N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
S05	Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

NOTES:

Please immediately freeze all PASS sample bags upon receipt.
Please ensure all other samples remained chilled sufficient to remain below 6 degrees C during further transit between labs as required.

Please note that CRS and/or SPOCAS analysis may be further requested on PASS Suite samples, pending initial pH results - please preserve/prepare the samples accordingly should this be required.

Company name:	Aecom Austraila Pty Ltd Tasmania
Contact name:	Robert Crowe
Project name:	Macquarie Point
Project ID:	60693007 / 12
Turnaround time:	5 Day
Date/Time received	Jun 12, 2025 3:16 PM
Eurofins reference	1231576

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 5.6 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Sample bag BH004W_6.0 received as BH004A_6.0. Logged as per COC. Please confirm sample ID.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: Savini.Suduwelikondage@eurofinsanz.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Austraila Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acid Sulfate Soils Field pH Test	Brisbane	Jun 23, 2025	7 Days
- Method: LTM-GEN-7060

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Lab Sample ID	QA Source	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S05	Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

Thanks Sheridan,

The results for this batch came through last night. Could you please line up analysis for the NASSG suites for Chromium Reducible Sulfur (CRS), Suspension Peroxide Oxidation Combined Acidity and Sulfur (SPOCAS), and Acid Neutralising Capacity (ANC) be conducted on samples from this batch, and from batch 1225146, as per the table below:

Field ID	Batch	Sample Date	Additional Analysis		
			CRS	SPOCAS	ANC
ABH004A_2	1225146	27-May-25	X	X	X
ABH004A_2.5	1225146	27-May-25	X		X

1237090

Thanks for the confirmation that the samples were frozen as well – assumed this was the case. It would probably be handy to note on future CoCs, particularly when samples are received at the analytical lab in Brisbane – not something which has ever been questioned, but would be a useful additional data point if any unusual data discrepancies come through in the future.

Cheers, and please let me know if you need any additional information or details,

Robert Crowe

Eurofins reference	1237090

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 5.6 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: Savini.Suduwelikondage@eurofinsanz.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Austraila Pty Ltd Tasmania email address.

Aecom Austraila Pty Ltd
Suite 6, Level 3,13-17 Castray Esplanade
Hobart
Tasmania 7000

NATA Accredited
Accreditation Number 1261
Site Number 20794 & 2780

Accredited for compliance with ISO/IEC 17025 – Testing
NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration, inspection, proficiency testing scheme providers and reference materials producers reports and certificates.

Attention: **Robert Crowe**

Report **1237090-S**

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S01	Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3'
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5
S03	Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5
S04	Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period

Data Validation

DATA VALIDATION REPORT					
Project number:	60693007	**Validation by:**	Robert Crowe	**Date:**	12-Nov-25
Client:	Macquarie Point Development Corporation				
Site:	Macquarie Point / Regatta Point				
Matrix type:	Acid Sulfate Soil (ASS)	**Data verified by:**	Robert Crowe	**Date:**	12-Nov-25
Primary samples:	354				
Laboratory:	Eurofins	**Technical Discipline Manager:**	Mark Davidson		
Lab reference:	See Below:				

Key Issues:	No QA/QC issues were identified in the field or laboratory datasets that could have a material implication to decision-making on the project.
Field Quality Assurance and Quality Control	
Laboratory Reports	pH Field Screens – 1091401, 1093109, 1094321, 1079381, 1099835, 1100380, 1141778, 1225146, 1231576 CRS / SPOCAS Analysis – 1097150, 1097156, 1103208, 1108737, 1144581, 1237090 Chip Tray Analysis - 1118179
Sampling personnel	Samples were collected: • At Macquarie Point between 6 April and 21 May 2024 by C Woodley, T Singhabahu, and M Richard (WSP Pty Ltd), and G Brewer and W Cromer (William Cromer Consulting Pty Ltd), and between 27 May and 11 June 2025 by R Bowers and T Gerstel (AECOM Australia Pty Ltd) • At Regatta Point on 20 September 2025 by E Meszaros (AECOM Australia Pty Ltd) All sampling staff were suitably trained and experienced in soil sampling methodologies, and were aware of and briefed on the sampling requirements.
Sampling Methodology	Soil samples were collected using hand auguring and push tube techniques.
Chain of Custody (COC)	Chain of custody documents completed by sampling personal listed above.
Analysis Request	Laboratory analysis request and sample receipt notification reviewed and approved by R Crowe
Field Blank	Samples were collected and assessed for ASS analysis only – field blanks were not required or collected.
Rinsate Blank	Samples were collected and assessed for ASS analysis only – rinsate blanks were not required or collected.
Trip Blank	Samples were collected and assessed for ASS analysis only – trip blanks were not required or collected.

DATA VALIDATION REPORT					
Project number:	60693007	**Validation by:**	Robert Crowe	**Date:**	12-Nov-25
Client:	Macquarie Point Development Corporation				
Site:	Macquarie Point / Regatta Point				
Matrix type:	Acid Sulfate Soil (ASS)	**Data verified by:**	Robert Crowe	**Date:**	12-Nov-25
Primary samples:	354				
Laboratory:	Eurofins	**Technical Discipline Manager:**	Mark Davidson		
Lab reference:	See Below:				

Handling and preservation	All samples were received chilled at the laboratory and in appropriate sample containers. Samples were received frozen (<0°C), with average sample receipt temperatures reported of between -4.2 to -0.1°C, with the exception of: • 1094321 – +2.9°C; 1231576 – +5.6°C; 1225146 - +10.2°C. However, as all samples in this batch were collected less than 24 hours prior to delivery to the analytical laboratory, where they were frozen, and were chilled following collection, this is not considered to constitute a breach in sample preservation • 1141778 – sample receipt temperature not recorded. However, as all samples in this batch were collected less than 24 hours prior to delivery to the analytical laboratory, and were chilled following collection, this is not considered to constitute a breach in sample preservation. • 1237090 – +5.6°C. This batch consisted of samples from batches 1094321 and 1231576 which were selected for further CRS/SPOCAS analysis, and the analytical laboratory (Eurofins) confirmed that the reported receipt temperature was the receipt temperature of batch 1231576, and that samples had been frozen since delivery to the laboratory. this is not considered to constitute a breach in sample preservation.
Laboratory QA/QC	
Tests requested/reported	pH field screening analysis was requested for all samples on chain of custody documentation supplied to the analytical laboratory with the sample containers. Samples were analysed and reported as requested by email by R Crowe.
Holding time compliance	Samples were frozen within 24 hours of collection, and stored in frozen conditions by the analytical laboratory prior to extraction and testing.
Laboratory Accreditation	The laboratory analysis was Eurofins MGT (Brisbane), which is a National Association of Testing Authorities (NATA) accredited laboratories.
Frequency of laboratory QC	The laboratory reported a sufficient frequency of quality control samples to assess whether the results have been reported to an acceptable accuracy and precision.
Method Blank	Method blank recoveries are not required for ASS assessment.
Laboratory duplicate RPDs	Laboratory duplicate Relative Percentage Differences (RPD) recoveries were within control limits for all samples analysed.
Laboratory control spike recovery	Laboratory control spikes are not required for ASS assessment
Matrix spike recovery	Matrix spikes are not required for ASS assessment.
Surrogate spike recovery	Surrogate spikes are not required for ASS assessment.
QA/QC Data Evaluation	

DATA VALIDATION REPORT

Project number:	60693007	**Validation by:**	Robert Crowe	**Date:**	12-Nov-25
Client:	Macquarie Point Development Corporation				
Site:	Macquarie Point / Regatta Point				
Matrix type:	Acid Sulfate Soil (ASS)	**Data verified by:**	Robert Crowe	**Date:**	12-Nov-25
Primary samples:	354				
Laboratory:	Eurofins	**Technical Discipline Manager:**	Mark Davidson

Comparison of Field Observations and Laboratory Results

No anomalous results between field observations and analysis results were noted.

Data transcription

A random 10% check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and tables generated by AECOM.

Limits of reporting

Soil Limits of Reporting (LORs) were sufficiently low to enable assessment against adopted guideline Investigation Levels.

Frequency of analytical duplicates

Analytical duplicates/method comparison were selected for SPOCAS analysis at a frequency greater than the required frequency of one in 10 primary samples analysed for CRS ASS suite (11 x SPOCAS duplicate analysis conducted for 105 x CRS primary analysis).

Analytical duplicate RPDs

Analytical duplicate RPDs were calculated for actual acidity (both including and excluding ANC) results reported for each CRS/SPOCAS analytical pair, for both results in %S and mole H+/t. Results of RPD calculations are presented on **Table T4**.

RPDs exceeded the adopted 30% control limits (based on the ASC NEPM) for the following sample analysis:

Lab Report No.	Samples	Analyte	RPD[1]
1103208	BH014_3.5-3.6_240424	Net Acidity (excluding ANC)	44-46%
1144581	BH253_0.5_240920	Net Acidity (excluding ANC)	149-152%

Notes: 1. Minor variation in calculated RPD values occurred depending on the reported unit (%S or mol H+/t) used for calculation.

Sullivan et al (2018) notes that the results of SPOCAS analysis may overestimate acidity due to interference from organic sulfides, as opposed to CRS which only reports inorganic sulfides, which represent environmental acidity risks.

At each location where RPD exceedances were reported, SPOCAS results were higher than CRS, and indicators of organic presence such as shells, rootlets, or brown soil colouration were reported, and it is considered likely that organic material within the sample matrices resulted in elevation of the reported sulfides concentrations.

As such, and as the majority of the CRS/SPOCAS sample pairs reported RPDs below the adopted control limit, the results of this assessment are considered suitable for interpretation.

