kg) and Level 3 (20 mg/kg) screening criteria for benzo(a)pyrene. Considering the LOR allows for adequate characterisation of Level 3 and Level 4 soils based on TCC, and LCC of benzo(a)pyrene was relied upon for characterisation, the LOR is not considered to impact the usability of the data for the purposes of soil characterisation.
- Laboratory QA/QC sampling procedures including analysis of matrix spike recoveries, surrogate spike recoveries, laboratory control spike recoveries, laboratory duplicates and frequency of QA/QC reported some minor variances from recommended limits or ranges, indicating minor possibility of under- or over-reporting for some chemicals. These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of stockpiles.

14 September 2022

Mr James Puustinen
Project Manager, Capital Works
Macquarie Point Development Corporation
GPO Box 51
HOBART TAS 7001

Email: james@macquariepoint.com

Dear Mr Puustinen

Environmental Approval No. 10512/2 – Reuse of Low-Level Contaminated Soil at Macquarie Point Development Site

On 1 September 2022 your consultant, AECOM requested that the re-use of low-level contaminated soil at the Macquarie Point Development Site, currently authorised under Environmental Approval 10512/1, be authorised to continue for a further 2-year period, beyond 7 October 2022.

I enclose Environmental Approval No. 10512/2 for the re-use of low-level contaminated soil from stockpile at the Macquarie Point site. This authorisation is valid for a period of two (2) years from 7 October 2022. This authorisation is provided under Regulation 21 of the Regulations, subject to conditions. Please find attached Environmental Approval No. 10512/2 containing the conditions to be complied with.

Please take note that evidence of compliance with these conditions must be made available to an Authorised Officer on request.

Section 39F of the *Macquarie Point Development Corporation Act 2012* requires that an accredited environmental auditor has certified the remediation of any part of the site prior to redevelopment of that part of the site. I recommend that you discuss with your auditor the suitability of the above referenced material for the intended land use.

Pursuant to Regulation 21(7) I have decided to waive the application fee in relation to this Environmental Approval.

If you require any further information regarding this correspondence, please contact the EPA at the contact details at the head of this correspondence.

Yours sincerely

Joe Tranter
MANAGER, CONTAMINATED LAND AND WASTE REGULATION
Delegate for the Director, Environment Protection Authority

Cc: Robert Crowe, robert.crowe@aecom.com

Encl: Draft Environmental Approval No. 10512/2

ENVIRONMENTAL APPROVAL No. 10512/2

Approval under the *Environmental Management and Pollution Control (Waste Management) Regulations 2020*

I, Joseph Tranter, Delegate for the Director, Environment Protection Authority, hereby grant approval in accordance with Regulation 21(4)(a) of the *Environmental Management and Pollution Control (Waste Management) Regulations 2020* for the reuse of the waste material described below provided the following requirements are complied with:

Approval issued to:
MACQUARIE POINT DEVELOPMENT CORPORATION

ABN
92 657 409 841

Waste description and quantity (the waste):
Low Level Contaminated Soil
No limit set

NEPM code and description:
N120: Soils contaminated with a controlled waste

Location (the land):
MACQUARIE POINT, 10 EVANS ST, HOBART TAS 7000

Producer of the waste:
Macquarie Point Development Corporation

Period for which approval is valid:
7 October 2022 to 7 October 2024

Requirements:

1. Where stockpiled soil, derived from the land, has been classified as Low Level Contaminated Soil (Level 2 Soil), in accordance with Information Bulletin No. 105, and contaminant concentrations are below the Site Specific Remediation Criteria defined in the document; 'Derivation of Remediation Criteria, Macquarie Point Redevelopment Project', prepared by AECOM and dated 9 August 2016, the stockpiled soil may be reused on the land, subject to the conditions of this approval.

2. The site environmental auditor, as accredited by Section 39F(3) of the Macquarie Point Development Corporation Act 2012, must endorse the reuse of each soil stockpile prior to the reuse occurring.

3. The reuse must be undertaken in accordance with the document titled 'Site Environment Management Plan, Macquarie Point Development Project', prepared by AECOM and dated 14 November 2018.

DELEGATE FOR THE DIRECTOR, ENVIRONMENT PROTECTION AUTHORITY Date of issue: 14 September 2022

4. The activity must be conducted in such a manner as to prevent environmental nuisance and environmental harm resulting from escape of the materials, spillage, or emission of dust.

5. Unless otherwise approved in writing by the Director, waste material must not be removed from the storage site for any reason, including disposal.

6. If an incident causing or threatening environmental nuisance, serious environmental harm, or material environmental harm from pollution occurs in the course of the approved activity, then the person responsible for the activity must immediately take all reasonable and practicable action to minimise any adverse environmental effects from the incident.

7. A record of the soil reuse must be kept from the date of issue of this approval. This record must be provided to the Director annually no later than 14 days after the anniversary of the issue date of this approval and include, as a minimum, all records for the 12 months preceding the anniversary. Records must also be made available to an Authorized Officer on request in writing, within the timeframe and for the reporting period specified within the request.

8. For each soil stockpile that is reused the record of soil reuse must include:
   a. A description of the soil.
   b. Results of soil classification, in accordance with Information Bulletin No. 105.
   c. The quantity of soil that was reused.
   d. The location at which the soil was reused.
   e. The endorsement from the site environmental auditor for the reuse.
   f. Any certification required under section 39F of the Macquarie Point Development Corporation Act 2012.

Signed: _____

Report Suspicious

Hi Rob,

This should be fine.

Just one thing though the description says: *The stockpile generally consists of fill material comprised of a mixture of brown sandy gravelly clay and sandy clayey gravel with a slight phenolic odour.*

But the field records saying this aren't obvious in the report. Just wanting to know what is the basis for saying the material is a soil and not a waste pile (or soil with a significant proportion of other wastes, like metal/plastic/waste wood, etc) that happens to have acceptable concentrations. The description as cut/pasted looks fine, but where did it come from? (the COC just notes 'soil').

Cheers,

David Lam | Senior Principal Environmental Consultant

Subject: Macquarie Point - Auditor Approval sought for reuse of material from AA6 ISS Pilot Trial as fill in the Precinct South

⚠ CAUTION: This email originated from an external sender. Verify the source before opening links or attachments.
⚠

Afternoon David, Adi,

In accordance with the approach in the *Precinct South Remediation Work Plan* (AECOM, 24 November 2022) and Environmental Approval 10512/2 (included as Appendix C of the attached report), this email is to seek Auditor approval for reuse of a stockpile RH_SP as fill material within the excavations undertaken as part of the Macquarie Point Precinct South remediation.

RH_SP is a stockpile of approximately 20 m^3 which consists of fill material excavated from beneath the Cold Store slab in the Gateway Area of Macquarie Point (also referred to as Audit Area 6) as part of works to complete the *in situ* solidification pilot trial in July-August 2022. The original source of the material (prior to placement at Macquarie Point) in unknown, but the material is believed to have been imported to build up the surface level of the area to allow construction of the Cold Store (circa 1995).

Please find attached Soil Categorisation and Waste Management Plan – RH_SP for this stockpile. From these results of categorisation samples collected, the following has been assessed:

- No exceedance of the Site Specific Remediation Criteria (RC) for the proposed future uses of the Precinct South were reported.
- The soil within the stockpile is suitable for categorisation as Level 2 – Low Level Contaminated Soil.

Excel copies of the sample results for this stockpile have been included with this email for your reference/review.

On the basis of the above, no unacceptable risk to current or future uses of the Site are likely to occur under the conditions of the Site Environment Management Plan.

Under EA10512/2, beneficial reuse of this stockpile as fill on the Macquarie Point can proceed with Auditor approval. It is proposed that this material be reused as fill in either the former UST Area (within and adjacent to the site road between the Red Shed and the former location of the Sea Road Shed) or for the removal of additional lead impacted soil on the boundary of the Precinct South and the Precinct North, where chase out of lead impacted soil was halted in 2020. The final location of reuse will be recorded by BlackCap, who are undertaking civil works associated with remediation, and reported in the final remediation validation report for works.

Please let me know if you have any questions or comments on this assessment, stockpile or the proposed reuse, or if you are happy to approve reuse as fill.

Cheers,

Robert Crowe

5 July 2023

Mr Sean McArdle
Project Manager - Capital Works
Macquarie Point Development Corporation
GPO Box 51
Hobart, Tasmania, 7001

Dear Sean,

Soil Categorisation and Waste Management Plan - Precinct South Remediation - Former UST Area Excavation Stockpiles
Macquarie Point Development Project

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of remediation at the Macquarie Point Site in Hobart, Tasmania (the Site). The Site location is shown on **Figure F1**

The Site has historically been used for mixture of commercial and industrial purposes. As part of the remediation work undertaken at the area of the Site referred to as the Precinct South, two soil stockpiles (UST_SP1 and UST_SP_Ext_59SP) were generated via excavation of hydrocarbon impacted soil beneath a Site road.

Biopiling and landfarming have been undertaken on these stockpiles by BlackCap Group Pty Ltd (BlackCap) to reduce hydrocarbon concentrations in soil and allow potential for beneficial reuse as backfill on the Site. The stockpiles are currently situated on the former SeaRoad Shed slab in the south-east corner of the Site.

At the request of the Corporation, AECOM has prepared this soil categorisation and waste management plan for these soil stockpiles. This report is intended to assess the effectiveness of the remediation of these stockpiles and act as a Waste Management Plan to advise of disposal options.

It is currently proposed that the stockpiles will be reused as fill material in excavations in the area of the Site referred to as the Precinct South under existing Environmental Approval No. 10512/2 (EA10512/2), included as **Appendix C**.

1.1 Objectives

The objectives of this letter are:

- To assess the remediation of stockpiles UST_SP1 and UST_SP_Ext_50SP.
- To provide characterisation of UST_SP1 and UST_SP_Ext_50SP in accordance with EPA Tasmania *Information Bulletin No. 105 - Classification and Management of Contaminated Soil for Disposal* (IB105).
- To assess suitability of UST_SP1 and UST_SP_Ext_50SP for beneficial Site reuse as backfill material in accordance with EA10512/2.

It is intended that this document can act as a Waste Management Plan for the reuse of the stockpiled material in accordance with Section 3 and Section 5 of IB105.

1.2 Scope of Work

Excavation and remediation of stockpiles was undertaken by BlackCap and is described in **Section 4.0**.

The following scope of work has been undertaken by AECOM:

- Field activities, including soil sampling from the stockpiles UST_SP1 and UST_SP_Ext_50SP, and the precursor stockpiles used to form them.
- Review and screening of sample results from the stockpiles against the criteria within IB105 for categorisation.

- Evaluate sample results against appropriate screening criteria to assess the suitability of the stockpile for beneficial reuse as fill material without unacceptable risk.
- Provision of this Soil Categorisation and Waste Management Plan for the disposal or reuse of the stockpile UST_SP1 and UST_SP_Ext_59SP.

1.3 Background

The Site, and surrounding area, largely located on reclaimed land within the Hobart port, has a history of mixed industrial use including the former Hobart Gasworks, rail freight and bulk fuel storage. Former industrial activities have been ceased at the Site. The Site is currently undergoing an Environmental Audit by Mr David Lam of Coffey under the *Macquarie Point Development Act 2012*.

The Precinct South area of the Site has had various uses, including land reclamation, bulk fuel terminal usage, freight handling, and fuel and oil transfer. As part of previous investigations, an area of elevated hydrocarbon impact to soil was identified adjacent to former fuel lines beneath a Site road adjacent between site buildings the Red Shed (to the west) and the SeaRoad Shed (to the east). The SeaRoad Shed was demolished in late 2022 and a large slab remains in its place. A removed Underground Storage Tank (UST) previously beneath the Site road is believed to be source of impacts to soil.

The Precinct South - Remediation Work Plan (the RWP) (AECOM, 2023a) and *The Precinct South – Technical Specification* (the Technical Specification) (AECOM, 2023b) were prepared to provide a framework and methodology for remediation of the Precinct South. BlackCap was engaged by the Corporation to undertake remediation of this area in accordance with the RWP and Technical Specification in early 2023. As part of these works, fuel impacted soil beneath the Site road and the SeaRoad Shed slab have been excavated and stockpiled on Site. UST_SP1 was formed by consolidation of a number of precursor stockpiles based on space constraints within the area of works.

On the basis of initial stockpile sample results, AECOM advised that excavated material may be suitable for remediation by biopiling and landfarming to reduce hydrocarbon concentrations and allow beneficial reuse.

1.4 Chemicals of Potential Concern

Based on available Site history and uses, and previous investigations conducted, the Chemicals of Potential Concern (CoPC) summarised in **Table 1** below have been identified for the areas in which the stockpiles were generated.

Table 1 Chemicals of Potential Concern

Former Land Use/ Potential Contaminating Activity	Contaminant of Potential Concern	Potentially Impacted Media
Land Reclamation	Heavy metals[1], TRH, PAH, BTEXN, phenolic compounds, SVOC, VOC, OCPs	• Soil • Groundwater • Soil Vapour
Freight Handling	Heavy metals[1], TRH, PAH, BTEXN, phenolic compounds, SVOC, VOC, pH	
Fuel Storage	Lead, TRH, PAH, BTEX, ACM	

Notes: TPH – Total Petroleum Hydrocarbons; TRH – Total Recoverable Hydrocarbons; PAH - Polycyclic aromatic Hydrocarbons; BTEXN – Benzene, Toluene, Ethylbenzene, Xylenes, Naphthalene; SVOC – Semi-Volatile Organic Compounds; Volatile Organic Compounds; OCP – Organochlorine Pesticides; 1 – aluminium, arsenic, cadmium, chromium, copper, lead, manganese, nickel, and zinc

1.5 Stockpile Description

The following stockpiles have been assessed in this report:

Table 2 Stockpiles Considered

Stockpile ID	Estimated Volume	Precursor Stockpiles
UST_SP1	200 m^3	UST_SP_1.5-2.0 UST_SP_EXT UST_SP_ch77-82
UST_SP_Ext_59SP	10 m^3	-

UST_SP1 consisted of a combination of three precursor stockpiles:

- UST_SP_1.5-2.0, generated from excavation of the initial UST area from 1.5 to 2.0 m below ground level (m bgl)
- UST_SP_EXT and UST_SP_ch77-82, generated from chase-out and excavation of the initial area to the east based on excavation validation results, beneath the SeaRoad Shed slab.

UST_SP_Ext_59SP was generated via further chase out based on excavation validation sampling.

The stockpiles have not been surveyed and therefore the volumes are estimated based on the dimensions of the stockpile measured on site by the AECOM field staff.

The stockpiles are shown at the time of most recent sampling on 6 June 2023 on **Plate 1** and **Plate 2** below. Both stockpiles consist of brown fill material with some cobbles/boulders present. Some small anthropogenic material (rebar) appears to be present in UST_SP1 (visible on the right side of **Plate 1**), and small amounts of hay from drainage protection are visible in both stockpiles.

Plate 1 UST_SP1, pre-remediation

Plate 2 UST_SP_Ext_50SP, pre-remediation

1.6 Proposed Reuse Scenario

Beneficial reuse of these stockpiles as fill material within the Precinct South is proposed. Remediation works, consisting of excavation of lead impacted soil to the north of the SeaRoad Shed slab, have resulted in the removal of soil from the Site, and the use stockpiles as fill material is considered advantageous as it reduces the import of clean fill to the Site, and the use of landfill as an alternative disposal of this material.

The intended location of reuse is shown on **Plate 3** below.