Appendix F

Leapfrog Works Geotechnical Model Outputs (WSP)

Memo

To:	Macquarie Point Development Corporation
From:	Michael Webster – WSP Australia Pty Ltd
Subject:	**Macquarie Point Stadium – Bulk Excavation Volume Estimates**
Our ref:	PS212776-WSP-MWL-GEP-MEM-003 Rev0
Date:	**23 August 2024**

Introduction

WSP Australia Pty Ltd (WSP) has been engaged by the Macquarie Point Development Corporation (MPDC) for geotechnical consulting services pertaining to the development of the proposed Macquarie Point Stadium, located in Hobart, Tasmania. As part of WSP's engagement, a three-dimensional engineering geological model was produced using the *Leapfrog Works* software package. This model delineated key geotechnical units present within the site, namely;

- Anthropogenic fill
- Estuarine sediments
- Alluvial sediments
- Dolerite*

*This unit was further subdivided into generalised rock weathering categories.

Excavation envelope modelling

At the request of MDPC, WSP incorporated the proposed bulk excavation envelopes (BEE) for the following infrastructure elements:

- The stadium, including the playing field and basement areas
- The practice wicket area
- The underground multistorey car park

The excavation outlines and finished surface levels were provided in two plans from MPDC to WSP via email, and appear to originate from Cox Architecture Pty Ltd (Cox). The plans used to define bulk excavation envelopes were:

- MPS-COX-DR-01-A20-0010, dated 24/05/2024. Used to define the BEE for the stadium and practice wicket.
- A2103, dated 17/08/2023. Used to define the BEE for the underground multistorey carpark.

WSP notes that at the direction of MPDC, a 600 mm over-excavation was to be included in the BEE, to account for drainage layers and floor slabs.

The batters used in bulk excavation envelopes varied across the site. Typically, a 2H : 1V batter was assumed for excavation of the stadium and practice wicket. However, a vertical excavation was assumed to be present along the southern boundary of the

Level 11, 567 Collins St
Melbourne VIC 3000

Fax: +61 3 9861 1144
www.wsp.com

WSP acknowledges that every project we work on takes place on First Peoples lands.
We recognise Aboriginal and Torres Strait Islander Peoples as the first scientists and engineers and pay our respects to Elders past and present.

WSP Australia Pty Limited ABN 80 078 004 798

stadium excavation, as the basement footprint directly abuts neighbouring Evans Street. The basement carpark was assumed to comprise vertical walls.

A screen render of the model showing the excavation level across the northern portion of the site is presented below in Figure 1

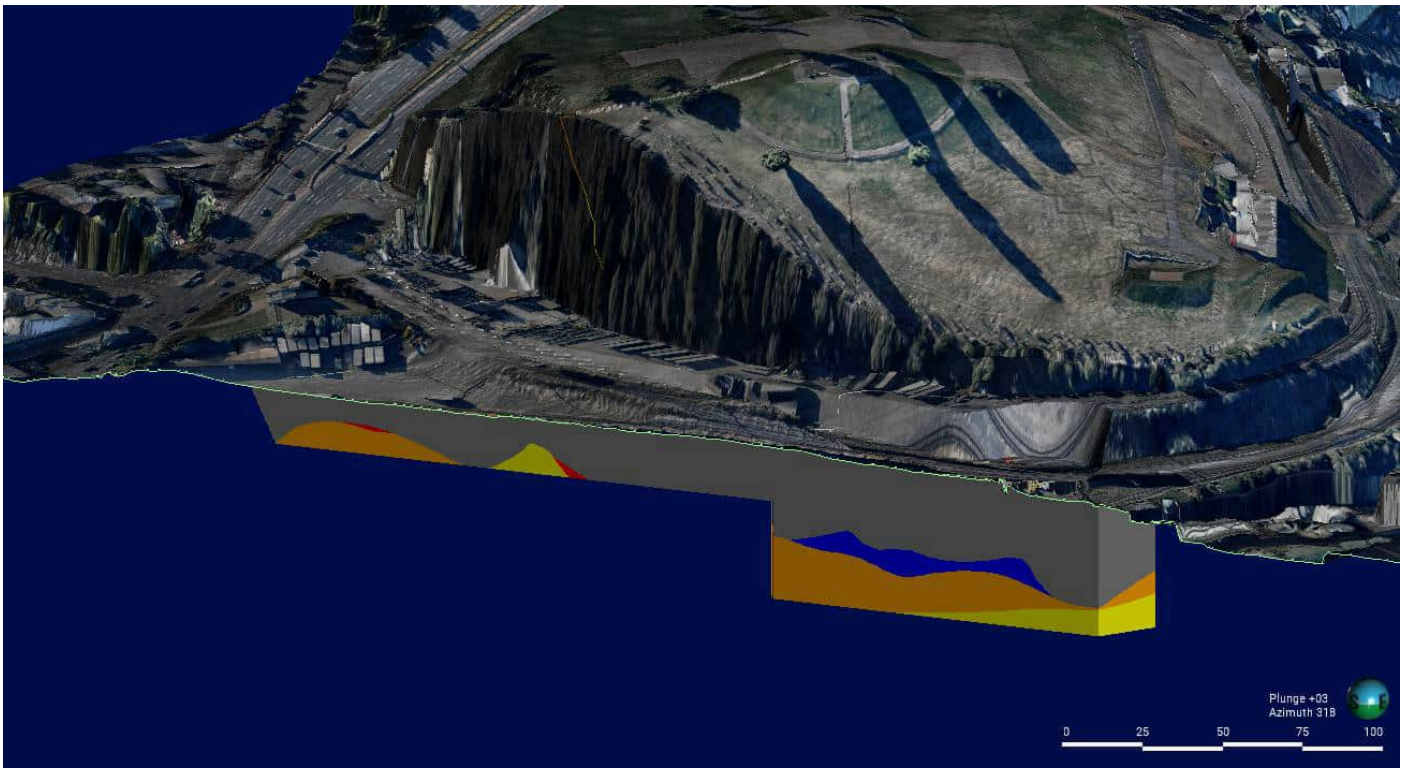

Figure 1 - Screen render of 3D excavation model showing stadium basement car park. View faces northwest.

A plan of the proposed excavation footprint and sections through the site are attached to this memo.

Volume Estimate

Using the assumed excavation envelopes as outlined above, inferred excavation volumes were obtained for the stadium, the practice wicket area, and for the basement carpark. The insitu (ie. unbulked) volumes, in cubic metres, are presented in Table 1 below.

Table 2 Estimated in situ excavation volumes: stadium plus practice wicket and basement carpark

Geotechnical unit	Stadium plus practice wicket (m^3)	Basement carpark (m^3)	Totals (m^3)
Anthropogenic fill	100,824	47,556	148,380
Estuarine sediments	0	6,915	6,915
Alluvial sediments	0	0	0
Dolerite – Residual soil	0	0	0
Dolerite – Extremely weathered	610	55	655
Dolerite – Highly to moderately weathered	15,723	14,165	29,888
Dolerite – Slightly weathered to fresh	1,094	4,181	5,275
TOTAL	118,251	72,872	191,123

In the absence of site-specific data, WSP has provisionally adopted bulking factors proposed by Pitt and Sherry within Chapter 7 of the MPDC document "Macquarie Point Multipurpose Stadium", provided to WSP on 19 August as document *PoSS 1.1_Stadium Design Description_240809_EARTHWORKS EXTRACT*, namely:

- Anthropogenic fill: 1.1 to 1.5
- Estuarine sediments: 1.1 to 1.2
- All dolerite: 1.5 to 1.6

Using the above bulking factors, the estimated excavated volume (in cubic metres) of material is estimated to be as follows:

Table 3 Estimated excavation volumes with bulking factors applied – Stadium plus practice wicket

Geotechnical unit	In situ volume (m^3)	Lower-bound bulking factor (m^3)	Upper-bound bulking factor (m^3)
Anthropogenic fill	100,824	110,906	151,236
Estuarine sediments	0	0	0
Alluvial sediments	0	0	0
Dolerite – Residual soil	0	0	0
Dolerite – Extremely weathered	610	915	976
Dolerite – Highly to moderately weathered	15,723	23,585	25,157
Dolerite – Slightly weathered to fresh	1,094	1,641	1,750
TOTAL	118,251	137,047	179,119

Table 4 Estimated excavation volumes with bulking factors applied – Basement car park

Geotechnical unit	In situ volume (m^3)	Lower-bound bulking factor (m^3)	Upper-bound bulking factor (m^3)
Anthropogenic fill	47,556	52,312	71,334
Estuarine sediments	6,915	7,607	8,298
Alluvial sediments	0	0	0
Dolerite – Residual soil	0	0	0
Dolerite – Extremely weathered	55	83	88
Dolerite – Highly to moderately weathered	14,165	21,248	22,664
Dolerite – Slightly weathered to fresh	4,181	6,272	6,690
TOTAL	72,872	87,522	109,074

Assumptions and limitations of modelling

The excavation envelope modelling outlined within this memorandum provides a high-level estimate of anticipated in situ and bulked volumes for the proposed excavation of the stadium, practice wicket and basement car park. It does not account for localised variations in excavation geometry, piling, footing excavations, lift overrun pits or other deviations from the generalised bulk excavation envelope profile. WSP notes that the volumes provided do not have conservatism applied to them, and represent the best estimate for in situ geological volumes.

Furthermore, the reliability of the 3D engineering geological model, from which the volumes were derived, will impact the volumes of the various materials expected to be present within the excavation footprint. Local variation away from known data points, such as boreholes and test pits, is to be expected and will impact volume estimates provided in this memorandum. This is discussed in greater detail within WSP's geotechnical interpretive report, dated July 2024 (ref. PS212776-GEO-REP-002 Rev0). Additionally, WSP notes that as 3D excavation envelopes were digitised and derived from 2D plans, errors in both georeferencing and placement of excavation envelope boundaries may exist.

WSP notes that the volume estimates will also be impacted by the ground surface used within the 3D engineering geological model. For the 3D model, a combination of publicly available and site-specific topographic information was used. Around the perimeter and the south-eastern section of the site, site-specific topographic information was available in the form of survey contours (ref. 306246 D01 R0 Macquarie Point). Through the central area of the site, this information was not available, and a 2008 LiDAR survey from the Tasmanian State Government was adopted. The combination of multiple surveys from different dates generated some artefacts within the adopted topographic surface, and WSP notes that the adopted surface is likely to differ from the existing surface levels onsite. This will particularly impact in situ volume estimates for fill.

Important information

Your attention is drawn to the document - "Important Information Relating to this Report", which is attached to this document. The statements presented in this document are intended to advise you of what your realistic expectations of this report should be. This document is not intended to reduce the level of responsibility accepted by WSP, but rather to ensure that all parties who may rely on this report are aware of the responsibilities each assumes in so doing.

Limitation Statement: Geotechnical Site Investigation

SCOPE OF SERVICES

This geotechnical site assessment report (the report) has been prepared in accordance with the scope of services set out in the contract, or as otherwise agreed, between the client and WSP (scope of services). In some circumstances the scope of services may have been limited by a range of factors such as time, budget, access and/or site disturbance constraints.

RELIANCE ON DATA

In preparing the report, WSP has relied upon data, surveys, analyses, designs, plans and other information provided by the client and other individuals and organisations, most of which are referred to in the report (the data). Except as otherwise stated in the report, WSP has not verified the accuracy or completeness of the data. To the extent that the statements, opinions, facts, information, conclusions and/or recommendations in the report (conclusions) are based in whole or part on the data, those conclusions are contingent upon the accuracy and completeness of the data. WSP will not be liable in relation to incorrect conclusions should any data, information or condition be incorrect or have been concealed, withheld, misrepresented or otherwise not fully disclosed to WSP.

GEOTECHNICAL INVESTIGATION

Geotechnical engineering is based extensively on judgment and opinion. It is far less exact than other engineering disciplines. Geotechnical engineering reports are prepared to meet the specific needs of individuals. A report prepared for a consulting civil engineer may not be adequate for a construction contractor or even some other consulting civil engineer. This report was prepared expressly for the client and expressly for purposes indicated by the client or his representative. Use by any other persons for any purpose, or by the client for a different purpose, might result in problems. The client should not use this report for other than its intended purpose without seeking additional geotechnical advice.

THIS GEOTECHNICAL REPORT IS BASED ON PROJECT-SPECIFIC FACTORS

This geotechnical engineering report is based on a subsurface investigation which was designed for project-specification factors, including the nature of any development, its size and configuration, the location of any development on the site and its orientation, and the location of access roads and parking areas. Unless further geotechnical advice is obtained this geotechnical engineering report cannot be used:

- when the nature of any proposed development is changed
- when the size, configuration location or orientation of any proposed development is modified.

This geotechnical engineering report cannot be applied to an adjacent site.

THE LIMITATIONS OF SITE INVESTIGATION

In making an assessment of a site from a limited number of boreholes or test pits there is the possibility that variations may occur between test locations. Site exploration identifies specific subsurface conditions only at those points from which samples have been taken. The risk that variations will not be detected can be reduced by increasing the frequency of test locations; however this often does not result in any overall cost savings for the project. The investigation program undertaken is a professional estimate of the scope of investigation required to provide a general profile of the subsurface conditions. The data derived from the site investigation program and subsequent laboratory testing are extrapolated across the site to form an inferred geological model and an engineering opinion is rendered about overall subsurface conditions and their likely behaviour with regard to the proposed development. Despite investigation the actual conditions at the site might differ from those inferred to exist, since no subsurface exploration program, no matter how comprehensive, can reveal all subsurface details and anomalies.

The borehole logs are the subjective interpretation of subsurface conditions at a particular location, made by trained personnel. The interpretation may be limited by the method of investigation, and can not always be definitive. For example, inspection of an excavation or test pit allows a greater area of the subsurface profile to be inspected than borehole investigation, however, such methods are limited by depth and site disturbance restrictions. In borehole investigation, the actual interface between materials may be more gradual or abrupt than a report indicates.

Limitation Statement: Geotechnical Site Investigation

SUBSURFACE CONDITIONS ARE TIME DEPENDENT

Subsurface conditions may be modified by changing natural forces or man-made influences. A geotechnical engineering report is based on conditions which existed at the time of subsurface exploration.

Construction operations at or adjacent to the site, and natural events such as floods, or groundwater fluctuations, may also affect subsurface conditions, and thus the continuing adequacy of a geotechnical report. The geotechnical engineer should be kept appraised of any such events, and should be consulted to determine if additional tests are necessary.

AVOID MISINTERPRETATION

A geotechnical engineer should be retained to work with other appropriate design professionals explaining relevant geotechnical findings and in reviewing the adequacy of their plans and specifications relative to geotechnical issues.

BORE/PROFILE LOGS SHOULD NOT BE SEPARATED FROM THE ENGINEERING REPORT

Final bore/profile logs are developed by geotechnical engineers based upon their interpretation of field logs and laboratory evaluation of field samples. Customarily, only the final bore/profile logs are included in geotechnical engineering reports. These logs should not under any circumstances be redrawn for inclusion in architectural or other design drawings. To minimise the likelihood of bore/profile log misinterpretation, contractors should be given access to the complete geotechnical engineering report prepared or authorised for their use. Providing the best available information to contractors helps prevent costly construction problems. For further information on this matter reference should be made to 'Guidelines for the Provision of Geotechnical Information in Construction Contracts' published by the Institution of Engineers Australia, National Headquarters, Canberra 1987.

GEOTECHNICAL INVOLVEMENT DURING CONSTRUCTION

During construction, excavation is frequently undertaken which exposes the actual subsurface conditions. For this reason geotechnical consultants should be retained through the construction stage, to identify variations if they are exposed and to conduct additional tests which may be required and to deal quickly with geotechnical problems if they arise.

REPORT FOR BENEFIT OF CLIENT

The report has been prepared for the benefit of the client and no other party. WSP assumes no responsibility and will not be liable to any other person or organisation for or in relation to any matter dealt with or conclusions expressed in the report, or for any loss or damage suffered by any other person or organisation arising from matters dealt with or conclusions expressed in the report (including without limitation matters arising from any negligent act or omission of WSP or for any loss or damage suffered by any other party relying upon the matters dealt with or conclusions expressed in the report). Other parties should not rely upon the report or the accuracy or completeness of any conclusions and should make their own enquiries and obtain independent advice in relation to such matters.

OTHER LIMITATIONS

WSP will not be liable to update or revise the report to take into account any events or emergent circumstances or facts occurring or becoming apparent after the date of the report.

Appendix G-8: Macquarie Point Site-wide Soil Vapour Bore and Groundwater Well Inspection and Gauging Event

Mr Greg Cooper
Chief Operating Officer
Company Secretary
Macquarie Point Development Corporation
41 Evans Street, Hobart, TAS, 7001

Dear Greg,

Macquarie Point - Site-wide Soil Vapour Bore and Groundwater Well Inspection and Gauging Event, February 2025

1.0 Introduction

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of a remediation strategy for the Macquarie Point site in Hobart, Tasmania (the Site).

Between 26 and 28 February 2025, AECOM conducted field works to access and inspect monitoring points on and adjacent to the Site, consisting of 123 groundwater wells and 29 soil vapour bores/sub-slab pins, which have been sampled as part of previous environmental investigations. Gauging of all accessible groundwater wells was also conducted during the inspection. An additional inspection of one well, MW60, was conducted on 24 March 2025.

This report has been prepared to provide a factual overview of the works conducted and the outcomes of the investigation. The Site location and layout are shown on **Figure F1** and **Figure F2** respectively.

1.1 Background

The redevelopment of Macquarie Point aims to restore and energise a Site that has long been associated with industrial, freight and rail use into a significant hub for the people of Hobart. Historic contamination at the Site is a legacy of past land uses, including gasworks, fuel handling and bulk storage, freight and rail transfer and locomotive servicing, and land reclamation across areas of the Site.

For the purpose of assessment, the Site has been divided into seven sub-areas for assessment based on the nature of identified contamination, historic activity, and the intended future uses of each area.

The Corporation is currently in the process of negotiating land transfer for the addition of Regatta Point, located to the north, to the overall Site, and for inclusion in the Environmental Audit that is being undertaken. The Royal Engineers Building and Land to the west of the Site is included in the overall planned development of the area, however no changes in use are planned and it is not intended to be included in the Audit at this time.

The location and boundaries of sub-areas of the Site are shown on **Figure 1** below.