Plate 3 Proposed Area of Reuse (image accessed at Nearmap.com on 5 July and dated 15 February 2023)

Reuse of stockpiled material would be undertaken under the conditions assumed to prepare the Site Specific Remediation Criteria (RC) discussed in **Section 3.3**. The future uses of the Precinct South considered for this assessment are:

- Commercial / Industrial Use
- Intrusive Maintenance Workers
- Open Space

The location of reuse will be recorded in the Remediation Validation Report to be prepared at the conclusion of remediation works in the Precinct South. The recorded characteristics of reused soil, including concentrations of CoPC, will be included in the record, and would be considered in the event of a reassessment of risks and remediation requirements in the event in a change in proposed future site uses.

2.0 Stockpile Remediation Technologies

Remediation of stockpiles was conducted by a combination of biopiling and landfarming. Each technique is described briefly below.

2.1.1 Land Farming

Land farming is an ex-situ remediation technology that involves spreading impacted soils in thin layers across a prepared surface and regularly turning the material to enable air flow through the soil matrix (CRC CARE, 2018). The soil material is placed on a lined surface, with drainage control and bunding, to minimise the potential for leaching and run-off of contaminants. The soil conditions are controlled to maximise the degradation rate, including moisture content (via irrigation/spraying), aeration (by tilling/turning) and pH (buffered to neutral by adding acid or alkali).

Where land farming is carried out in the open and volatile contaminants (such as hydrocarbons) are involved, volatilisation can be a significant contributor to loss of contaminants. For successful treatment to meet regulatory drivers, additional degradation (via the addition of nutrients or biopiling) may be required to satisfy remediation thresholds for off-Site disposal.

2.1.2 Biopiling

Biopiling (stockpiles) is an ex-situ application of bioremediation where petroleum hydrocarbon impacted soils are excavated and placed in a treatment area where agents (such as fertilizer) are usually mixed into the contaminated soils to enhance the degradation process (CRC CARE, 2018). The soil can be placed in stockpiles (biopiles) or rows (windrows). To increase the effectiveness of biopiling, excavated soils can be aerated through mechanical turning or tilling, and moisture, temperature, oxygen, and pH can be adjusted. During this process, leachate is likely to occur and leachate barriers or a collection system are required to avoid contamination leaching into the soil and groundwater below or around the treatment area.

The addition of nutrients (typically in the form of plant fertilizer) helps to stimulate native microorganisms in the biopile material to enhance degradation of the petroleum contaminant. The organic make-up of the contaminant and the presence of other organic matter typically provides sufficient carbon for microorganism stimulation, however nutrient addition increase availability of nitrogen, phosphorus and/or potassium to the biopile to a Carbon: Nitrate: Phosphorus (C:N:P) ratio of 100:1:0.1 is recommended for effective treatment.

Additional engineering controls can be implemented, as an addition to biopile remediation, which can take the form of contained ventilation piping and blower, irrigation piping and/or sump and pump systems to facilitate aeration and drainage to maximise degradation rates.

3.0 Assessment Criteria

3.1 Data Quality Indicators

The laboratory data, including copies of the chain of custody (CoC) documentation, sample receipt notification (SRN) reports, quality control (QC) reports, and certificates of analysis are attached in **Appendix A**.

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the laboratory and field data include:

- Assessment of field duplicate sampling rates and reproducibility of the data by calculation of the relative percentage difference (RPD) for laboratory and field duplicate samples (both intra- and inter-laboratory) to provide an indication of the precision of the data.
- Assessment of the analytical results for laboratory quality control samples to provide an indication of the accuracy of the data.
- Assessment of a range of QC and quality assurance (QA) measures generated from both the field sampling and laboratory analytical programs.

Assessment criteria for DQIs for soil samples are listed below in **Table 3**. Assessment against DQIs is provided in **Section 5.5**, and in **Appendix B**.

Table 3 Acceptance Criteria for Data Quality Indicators

Data Quality Indicator	Acceptance Criteria
Rinsate, Field and Trip blanks	Less than the laboratory Limit of Reporting (LOR)
Intra and inter laboratory field duplicates (1) (3)	RPD less than ± 30%
Laboratory duplicates (2) (3)	RPDs Less than: • 30% for high level laboratory duplicates (i.e., >20 x LOR) • 50% for medium level laboratory duplicates (i.e., 10 to 20 x LOR) • 200% for low level laboratory duplicates (i.e., 1 to 10 x LOR)
Matrix spikes (3) (4)	Recoveries between 70-130% of the theoretical recovery
Method blanks	Less than the laboratory LOR
Laboratory control samples (5)	Recoveries between 70-130%.
Surrogate spikes	Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for tests but are within the criteria described in USEPA Method SW846.

Notes:

1. *Potential exceptions to these criteria may occur where the results are close to the LOR. This typical RPD range is obtained Schedule B3 of the National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM Schedule B3).*
2. *If the results are close to the LOR, then higher results will be accepted.*
3. *Assumes that samples are homogeneous, and the background analyte level is less than 20% of the spike level (refer to USEPA Method 8000B). Note that there is no requirement for matrix spikes to pass as certain matrices may preclude recovery of spiked compounds. In this case data will be accepted if LCS data meets the acceptance criteria.*
4. *80% of the compounds tested must fall within the control limits. Control limits are dynamic and vary for individual tests as per USEPA Method 8000B.*
5. *Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for individual tests but are within the criteria described in USEPA Method SW846.*

3.2 Soil Categorisation (IB105 Guideline Values)

To assess and categorise the soil within the stockpiles, soil analytical results were screened against the criteria in Table 2 of TAS EPA IB105, which uses four categories to classify contaminated soil as:

- Level 1 (Fill Material)
- Level 2 (Low Level Contaminated Soil)
- Level 3 (Contaminated Soil)
- Level 4 (Contaminant Soil for Remediation).

Excavated materials are required to be classified as Level 1 or Level 2 soils in accordance with IB105 to be considered for reuse.

3.3 Site Specific Remediation Criteria

AECOM has prepared Site Derived Remediation Criteria (RC) for soil and groundwater to inform potential remediation/ management works required at the Site for the protection of human health (*Derivation of Remediation Criteria, Macquarie Point Development Project*, AECOM, 2016). The following scenarios have been considered based on the potential future land uses:

- Recreational Open Space Users
- Residents:
  - Slab-on-grade unknown construction or multi-storey building
  - Low rise slab-on grade
  - Building with basement car park.
- Commercial:
  - Slab-on-grade unknown construction or multi-storey building.
- Commercial/ Light Industrial Workers:
  - Working within a basement car park
  - Low rise slab-on-grade.
- Maintenance Workers (including excavation to depths of up to 1 m bgl).

The RC is based on generic assumptions regarding future land use including:

- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of Intrusive Maintenance Workers [IMW]) to have direct contact with soils. Agreement with the Site Contaminated Land Auditor will likely be required when specifying an appropriate engineered break layer to mitigate potential direct contact with underlying soils. The engineered break layer may consist of, but not be limited to:
  - Paved surfaces (e.g., concrete, asphalt, etc.)
  - Building footings
  - Sufficient clean soil to mitigate potential direct access to underlying soil during incidental digging (e.g., 0.5 – 1.0 m topsoil)
  - Other suitable materials: e.g., geosynthetic materials that may provide a suitable physical barrier and may be able to be used as alternative to a thicker earthen layer.
- A Site Environment Management Plan (SEMP) will be in place in the future to maintain/manage the surface cover and to specify the requirement for a Work Health and Safety Plan (WHSP) for ground breaking activities, including Intrusive Maintenance Workers.
- Adjacent off-Site land uses include open space, commercial/industrial and residential areas. As these potential land uses have been considered on Site, the derived RC are considered to also

be protective of potential exposures to off-Site receptors (e.g., via groundwater migration beyond the Site boundary).

For current and proposed future uses of the proposed area of reuse (the Precinct South) residential use is not planned or considered likely to occur due to the planned future uses of the Site, and zoning controls and limitations for this area due to proximity to port facilities.

The Site has recently been announced as a preferred location for development of a future sports stadium. While no details of stadium design have been provided and specific RC for this use have not been developed, exceedances of the RC with respect to future Commercial/Light Industrial and Intrusive Maintenance Worker use of this area are considered as the most appropriate for a sporting/culture area.

It is noted that if and when further details of the stadium design are determined, a review of the remediation and approved future Site uses may be required to determine if there is potential for unacceptable risks associated with uses that have not been subject to direct consideration in assessment/auditing to date. This may require reconsideration of necessary remediation or management measures required to manage residual risks following the completion of practicable remediation.

3.4 Environmental Approval No. 10512/2

On 14 September 2022, Environmental Approval No. 10512/2 (attached as **Appendix C**) was issued by the Environment Protection Authority (EPA) Tasmania detailing the requirements under which beneficial reuse of waste material (excavated soil) which had been produced from on the Site was allowable. EA 10512/2 was issued to renew previous EA 10512/1, which was issued on 7 October 2020 for a two year period.

EA 10512/2 states (among other requirements):

1. Where stockpiled soil, derived from the land, has been classified as Low Level Contaminated Soil (Level 2 Soil), in accordance with Information Bulletin No. 105, and contaminant concentrations are below the Site Specific Remediation Criteria defined in the document; 'Derivation of Remediation Criteria, Macquarie Point Redevelopment Project', prepared by AECOM and dated 9 August 2016, the stockpiled soil may be reused on the land, subject to the conditions of this approval.
2. The site environmental auditor, as accredited by Section 39F(3) of the Macquarie Point Development Corporation Act 2012, must endorse the reuse of each soil stockpile prior to the reuse occurring.
3. The reuse must be undertaken in accordance with the document titled 'Site Environment Management Plan, Macquarie Point Development Project', prepared by AECOM and dated 14 November 2018.

Reuse of soil under EA 10512/2 must meet these requirements.

4.0 Field Methodology and Data

4.1 Field Activities

The following field activities associated with these stockpiles have been conducted by BlackCap and AECOM:

Table 4 Field Activities

Date	Activity
13-16 March 2023	Initial excavation of soil from former UST Area by BlackCap. Excavation of additional soil advised based on field screening by AECOM.
21 March 2023	Initial excavation validation sampling and stockpile classification of UST_SP_1.5-2.0, UST_SP_EXT_01 and UST_SP_ch77-82 by AECOM.
26 April 2023	Removal of SeaRoad Shed Slab and further chase out of TRH impacted soil.
23 May 2023	Sampling of UST_EXT_59SP by AECOM. Advice to remediate based on field assessment. It was identified that other stockpiles had been combined in UST_SP1 by BlackCap.
25 May 2023	Addition of nutrients and turning of stockpiles
6 June 2023	Validation sampling of stockpiles.

A description of each activity carried out is provided below.

4.2 Soil Excavation and Stockpile Handling

Soil stockpiles were generated as part of the site remediation to remove soil impacted with fuel hydrocarbons, believed to be present due to a UST previously present in the area of works. For some areas, existing surface cover (the SeaRoad Shed slab) was broken and removed prior to excavation.

Stockpiles were excavated by BlackCap and moved using a mechanical excavator and stored on existing hardstand (the concrete slab remaining from the SeaRoad Shed [demolished in late 2022]) when moved away from the point of excavation to prevent mixing with surface soils.

AECOM field staff inspected excavations and assessed extent of excavation based on indicators of potential fuel impact including staining, odours, and measurement of vapour using a hand-held Photo-Ionisation Detector (PID). If indicators of fuel impact were present, further excavation was recommended and conducted by BlackCap.

4.3 Stockpile Remediation

To provide additional nutrients and increase the rate of biological activity within the biopiles, a commercially available fertiliser mix was added to stockpiles within water by BlackCap. It is recommended in CRC CARE 2018 that a carbon / nitrate / phosphorus ratio of 100/1/0.1 should be used.

Based on this ratio, BlackCap selected a commercially available fertilizer with a reported nitrogen / phosphorus / potassium (NPK) ratio of 14% / 7% / 3% to provide additional nutrients to the stockpiles.

100 L of fertiliser mix was combined with water and turned through the stockpiles on 25 May 2023.

4.4 Sample Collection

Validation and categorisation sampling of individual stockpiles was undertaken by AECOM field staff following the procedures in the *Precinct South Remediation Work Plan* (AECOM, 2023a) prepared for works. The general sampling methodology is summarised below:

- Nitrile gloves were used for the collection of each soil sample, and a new pair donned between each sample location.

- Samples were collected at a minimum rate of 1 per 25 m^3 of soil as per IB105. Field estimates of stockpile volumes were collected by AECOM. No survey data was collected.
- Sample locations were uniformly distributed throughout the excavated material.
- Soil samples were collected manually using a hand auger/trowel or similar from a depth of >0.2 m below the stockpile surface.
- Soil samples were stored in laboratory supplied 150 mL decontaminated glass jars with Teflon™ lined lids, and immediately placed in an 'esky' cooler with ice during sample storage and transport to the selected analytical laboratory under chain of custody procedures.

5.0 Assessment of Results

5.1 Sample Density

The number of samples analysed, i.e., sample density, is assessed against the estimated stockpile volume as summarised in **Table 5** below.

Table 5 Sample Density Assessment

Date	Stockpile ID	Volume (m^3)	Number of Primary Samples	Sample Density
Pre-Remediation				
21 March 2023	UST_SP_1.5-2.0	80	5	1 primary sample per 16 m^3
21 March 2023	UST_SP_EXT	150	8	1 primary sample per 12.5 m^3
21 March 2023	UST_SP_ch77-82	30	3	1 primary sample per 10 m^3
23 May 2023	UST_SP_Ext_59SP	10	3	1 primary sample per 3.3 m^3
Post-Remediation				
6 June 2023	UST_SP1[1]	200	6	1 primary sample per 30 m^3
6 June 2023	UST_SP_Ext_59SP	10	3	1 primary sample per 3.3 m^3

Notes: UST_SP1 was formed by combination of UST_SP_1.5-2.0, UST_SP_EXT, and UST_SP_ch77-82.

The following is noted:

- The total estimated volume of the three stockpiles which form UST_SP1 (UST_SP1.5-2.0, UST_SP_EXT, and UST_SP_ch77-82) during initial sampling is 260 m^3, which is greater than the estimated volume of this stockpile during post-remediation sampling (200 m^3). Field estimated of volumes are based on pacing out and measurement of stockpile dimensions and estimation of stockpile height and following initial excavation all three stockpiles were of irregular shape and layout with variation in height across the stockpile. Initial volumes may have been overestimated by field staff.
- Sampling density in stockpile UST_SP1 was lower than that the sampling frequency of one primary sample per 25 m^3 recommended in IB105. However, the mixing undertaken as part of remediation is expected to have homogenised the stockpile, which is reflected in the post-remediation sample results on **Table T3** and **Table T4**, and sample density is still considered suitable for assessment.

Samples were collected based on a grid distribution within the stockpiles. Overall, the sampling density is considered acceptable for the categorisation and assessment of the stockpile.

5.2 Laboratory Analysis

Initial soil characterisation samples were submitted by AECOM to the laboratories for the following analytical suites:

- 30% of primary samples - EPA Tasmania IB105 analytical suite [excluding tributyltin (TBT)]
- Remaining primary samples - TPH/TRH, BTEXN, PAHs, phenols, and metals (lead)

As UST_SP_EX_50SP is a small (10 m^3) stockpile collected from directly adjacent to the previous stockpiles, it was not sampled for IB105 analytical suites.

Toxicity Characteristic Leaching Procedure (TCLP) analysis was conducted for targeted samples as discussed in **Section 5.4.1**.

Following remediation, all stockpile samples were analysed for:

- Total Contaminant Concentration - TPH/TRH, BTEXN, PAHs, phenols, and metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc, and mercury).
- TCLP Leachate - PAHs

The laboratory certificates of analysis and QC reports, as well as copies of the CoC and SRN documentation are attached in **Appendix A**. It is noted that these lab reports contain sample results for other assessment conducted as part of works which is not discussed in this report.