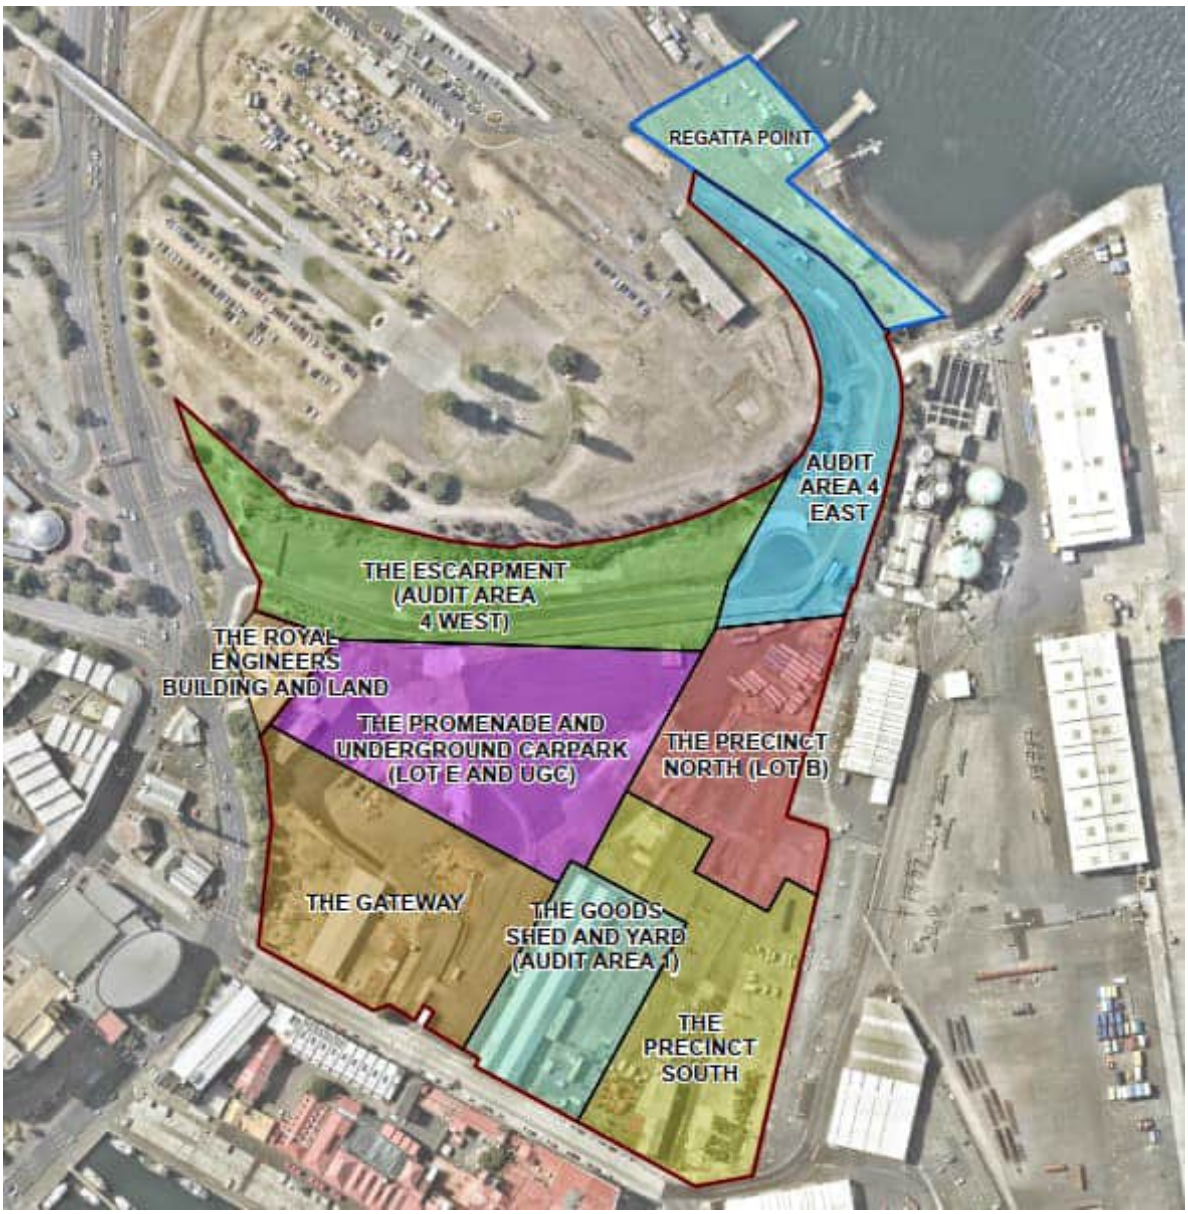

Figure 1 Site Assessment Areas

As part of the historic assessment and investigation of the Site, AECOM has conducted groundwater monitoring events (GMEs) at the Site since 2015, with the most recent Site-wide GMEs conducted in August and November 2019 (AECOM, 2020a). Targeted GMEs have been conducted since 2019, in and around the sub-areas of the Site referred to as the Gateway in late 2022 (AECOM, 2023a), the Precinct South in late 2023 (AECOM, 2024a), and in Regatta Point in late 2024, with results to be issued as part of a Detailed Site Investigation report for this area.

Light Non-Aqueous Phase Liquid (LNAPL) has been identified on groundwater in central and south-eastern areas where historic fuel storage has occurred. Remediation of LNAPL was conducted between 2015 and 2017, and was assessed as having met the practicable remediation end-points, after a period of post-remediation monitoring, in 2021 (AECOM, 2021a)

Soil vapour monitoring events targeting specific buildings and areas of potential vapour generation have been conducted in 2019 (AECOM, 2021b).

Due to the time period since previous Site-wide GMEs and soil vapour monitoring events, and due to ongoing changes in the Site surface (as a result of demolition, remediation, soil excavation and surface covering activities undertaken on-Site), the condition of many monitoring points for these

media unknown, and previous targeted GMEs and other Site inspections have identified damage or loss of monitoring points.

1.2 Objectives

The overall objectives of the Site-wide soil vapour bore and groundwater well inspection, and gauging event, were to:

- Assess and record the condition of monitoring points (groundwater wells and soil vapour bores/sub-slab pins) at and adjacent to the Site, and, where monitoring points were not suitable for future monitoring, identify the requirements for repair or replacement.
- Collect updated groundwater elevation data at and surrounding the Site, including inferred hydraulic contours and gradients.

This report has been prepared to provide a summary of the activities conducted and the status of the monitoring networks for groundwater and soil vapour, to enable maintenance, repair, and/or replacement to be conducted as part of a future scope of work.

1.3 Scope of Work

The following activities were completed by AECOM to fulfil the objectives of this inspection:

- Update of the existing Site Safety Health and Environment Management Plan (SHEMP) to reflect the proposed scope of works, and preparation of task-specific safe work method statements (SWMS) for the proposed field activities.
- Requesting and receiving access approval to monitoring points located:
    - In the central area of the Site, currently leased and occupied by the Tasmanian Water and Sewerage Corporation Pty Ltd (TasWater) for construction equipment storage.
    - On third-party lands to the east of the Site, owned and occupied by the Tasmanian Ports Corporation Pty Ltd (TasPorts).
- Mobilisation to the Site between 26 and 28 February 2025 to inspect and access the following monitoring points previously used for Site investigations:
    - 123 groundwater bores, noting that access to three groundwater wells was not attempted by field staff, and six groundwater wells installed along active roadways were inspected from the sidewalk as discussed in **Section 2.0**.
    - 29 soil vapour bores or sub-slab pins.

    Accessible groundwater bores were also gauged as part of this mobilisation.
- Mobilise to the Site on 24 March 2025 to visually assess groundwater well MW60 for the presence/absence of LNAPL (discussed in **Section 3.3**).

2.0 Field Methodology

The following activities were conducted by AECOM between 26 and 28 February 2025 at and adjacent to the Site:

- Site walkover and well inspection and location.
- Well gauging

Field activities were undertaken by trained and experienced AECOM field personnel.

A handheld Trimble Global Positioning System (GPS) unit with an accuracy of +/- 0.01 m was used to identify monitoring point locations. If the monitoring point was not visible at the surface, a metal detector and hand tools were used to assess if the monitoring point was present and had covered in soil or buried close to the surface.

When a monitoring point was located, AECOM staff:

- Undertook a visual inspection to verify the condition at the surface, including condition of metal gatic covers, bolts and well caps for damage or discrepancies (e.g. sheared bolts; missing well caps) and other notable observations (e.g. presence of water levels loggers installed in wells, flooded gatics, etc).
- Opening of the well cap or vapour cap followed by immediate measurement of potential vapours in the well head by using a Photo-ionisation Detector (PID).
- Inspection of the condition of the well casing or vapour tubing at the surface to check for any indications of damage or blockage.
- Gauged and recorded the groundwater standing water level (SWL) and the depth to bottom of the well (DTB), using an interface probe (IP). Where LNAPL was present, the thickness was recorded, but DTB was not measured so as not to contaminate the IP any more than was necessary.

If a monitoring point could not be located, any features of its previously recorded location, such changes in surfaces or temporary features (such as shipping containers) which could obscure the monitoring point were recorded.

On 24 March, 2024, groundwater well MW60 was accessed using the methodology above. A bailer was lowered into the well and bought to the surface to assess if LNAPL was present in the well.

It is noted that:

- Six groundwater wells located on roadways were not included in the inspection and gauging scope as noted in **Section 1.3**. The wells on roadways were:
  - MW130_GHD, MW131_GHD, MW132_GHD, MW133_GHD, and MW150, installed in the surface of a public road (Evans Street) to the south of the Site.
  - MW145, installed in a Site road in the Escarpment.

  The presence/absence of these wells was visually ascertained by field staff from the footpath to assess if any potential indicators of damage were visible and has been included in assessment of well condition.
- Three groundwater wells ((MW173 on-Site, and PC08 and PC14 off-Site) were not accessed by field staff during works:
  - MW173 is considered likely to be intact and accessible, as this well was recently installed and has been sampled most recently in December 2023, and no large scale development works are known to have occurred in the vicinity.
  - PC08 and PC14 are located in TasPorts land to the south-east of the Site. A white mark which may be the well gatic of PC14 is visible in bitumen on the NearMap aerial photograph of the area dated 31 December 2024.

Field records collected during inspection and gauging are attached in **Appendix C**.

3.0 Field Observations and Outcomes

3.1 General Site Status and Uses

The field team made the following general observations about uses of the Site and surrounding areas during inspection, which are considered to potentially affect the accessibility of monitoring points:

- Remediation and soil excavation in the central portion of the Site (the eastern portion of the Promenade and Underground Carpark, and the western portions of the Precinct North and Precinct South) have significantly changed surface levels since 2019.
- The northern portion of the Precinct North, and portions of the Promenade and Underground Carpark, the Escarpment, and Audit Area 4 East are currently leased and occupied by TasWater as a construction laydown area.

3.2 Soil Vapour Bore and Groundwater Well Condition

The results of the soil vapour bore and groundwater well inspection are presented on **Table T1**. Historic gauging results, including historic DTB and if LNAPL has been previously detected in the well, have also been noted.

Based on observed features during the inspection and comparison to historic data, the condition of monitoring points, and whether they are useable for future investigations, have been assessed on **Table T1** using the categories listed on **Table 1** below.

Table 1 Monitoring Point Inspection Categories

Outcome	Description
Condition	
Intact	Monitoring point is accessible and has not indications of damage or any other features which would prevent sampling.
Minor Repair	Minor damage or defect, such as missing gatic bolts or seal, flooded wellhead etc, which can be fixed with hand tools or minor replacement parts.
Major Repair	Major repairs are needed, such as replacement of gatic or well head, removal of blockage in well, or removal of asphalt, which would require a driller on Site.
Lost/Destroyed	Monitoring point is considered to be lost or destroyed to due major earthworks or changes in Site surface.
Not accessed	Monitoring point was in an inaccessible area, was believed to be under a temporary structure (such as a shipping container or scaffolding), or was not attempted to be accessed by field staff for some other reason (noted on **Table T1**).
Suitable for Future Monitoring?	
Yes	The monitoring point could be used for future investigations
Likely	While not confirmed, it is considered likely that the monitoring point could be used for future monitoring. Locations in this category may require minor repairs, or were not accessible but we observed from a distance.
No	The monitoring point is unlikely to be able to be repaired/restored.
Unknown	The monitoring point may still exist, but may require major repair, or was inaccessible and could not be directly observed to assess condition.

Assessment of the condition and usability of monitoring points is provided by location on **Table T1**, and summarised on **Table 2** below. The locations and status of monitoring points are shown on **Figure F3** and **Figure F4**.

Table 2 Summary of Monitoring Point Inspection

Status		Number of Locations	% of total
Groundwater Wells			
Total Number	123		
Condition	Intact	41	33%
	Minor Repair	10	8%
	Major Repair	17	14%
	Lost/Destroyed	39	32%
	Not Accessed	16	13%
Suitable for Future Monitoring?	Yes	49	40%
	Likely	12	10%
	No	40	32%
	Unknown	22	18%
Soil Vapour Points			
Total Number	29		
Condition	Intact	1	3%
	Minor Repair	2	7%
	Major Repair	4	14%
	Lost/Destroyed	22	76%
	Not Accessed	0	0%
Suitable for Future Monitoring?	Yes	3	10%
	Likely	0	0%
	No	22	76%
	Unknown	4	14%

Based on the results of inspection, while a full review of all groundwater contaminant source zones and known impacts has not been conducted, based on the inspection of groundwater wells the following observations and conclusions are made:

- The groundwater monitoring network is largely intact around the boundaries of Macquarie Point, although gaps are considered present in the north to north-west, including suitable wells to assess background groundwater conditions, with MW120 and BG1, which were previously used for this purpose, destroyed or requiring major repairs.

  Understanding the condition of groundwater entering and leaving the Site is required to provide confidence on assessment of potential risks to off-Site receptors (human and ecological), and repair or replacement of wells to allow confidence in assessment of groundwater at the Site boundaries is recommended.

- Many wells in the central portion of the Site, in particular in the vicinity of previously identified areas of LNAPL impact, have been lost.

  While these LNAPL plumes have previously been assessed as stable and unlikely to migrate (AECOM, 2021a), the potential exists for changes in surface cover or remediation to have altered previous outcomes, and replacement wells to provide a suitable level of understanding and confidence on the location and mobility of LNAPL should be considered.

- Groundwater wells on Regatta Point are intact and suitable for future uses.

- Access was granted for gauging and inspection of off-Site wells on TasPorts land to the south and east of Macquarie Point. Limited sampling has been conducted on these wells previously, and further access to sample and assess off-Site groundwater conditions should be investigated with the landowner (TasPorts)

The majority of soil vapour monitoring points have also been lost or destroyed. Development of an investigation program to confirm results of previous soil vapour monitoring (AECOM, 2021b) and assess any changes to soil vapour risk profiles, including replacement of lost soil vapour locations or installation of new locations, is recommended.

It is noted that one-for-one replacement of lost or damaged groundwater wells and soil vapour monitoring points may not be required or practicable, considering the existing data set and relatively short period before large-scale development of the Site is planned to commence.

Groundwater wells which are lost or damaged, and are not intended to be repaired to allow future sampling, represent a potential pathway for contamination to groundwater. Decommissioning of any such groundwater wells should be conducted, as far as practicable, by a licenced driller in accordance with the *Minimum Construction Requirements for Water Bores in Australia* (NUDLC, 2020).

3.3 Groundwater Contours and Flow Direction

As part of the inspection discussed in **Section 3.2**, 49 accessible groundwater wells on and adjacent to the Site were gauged.

Results of gauging are presented on **Table T1**. The recorded depths to groundwater ranged between:

- 1.025 metres Below Top Of Casing (mBTOC) (MW178 on Regatta Point) to 6.511 mBTOC (MW160 in Audit Area 4 East)
- 0.095 m Australian Height Datum (mAHD) (MW180 on Regatta Point) to 3.198 mAHD (MW121 in the Promenade and Underground Carpark).

Inferred potentiometric contours for shallow groundwater (i.e., wells screened above the top of the aquifer to less than 10 m below ground level [m bgl]) are shown on **Figure F5**. The gauging data indicates that:

- Groundwater flow on Macquarie Point is generally to the south, with groundwater entering the Site from the east and west, and groundwater gradients are steeper in the north and relatively flat in the central portion of the Site, consistent with previous investigations (AECOM, 2020a, AECOM, 2024a).
- A northerly flow is potentially present in the Escarpment / Audit Area 4 East. Groundwater flow in this manner has not been observed during previous GMEs, which have reported groundwater entering the Site from the north.

  Changes in the Site surface due to remediation since 2019 may have affected groundwater flow However, the groundwater wells in the north and north-eastern parts of the Site were not gauged during this monitoring round, due to either damage or equipment in place over them, and the northerly flow may be an artefact of the lack of groundwater elevation information in the northern portion of the Site. Monitoring of wells in the northern portion of the Site is recommended to determine if groundwater flow directions have altered.
- Apparent mounding is present at MW159, on the north-eastern boundary of Macquarie Point adjacent to the TasWater operated Waste Water Treatment Plant (WWTP), and may indicate an inflow of groundwater which has been potentially impacted by WWTP operations. Sampling of MW159, and other wells in this area, is recommended to assess if new impacts have been introduced to this area of the Site.

Dense Non-Aqueous Phase Liquid (DNAPL) was not encountered in any wells. However, measurable LNAPL, ranging between 0.008 to 0.095 m in thickness, was encountered in six wells, presented in **Table 3** below. The historical reported range of LNAPL thickness from previous GMEs and monitoring at these wells (AECOM, 2021a, AECOM, 2024b) has also been included.

Table 3 Measurable LNAPL Reported, February 2025

Well	Depth (mBTOC)		LNAPL Thickness (m)		Thickness within historic range?
	LNAPL	Groundwater	Feb 2025	Historic Maximum	
The Precinct South					
MW03	1.980	1.990	0.010	0.091	Yes
MW05	1.732	1.740	0.008	0.096	Yes
MW154	2.094	2.125	0.031	Not detected	No
PW02	2.200	2.250	0.050	0.160	Yes
S8	2.060	2.155	0.095	0.120	Yes
Off-Site (TasPorts)					
PC13	1.300	1.310	0.010	Not detected	No

It is noted that, as discussed in **Section 3.2**, all wells targeted LNAPL in the central portion of the Site were lost or destroyed, and LNAPL is considered likely to remain present on groundwater in that area.

LNAPL detections at MW03, MW05, PW02 and S8 were within historic reported thicknesses, and LNAPL transmissivity testing conducted in 2024 (AECOM, 2024b) reported that LNAPL at MW03, PW02 and S8 was not likely to be mobile or practicable to recover. While LNAPL was detected at MW05 in excess of historic maximums in December 2023, no LNAPL was present in 2024.

LNAPL has not been previously detected in MW154, which are located to the south of previous LNAPL detections in the Precinct South, or PC13, which is to the east of the Precinct South on TasPorts land. For these detections:

- MW154 is in close proximity to S8, and LNAPL migration may be occurring in this area. Mobilisation may have been encouraged by remediation in the Precinct South in 2023, which included excavation to and disturbance of groundwater, or by works along Evans Street to the south to prepare for realignment of the Hobart Main Sewer, which included test pitting and pumping of groundwater. However, this detection may also represent ongoing migration of LNAPL.
- PC13 has only been accessible once previously, for gauging and recording groundwater parameters in 2017, and LNAPL was not detected. As this location is inferred hydraulically upgradient of Macquarie Point, on land known to have historically been used for bulk fuel storage, this detection indicates an LNAPL plume is present on TasPorts land, which may or may not be connected to LNAPL on Macquarie Point, based on proximity to MW03.