The laboratory analytical results are presented on **Table T1** and **Table T2** (pre-remediation) and **Table T3** and **Table T4** (post-remediation).

5.3 Effectiveness of Remediation

As stockpiles were relocated, combined, and turned as part of remediation works, direct comparison between sample points pre- and post-remediation is not possible.

The changes in average concentrations of CoPC which reported exceedances of the Site Commercial/Industrial RC prior to remediation is presented on **Table 6** below.

Where sample results were below the laboratory supplied Limits of Reporting (LOR), they have conservatively been assumed to be at the LOR for the purpose of assessment. For UST_SP1, the average concentrations of samples from all precursor stockpiles have been used to calculate pre-remediation averages.

Table 6 Stockpile Remediation Assessment –TRH

Stockpile	CoPC	Average Concentrations (mg/kg)		% Initial Remaining
		Pre-Remediation	Post-Remediation	
UST_SP1	TRH >C6-C10 (minus BTEXN)	23	All results below LOR (10 mg/kg)	N/A
	TRH >C10-C16 (minus naphthalene)	1,343	62	4.6%
	TRH >C16-C34	1,024	273	27%
	TRH >C34-C40	104	All results below LOR (100 mg/kg)	N/A
UST_SP_Ext_59 SP	TRH >C6-C10 (minus BTEXN)	All results below LOR (10 mg/kg)		
	TRH >C10-C16 (minus naphthalene)	487	120	25%
	TRH >C16-C34	1,247	882	71%
	TRH >C34-C40	107	106	99%

The following was noted for the effectiveness of TRH remediation:

- Volatile TRH concentrations were below LOR following remediation. Volatile TRH are generally more easily oxidised and volatilised and would be expected to undergo significant reduction due to stockpile movements and turning, and exposure to oxygen/atmosphere.
- Greater reduction in semi-volatile TRH concentrations were observed for shorter-chain (more volatile) semi-volatile TRH, which is expected as these CoPC are more likely to volatilise and are more easily digested by soil bacteria.
- Greater reduction in semi-volatile TRH concentrations were observed in UST_SP1. The soil in this stockpile was excavated earlier than UST_SP_Ext_59S, and has been moved and combined several times, and has had additional opportunities for volatilisation and oxidation of TRH (due to

more accessible oxygen while stockpiles as compared to *in situ*), which is considered likely to be the cause of this difference.

It is noted that both stockpiles remain *ex situ* and oxidation and volatilisation of TRH is expected to be ongoing.

5.4 Soil Assessment

5.4.1 Soil Categorisation

The soil analytical data collected, including soil Total Contaminant Concentration (TCC) and Leachable Contaminant Concentration (LCC), compared to the guideline values presented in Table 2 of IB105 for categorisation, are presented on **Table T1** to **Table T4**, attached.

Based on the available data pre- and post-remediation, both stockpiles are considered suitable to categorise as **Level 2 – Low Level Contaminated Material**.

CoPC with reported exceedances of IB105 criteria are discussed below.

TPH and BTEXN

Prior to remediation, exceedances of the IB105 Level 1, Level 2, and Level 3 TCC criteria for semi-volatile TPH C10-C36 fraction were reported in the precursor stockpiles to UST_SP1. Exceedances of the IB105 Level 1 TCC criteria for TPH C10-C36 were reported within UST_EXT_59SP.

Following remediation, UST_SP1 reported no exceedances of Level 2 IB105 TCC criteria for TPH. Exceedances of the IB105 Level 1 TCC criteria for TPH C10-C36 were reported in UST_EX_59SP.

On this basis, TPH concentrations within the stockpiles are not considered to preclude the material from being categorised as Level 2 – Low Level Contaminated Soil.

PAHs

Both pre- and post-remediation, exceedances of the IB015 Level 2 TCC criteria were reported for benzo(a)pyrene and Sum of PAHs for multiple samples collected from both stockpiles.

Toxicity Characterisation Leaching Procedure (TCLP) assessment was conducted on all samples, with the exception of UST_EX_59SP pre-remediation. Samples collected from UST_EX_59SP following remediation were assessed for TCLP Leachate for PAHs.

All analysed samples reported a leachate contaminant concentration for benzo(a)pyrene and for benzo(a)pyrene Toxicity Equivalence Quotient (TEQ) below the IB105 Level 2 LCC.

Section 2.2.4 of IB105 states that "*Where a leachable concentration is proscribed in Table 2, generally that value will take precedence over the total concentration value and will be used as the sole determinant of final classification for disposal*".

On this basis, the exceedances of IB105 Level 2 TCC criteria for benzo(a)pyrene and Sum of PAHs are not considered to preclude the stockpiles from being categorised as Level 2 – Low Level Contaminated Soil.

Metals

Exceedances of the Level 1 IB105 TCC criteria for metals including copper, lead, tin, zinc, and/or mercury were reported in samples from UST_SP1 or precursors stockpiles both pre- and post-remediation. No exceedances of the Level 2 IB105 TCC criteria have been reported, and on this basis metals concentrations within the stockpiles are not considered to preclude the material from being categorised as Level 2 – Low Level Contaminated Soil.

Other Materials Within the Stockpiles

The stockpiles are noted to contain some non-soil materials, including cobbles and rocks within the soil, potential chucks of iron rebar, and small amounts of hay.

Section 4.1.2 of IB105 states that: "*The definition of Fill Material includes inert construction material, soils, and rocks, which have not been contaminated with any substance, and stable asphalt or bituminous pavement material, all of which are generally considered inert for use as 'fill'. However,*

soil and other material classified as Fill Material can still be a 'pollutant' under EMPCA and must be responsibly managed".

The rocks, cobbles and other materials present in the stockpiles are considered suitable to classify as inert construction material as:

- The rocks/cobbles were present within soil while *in situ* since at least 2015 (when AECOM commenced works on the Site), and it considered unlikely that contamination which could present an unacceptable risk to future uses could be present in the solid material and not have presented an indicator in surrounding soil.
- The small amounts of hay, believed likely to be part of temporary run-off controls during stockpiling, are not considered likely to present a risk to future uses.
- The small amount rebar within UST_SP1 is not anticipated to present an environmental risk to future uses, and the SEMP and assumptions of the RC include maintenance of hard cover over the entire Site for future uses. Removal of rebar to the extent practicable is recommended to reduce potential physical risks associated with future excavation or handling of soil.
- The proposed reuse scenario (use as backfill) is effectively the same as the condition from which the material was excavated. As noted above, no impact to surrounding soil has been detected from samples surrounding the soil materials.
- Soil in the proposed area of reuse has reported anthropogenic impacts present (AECOM, 2023a). Inclusion of this material is not considered to alter or preclude any potential uses of this soil (i.e., aesthetic considerations) which are not already precluded by known conditions at the point of reuse.

Inclusion of inert construction waste in material to be backfilled is considered suitable. Rebar should be removed to the extent practicable to remove risk of physical injury to future site users.

5.4.2 Reuse Assessment

Results of stockpile sampling have been assessed against the Site Specific RC for proposed reuse as fill material in the Precinct South. The results are presented in **Table T1** for results pre-remediation, and on **Table T3** for sample results post-remediation.

Prior to remediation, exceedances of the following Site Specific RC were reported in stockpile samples:

- Naphthalene:
  - Potential Future Residents (unknown construction or multi-storey building)
- TRH >C6-C10 (minus BTEX)
  - Potential Future Residents (unknown construction or multi-storey building)
  - Potential Future Residents (low rise slab-on-grade)
  - Potential Future Residents (building with a basement carpark)
  - Potential Future Commercial (unknown construction or multi-storey building)
  - Potential Future Commercial/Light Industrial Workers (low rise slab-on-grade)
  - Potential Future Commercial/Light Industrial Workers (working within a basement)
- TRH >C10-C16 (minus naphthalene),
  - Potential Future Residents (unknown construction or multi-storey building)
  - Potential Future Residents (low rise slab-on-grade)
  - Potential Future Residents (building with a basement carpark)
  - Potential Future Commercial (unknown construction or multi-storey building)
  - Potential Future Commercial/Light Industrial Workers (working within a basement)

Following remediation, exceedance of Potential Future Residents (unknown construction or multi-storey building) and Potential Future Residents (low rise slab-on-grade) for TRH >C10-C16 (minus naphthalene) were reported in both stockpiles, with all other CoPC analysed below RC, including CoPC with exceedances of RC detected prior to remediation.

Residential use of the proposed area of reuse area is not planned and is considered unlikely to be considered in future due to the proximity of active port facilities to the east.

On this basis, stockpiles UST_SP1 and UST_SP_Ext59SP are considered to be suitable for reuse as fill material under the conditions and assumptions of the Site Specific RC described in **Section 3.3**. The location of reuse will be recorded, and soil data reassessed if any change in current or potential future use occurs.

5.5 Quality Assurance / Quality Control (QA/QC) Data Validation

The objective of the QA/QC program is to provide an assessment of the reliability of the data presented for interpretation. QA/QC assessment of the analytical data and sampling methodology has been conducted by AECOM following data collection by AECOM field staff. Samples were assessed against the DQIs discussed in **Section 3.1**. The detailed data validation report is presented in **Appendix B** and results are summarised below.

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- Five intra-laboratory and two inter-laboratory field duplicate sample pairs were collected from the 28 primary samples collected from stockpiles.

  Intra-laboratory duplicate samples were collected at a rate greater than or equal to one per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples) and the duplicate sample rate is considered satisfactory for assessment of data reliability.

- Of a total of 635 Relative Percentage Difference (RPD) values calculated for intra- and inter-laboratory duplicate samples analysed, 45 RPD values (<~7%) were reported above the adopted acceptable RPD DQO limits. RPD exceedances were reported for lead, TRH and PAHs. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

  As 93% of duplicate RPD values were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.

- Trip blank and rinsate blank analytical results were reported below the laboratory LORs.

- All samples were received by the primary analytical laboratory between 0 and 6°C. While secondary laboratory samples were received at 6.2 – 6.5°C, up to 0.5°C above the recommended range, these samples have not been relied on for assessment of stockpile status and have been used for comparison of analytical methodologies only. Receipt at higher than recommended temperatures may contribute to discrepancies in calculated RPDs noted above.

- For a number of the primary samples analysed, the laboratory reported a LOR of 0.5 mg/kg for benzo(a)pyrene, which is higher than the IB105 TCC Level 1 screening criterion (0.08 mg/kg), however is lower than the Level 2 (2 mg/kg) and Level 3 (20 mg/kg) screening criteria for benzo(a)pyrene. Considering the LOR allows for adequate characterisation of Level 3 and Level 4 soils based on TCC, and LCC of benzo(a)pyrene was relied upon for characterisation, the LOR is not considered to impact the usability of the data for the purposes of soil characterisation.

- Laboratory QA/QC sampling procedures including analysis of matrix spike recoveries, surrogate spike recoveries, laboratory control spike recoveries, laboratory duplicates and frequency of QA/QC reported some minor variances from recommended limits or ranges, indicating minor possibility of under- or over-reporting for some chemicals. These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of stockpiles.

6.0 Conclusions and Recommendations

Soil categorisation sample data results for two soil stockpiles, generated by removal of hydrocarbon impacted soil, has been considered in this report:

- UST_SP1, consisting of approximately 200 m^3 of soil and fill material. This stockpile was formed by combination of three precursor stockpiles UST_SP_1.5-2.0, UST_SP_EXT, and UST_SP_ch77-82.
- UST_SP_Ext_50SP, consisting of approximately 10 m^3 of soil and fill material.

Stockpiles were generated via excavation of hydrocarbon impacted soil associated with a UST (previously removed).

Beneficial reuse of the stockpiles as backfill is proposed within the area of Macquarie Point referred to as the Precinct South, under the conditions of Environmental Approval EA10512/2. The proposed area of reuse is intended for future Commercial/Industrial uses.

Initial assessment of excavated soil identified concentrations of TPH/TRH which would preclude the proposed beneficial reuse. Remediation of the stockpiles was undertaken via biopiling/land-farming by BlackCap, who applied approximately 100L of a commercial fertiliser mixed in a water feed on 1 June 2023.

Based on sampling of both stockpiles pre- and post-remediation, the following conclusions have been reached in this assessment:

- Sampling of UST_SP_Ext59SP was conducted at sufficient density to allow assessment of potential contaminants. Sampling of UST_SP1 was undertaken a density of 1 primary sample per 30 m^3, slightly lower than the recommended frequency in IB105. However, based on homogenisation of the stockpile during sample movement and remediation, the results are considered suitable for interpretation.
- Exceedances of the following IB105 criteria have been reported in samples from one or both stockpiles:
  - TCC of TPH C10-C36 fraction was reported in excess of the IB105 Level 1, Level 2, and Level 3 criteria prior to remediation. Following remediation, concentrations of TPH C10-C36 fraction in excess of the IB105 Level 1 TCC criteria remained.
  - Concentrations of benzo(a)pyrene and Sum of PAHs in excess of the IB105 Level 1, Level 2, and Level 3 TCC criteria were reported pre- and post-remediation. However, TCLP leachate concentrations for benzo(a)pyrene and benzo(a)pyrene TEQ were reported below the IB105 Level 2 criteria for all samples. In accordance with Section 2.2.4 of IB105, LCC values take precedence over TCC and are the sole determinant in final classification of material.
  - Concentrations of metals (copper, lead, tin, zinc, and/or mercury) in excess of the IB105 Level 1 TCC criteria were reported in stockpiles pre- and post-remediation.

  The stockpiles are noted to contain some non-soil materials, including cobbles and rocks within the soil, potential chucks of iron rebar, and small amounts of hay. These materials are considered suitable to classify as inert construction material and are not considered likely to present an environmental risk under the proposed reuse scenario. It is recommended that iron rebar be removed to the extent practicable prior to reuse to reduce any physical risk in future handling of material.
- Prior to remediation, the stockpiles reported sample locations with concentrations of naphthalene, TRH C6-C10 (minus BTEX), and/or TRH >C10-C16 (minus naphthalene) in excess of Site Specific RC for future Residential and Commercial/Industrial uses.

  Following remediation, concentrations of TRH C6-C10 (minus BTEX) in excess of Site Specific RC for future Residential uses were reported in both stockpiles. However, as the proposed area of reuse is not planned for residential use, and record of the stockpile results will be recorded and reassessed in the event of a future change in use or proposed use, reuse of the material is not considered to represent an unacceptable risk to future users.
- No irregularities in DQIs were reported which may render results unsuitable for interpretation

Based on this assessment, UST_SP1 and UST_SP_Ext59SP can be classified as **Level 2 – Low Level Contaminated Soil** and are suitable for reuse as fill material on the Macquarie Point site, under the conditions assumed in the RC and discussed in the SEMP.

Reuse of the soil is proposed under the conditions described in EA10512/2. Endorsement of reuse by the Site Environmental Auditor is required prior to reuse.

It is recommended iron rebar noted within stockpiles be removed to the extent practicable prior to reuse as fill.

In the event that an alternative disposal methodology be proposed, or further treatment undertaken, this waste management plan should be updated, or a new plan be prepared, by a suitably experienced environmental professional.