Additional assessment to confirm the presence or absence of LNAPL, and assess any potential mobility if confirmed, is recommended.

During gauging on 27 February 2025, field staff reported 0.002 m of LNAPL detected on the surface of MW60, located in the Precinct South, to the south of LNAPL Plume B. LNAPL has not been historically detected in this well. However, field staff noted organic matter in this well in field notes, and verbally reported that this was a whitish potential biofilm which fouled the interface probe and may have potentially given false positives for LNAPL. AECOM staff returned to MW60 on 25 March 2025, and while the interface probe reported 0.001 m of non-conductive material on the surface of groundwater (typically considered LNAPL), bailing of the well (shown on **Plate 1** below) identified that no LNAPL was present, and that the reported detection was caused by a biofilm (visible on the lower right side of the bailer) and small living insects were present in the well. LNAPL is not considered to be present in MW60 based on this result.

Plate 1 **Biofilm (lower right) and small insects present on groundwater bailed from MW60, 25 March 2025 (AECOM)**

4.0 Conclusions and Recommendations

At the request of the Corporation, AECOM conducted an inspection of groundwater wells and soil vapour monitoring points at and surrounding the Macquarie Point Site between 26 and 28 February 2025.

Based on the results of the inspection, 30-50% of the groundwater wells and 76-90% of soil vapour monitoring points on and surrounding the Site have been destroyed or otherwise damaged by Site activities and remediation, and are no longer suitable for future monitoring.

Based on gauging data collected from 49 accessible groundwater wells, inferred groundwater contours and flow have been generated, noting:

- Groundwater was present between approximately 1 and 6.5 m bgl across the Site, with groundwater contours generally indicating a southerly flow, consistent with previous assessments. Groundwater contours indicated that there was a potential for northerly flow in the Escarpment and Audit Area 4 East, and for inflow from the WWTP to the east of the Site.
- LNAPL was detected in the Precinct South and off-Site to the east, including detections for the first time in MW60 (although this detection may be a false positive due to biological material fouling the interface probe), MW154, and PC13.

It is recommended that:

- Prior to future groundwater or soil vapour sampling, additional groundwater wells or soil vapour monitoring bores are installed at suitable locations to assess and updated available information on:
    - The condition of groundwater entering and leaving the Site.
    - The location and any changes in potential mobility of LNAPL.
    - Soil vapour risks associated with the updated proposed future development of the Site.
    - Any other soil vapour or groundwater data gaps identified in other Site assessments (for example, further assessment requirements identified in the Gateway area following remediation in 2024 [AECOM, 2025]).

    The scope of any replacement activities may be able to be reduced, based on the existing data set and relatively short period before large-scale development of the Site is proposed to commence. Site Environmental Auditor endorsement of such reduction in the soil vapour and groundwater monitoring network should be sought.
- Soil vapour and groundwater monitoring event(s) are recommended to be conducted following repair of the monitoring networks, and should include in their scope:
    - General monitoring to update information on the Site condition, and assess if any changes have occurred which affect the Conceptual Site Model or potential risk pathways from soil vapour or groundwater.
    - Targeted sampling or monitoring to assess potential changes to groundwater flow direction, in particular in the northern portion of the Site or possible inflow of WWTP-impacted water in the vicinity of MW156, and LNAPL presence and potential mobility in the south-east portion of the Site.
    - Targeted sampling for any data gaps or requirements identified in other Site assessments.
- Groundwater wells which are lost, or damaged and not intended to be repaired, should be decommissioned by a licenced driller in accordance with the *Minimum Construction Requirements for Water Bores in Australia* (NUDLC, 2020).

Please contact the undersigned if you have any questions or require any additional information on the contents of this letter.

Yours faithfully

Robert Crowe

Limitations

AECOM Australia Pty Limited (AECOM) has prepared this Report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation, and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract *Macquarie Point Development Project – Proposal to undertake a Site-Wide Soil Vapour Bore and Groundwater Well Inspection and Gauging Event* dated 17 February 2025.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 3 and 25 March 2025, and is based on the conditions encountered and information reviewed at the time of preparation, as referenced within the Report text. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

1.0 Introduction

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of a remediation strategy for the Macquarie Point Site in Hobart, Tasmania (the Site). The location of the Site is shown on **Figure F1**.

1.1 Background

Previous environmental investigations at the Site have identified groundwater contamination in association with historical activities undertaken on-Site. A review and assessment of potential risk posed to off-Site aquatic ecological receptors, from Site-related groundwater impacts, has previously been reported in *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020a) and is summarised in **Section 1.2** below. Based on a weight-of-evidence approach, using the conceptual site model (CSM) and Site data available at the time, it was concluded that groundwater emanating from the Site boundary is unlikely to pose an unacceptable risk to off-Site aquatic ecological receptors at Sullivans Cove and the River Derwent.

The AECOM (2020a) report was issued to the Site Environmental Auditor in 2020. It has since served as a key reference for assessing Site conditions, including guiding Clean Up to the Extent Practicable (CUTEP) determinations and site-suitability assessments across several portions of the Site.

Since the AECOM (2020a) assessment, further investigations and remediation have been undertaken at the Site, and changes have occurred in the Site conditions and proposed development plans. Given the time elapsed, the availability of further data and information, and changes to proposed development, a review has been undertaken to confirm whether the assessment of potential off-site ecological risks and conclusions of the AECOM (2020a) assessment remains applicable and reflective of current conditions. The findings of the review have been documented in this 'Addendum' to the AECOM (2020a) assessment, intended to be read in conjunction with AECOM (2020a).

1.2 Assessment of Potential Off-Site Ecological Impacts (AECOM, 2020a)

The *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020a) was previously prepared to evaluate the potential risk to identified off-Site aquatic ecological receptors from Site-related groundwater impacts. The assessment was based on groundwater data collected until 2019, from a series of GMEs undertaken at and surrounding the Site, between 2015 and 2019 (refer to **Section 3.2** for further details).

The key receptors considered in the AECOM (2020a) assessment were the adjacent marine aquatic ecosystems of the River Derwent and Sullivans Cove, which are the inferred points of discharge of Site groundwater. Terrestrial ecological receptors were not identified as the Site is largely covered in asphalt and concrete hardstand and does not support terrestrial ecology. Significant future terrestrial habitat of high value was also considered unlikely with regards to potential development scenarios within the urban industrial setting.

The AECOM (2020a) assessment considered multiple lines of evidence to assess potential risk posed to off-Site aquatic ecological receptors. Based on the outcomes of the weight-of evidence assessment, it was considered that the concentrations of Chemicals of Potential Ecological Concern (CoPEC) in groundwater beneath the Site are unlikely to pose an unacceptable risk to off-Site aquatic ecological receptors at the inferred points of discharge, on the basis that:

- The assessed adjacent aquatic habitats are artificial, of low ecological value and considered to be 'highly disturbed' environments.
- Concentrations of CoPEC were below adopted screening levels near Sullivans Cove and the River Derwent, and were likely to attenuate further prior to discharge into these areas, or were associated with background conditions.
- Hydrocarbon fingerprinting of an LNAPL sample collected from within Plume B suggested that the LNAPL is dominantly composed of weathered diesel and lube oil. No new sources of LNAPL were

identified. The plume was likely to be relatively stable, and no significant TRH-signature was evident downgradient near the receiving environment at Sullivans Cove.

- A mixing zone indicating estuarine/saline water interaction noted near Sullivans Cove is likely to result in the reduction of groundwater concentrations of key CoPEC prior to the point of discharge into the receiving environments.
- The Hobart Rivulet concrete walls are understood to extend below the groundwater level beneath the Site and may act as a barrier to groundwater flow in the direction of the point of discharge to River Derwent.
- Groundwater was inferred to predominately discharge through cracks and protrusions in the seawalls. No obvious groundwater seepage through the concrete seawall[1] was noted near Sullivans Cove or the River Derwent during low tide inspections as part of the assessment.

In summary, based on the weight of evidence approach, which considered concentrations of CoPEC, composition and stability of LNAPL impacts, and interaction between groundwater and seawater, including the effects of subsurface infrastructure and seawalls, it was concluded that groundwater emanating from the Site boundary is unlikely to pose an unacceptable risk to off-Site aquatic ecological receptors at Sullivans Cove and the River Derwent.

Notwithstanding the outcomes of the AECOM (2020a) assessment, NAPL remains in parts of the Site subsurface which have been subject to remediation to the extent practicable to mitigate potential future risks. Further details regarding the status of the NAPL areas, and their potential to impact off-Site aquatic ecological receptors are discussed in **Section 2.6**.

The *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020a) was conducted based on Site conditions and data available at the time. Current Site conditions and updated data have been considered in this 'Addendum' to the AECOM (2020a) assessment.

1.3 Objectives and Scope of Work

The objective of this Addendum is to evaluate whether current Site conditions and new information since the AECOM (2020a) assessment indicate a material change in the off-Site aquatic ecological risk profile, and to confirm if the assumptions and outcomes remain valid.

The following scope of work has been undertaken to address the objective:

- Review and incorporation of further Site data and information available since the AECOM (2020a) assessment, including the following considerations:
  - Review the CSM to consider changes in current or proposed future land use, and changes to subsurface utilities alignments, for possible changes in risk pathways.
  - Review the appropriate ecosystem classification and associated species protection level to apply to the receiving environment.
  - Incorporate additional groundwater data collected between 2022 and 2025, including per- and poly-fluoroalkyl substances (PFAS), which were not assessed in 2020.
  - To include assessment of Regatta Point, which was not part of the Site in 2020.
  - To discuss the impact of remediation work completed at the Site since 2020 on the ecological risk profile.
- Review the assumptions and outcomes of the AECOM (2020a) assessment in the context of the updated information, to determine whether they remain applicable, and identify material changes in the off-Site aquatic ecological risk profile of the Site associated with Site-related groundwater impacts.

[1] The term 'seawall' is used in a broad sense to describe a range of shoreline protection structures, including vertical concrete walls and rock revetment walls. This terminology aligns with usage in the AECOM (2020a) assessment.

The Addendum includes summary text, tables and figures to incorporate the new data and confirm whether the conclusions of the AECOM (2020a) assessment remain valid and representative of the risk profile at the Site.

This Addendum is to be read in conjunction with AECOM (2020a). The outcomes of this Addendum will be used to inform subsequent assessments of the Site, including CUTEP and Site-suitability determinations by the Site Environmental Auditor.

2.0 Site Details and CSM Review

General contextual and historical information relating to the Site and the surrounding off-Site area has been documented in several previous reports, including in the AECOM (2020a) report, and most recently in *Soil, Groundwater and Soil Vapour Investigation 2025* (AECOM, 2025a). As this information remains applicable, it is not reiterated in this Addendum, except where changes have occurred or new information is available that are directly relevant to the assessment of potential off-Site aquatic ecological risks, or are materially relevant to the CSM.

2.1 Site Layout and Land Use

The Site remains a mixed-use zone, subject to a combination of commercial/industrial and open space uses. Although current Site use has not changed significantly since 2020, the following key changes in Site layout and surrounding land use have been identified:

- **Site layout:** The current Site layout is presented on **Figure F2** of the **Figures** section, with the following changes noted since issue of AECOM (2020a):
  - The Corporation is in the process of modifying the title of the Site to include land within Regatta Point, while excluding a portion of land within Audit Area 4 East:
    - Regatta Point, which is located to the northeast of the Site, adjacent to River Derwent, is currently under Crown lease and in the process of being transferred to the control of the Corporation. It is planned to be incorporated into the Macquarie Point Environmental Audit, noting soil and groundwater assessments have recently been undertaken in this area (AECOM, 2025f). Regatta Point was not considered in the AECOM (2020a) assessment. While it is located closer to key aquatic receptors, it has a relatively less intensive history of contaminating land uses compared to other portions of the Site, and the types of Chemicals of Potential Concern (CoPC)[2] are comparable to those observed elsewhere on the Site.
    - The northern portion of Audit Area 4 East is planned to be transferred to the Tasmanian Department of State Growth. Its future exclusion from the Site boundary is not expected to affect the assessment of potential off-Site risks. Groundwater data from this area remain relevant to the assessment as it has historically been associated with the Site.
  - The Site sub-areas utilised for environmental assessment have been modified since the issue of AECOM (2020a), with the relationship between the areas used summarised on **Table 1** below. Current assessment area boundaries are shown on **Figure F2**.

Table 1 Relationship between Current Assessment Areas and Former Audit Areas

Current Assessment Area ID	Former Audit Area ID
The Goods Shed and Yard	Audit Area 1
The Escarpment (Audit Area 4 West)	The western portion of Audit Area 4 and the northern portion of Audit Area 2
The Promenade and Underground Carpark (Lot E and UGC)	The southern portion Audit Area 2, and the northeastern portion of Audit Area 5
The Precinct North (Lot B)	Audit Area 7, the eastern portion of Audit Area 2, and the northeastern portion of Audit Area 5
The Precinct South	Audit Area 3 and the southeastern portion of Audit Area 5
The Gateway	Audit Area 6 and the southwestern portion of Audit Area 5
Audit Area 4 East	The eastern portion of Audit Area 4
Regatta Point	Not previously included in Audit Areas.

[2] In this Addendum, the term 'CoPC'(Chemicals of Potential Concern) is used to refer to the broad range of chemicals associated with the Site. The term "CoPEC" (Chemicals of Potential Ecological Concern) is only applied where Tier 1 ecological screening indicates exceedances of relevant screening guidelines.

- **Site surface and elevations:** Remediation and resurfacing works since 2020 have altered surface conditions. Additional bulk earthworks and re-levelling are planned, to support the proposed stadium development (refer **Section 2.2**), which will significantly change Site surface elevation and has the potential to decrease the depth to groundwater. These changes are not expected to materially affect the off-Site aquatic ecological risk profile, as groundwater is still likely to discharge to the River Derwent and Sullivans Cove. Furthermore, these excavations may also reduce residual contamination mass in the subsurface, potentially leading to a decrease in groundwater contaminant concentrations over time.
- **Surrounding land use:** a key change in the surrounding land use and infrastructure is that the Macquarie Point Sewage Treatment Plant (STP) located off-Site to the northeast is planned for decommissioning and replacement with a new sewage pumping station (SPS) and emergency storage facility, noting construction of the SPS has commenced. As part of these works, the Hobart Main Pipeline (sewer), which runs beneath the Site, will be decommissioned and removed. A new sewer line is proposed to be installed off-Site to the south beneath Evans Street, and east beneath TasPorts land.

  These infrastructure upgrades could improve water quality in adjacent surface water bodies over time through reduced nutrient loads and improved containment. However, they may also influence groundwater levels and flow patterns. Ongoing groundwater monitoring is recommended for the Site in accordance with the Site Environment Management Plan (SEMP). If future changes in groundwater flow are identified, additional assessment of the potential off-Site ecological impacts should be undertaken based on updated monitoring data at the time.

2.2 Proposed Development Plan

At the time of the AECOM (2020a) assessment, the development plans for the Site comprised a mix of uses including (but not limited to): arts and institutional; retail and commercial; medium to high density residential; recreation/ open space; and transport/ vehicle access.

In September 2022, the Tasmanian Government Department of State Growth announced that the Macquarie Point Site is the preferred location for a future multipurpose stadium. In August 2024, the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024) was released by the Corporation for the redevelopment of the Site, which sets out a mixed-use precinct comprised of interconnected discrete zones, summarised on **Table 2** and presented on **Plate 1**.

Table 2 Precinct Plan - Proposed Development Precincts

Precinct	Land Use
Aboriginal culturally informed zone	Open space
Multipurpose stadium and associated concourse zone	Open space and commercial
Royal Engineers building and land	Open space and commercial
Complementary integrated mixed use zone, including restraints, cafes, hotels, medical facilities and commercial office space	Open space and commercial
Antarctic facilities zone including commercial spaces and connections with the complementary integrated mixed use zone	Commercial and underground car parking
Residential development and public foreshore zone accommodating a variety of tenures and housing opportunities, along with a new public promenade and food and beverage offerings	Medium to high density residential, commercial and open space
A transport corridor and roadway linking Regatta Point to the main areas of the Site	Open space / vehicle traffic / foot traffic
A vegetated area along the northern boundary of the Site, where the escarpment below the Hobart Cenotaph would prevent development or construction	Open space

In addition, subsurface utilities and maintenance activities are anticipated to occur in all Site areas, and excavation and modification of the final surface level across the Site is expected to occur as discussed in **Section 2.1**, which could impact groundwater flow and interactions.

The change in proposed development is unlikely to result in a material change in potential risks to off-Site aquatic ecology, relative to the AECOM (2020a) assessment, on the basis of the following:

- The current proposed development plan and previous visions for the Site both comprise 'mixed-use' scenarios.
- A Site Environment Management Plan (SEMP) or similar is expected to be implemented as part of the development plan to minimise and manage potential risks associated with groundwater and LNAPL.
- As part of the groundwater management plan in the current Site SEMP (AECOM, 2025c), on-going groundwater monitoring is recommended during and following major construction (i.e. upcoming stadium) to assess if changes occur which may affect the overall risk profile.