Yours faithfully

Laboratory Reports

ALS Environmental

SAMPLE RECEIPT NOTIFICATION (SRN)

Work Order : **EM2305209**
Amendment : **1**

Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
E-mail	: robert.crowe@aecom.com	E-mail	: peter.ravlic@alsglobal.com
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Facsimile	: 03 9654 7117	Facsimile	: +61-3-8549 9626
Project	: 60693007	Page	: 1 of 4
Order number	: 60693007-3	Quote number	: ES2021AECOMAU0044 (EN/004/21)
C-O-C number	: ----	QC Level	: NEPM 2013 B3 & ALS QC Standard
Site	: Macquarie Point		
Sampler	: TIM SMITH02		

Dates

Date Samples Received	: 22-Mar-2023 11:15	Issue Date	: 30-Mar-2023
Client Requested Due Date	: 29-Mar-2023	Scheduled Reporting Date	: **29-Mar-2023**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Intact.
No. of coolers/boxes	: 2	Temperature	: 4.3°C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 49 / 45

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Extra samples received:**
  UST_QC106 (sample 046)
  UST_QC206 (sample 047)
  OL_90_0.6_E (sample 048)
  OL_90_1.0 (sample 049)
  Rail Timber 01 (sample 050)
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023
Order number	: 60693007-3	Date Analysis Commenced	: 24-Mar-2023
C-O-C number	: ----	Issue Date	: 18-Apr-2023
Sampler	: TIM SMITH02		
Site	: Macquarie Point		
Quote number	: EN/004/21		
No. of samples received	: 29		
No. of samples analysed	: 29		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2305209**	Page	: 1 of 21
Amendment	: **1**		
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023
Site	: Macquarie Point	Issue Date	: 18-Apr-2023
Sampler	: TIM SMITH02	No. of samples received	: 49
Order number	: 60693007-3	No. of samples analysed	: 45

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Hexavalent Chromium by Alkaline Digestion and DA Finish	EG048G	SOIL	In house: Referenced to USEPA SW846, Method 3060. Hexavalent chromium is extracted by alkaline digestion. The digest is determined by photometrically by automatic discrete analyser, following pH adjustment. The instrument uses colour development using dephenylcarbazide. Each run of samples is measured against a five-point calibration curve. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	SOIL	In house: Referenced to APHA 4500-CN C / ASTM D7511 / ISO 14403. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3).
Total Fluoride	EK040T	SOIL	(In-house) Total fluoride is determined by ion specific electrode (ISE) in a solution obtained after a Sodium Carbonate / Potassium Carbonate fusion dissolution.
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).

Analytical Methods	Method	Matrix	Method Descriptions
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Benzo(a)pyrene- Waste Classification (TAS requirements)	EP075-TAS	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
Volatile Hydrocarbon Speciation (TPH CWG & RIVM fractions)	EP079-CWG	SOIL	In house: Conventional TPH and MAH data are determined by Purge and Trap GCMS analysis. TIC data (as fractions) and target aromatics (or groups of aromatics) are used to compute aliphatic and aromotic hydrocarbon fractions by addition or difference. Fractions conform to those outlined in TPHCWG, 1998,Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021/2004, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Alkaline digestion for Hexavalent Chromium	EG048PR	SOIL	In house: Referenced to USEPA SW846, Method 3060A.
Total Fluoride	EK040T-PR	SOIL	In house: Samples are fused with Sodium Carbonate / Potassium Carbonate flux.
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Tumbler Extraction of Solids - VIC EPA Screen	ORG17-EM	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Tumbler Extraction of Solids (Option B - Non-concentrating)	ORG17-SP	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 20mL 1:1 DCM/Acetone by end over end tumble. The solvent is transferred directly to a GC vial for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

C-O-C number	: ----	Date Issued	: 18-Apr-2023 10:31
No. of samples received	: 29		
No. of samples analysed	: 29	Quote number	: EN/004/21

General Comments

This guideline comparison report **only** provides comparison of reported result against limit thresholds for the 'Fill Material', 'Low Level Contaminated Soil', and 'Contaminated Soil' categories in Table 2 of EPA Tasmania Information Bulletin No. 105.
This guideline comparison report is **NOT** a compliance report. Classification of soils requires consideration of a number of other factors including preliminary site investigation, sampling density and statistical calculations and measurement uncertainty.
This guideline comparison report only provides comparison data for parameters, specifically listed within Table2 of the EPA Tasmania Information Bulletin No. 105, that are analysed by ALS.
Only results in the 'Analytical Results' section have been compared to the guideline.

Additional information pertinent to this report will be found in the following separate attachments: Certificate of Analysis, Quality Control Report, QA/QC Compliance Assessment to Assist with Quality Review and Sample Receipt Notification.

CERTIFICATE OF ANALYSIS

Work Order	: **EM2305209-AB**	Page	: 1 of 39
Amendment	: **1**		
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007	Date Samples Received	: 22-Mar-2023 11:15
Order number	: 60693007-3	Date Analysis Commenced	: 24-Mar-2023
C-O-C number	: ----	Issue Date	: 18-Apr-2023 10:25
Sampler	: TIM SMITH02		
Site	: Macquarie Point		
Quote number	: EN/004/21		
No. of samples received	: 29		
No. of samples analysed	: 29		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
~ = Indicates an estimated value.

- EP070-CWG: EM2305209_010 Unable to determine surrogate recovery due to matrix interferences.
- EG048G: EM2305209 #19 Poor insoluble matrix spike recovery for Hexavalent Chromium due to sample matrix. Confirmed by re-extraction and re-analysis.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2305209 #13 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #19 Poor spike recovery for total metal due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #21 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2305209 #30 Poor duplicate precision for total metals due to sample matrix. Confirmed by re-digestion and re-analysis.
- Amendment (30/03/2023):This report has been amended following the request from client to split report. All analysis results are as per the previous report
- EP075(SIM): EM2305209_023 Poor duplicate precision due to sample heterogeneity. Confirmed by MS QC.
- EP075(SIM): EM2305209_001 Poor duplicate precision for fluoranthene and pyrene due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EP075(SIM): EM2305209_023 Poor matrix spike recovery sample heterogeneity. Confirmed by DUP QC.
- EP071: EM2305209-024 Poor matrix spike recovery due to sample matrix. Confirmed by re-extraction and re-analysis.
- EP075(SIM): EM2305209_042 Poor matrix spike recovery for pyrene due to sample matrix. Confirmed by re-extraction and re-analysis.
- ALS is not NATA accredited for the analysis of organics or inorganics in timber.
- EN33a-G: EM2305209 #050 Due to limited sample for leach analysis, a scaled down amount of 30g into 600mL was used.

4-Bromofluorobenzene	460-00-4	56	124

CERTIFICATE OF ANALYSIS

Work Order	: **EM2310878**	Page	: 1 of 11
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 07-Jun-2023 11:45
Order number	: 60693007-2	Date Analysis Commenced	: 10-Jun-2023
C-O-C number	: 53213	Issue Date	: 22-Jun-2023 16:48
Sampler	: TIM SMITH		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 18		
No. of samples analysed	: 18		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- This is a rebatch of EM2310229.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 50%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2310878**	Page	: 1 of 5

Order number	: 60693007-2	No. of samples analysed	: 18

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
TPH Speciation (TPH CWG & RIVM fractions)	EP070-CWG	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C35. Fractions conform to those outlined in TPHCWG, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons).
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Volatile Hydrocarbon Speciation (TPH CWG & RIVM fractions)	EP079-CWG	SOIL	In house: Conventional TPH and MAH data are determined by Purge and Trap GCMS analysis. TIC data (as fractions) and target aromatics (or groups of aromatics) are used to compute aliphatic and aromatic hydrocarbon fractions by addition or difference. Fractions conform to those outlined in TPHCWG, 1998, Analysis of Petroleum Hydrocarbons in Environmental Media, TPH Criteria Working Group, Toxicity Technical Action Group, vol I and RIVM report 601501021/2004, Environmental Risk Limits for Mineral Oil (Total Petroleum Hydrocarbons)

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids (Option B - Non-concentrating)	ORG17-SP	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 20mL 1:1 DCM/Acetone by end over end tumble. The solvent is transferred directly to a GC vial for analysis.

Hi Peter,

Can I request the following additional analysis on this batch? Would you also be able to give me a quick call if any issues – unfortunately just moved house and having some fun IT teething issues at the moment.

Cheers, and hope you have a good weekend ahead,

Rob

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- This is a rebatch of EM2305209.
- EN33a-G: EM2307275 #001 Due to limited sample for leach analysis, a scaled down amount of 30g into 600mL was used.
- EN33a-G: EM2307275 #002, #003, #009 Due to limited sample for leach analysis, a scaled down amount of 50g into 1000mL was used.

Site	: Macquarie Point		
Quote number	: EN/004/21		
No. of samples received	: 23		
No. of samples analysed	: 23		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Eric Chau	Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Analysis Holding Time Compliance

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Leachable Metals by ICPAES	EG005C	SOIL	In house: referenced to APHA 3120; USEPA SW 846 - 6010: The ICPAES technique ionises leachate sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
TCLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN33a-G	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
Separatory Funnel Extraction of Liquids	ORG14	SOIL	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- This is a rebatch of EM2305209.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Hi Ru

Can you please organise the below RB

Thanks

Kind Regards

right solutions. right partner.

Morning Dai, Peter,

Thanks for the help with this last week – files have been received and imported OK.

Can I please request TCLP PAH leachate assessment and lead leachate assessment for the samples in batch EM2305209-AB as per the table below?

Please let me know if any additional information is needed,

Cheers, Rob

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
MINNIE TRAN	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Tim Kuo	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005-T : EM2309346 #8 Poor duplicate precision for total Lead due to sample matrix. Confirmed by re-digestion and re-analysis.
- EG005-T : EM2309346 #12 results for total Lead have been confirmed by re-digestion and re-analysis. It's been noted that the repeated results vary greatly. Repeated results are as follows: Lead: 1220 mg/kg, 831 mg/kg, and 783 mg/kg.
- EG005-T : EM2309346 #13 results for total Lead have been confirmed by re-digestion and re-analysis. It's been noted that the repeated results vary greatly. Repeated results are as follows: Lead: 523 mg/kg, 6630 mg/kg, and 1420 mg/kg.
- **EA200 Legend**
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: Analysis of asbestos from swabs and tapes is not covered under the current scope of NATA accreditation.
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

- EA200: N/A - Not Applicable

No. of samples analysed	: 26		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
MINNIE TRAN	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Tim Kuo	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

				Method Blank (MB) Report	Laboratory Control Spike (LCS) Report

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	EM2309346--008	OL_EX_SP4_01	**Lead**	7439-92-1	39.0 %	0% - 20%	**RPD exceeds LOR based limits**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Cyanide by Segmented Flow Analyser	EK026SF	SOIL	In house: Referenced to APHA 4500-CN C / ASTM D7511 / ISO 14403. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Cyanide has not been logged for sample 025 due to container non-compliance.**
- **Samples 008-013 and 027 placed on hold pending confirmation of whether samples are to be analysed (COC lists these samples for both analysis and hold).**
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

EM2309346-027 : [23-May-2023] : OL_EX_SP4_01 - Solid

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

HI Peter, no those samples should not be on hold. Analysis should be TRH BTEXN PAH Phenols and Pb, with additional ACM in soil and ACM ID at SP4 samples. Additionally samples from SP6 should include cyanide in the analysis

Hi Tim

Can you please confirm if the following samples are on hold or for analysis

SP4_01 through to SP5_03

Thanks

No. of samples received	: 29		
No. of samples analysed	: 28		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Lu	VOC Section Supervisor	Melbourne Inorganics, Springvale, VIC
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG005T: EM2310229 #4, the LOR has been raised for cadmium due to sample matrix interferences.
- EG005T: EM2310229 #7, sample heterogeneity has been observed for Zinc, with the following results obtained: 1230 mg/kg, 2790 mg/kg and 3600 mg/kg.
- EG005T: EM2310229 #7, sample heterogeneity has been observed for Lead, with the following results obtained: 380 mg/kg, 502 mg/kg and 932 mg/kg.
- EG005T: EM2310229 #31, sample heterogeneity has been observed for Zinc, with the following results obtained: 1590 mg/kg, 758 mg/kg and 691 mg/kg.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP075(SIM): EM2310229_001 Poor duplicate precision due to sample heterogeneity. Confirmed via visual inspection.
- EG035T: EM2310229#24 Poor matrix spike recovery for total mercury due to sample matrix. Confirmed by re-extraction and re-analysis.

C-O-C number	: 53213	Issue Date	: 15-Jun-2023
Sampler	: TIM SMITH		
Site	: Macquarie Point Oil and Diesel Line removal		
Quote number	: ME/386/22		
No. of samples received	: 29		
No. of samples analysed	: 28		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Lu	VOC Section Supervisor	Melbourne Inorganics, Springvale, VIC
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2310229**	Page	: 1 of 12
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Telephone	: +6138549 9645
Project	: Macquarie Point	Date Samples Received	: 07-Jun-2023
Site	: Macquarie Point Oil and Diesel Line removal	Issue Date	: 15-Jun-2023
Sampler	: TIM SMITH	No. of samples received	: 29
Order number	: 60693007-2	No. of samples analysed	: 28

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EP075(SIM)B: Polynuclear Aromatic Hydrocarbons	EM2310229--001	OL_EX_420_0.5	**Fluoranthene**	206-44-0	64.9 %	0% - 50%	**RPD exceeds LOR based limits**
EP075(SIM)B: Polynuclear Aromatic Hydrocarbons	EM2310229--001	OL_EX_420_0.5	**Pyrene**	129-00-0	63.5 %	0% - 50%	**RPD exceeds LOR based limits**
Matrix Spike (MS) Recoveries							
EG035T: Total Recoverable Mercury by FIMS	EM2310229--024	OL_EX_SP7_02	**Mercury**	7439-97-6	132 %	76.0-116%	**Recovery greater than upper data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

Receipt Detail	:	No. of samples received / analysed	: 29 / 28

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Received by Scott (ALS) 24/5/23, 1235

Hi Tim

Due to lab workload at the moment, we are unable to provide results this week

We can report by Monday 29/5

Thanks

#993445

Kind Regards

26/05/23

Sample Receipt Advice

Company name:	AECOM Aust Pty Ltd Melbourne
Contact name:	Tim Smith
Project name:	Not provided
Project ID:	Not provided
Turnaround time:	5 Day
Date/Time received	May 26, 2023 4:00 PM
Eurofins reference	993445

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 6.5 degrees Celsius.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- **N/A** Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Michael Morrison on phone : 03 8564 5933 or by email: MichaelMorrison@eurofins.com

Results will be delivered electronically via email to Tim Smith - tim.smith02@aecom.com.

Note: A copy of these results will also be delivered to the general AECOM Aust Pty Ltd Melbourne email address.

Certificate of Analysis

AECOM Aust Pty Ltd Melbourne
Collins Square, Tower 2, Level 11, 727 Collins Street
Docklands
VIC 3008

NATA Accredited
Accreditation Number 1261
Site Number 1254

Accredited for compliance with ISO/IEC 17025 – Testing
NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration, inspection, proficiency testing scheme providers and reference materials producers reports and certificates.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample Receipt Advice

Company name:	AECOM Aust Pty Ltd Melbourne
Contact name:	Robert Crowe
Project name:	MACQUARIE POINT OIL AND DIESEL LINE REMOVAL
Project ID:	Not provided
Turnaround time:	5 Day
Date/Time received	Jun 9, 2023 3:54 PM
Eurofins reference	997785

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 6.2 degrees Celsius.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Notes

Please confirm soil suite analysis

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Michael Morrison on phone : 03 8564 5933 or by email: MichaelMorrison@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general AECOM Aust Pty Ltd Melbourne email address.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR: RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Appendix B

Data Validation

Data Validation

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the data considered in this report are presented in **Section 3.1** of the main report. Quality assurance (QA) and quality control (QC) assessment of the sampling methodology and analytical data against the DQIs has been undertaken in this data validation.

ALS Laboratories (ALS) Melbourne was selected as the primary laboratory and Eurofins was selected as the secondary laboratory for chemical analysis. Both laboratories are accredited by the National Association of Testing Authorities (NATA) for the analyses selected.

The sampling events and relevant laboratory reports pertaining to the stockpiles considered in this report are summarised in below **Table 1**.

Table 1 Stockpile Data Considered

Stockpile ID	Sampling Event	Sampling Personnel	Lab Report Numbers
UST_SP_1.5-2.0 UST_SP_ch77-81 UST_SP_EXT	21 March 2023 – Pre-remediation sampling	Timothy Smith (AECOM)	EM2305209-AB EM2307275
UST_SP_59SP	25 May 2023 – Pre-remediation sampling	Timothy Smith (AECOM	EM2309346 993445*
UST_SP1	7 June 2023 – Post-Remediation Sampling	Timothy Smith (AECOM	EM2310229 EM2310878 997785*

*Note: * – Laboratory reports from the secondary laboratory.*

Copies of the laboratory documentation including chain of custody (CoC) documentation, sample receipt notification (SRN) reports, QC reports, and certificates of analysis are attached in **Appendix A**.

1.0 Assessment of Field Data Quality

1.1 Sample Collection

Soil samples from stockpiles were collected by AECOM field personal with appropriate environmental sampling experience. Sample collection was conducted with reference to the methodology described in **Section 4.2** of the main report. Samples were collected in laboratory supplied sample containers and placed in chilled eskies prior to transportation to the selected laboratories.

1.2 Intra- and Inter-Laboratory Field Duplicate Samples

Five intra-laboratory and two inter-laboratory field duplicate sample pairs were collected from the 28 primary samples collected from stockpiles.

Intra-laboratory duplicate samples were collected at a rate greater than or equal to one per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples) and the duplicate sample rate is considered satisfactory for assessment of data reliability.

Duplicate samples have been compared to primary samples and Relative Percentage Differences (RPDs) were calculated. Results of field duplicate samples and RPDs are presented in **Table B1**.

The following acceptance criteria have been applied for RPDs:

- RPD less than 30% for high level laboratory duplicates (i.e. concentrations >20 x LOR)
- RPD less than 50% for medium level laboratory duplicates (i.e. concentrations 10 – 20 x LOR)
- RPD less than 200% for low level laboratory duplicates (i.e. concentrations 1 – 10 x LOR)

Of a total of 635 RPD values calculated, 45 RPD values (<~7%) were reported above the adopted acceptable RPD DQO limits. RPD exceedances were reported for lead, TRH and PAHs. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

As 93% of duplicate RPD values were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.

1.3 Trip Blank

One trip blank consisting of clean, laboratory supplied distilled water was submitted with each cooler box transported to the laboratory.

Trip blanks were analysed for select volatile compounds, including TPH C_6-C_9, TRH C_6-C_{10}, and BTEXN. Concentrations of target compounds reported below the LOR for all trip blanks, indicating that cross contamination of samples occurring in transit is unlikely to have occurred.

Trip blank results are reported on **Table B2** attached.

1.4 Rinsate Blank

Rinsate blank was prepared by pouring laboratory supplied water over non-dedicated sampling equipment (a trowel) following decontamination procedures to assess the potential for cross-contamination.

A total of three rinsate blank was analysed as part of these works, one for each day on which sampling occurred.

All rinsates reported concentrations of CoPC below LOR, indicating cross contamination is unlikely to have occurred during sampling.

Rinsate blanks results are reported on **Table B2** attached.

2.0 Assessment of Laboratory Data Quality

A summary of the assessment of laboratory data quality for soil, leachate and QA/QC samples relevant to the report is provided in **Section 2.1** – **Section 2.6** below.

Soil samples were analysed for a combination of analytes including metals, cyanide, fluoride, TPH/TRH, BTEX, PAH, MAH, phenols, PCBs and pesticides. As these analytes include the CoPC identified in **Section 1.4** (of the main report) for the areas in which the stockpiles were generated, based on available Site history and uses, and previous investigations conducted, soil analytical program is considered appropriate for the purposes of this report. The adequacy of the analytical suite selected is further detailed in in **Section 5.2** of the main report.

2.1 Sample Receipt Temperature

Soil samples were kept chilled during storage and transportation with ice in portable coolers until received by the laboratory for analysis. Samples were reported to be received in good condition in appropriately preserved sample containers.

Samples were reported received by ALS (the primary laboratory) between 3.7 and 5.6°C, and by Eurofins (the secondary laboratory) between 6.2 and 6.5°C. Primary samples were within the acceptable target range of 0 – 6°C, and while secondary laboratory samples were received up to 0.5°C above the recommended range, these samples have not been relied on for assessment of stockpile status and have been used for comparison of analytical methodologies only. Receipt at higher than expected temperatures may contribute to discrepancies in calculated RPDs.

Leachate analysis was conducted on samples previously extracted and do not have sample receipt temperatures reported.

2.2 Sample Holding Times

All primary samples were received by laboratories within the recommended holding times for the requested analyses.

Proactive holding time assessments completed by the analytical laboratories are provided in **Appendix A**.

2.3 Limits of Reporting

For a number of the primary samples analysed, the laboratory reported a LOR of 0.5 mg/kg for benzo(a)pyrene, which is higher than the IB105 TCC Level 1 screening criterion (0.08 mg/kg), however is lower than the Level 2 (2 mg/kg) and Level 3 (20 mg/kg) screening criteria for benzo(a)pyrene. Considering the LOR allows for adequate characterisation of Level 2 to Level 4 soils based on TCC, and LCC of benzo(a)pyrene was relied upon for characterisation, the LOR is not considered to impact the usability of the data for the purposes of soil characterisation.

2.4 Laboratory Method Blanks

All soil laboratory method blanks, detailed in **Appendix A**, were reported within the acceptable range, i.e. below the laboratory LORs.

2.5 Laboratory Control Spikes

Laboratory control spikes, detailed in **Appendix A**, were within the laboratory-derived control limits for the methods used, and no outliers were reported.

2.6 Frequency of Quality Control Spike

Frequency of quality control spikes, detailed in **Appendix A**, were at the rate expected by applicable QC specifications, and no outliers were reported.

2.7 Laboratory Duplicates and RPDs

The RPD between analytical results for primary samples collected from the stockpiles and their corresponding laboratory duplicates were within acceptable limits, with the exception of the duplicate outliers listed below in Error! Not a valid bookmark self-reference..

Table 2 Laboratory Duplicate RPD Exceedances

Work Order	Sample ID	Analyte	RPD	Limits
EM2305209	UST_SP_EXT_06	Lead	31.5%	0 - 20%
	UST_SP_1.5-2.0_02	Lead	38.9%	0 - 20%
		Zinc	90%	0 - 20%
	UST_SP_1.5-2.0_04	Phenanthrene	116%	0 - 20%
		Anthracene	133%	0 - 50%
		Fluoranthene	105%	0 - 20%
		Pyrene	92.3%	0 - 20%
		Benz(a)anthracene	106%	0 - 20%
		Chrysene	102%	0 - 20%
		Benzo(b+j)fluoranthene	101%	0 - 20%

Work Order	Sample ID	Analyte	RPD	Limits
		Benzo(k)fluoranthene	108%	0 - 50%
		Benzo(a)pyrene	96.9%	0 - 20%
		Indeno(1.2.3.cd)pyrene	96.2%	0 - 50%
		Benzo(g.h.i_perylene	94.2%	0 - 50%

RPD exceedances are attributed to the heterogeneity of the soil samples submitted to the laboratory. The presence of varied fill material is well documented across the Site, including areas where these stockpiles were generated. These exceedances are not considered to impact interpretation of the results.

2.8 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix A**. Matrix spike recoveries were noted to be within the data quality objective range of 70% - 130%, or laboratory-derived limits for the methods used, with the exceptions of the outliers noted in **Table 3** below.

Table 3 Matrix Spike Outliers

Work Order	Sample ID	Analyte	Matrix Spike	Limits
EM2305209	UST_SP_1.5-2.0_04	Pyrene	45.6%	65.5-136%
	UST_SP_1.5-2.0_05	TP C10-C14	Not Determined	MS recovery not determined – background level greater than or equal to 4x spike level
		TPH C15-C28	72.6%	75.6-122%
		TRH C10-C16	Not Determined	MS recovery not determined – background level greater than or equal to 4x spike level

Matrix spike recovery outliers reported are due to matrix interference with samples. The presence of varied fill material is well documented across the Site, including areas where these stockpiles were generated. Overall, these outliers are not considered to impact interpretation of the results.

2.9 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory quality control reports provided in **Appendix A**. All surrogate spike recoveries for regular sample matrices were within the surrogate control limits adopted for the methods used. No surrogate recovery outliers were reported.

3.0 Summary

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- Five intra-laboratory and two inter-laboratory field duplicate sample pairs were collected from the 28 primary samples collected from stockpiles.

  Intra-laboratory duplicate samples were collected at a rate greater than or equal to one per 20 primary samples, which is consistent with the rate specified in the sample methodology (one duplicate per 20 primary samples) and the duplicate sample rate is considered satisfactory for assessment of data reliability.

- Of a total of 635 RPD values calculated for intra- and inter-laboratory duplicate samples analysed, 45 RPD values (<~7%) were reported above the adopted acceptable RPD DQO limits. RPD exceedances were reported for lead, TRH and PAHs. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

  As 93% of duplicate RPD values were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.

- Trip blank and rinsate blank analytical results were reported below the laboratory LORs.
- All samples were received by the primary analytical laboratory between 0 and 6ºC. While secondary laboratory samples were received at 6.2 – 6.5ºC, up to 0.5ºC above the recommended range, these samples have not been relied on for assessment of stockpile status and have been used for comparison of analytical methodologies only. Receipt at higher than recommended temperatures may contribute to discrepancies in calculated RPDs noted above.
- For a number of the primary samples analysed, the laboratory reported a LOR of 0.5 mg/kg for benzo(a)pyrene, which is higher than the IB105 TCC Level 1 screening criterion (0.08 mg/kg), however is lower than the Level 2 (2 mg/kg) and Level 3 (20 mg/kg) screening criteria for benzo(a)pyrene. Considering the LOR allows for adequate characterisation of Level 3 and Level 4 soils based on TCC, and LCC of benzo(a)pyrene was relied upon for characterisation, the LOR is not considered to impact the usability of the data for the purposes of soil characterisation.
- Laboratory QA/QC sampling procedures including analysis of matrix spike recoveries, surrogate spike recoveries, laboratory control spike recoveries, laboratory duplicates and frequency of QA/QC reported some minor variances from recommended limits or ranges, indicating minor possibility of under- or over-reporting for some chemicals. These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of stockpiles.

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 200 (1-10 x EQL); 50 (10-20 x EQL); 30 (> 20 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

Mr James Puustinen
Project Manager, Capital Works
Macquarie Point Development Corporation
GPO Box 51
HOBART TAS 7001

Email: james@macquariepoint.com

Dear Mr Puustinen

Environmental Approval No. 10512/2 – Reuse of Low-Level Contaminated Soil at Macquarie Point Development Site

On 1 September 2022 your consultant, AECOM requested that the re-use of low-level contaminated soil at the Macquarie Point Development Site, currently authorised under Environmental Approval 10512/1, be authorised to continue for a further 2-year period, beyond 7 October 2022.

I enclose Environmental Approval No. 10512/2 for the re-use of low-level contaminated soil from stockpile at the Macquarie Point site. This authorisation is valid for a period of two (2) years from 7 October 2022. This authorisation is provided under Regulation 21 of the Regulations, subject to conditions. Please find attached Environmental Approval No. 10512/2 containing the conditions to be complied with.

Please take note that evidence of compliance with these conditions must be made available to an Authorised Officer on request.

Section 39F of the *Macquarie Point Development Corporation Act 2012* requires that an accredited environmental auditor has certified the remediation of any part of the site prior to redevelopment of that part of the site. I recommend that you discuss with your auditor the suitability of the above referenced material for the intended land use.

Pursuant to Regulation 21(7) I have decided to waive the application fee in relation to this Environmental Approval.

If you require any further information regarding this correspondence, please contact the EPA at the contact details at the head of this correspondence.

Yours sincerely

Joe Tranter
MANAGER, CONTAMINATED LAND AND WASTE REGULATION
Delegate for the Director, Environment Protection Authority

Cc: Robert Crowe, robert.crowe@aecom.com

Encl: Draft Environmental Approval No. 10512/2

ENVIRONMENTAL APPROVAL No. 10512/2

Approval under the *Environmental Management and Pollution Control (Waste Management) Regulations 2020*

I, Joseph Tranter, Delegate for the Director, Environment Protection Authority, hereby grant approval in accordance with Regulation 21(4)(a) of the *Environmental Management and Pollution Control (Waste Management) Regulations 2020* for the reuse of the waste material described below provided the following requirements are complied with:

Approval issued to:
MACQUARIE POINT DEVELOPMENT CORPORATION

ABN
92 657 409 841

Waste description and quantity (the waste):
Low Level Contaminated Soil
No limit set

NEPM code and description:
N120: Soils contaminated with a controlled waste

Location (the land):
MACQUARIE POINT, 10 EVANS ST, HOBART TAS 7000

Producer of the waste:
Macquarie Point Development Corporation

Period for which approval is valid:
7 October 2022 to 7 October 2024

Requirements:

1. Where stockpiled soil, derived from the land, has been classified as Low Level Contaminated Soil (Level 2 Soil), in accordance with Information Bulletin No. 105, and contaminant concentrations are below the Site Specific Remediation Criteria defined in the document; 'Derivation of Remediation Criteria, Macquarie Point Redevelopment Project', prepared by AECOM and dated 9 August 2016, the stockpiled soil may be reused on the land, subject to the conditions of this approval.

2. The site environmental auditor, as accredited by Section 39F(3) of the Macquarie Point Development Corporation Act 2012, must endorse the reuse of each soil stockpile prior to the reuse occurring.

3. The reuse must be undertaken in accordance with the document titled 'Site Environment Management Plan, Macquarie Point Development Project', prepared by AECOM and dated 14 November 2018.

DELEGATE FOR THE DIRECTOR, ENVIRONMENT PROTECTION AUTHORITY Date of issue: 14 September 2022

4. The activity must be conducted in such a manner as to prevent environmental nuisance and environmental harm resulting from escape of the materials, spillage, or emission of dust.

5. Unless otherwise approved in writing by the Director, waste material must not be removed from the storage site for any reason, including disposal.

6. If an incident causing or threatening environmental nuisance, serious environmental harm, or material environmental harm from pollution occurs in the course of the approved activity, then the person responsible for the activity must immediately take all reasonable and practicable action to minimise any adverse environmental effects from the incident.

7. A record of the soil reuse must be kept from the date of issue of this approval. This record must be provided to the Director annually no later than 14 days after the anniversary of the issue date of this approval and include, as a minimum, all records for the 12 months preceding the anniversary. Records must also be made available to an Authorized Officer on request in writing, within the timeframe and for the reporting period specified within the request.

8. For each soil stockpile that is reused the record of soil reuse must include:
   a. A description of the soil.
   b. Results of soil classification, in accordance with Information Bulletin No. 105.
   c. The quantity of soil that was reused.
   d. The location at which the soil was reused.
   e. The endorsement from the site environmental auditor for the reuse.
   f. Any certification required under section 39F of the Macquarie Point Development Corporation Act 2012.

Signed: _____

DELEGATE FOR THE DIRECTOR, ENVIRONMENT PROTECTION AUTHORITY

Report Suspicious

Hi Rob,

This seems fine to me. The only comments I would make are that

- The table could be clearer in separating out current versus pre-remediation results (which appear in an undivided table unless I am mis-reading)
- The presence of anthropogenic fill (in this case, re-bar was noted) IMO should always include at least pro-active recording of at least the visual presence/absence of any potential ACM – and this didn't seem to have occurred.

These things aren't material for this instance, but ideally future such documents recording conditions in order to determine suitable management would reduce potential lack of clarity on these issues.

Cheers,

David Lam | Senior Principal Environmental Consultant

Subject: The Precinct South - Proposed Stockpile Reuse

⚠ CAUTION: This email originated from an external sender. Verify the source before opening links or attachments. ⚠

Morning David, Adi,

As part of works within the Precinct South at Macquarie Point, two stockpiles (UST_SP1 and UST_SP_Ext_59SP) which generated via excavation of hydrocarbon impacted soil to the west of and beneath the former SeaRoads Shed slab have been remediated onsite and are proposed for reuse as fill material to the north of the SeaRoad Shed.

The soil categorisation and waste management plan for these stockpiles and the proposed reuse scenario is available HERE for your review (including excel tables of soil data).

Please let me know if you have any comments, questions or require any further information to assess the proposed reuse, or would like to discuss the proposed reuse and any additional conditions which may be required. Otherwise, if you are happy for the reuse to proceed please let me know and I will direct BlackCap to use the soil as planned.

Thanks,

Robert Crowe

1 October 2023

Mr Sean McArdle
Project Manager - Capital Works
Macquarie Point Development Corporation
41 Evans Street, Hobart, TAS, 7000

Dear Sean,

Stockpile Remediation Validation and Waste Management Plan - PS-Pb-SP1 and PS-Pb-SP2

1.0 Introduction

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of remediation at the Macquarie Point Site in Hobart, Tasmania (the Site). The Site location is shown on **Figure F1**.

The Site, and surrounding area, largely located on reclaimed land within the Hobart port, has a history of mixed industrial use including the former Hobart Gasworks, rail freight and bulk fuel storage.

Industrial activities have been ceased at the Site, however impacts are known to be present within soil. As part of the development works undertaken at the Site, soil stockpiles

At the request of the Corporation, AECOM has prepared this soil categorisation and waste management plan for soil stockpiles PS-Pb-SP1 and PS-Pb-SP2, which were generated as part of the Precinct South remediation project, which includes the excavation of soils with known elevated concentrations of lead which may represent an unacceptable risk to future Site users. This report is intended to assess the current status of these stockpile prior to removal from the Site and assess the effectiveness of lead stabilisation remediation conducted on the stockpiles to reduce leachability of contaminants present.

It is currently proposed that stockpiles be removed from the Site for either disposal or for beneficial reuse as a covering material at a commercial or industrial site. McRobies Gully Waste Management Centre (McRobies), a waste site owned and operated by the City of Hobart (CoH), is currently proposed site for disposal of soil.

1.1 Objectives

The objectives of this letter are:

- To assess the effectiveness of lead stabilisation remediation of PS-Pb-SP1 and PS-PB-SP2 to reduce lead leachate concentrations detected during initial sampling of the stockpiles.
- To provide characterisation of the soil currently stockpiled within PS-Pb-SP1 and PS-PB-SP2 in accordance with EPA Tasmania *Information Bulletin No. 105 - Classification and Management of Contaminated Soil for Disposal* (IB105).
- To assess suitability of the stockpiles for beneficial off-Site reuse as fill and levelling material at McRobies.

It is intended that this document can act as a Waste Management Plan for the off-Site disposal or reuse of the stockpiled material in accordance with Section 3 and Section 5 of IB105.

1.2 Scope of Work

The following scope of work has been undertaken by AECOM:

- Review and screening of sample results from the stockpiles against the criteria within IB105 for categorisation.
- Evaluate sample results against appropriate screening criteria to assess the suitability of the stockpiles for beneficial reuse as covering material at the McRobies without unacceptable risk.
- Assess the reduction in Chemicals of Potential Concern (CoPC) by on-Site remediation.

- Provision of this Soil Categorisation and Waste Management Plan for the disposal or reuse of stockpiles.

Soil excavation and remediation works were planned and conducted by BlackCap Group Pty Ltd (BlackCap), and soil sampling has been undertaken by AECOM and by Elgin Associates Pty Ltd (Elgin), as detailed in **Section 4.0**.

1.3 Background

The Site, and surrounding area, largely located on reclaimed land within the Hobart port, has a history of mixed industrial use including the former Hobart Gasworks, rail freight and bulk fuel storage. Former industrial activities have been ceased at the Site. The Site is currently undergoing an Environmental Audit by Mr David Lam of Coffey under the *Macquarie Point Development Act 2012*.

As part of the development and remediation of the Site, the Precinct South Remediation Project is currently being undertaken by BlackCap, which involves the removal of impacted soil from the southeast area of the Site. Previously identified impacts in this area which are being removed as part of these works are:

- Remnant buried fuel lines.
- Hydrocarbon impacted soil at the former location of an Underground Storage Tank (UST) which has been removed from the Site.
- Areas of lead impacted soil, sourced from historic land reclamation.

1.4 Chemicals of Potential Concern

Based on available Site history and uses, and previous investigations conducted, the Chemicals of Potential Concern (CoPC) summarised in **Table 1** below have been identified for the areas in which the stockpiles were generated.

Table 1 Chemicals of Potential Concern

Former Land Use/ Potential Contaminating Activity	Chemicals of Potential Concern	Potential Impacted Media
Land Reclamation	Heavy metals[1], TPH/TRH, PAH, BTEXN, phenolic compounds, SVOC, VOC, OCPs	Soil Groundwater Soil vapour
Freight Handling	Heavy metals[1], TPH/TRH, PAH, BTEX, phenolic compounds, SVOC, VOC, pH	
Fuel Storage and Locomotive Fuelling	Lead, TPH/TRH, PAH, BTEXN	

Notes: TPH – Total Petroleum Hydrocarbons; TRH – Total Recoverable Hydrocarbons; PAH - Polycyclic aromatic Hydrocarbons; BTEXN – Benzene, Toluene, Ethylbenzene, Xylenes, Naphthalene; SVOC – Semi-Volatile Organic Compounds; Volatile Organic Compounds; OCP – Organochlorine Pesticides; 1 – arsenic, chromium, manganese, aluminium, cadmium, chromium, copper, lead, nickel and zinc; 2 - lead and arsenic.

Previous investigations of the Site have typically identified notable concentrations of TPH, PAHs and lead in soil as key CoPCs.

1.5 Stockpile Descriptions

The stockpiles considered in the report are:

- PS-Pb-SP1, consisting of an estimated 600 m^3 of soil and fill material. Field observations of this stockpile during sampling by Elgin noted anthropogenic materials in this stockpile, consisting of paper bag fragments, which are inferred to be from the soil remediation reagent mixing process undertaken by BlackCap (see **Section 4.4**), and glass and ceramic fragments, which are sourced from historical fill and backfill which make up this stockpile.
- PS-Pb-SP2, consisting of an estimated 250 m^3 of soil and fill material. Field observations of this stockpile during sampling by Elgin noted anthropogenic materials in this stockpile, consisting of

paper bag fragments, which are inferred to be from the soil remediation reagent mixing process undertaken by BlackCap (see **Section 4.4**), and glass, ceramic and brick fragments, which are sourced from historical fill and backfill which make up this stockpile. Material in this stockpile may also contain small fragments of Asbestos Containing Material (ACM) from the precursor stockpiles combined to form it, as discussed below.

Both stockpiles are currently situated on a sealed slab in the south-east corner of the Site

Plate 1 PS-Pb-SP1, 1 September 2023 (photograph provided by Elgin)

Plate 2 PS-Pb-SP2, 1 September 2023 (photograph provided by Elgin)

These stockpiles were combined from previous excavations stockpiles, as listed on **Table 2** below and combined for remediation and assessment by BlackCap. Stockpiles were assessed as suitable for lead stabilisation remediation, as described in **Section 2.0**, on the basis of initial assessment of soil samples collected by AECOM at the time of excavation.

Table 2 Source Stockpiles

Source Stockpile	Estimated Volume	Comment
PS-Pb-SP1		
OL_EX_SP1	250 m^3	Initial excavation of known area of lead above Site Specific Remediation Criteria.
OL_EX_SP2	100 m^3	
OL_EX_SP3	40 m^3	
OL_EX_SP6	60 m^3	Minor blue flecks noted in one portion as potential “Prussian Blue” by field staff.
OL_EX_SP7	15 m^3	
OL_EX_SP8	80 m^3	
PS-Pb-SP2		
OL_EX_SP4	50 m^3	Minor potential ACM fragments noted and removed by field staff
OL_EX_SP5	40 m^3	
DL_SP	205 m^3	Soil removed surrounding pipeline with ACM cladding.

The following was noted in assessment of initial stockpiles:

- DL_SP consisted of soil excavated during removal of a remnant pipeline which was clad with ACM. The cladding was reported in good condition during excavation of the pipeline, however during sampling, the occasional fragment of ACM was observed (shown on **Plate 3** below) and removed by AECOM field staff. As a precautionary measure, initial samples from this stockpile were assessed for asbestos fibres with none detected.

Plate 3 ACM Cladding Fragment (DL_SP)

- All OL_EX stockpiles (SP1 to SP6) were excavated from an area of detected lead concentrations in excess of 600 mg/kg, the Site Specific Remediation Criteria (RC) (AECOM, 2016). OL_EX_SP1 consisted of the initial excavation of this area, with OL_EX_SP2 to OL_SP_EX6 consisting of follow-up excavation and chase out of material. It is noted that the lead RC is less than the maximum allowable Level 1 – Fill total contaminant concentration (TCC) for lead.
- OL_EX_SP4 and OL_EX_SP5 each had one small piece of potential ACM noted and removed by field staff. No additional ACM was observed by BlackCap during excavation or handling of these stockpiles, or by AECOM staff during sampling of these or other stockpiles (with the exception of DL_SP discussed above). The excavated material consists of fill from historic backfilling for land reclamation, and occasional small fragments of ACM are not uncommon in fill of this nature for this or similar Sites.
- OL_EX_SP6 had a small amount of blue paint material in one area noted to be potential "Prussian Blue", a dark blue pigment historical used in paints with high levels of cyanide. The total volume observed is shown on **Plate 4** below.

  This material was removed and samples from this stockpile were assessed for cyanide in addition to other known CoPC for the area.

Plate 4 Blue Paint (Potential Prussian Blue) OL_EX_SP6

2.0 Stockpile Remediation

Based on detected contaminants within stockpiles, chemical immobilisation was selected as a potentially effective remediation technology to reduce lead leachate concentrations generated by waste soil and fill produced on the Site. Technology selection was conducted with reference to the *CRC CARE National Remediation Framework Technology guide: Bioremediation* (CRC CARE, 2018) and *CRC CARE National Remediation Framework Technology Guide: Soil – Chemical immobilisation and stabilisation* (CRC CARE, 2019).

Chemical immobilisation and stabilisation can be either ex situ or *in situ* remediation technology that involves mixing reagents into contaminated materials (such as soil or stockpiles) to alter their physical properties by the processes of sorption, precipitation or incorporation into crystal lattices, or by encapsulating the contaminants, with the objective of reducing the rate of contaminant migration via leaching (CRC CARE, 2019). This is achieved through the addition of reagents to the contaminated material in the presence of water, the aim of which is to induce chemical and physical conditions favourable for encapsulating contaminants and reducing their solubility from the contaminated materials matrix, such as the contaminant leachability from soil.

The treatment used at the Site utilised the following reagent and target ratios:

- 2% w/w single super phosphate (SSP)
- 3% w/w magnesium oxide (MgO)

Both SSP and MgO are commonly used agricultural fertilisers. The supplied SSP reacts with lead in soil to form pyromorphite, an insoluble and relatively stable lead mineral, and at pH of 4.0 or great, overall dissolution of less than 1% of lead has been reported in literature (Scheckel and Ryan, 2002). The MgO acts to buffer the treated material and maintain neutral to alkaline conditions (Shen et al, 2019).

Bench scale trials of chemical immobilisation of lead were conducted on Site soils (AECOM, 2020) and demonstrated that this technology was suitable for Site soils. It is noted that approximately 835 m^3 of lead impacted soil was treated and had lead leachate levels reduced to below the IB105 Level 2 total leachate concentration limits in late 2020 (AECOM, 2021).

Stockpile remediation by chemical immobilisation was approved by City of Hobart in Development Approval PLN-19-616.

3.0 Assessment Criteria

3.1 Data Quality Indicators

The laboratory data, including copies of the chain of custody (CoC) documentation, sample receipt notification (SRN) reports, quality control (QC) reports, and certificates of analysis are attached in **Appendix A**.

The Data Quality Indicators (DQIs) adopted to assess the precision and accuracy of the laboratory and field data include:

- Assessment of field duplicate sampling rates and reproducibility of the data by calculation of the relative percentage difference (RPD) for laboratory and field duplicate samples (both intra- and inter-laboratory) to provide an indication of the precision of the data.
- Assessment of the analytical results for laboratory quality control samples to provide an indication of the accuracy of the data.
- Assessment of a range of QC and quality assurance (QA) measures generated from both the field sampling and laboratory analytical programs.

Assessment criteria for DQIs for soil samples are listed below in **Table 3**. Assessment against DQIs is provided in **Section 5.3**, and in **Appendix B**.

Table 3 Acceptance Criteria for Data Quality Indicators

Data Quality Indicator	Acceptance Criteria
Rinsate, Field and Trip blanks	Less than the laboratory Limit of Reporting (LOR)
Intra and inter laboratory field duplicates (1) (3)	RPD less than ± 30%
Laboratory duplicates (2) (3)	RPDs Less than: • 30% for high level laboratory duplicates (i.e., >20 x LOR) • 50% for medium level laboratory duplicates (i.e., 10 to 20 x LOR) • 200% for low level laboratory duplicates (i.e., 1 to 10 x LOR)
Matrix spikes (3) (4)	Recoveries between 70-130% of the theoretical recovery
Method blanks	Less than the laboratory LOR
Laboratory control samples (5)	Recoveries between 70-130%.
Surrogate spikes	Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for tests but are within the criteria described in USEPA Method SW846.

Notes:

1. *Potential exceptions to these criteria may occur where the results are close to the LOR. This typical RPD range is obtained Schedule B3 of the National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM Schedule B3).*
2. *If the results are close to the LOR, then higher results will be accepted.*
3. *Assumes that samples are homogeneous, and the background analyte level is less than 20% of the spike level (refer to USEPA Method 8000B). Note that there is no requirement for matrix spikes to pass as certain matrices may preclude recovery of spiked compounds. In this case data will be accepted if LCS data meets the acceptance criteria.*
4. *80% of the compounds tested must fall within the control limits. Control limits are dynamic and vary for individual tests as per USEPA Method 8000B.*
5. *Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for individual tests but are within the criteria described in USEPA Method SW846.*

3.2 Soil Categorisation (IB105 Guideline Values)

To assess and categorise the soil within the stockpiles, soil analytical results were screened against the criteria in Table 2 of TAS EPA IB105, which uses four categories to classify contaminated soil as:

- Level 1 (Fill Material)
- Level 2 (Low Level Contaminated Soil)
- Level 3 (Contaminated Soil)
- Level 4 (Contaminant Soil for Remediation).

Analytical data for soil total contaminant concentration (TCC) and leachable contaminant concentration (LCC), compared to the criteria presented in Table 2 of IB105, is presented in **Table T1** and **Table T2**, attached.

Excavated materials are required to be classified as Level 1 or Level 2 soils in accordance with IB105 to be considered for reuse.

3.3 Off-Site Reuse Criteria

Section 4.2 of IB105 notes that Level 2 – Low Level Contaminated Soil, may be suitable for use as intermediate covering material at nominated municipal landfills.

McRobies has proposed that, where no unacceptable human health or ecological risks are present, some stockpiles may be beneficially reused as a cover material for an old tip face within their facility. Stockpiles which may present an unacceptable risk will not be used in this scenario and will be disposed of as Low Level Contaminated Soil by McRobies.

The beneficial reuse scenario proposed by McRobies is summarised below:

- The excavated material will be transported off-Site by a contractor on behalf of the Corporation or the receiving Site. Reasonable precautions will be undertaken to ensure that no environmental or human health harm results from the movement of potentially contaminated materials between the sites. All truckloads will be tracked.
- The receiving site (McRobies) intends to use the soil as cover and levelling material on old land fill batters.
- Material will be immediately applied to the old tip face and levelled using an enclosed excavator or other mechanical methods. No manual works outside the machine are planned as part of the soil placement.
- McRobies will develop a Safe Work Method Statement (SWMS) for the placement of the soil which will include handling measures and personal protective equipment (PPE) requirements. The minimum PPE requirements for the work are gloves, long sleeves and pants, eye protection and face mask, and will include procedures (such as washing of hands before eating, drinking or smoking to remove any material) to reduce any potential exposure by McRobies staff while handling and placing material.
- A cover layer of clean fill and green waste will be placed over the imported material following levelling to prevent dust generation or contact with the soil.
- The areas of reuse are remote from members of the public or any staff outside excavators/machines.
- The area of reuse is unsaturated (i.e., above the water table).
- The material will not be stored by McRobies prior to use.
- If the soil is dry and generating dust when imported, wetting will be used to supress dust.
- No further excavation or disturbance of the area of use will take place following import of the material.
- McRobies has an EPA certified leachate capture and treatment system. Leachate from the area of reuse will be captured in a silt trap/holding basin prior to discharge to sewer.

Based on the off-Site reuse scenario described above, including the low potential for contact between the soil and site workers and lack of ecological receptors at the proposed reuse location, the ASC NEPM (2013) *National Environment Protection Council, National Environment Protection (Assessment*

of Site Contamination) Measure 1999 (as amended May 2013) Heath Investigation Levels (HILs) for Commercial / Industrial use (HIL-D) have been adopted for assessment of the material for reuse. Sample results from stockpiles considered for reuse are assessed against the ASC NEPM HIL-D criteria on **Table T1**.

The HIL-D criteria assume a level of exposure to impacted soil, specifically that adults on the receiving site may have direct contact with soil for one hour per day, 240 days per year, for 30 years. Under the proposed reuse scenario, contact with impacted soil at this frequency and duration is not likely to occur, and the HIL-D criteria are be considered conservative for assessment of the material.

4.0 Field Methodology and Data

4.1 Field Activities

The following field activities associated with this stockpile have been conducted:

Table 4 Field Activities

Date	Activity
27 February - 3 March 2023	Excavation of soil around remnant pipeline with ACM cladding and generation of stockpile DL_EX_SP by BlackCap.
7 March 2023	Initial stockpile sampling of DL_SP by AECOM.
28 March 2023	Follow-up sampling of DL_SP by AECOM to assess extent of detected lead impact.
27 – 31 March 2023	Initial excavation of soil with lead impacts in excess of Site Specific RC by BlackCap and generation of stockpile OL_EX_SP1.
3 April 2023	Stockpile sampling of OL_EX_SP1 by AECOM.
14 April – 12 May 2023	Additional excavation of lead impacted soil area and generation of stockpiles OL_EX_SP2 to OL_EX_SP6 by BlackCap
23 May 2023	Stockpile sampling of OL_EX_SP2 to OL_EX_SP6 by AECOM.
29 May – 2 June 2023	Additional excavation of lead impacted soil area and generation of stockpiles OL_EX_SP7 and OL_EX_SP8 by BlackCap
6 June 2023	Stockpile sampling of OL_EX_SP7 and OL_EX_SP8 by AECOM.
21 – 25 August 2023	Combination of stockpiles into PS-Pb-SP1 and PS-Pb-SP2 and chemical stabilisation remediation by BlackCap
1 September 2023	Stockpile sampling of PS-Pb-SP1 and PS-Pb-SP2 by Elgin.

A description of each activity carried out is provided below.

4.2 Soil Excavation and Stockpile Handling

The stockpiles assessed in this report were excavated by BlackCap between February and June 2023. Stockpiles were excavated and moved using a mechanical excavator and stored on an existing hardstand concrete slab adjacent to the area of excavation, the former SeaRoad Shed, to prevent mixing with surface soils. The stockpiles generally consisted of fill material, with some anthropogenic waste noted within the stockpile.

4.3 Sample Collection

Validation and categorisation sampling of individual stockpiles was undertaken by AECOM or Elgin field staff following the procedures in the Sampling, Analysis and Quality Plans (SAQPs) prepared for works. The general sampling methodology is summarised below:

- Nitrile gloves were used for the collection of each soil sample, and a new pair donned between each sample location.
- Samples were collected at a minimum rate of either :
  - 1 per 25 m^3 of soil as per IB105; or
  - Three primary samples per stockpile.
- Sample locations were uniformly distributed throughout the excavated material.
- Soil samples were collected manually using a hand auger/trowel or similar from a depth of >0.2 m below the stockpile surface.
- Soil samples were stored in laboratory supplied 150 mL decontaminated glass jars with Teflon™ lined lids, and immediately placed in an 'esky' cooler with ice during sample storage and transport to the selected analytical laboratory under chain of custody procedures.

Field notes collected by AECOM and Elgin during stockpile sampling are attached as **Appendix C**.

4.4 Stockpile Remediation

BlackCap was engaged by the Corporation undertake chemical lead immobilisation, as described in **Section 2.0**, for the remediation of lead impacted within the stockpiles.

The target reagent concentrations for stabilisation of lead impacts, based on previous remediation conducted on the Site, were:

- 2% w/w single super phosphate (SSP)
- 3% w/w magnesium oxide (MgO)

BlackCap estimated approximately 2,000 tonnes of soil. The soil being treated was spread at a uniform level across an intact slab on the Site, and 40 tonnes of SSP were spread using a computerised spreading truck and 60 tonnes of MgO were placed on a grid layout in 20 kg paper bags, or in small volumes from 1 tonne bulk bags, for uniform spread.

Soil and reagents were then mixed using a rotary mixer shown on **Plate 5** below, before being re-established in windrows for testing and storage.

Plate 5 Soil mixing of remediation reagents through soil (photograph provided by BlackCap)

5.0 Assessment of Results

5.1 Sample Density

The number of samples analysed, i.e., sample density, is assessed against stockpile volumes estimated by field staff as summarised in **Table 5** below.

Table 5 Sample Density Assessment

Date	Stockpile ID	Est. Volume (m^3)	Primary Samples	Sample Density (m^3 per primary sample)
PS-Pb-SP1				
Pre-Remediation				
3 April 2023	OL_EX_SP1	250	10	25
23 May 2023	OL_EX_SP2	100	4	25
	OL_EX_SP3	40	3	14
	OL_EX_SP6	60	3	20
6 June 2023	OL_EX_SP7	15	3	5
	OL_EX_SP8	75	3	25
Post-Remediation				
1 September 2023	PS-Pb-SP1	600	24	25
PS-Pb-SP2				
Pre-Remediation				
7 March 2023	DL_SP	200	10	20
28 March 2023	DL_SP[1]	205	10	20.5
23 May 2023	OL_EX_SP4	50	3	17
	OL_EX_SP5	40	3	14
Post-Remediation				
1 September 2023	PS-Pb-SP2	250	10	25

Note: [1]DL_SP was sampled a second time on 28 March 2023 to assess extent of detected lead impacts.

Sampling density from all stockpiles was greater than the sampling frequency of one primary sample per 25 m^3 recommended in IB105 for all sampling events, and a minimum of three primary samples were collected per stockpile. Samples were collected from a generally grid based distribution in material.

Some variances in volume estimates between sum of precursor (pre-remediation) stockpiles and final post-remediation stockpiles occurred. Field estimates of stockpile volumes were performed by field staff based on field observation and measurement of stockpile dimensions and have a degree of uncertainty due to irregularity in stockpile shape and surface height, and a degree of difference between stockpile volumes when measures at different times after stockpile movements or treatment is expected.

Overall, the sampling density is considered acceptable for the categorisation and assessment of these stockpiles.

5.2 Laboratory Analysis

Initial soil characterisation samples were submitted to the laboratories for the following analytical suites:

- EPA Tasmania IB105 analytical suite [excluding tributyltin (TBT)]
- TPH/TRH, BTEXN, PAHs, phenols and metals (lead)

30% or greater of the initial samples collected from each stockpile were analysed for the IB105 suite of contaminants, excluding TBT, with the remaining samples analysed for key CoPC which have been identified as part of previous Site works or as likely to occur due to previous Site uses. The analytical suite selected is considered to be adequate for the assessment of these stockpiles. Toxicity Characteristic Leaching Procedure (TCLP) analysis was conducted for targeted samples.

Additional assessment was conducted as follows:

- A second round of samples from DL_SP were analysed for lead (total contaminant concentration [TCC] and leachate contaminate concentration [LCC]) to assess extent of lead in the stockpile based on one initial detection.
- Analysis of all initial samples collected from DL_SP and OL_EX_SP4 for asbestos fibres, following reported small ACM fragments removed by field staff.
- Analysis of all primary samples from OL_EX_SP6 for cyanide following observation of a small area of blue spotting identified as potential Prussian Blue dye.

Following remediation, all samples were analysed for:

- Lead (TCC and LCC) to assess final concentrations and effectiveness of remediation.
- Polycyclic Aromatic Hydrocarbons (PAHs) (TCC and LCC) to assess final leachable concentrations of these CoPCs, as TCLP leachate of the CoPC was not conducted on some precursor stockpiles.

The laboratory certificates of analysis and QC reports, as well as copies of the CoC and SRN documentation are attached in **Appendix A**.

The laboratory analytical results are presented in **Table T1** and **Table T2**.

5.3 Quality Assurance / Quality Control

The objective of the QA/QC program is to provide an assessment of the reliability of the data presented for interpretation. QA/QC assessment of the analytical data and sampling methodology has been conducted by AECOM on the basis of discussion of the data collected by AECOM field staff, as well as discussion with Elgin and BlackCap staff. Samples were assessed against the DQIs discussed in **Section 3.1**. The detailed data validation report is presented in **Appendix B** and results are summarised below.

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

- Of a total of 883 RPD values, 56 RPD values (~6%) were reported above the adopted acceptable RPD DQO limits. The RPD exceedances were predominantly associated with concentrations of PAHs and metals. This is not unexpected considering the degree of heterogeneity known to be associated with soil fill material. Heterogeneity of the soil, in particular the fill material, has been visually confirmed across the stockpiles and the variability of soil composition is likely to have resulted in these exceedances.

  As approximately 94% of duplicate RPD values were reported within the acceptable range, and considering known heterogeneity, the RPD results are not considered to have compromised the interpretive use of the data.
- Detectable concentrations of naphthalene and phenol were present in rinsate blank DL_QCB06, collected during sampling of DL_SP on 7 March 2023. The detected concentrations are not considered to affect the outcomes of interpretation of this data.
- Three secondary laboratory sample batches (978719, 993445, and 1023335) were received between 6.5 and 9.7°C above the recommended temperature of 6°C. The higher than recommended receipt temperatures are not expected to affect interpretation due to the attempts to chill noted and the periods of exposure to atmosphere and movement of stockpiles prior to sampling.
- Other laboratory QA/QC sampling procedures including analysis of matrix spike recoveries, laboratory duplicates and frequency of QA/QC reported some minor variances from

recommended limits or ranges, indicating minor possibility of under- or over-reporting for some chemicals.

These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data is considered to be suitable for interpretative use and assessment of stockpiles.

5.4 Effectiveness of Remediation

Table 6 below summarises the reagent concentrations added to each stockpile and the estimated dosing amount for soil.

Table 6 Stockpile Remediation Reagent Assessment

Parameter		Value
Stockpile Volume (m^3)	PS-Pb-SP1	600
	PS-Pb-SP2	250
	TOTAL	**850**
Soil Density (tonne/m^3) (assumed based on fill consistency)		1.8
Soil mass (tonne)		1,530
SSP	Target Concentration ($\%^w/_w$)	2%
	Mass (tonne)	40
	Actual Concentration ($\%^w/_w$)	2.6%
MgO	Target Concentration ($\%^w/_w$)	3%
	Mass (tonne)	60
	Actual Concentration ($\%^w/_w$)	3.9%

The results of samples collected prior to and following remediation are presented on **Table T1** and **Table T2**, attached. The changes in lead TCC and LCC in treated material is summarised on **Table 7** below.

Table 7 Chemical Immobilisation of Lead Assessment

Parameter		Pre-Remediation[1]	Post-Remediation	% of Initial
PS-Pb-SP1				
Lead TCC (mg/kg)	Minimum	126	291	230%
	Maximum	2,340	1,200	51%
	Mean	746	736	99%
	Standard Deviation	520	167	32%
Lead LCC (mg/kg)	Minimum[2]	0.2	<0.1	<50%
	Maximum	1.3	0.4	31%
	Mean	0.49	0.13	27%
	Standard Deviation	0.28	0.08	29%

Parameter		Pre-Remediation[1]	Post-Remediation	% of Initial
PS-Pb-SP2				
Lead TCC[3] (mg/kg)	Minimum	120	454	378%
	Maximum	55,500 / 1,420	844	2% / 59%
	Mean	2,520 / 400	614	24% / 159%
	Standard Deviation	10,810 / 318	102	1% / 32%
Lead LCC (mg/kg)	Minimum	<0.1	<0.1	N/A
	Maximum	34.1 / 4.6	<0.1	<0.1% / <2%
	Mean	3.72 / 0.7	<0.1	<3% / <14%
	Standard Deviation	10.16 / 1.4	N/A	N/A

Notes: [1]It is noted that not all pre-remediation samples were analysed for lead LCC (discussed below) [2]Where results were reported below the LOR, they have conservatively been assumed to be at the LOR; [3]Maximum, mean and standard deviation for PS-Pb-SP2 pre-remediation were calculated included and excluding the sample at DL_SP-05 as discussed below. Results included DL_SP-05 are listed first on the table above.

The following is noted from assessment of remediation effectiveness:

- Reagent volumes added to stockpiles exceeded the estimated quantities and have an allowance for incomplete mixing. If areas of soil exist which have not been mixed with sufficient quantities of reagent, it is considered likely that there remain reagents in soil which can react with lead leachate if generated in future.
- Mean lead LCC was reduced to between 2 and 27% of pre-remediation samples.
- No lead LCC above the IB105 Level 2 – Low Level Contaminated Soil maximum LCC criteria was detected post-remediation.
- Minimum lead TCC increased, and maximum lead TCC decreased, for both stockpiles. This is considered likely to be due to a level of homogenisation which occurred during stockpile movement, mixing, and/or remediation. The standard deviation of lead TCC and lead LCC results decreased for both stockpiles, which also supports homogenisation of the stockpiles occurring.
- It is noted that not all pre-remediation samples were assessed for lead LCC. However, all pre-remediation samples with a lead TCC greater than the Level 2 – Low Level Contaminated Soil TCC criteria were assessed (i.e., soil with higher lead concentrations), and the calculated mean TCC for pre-remediation soils may be reported higher than present pre-remediation.
- Very high lead TCC and LCC were reported pre-remediation in sample DL_SP_05, collected from DL_SP, a precursor stockpile to PS-Pb-01. This detection is discussed further in **Section 5.5.1** below, however based on repeat sampling of the stockpile and interview with field staff it is not considered characteristic of the stockpile or to indicate an unacceptable risk of lead leachate. Comparison of results of remediation for PS-Pb-SP2 have been conducted with and without results from this sample location to assess remediation effectiveness with and without the influence of the outlier data point.

Based on the results of lead TCC and LCC pre- and post-remediation, chemical immobilisation of lead within PS-Pb-SP1 and PS-Pb-SP2 is considered successful.

5.5 Soil Categorisation

5.5.1 IB105 Categorisation

The soil analytical data collected, including soil TCC and LCC concentrations, compared to the guideline values presented in Table 2 of IB105 for categorisation are presented on **Table T1** and **Table T2**, attached, and summarised on **Table 8** below.

Table 8 Comparison to IB105 Criteria

Criteria	CoPC in Excess of TCC	CoPC in Excess of TCC
PS-Pb-SP1		
Pre-Remediation		
Level 1 - Fill	Benzo(a)pyrene, Sum of PAHs, Cyanide Total, Mercury, Arsenic, Barium, Chromium, Copper, Lead, Manganese, Tin, Zinc, TPH (C10-C36).	N/A
Level 2 – Low Level Contaminated Soil	Benzo(a)pyrene, Sum of PAHs, Lead	Lead
Level 3 – Contaminated Soil	Sum of PAHs	No exceedances
Post-Remediation		
Level 1 - Fill	Sum of PAHs, Cyanide Total, Fluoride, Mercury, Arsenic, Barium, Cadmium, Chromium, Copper, Lead, Nickel, Tin, Zinc,	N/A
Level 2 – Low Level Contaminated Soil	Benzo(a)pyrene, Sum of PAHs, Lead	No exceedances
Level 3 – Contaminated Soil	No exceedances	No exceedances
PS-Pb-SP2		
Pre-Remediation		
Level 1 - Fill	Benzo(a)pyrene, Sum of PAHs, Mercury, Arsenic, Cadmium, Copper, Lead, Silver, Zinc, TPH (C10-C36).	N/A
Level 2 – Low Level Contaminated Soil	Benzo(a)pyrene, Sum of PAHs, Lead	No exceedances
Level 3 – Contaminated Soil	Lead	No exceedances
Post-Remediation		
Level 1 - Fill	Sum of PAHs, Cyanide Total, Fluoride, Mercury, Arsenic, Cadmium, Chromium, Copper, Lead, Tin, Zinc,	N/A
Level 2 – Low Level Contaminated Soil	Benzo(a)pyrene, Sum of PAHs,	No exceedances
Level 3 – Contaminated Soil	No exceedances	No exceedances

Notes: PAH – Polycyclic Aromatic Hydrocarbons; TPH – Total Petroleum Hydrocarbons

The following has been considered in categorisation of PS-Pb-SP1 and PS-Pb-SP2:

- Section 2 of IB015 notes that where LCC criteria are prescribed, they take generally take precedence over the TCC and should be used as the sole determinant of final classification for disposal.

  TCC of benzo(a)pyrene, Sum of PAHs, and lead exceeding the Level 2 – Low Level Contaminated Soil criteria were reported in pre- and post-remediation stockpiles. All samples collected from post-remediation stockpiles were assessed for LCC (or had the benzo(a)pyrene

Toxicity Equivalent Factor [TEQ] calculated in the case of Sum of PAHs) and reported results below the Level 2 LCC.

On this basis, the TCC concentrations above the Level 2 criteria are not considered to preclude classification of this material as Level 2 – Low Level Contaminated Soil

- One sample (DL_SP_05, collected 7 March 2023) from DL_SP, a precursor stockpile to PS-Pb-SP2, reported lead TCC in excess of the Level 3 – Contaminated Soil criteria. This result was confirmed by reanalysis of this sample by the analytical laboratory (ALS).

  The reported TCC and LCC are considered likely to indicate that there may have been a small piece of lead metal, or an alternative source of lead such as solder splatter, present in DL_SP at this location. As DL_SP had been moved before initial validation sample results were received, the area where DL_SP_05 was collected could not be inspected for a potential source. A second round of sampling from DL_SP was conducted on 23 March to:

  - Inspect the stockpile for any possible sources of the reported lead concentration (i.e., metal fragments, solder splatter etc).
  - Assess if lead impacts were widespread within the stockpile or had potentially been missed during initial sampling.

  No potential sources were observed during the second sampling event. No exceedances of the IB105 TCC were detected, although exceedances of the LCC were detected in samples DL_SP_15 and DL_SP_17. No exceedances of the Level 2 TCC or LCC were detected in post-remediation samples collected from PS-Pb-SP2 (with all lead LCC below the LOR of 0.1 µg/L).

  On this basis, it is not considered that the lead detected at DL_SP_05 is characteristic of the stockpile as a whole or that the reported concentrations at this location represent a potential ongoing source which would result in this stockpile being unsuitable to consider Level 2 – Low Level Contaminated Soil.

Based on the results of analysis and the considerations discussed above, it is considered suitable to classify both PS-Pb-SP1 and PS-Pb-SP2 as Level 2 – Low Level Contaminated Soil.

5.5.2 Off-Site Reuse Scenario

The soil analytical data collected, compared to the guideline values presented for HIL-D on Table 1A(1) of the ASC NEPM, is presented on **Table T1** attached, and summarised on **Table 8** below.

Table 9 Comparison to ASC NEPM HIL-D Criteria

Criteria	CoPC in Excess (Pre-Remediation)	CoPC in Excess (Post-Remediation)
PS-Pb-SP1	Lead	No exceedances
PS-Pb-SP2	Lead	No exceedances

The following has been considered in assessment of the suitability of the stockpiles for reuse as described in **Section 3.3**:

- Lead concentrations in excess of the HIL-D criteria (1,500 mg/kg) were reported in pre-remediation stockpiles as follows:
  - OL_EX_SP1, OL_EX_SP2 (precursor stockpiles to PS-Pb-SP1)
  - DL_SP_05 (precursor stockpile to PS-Pb-SP1)

  The reported lead TCC in excess of the HIL-D pre-remediation are not considered to preclude the proposed reuse scenario as:

  - As discussed in **Section 5.4**, comparison of pre- and post-remediation lead concentrations indicate that a level of homogenisation and reduction in maximum lead concentrations (as demonstrated by the lower standard deviation of results detected post-remediation) is considered likely to have occurred during movement, mixing or remediation of stockpiles,

and it is considered likely that areas of high lead concentrations have been mixed into surrounding soil and overall concentration decreased.

- The risk pathway for exposure to lead TCC is via inhalation or ingestion of impacted soil. Under the proposed reuse scenario, no long-term direct contact with soil is considered likely to occur due to the covering material, and a SWMS will be prepared by the receiving for handling and placement of the material to minimise potential exposure by their staff.
- As noted in **Section 3.3**, the assumptions used in the ASC NEPM to generate assume a high level and long term exposure to soil, and do not account for Personal Protective Equipment (PPE) such as gloves or procedures such as handwashing which can be used to reduce the risk of exposure and remove these risk pathways.
- No lead TCC in excess of the HIL-D was detected in the final categorisation samples collected post-remediation.

- No HIL-D criteria are presented in the ASC NEPM for benzo(a)pyrene or Sum of PAHs, which were also detected above the IB105 Level 2 TCC in the soil. Similar to the lead concentrations discussed above, the risk pathway from these CoPC is via inhalation or ingestion. Under the proposed reuse scenario in **Section 3.3**, potential risks to receiving site staff will be controlled via SWMS during handling and placement, and by the cover layer to be included in the long-term placement of material.
- Fragments of ACM were noted in precursor stockpiles to PS-Pb-SP2. Although all ACM fragments were removed by field staff where observed, the potential exists for fragments to exist within the soil. The potential ACM fragments are not considered to preclude offsite reuse under the proposed conditions in **Section 3.3**, as:
  - ACM observed was non-friable.
  - No asbestos fibres were detected in soil samples from the point of observation.
  - No areas of large quantities of bulk ACM, which may indicate large sheeting or fragments, were observed.

  Based on the observed quantities and overall volume and mass of the PS-Pb-SP2, the total volume of ACM is considered likely to be below the 0.05%$^{w}/_{w}$ criteria for asbestos in soil for commercial/industrial use provided in the ASC NEPM.

  Fragments of ACM are common to observe in industrial fill material and can often be managed in place without representing an unacceptable risk to site users. The proposed reuse scenario includes installation of a covering layer which, if greater than 10 cm, would be suitable for containment of ACM of the type observed during stockpile sampling, and is not considered to preclude reuse of PS-Pb-SP2 under the conditions described in **Section 3.3**.
- Some small areas of blue paint discolouration were noted at the source location of OL_EX_SP6, a precursor stockpile to PS-PB-SP1, and noted by field staff as potential Prussian Blue paint as discussed in **Section 1.5**.

  The total volume of blue paint observed was small and localised in a small volume removed from the stockpile and disposed of to a hazardous waste bin. No elevated cyanide (the CoPC for Prussian Blue paint/dye) were detected in samples from OL_EX_SP6, which were generally lower than reported in other samples assessed from the area, and it is considered likely that either:
  - The observed blue paint was not Prussian Blue; or
  - There was not sufficient material to impact the stockpile or represent an unacceptable risk to future uses.

  The blue-coloured material was removed from OL_EX_SP6 and was not observed in any other areas during sampling or movement of this or other stockpiles.

Based on the assessment above, PS-Pb-SP1 and PS-Pb-SP2 are considered suitable for reuse as cover material at McRobies Gully under the reuse scenario described in **Section 3.3**.

6.0 Conclusions and Recommendations

As part of the Precinct South remediation of the Macquarie Point site undertaken by BlackCap, two soil stockpiles were generated which have been considered in this report:

- PS-Pb-SP1, consisting of approximately 600 m^3 of soil and fill material.
- PS-Pb-SP2, consisting of approximately 250 m^3 of soil and fill material.

The following conclusions have been drawn from this assessment:

- The following exceedances of waste classification criteria from IB105 were detected in soil samples from the stockpiles:
  - Benzo(a)pyrene and Sum of PAHs were detected above the Level 2 and Level 3 TCC criteria. However, no exceedances of the benzo(a)pyrene or the benzo(a)pyrene TEQ were detected in precursor or in the categorisation samples collected from the final stockpiles.

    Section 2 of IB015 notes that where LCC criteria are prescribed, they take generally take precedence over the TCC and should be used as the sole determinant of final classification for disposal.
  - Exceedance of the Level 2 – Low Level Contaminated Soil LCC for lead was detected in soil from precursor samples for each stockpile. The stockpiles were treated to chemically stabilise lead with an estimated reagent dosing of:
    - 2.6% single super phosphate
    - 3.9% magnesium oxide

    Chemical stabilisation using these reagents binds leached lead into stable pyromorphite. Remediation of the stockpiles was assessed as successful and no exceedances of the lead LCC were reported in soil following treatment. Both reagents used are commonly used agricultural chemicals and are not considered to alter the risk profile of the stockpiles.
- The stockpiles were assessed against the ASC NEPM HIL-D, and for other observations during stockpile excavation and sampling, for suitability for reuse as cover material at the McRobies Gully Waste Management Centre, a municipal landfill. The following was observed or has been considered in assessing the stockpiles for reuse:
  - Lead concentrations in excess of the ASC NEPM HIL-D for lead were observed in precursor stockpiles combined to form PS-Pb-SP1 and PS-Pb-SP2. These detections are not considered to represent an unacceptable risk under the proposed reuse scenario as:
    - A degree of homogenisation and decrease of peak areas of lead concentration is considered likely to have occurred during movement, combination, and remediation of stockpiles.
    - Exposure to lead in soil can be managed by PPE, handling procedures, and the final conditions of reuse (including a surface layer) and does not represent an unacceptable risk if managed as described in the reuse scenario.
    - The NEPM HIL-D criteria assume a level of contact over a long period of time which is unlikely to occur under the proposed reuse scenario.
    - No lead TCC in excess of the HIL-D were detected in samples collected from the final stockpiles.
  - The NEPM HIL-D does not contain criteria for benzo(a)pyrene or Sum of PAHs, both of which reported TCC above the Level 2 – Low Level Contaminated Soil criteria. However, these CoPC are considered unlikely to represent a leachate risk, based on the TCLP LCC assessment conducted on stockpile samples, and the risk pathway from these CoPC is via inhalation or ingestion. Under the proposed reuse scenario potential risks to receiving site staff will be controlled via SWMS during handling and placement, and by the cover layer to be included in the long-term placement of material.

- Small, isolated fragments of ACM were observed and removed by field staff from precursor stockpiles of PS-Pb-SP2. The ACM observed is not considered to represent a risk to the proposed offsite reuse as:
  - ACM observed was non-friable and not observed in large quantities which may be indicative of large scale ACM disposal.
  - No asbestos fibres were detected in soil samples from the stockpiles.
  - Based on the quantities observed, the total ACM within PS-Pb-SP2 is considered unlikely to exceed the ASC NEPM non-friable asbestos criteria of 0.05%$^{w}/_{w}$ for commercial/industrial land.

  It is recommended a cover layer of at least 10 cm be placed over PS-Pb-SP2 to prevent any ACM fragments at or near the surface of the area of reuse of PS-Pb-SP2.

Based on this assessment, PS-Pb-SP1 and PS-Pb-SP2 can be classified as **Level 2 – Low Level Contaminated Soil** and are suitable for disposal as covering material at McRobies, under the conditions described below.

The following recommendations are made based on this assessment:

- The excavated material will be transported off-Site by a contractor on behalf of the Corporation or the receiving Site. Reasonable precautions will be undertaken to ensure that no environmental or human health harm results from the movement of potentially contaminated materials between the sites. All truckloads will be tracked.
- The receiving site (McRobies) intends to use the soil as cover and levelling material on old land fill batters.
- Material will be immediately applied to the old tip face and levelled using an enclosed excavator or other mechanical methods. No manual works outside the machine are planned as part of the soil placement.
- McRobies will develop a Safe Work Method Statement (SWMS) for the placement of the soil which will include handling measures and personal protective equipment (PPE) requirements. The minimum PPE requirements for the work are gloves, long sleeves and pants, eye protection and face mask, and will include procedures (such as washing of hands before eating, drinking or smoking to remove any material) to reduce any potential exposure by McRobies staff while handling and placing material.
- A cover layer of at least 10 cm clean fill and green waste will be placed over the imported material following levelling to prevent dust generation or contact with the soil.
- The areas of reuse are remote from members of the public or any staff outside excavators/machines.
- The area of reuse is unsaturated (i.e., above the water table).
- The material will not be stored by McRobies prior to use.
- If the soil is dry and generating dust when imported, wetting will be used to supress dust.
- No further excavation or disturbance of the area of use will take place following import of the material.
- McRobies has an EPA certified leachate capture and treatment system. Leachate from the area of reuse will be captured in a silt trap/holding basin prior to discharge to sewer.

Approval from EPA is required prior to the disposal of any material, and all material must be transported off Site by an appropriately licensed waste transporter. In the event that an alternative disposal methodology, be proposed or further treatment required, this waste management plan should be updated, or a new plan be prepared, by a suitably experienced environmental professional.

Yours faithfully

Robert Crowe

8.0 Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of Macquarie Point Development Corporation and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract dated 20 December 2022.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 1 September and 1 October 2023, and is based on the data sourced identified in this report available at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.