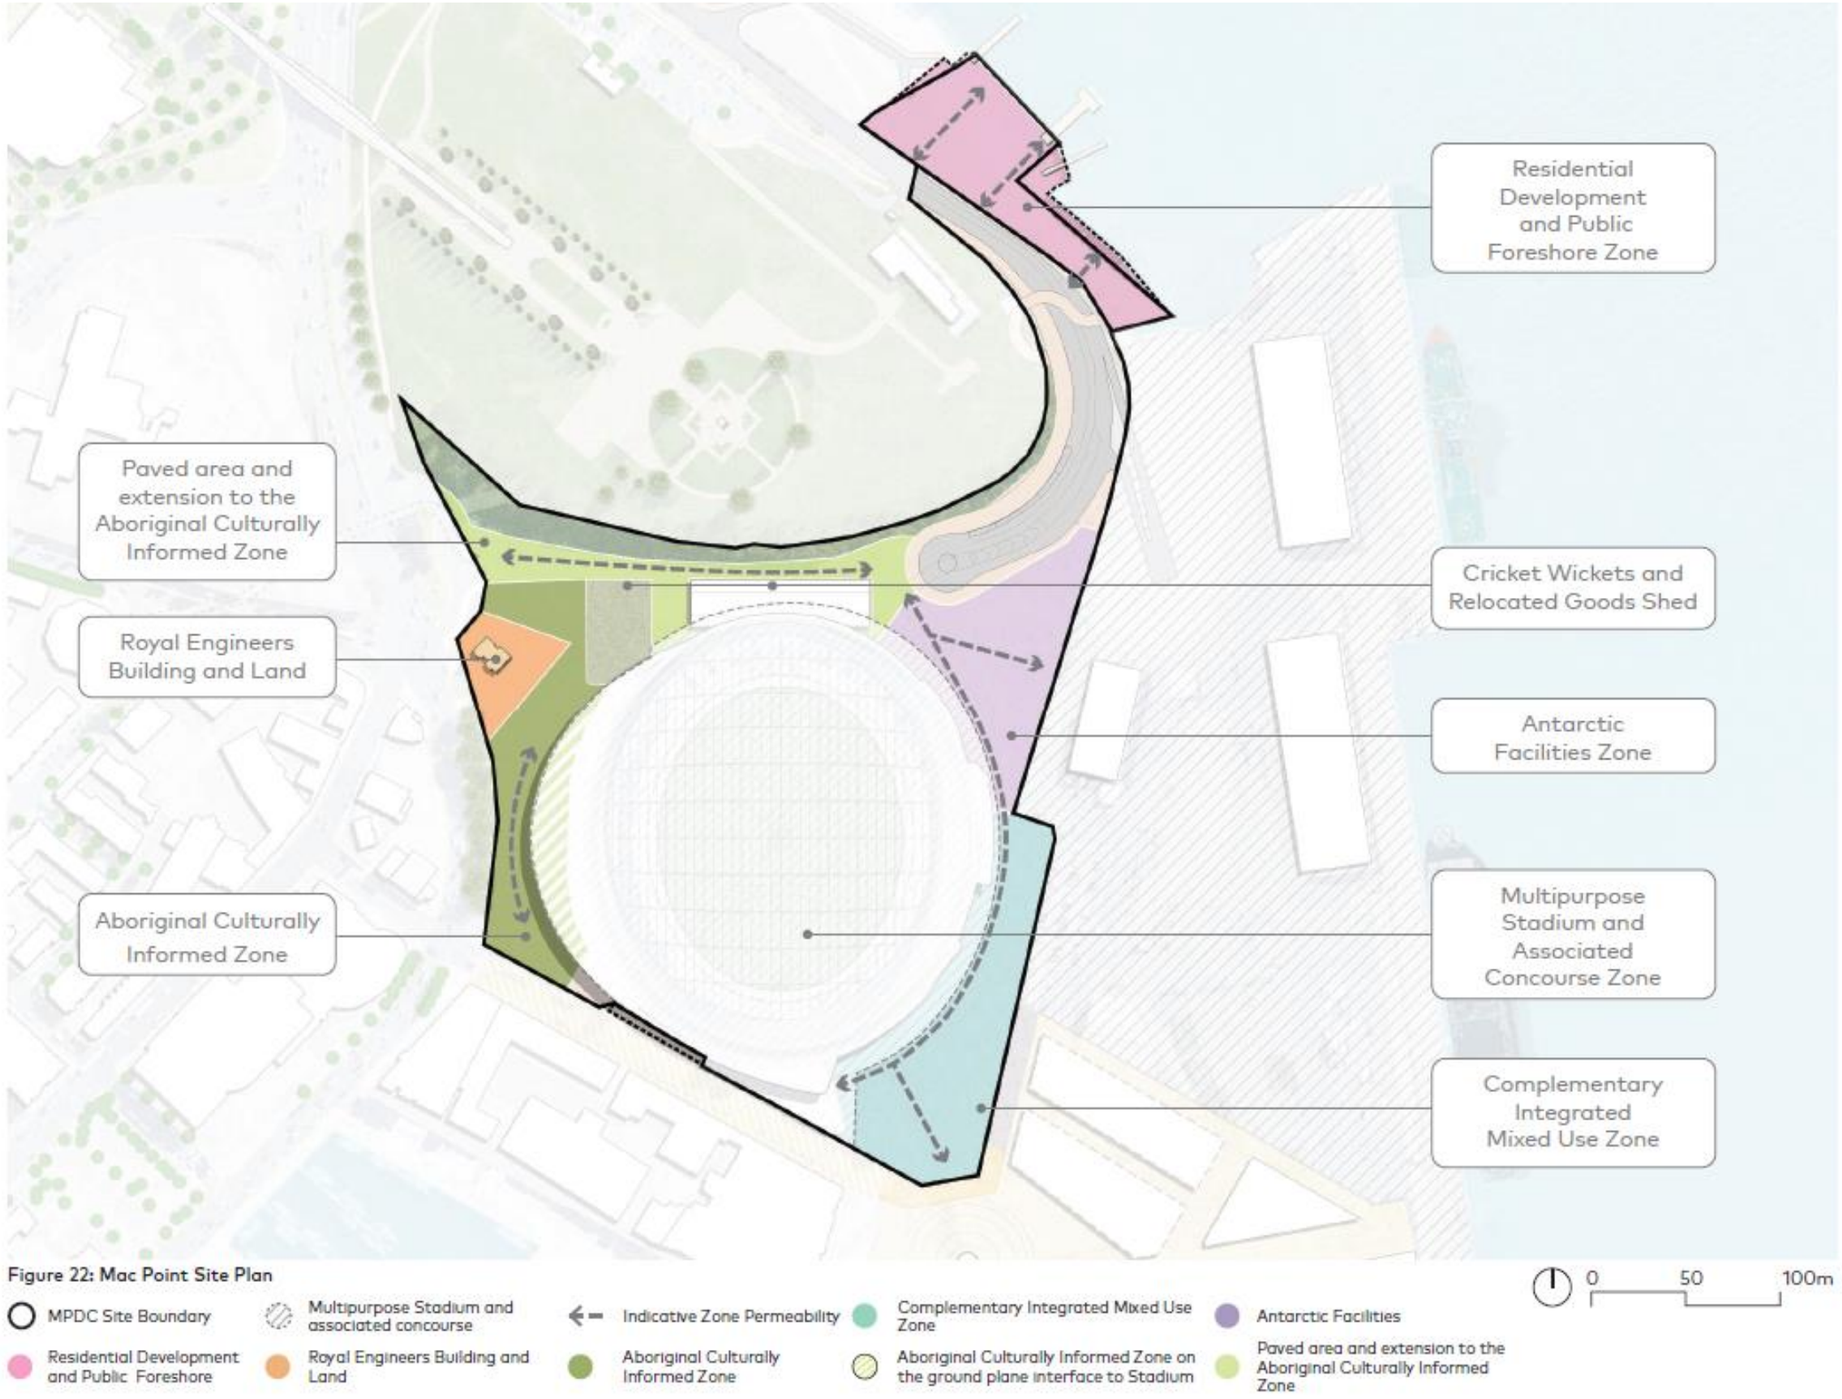

Plate 1 Proposed Future Land Uses (MPDC, 2024)

2.3 Additional Investigations Completed

The following additional investigations have been conducted at the Site since the AECOM (2020a) assessment, which provide updated environmental data and information on Site condition that could influence the understanding of the CSM and the assessment of potential off-Site ecological impacts:

- Targeted GMEs and groundwater gauging conducted at and surrounding the Gateway in December 2022 (AECOM, 2024a) and Precinct South in December 2023 (AECOM, 2024b).
- Installation and sampling of new groundwater monitoring wells at and surrounding Regatta Point in September 2024 (AECOM, 2025f).
- Installation and sampling of new groundwater monitoring wells in June 2025 (AECOM, 2025a) across various portions of the Site to repair damaged wells, replace lost wells, and to address gaps identified in the groundwater monitoring network.
- Investigations of Acid Sulfate Soils (ASS) (AECOM, 2025d).
- Remediation and validation work (refer **Section 2.5**) undertaken at:
  - the Gateway area (AECOM, 2025e), noting a CUTEP report is currently in preparation.
  - the Precinct South area (AECOM, 2024c), including preparation of a CUTEP report (AECOM, 2025g).
  - the Promenade and Underground Carpark (Lot E and Underground Carpark (UGC)) and Precinct North (Lot B) areas (AECOM, 2021d), including preparation of a CUTEP reports (AECOM, 2021a and 2021f).

The scope and details of these investigations are documented in the respective reports and are therefore not reiterated herein, however the outcomes of these investigations have been used in this assessment.

2.4 Geology and Hydrogeology

The local Site-wide geology and hydrogeology have been described in previous reports and are therefore not reiterated herein, however, key updates based on investigations undertaken since the AECOM (2020a) assessment are included below:

- **Acid Sulfate Soils (ASS):** The potential for the presence of ASS at the Site has recently been investigated, noting the Site is mapped as having a low probability (6-70%) of Potential Acid Sulfate Soils (PASS), as indicated on LISTmap's Coastal Acid Sulfate Soils (0 – 20m AHD) layer (DNRET, 2025). The outcomes of the investigation are detailed in *Acid Sulfate Soil Investigations* (AECOM, 2025d), noting no actual ASS (AASS) was detected, however, PASS has been detected in soils in the southern, eastern and central portions of the Site, and will require management if excavated or disturbed.

  PASS contain iron sulfide minerals (e.g. pyrite) that are stable under waterlogged, anaerobic conditions. However, if exposed to oxygen (e.g. through excavation, drainage, or dewatering) they can oxidize and produce sulfuric acid and result in acidified (i.e. lowered pH) conditions. Acidification can mobilise metals, which can subsequently leach into groundwater or discharge to surface water through runoff and cause adverse ecological impacts.

  If PASS are disturbed without appropriate controls, the acidification and increased mobilisation of metals could increase the potential risk to off-Site aquatic ecological receptors. However, the risks can be managed with appropriate controls in accordance with the SEMP (AECOM, 2025c), which requires that Site activities where disturbance of soil is identified must have an Acid Sulfate Soil Management Plan (ASSMP) prepared, with reference to the *Tasmanian Acid Sulfate Soil Management Guidelines* (DPIPWE, 2009). Assuming an ASSMP will be implemented, the presence of PASS is not expected to increase ecological risks.

- **Groundwater elevations, flow and discharge points:** A Site-wide GME was recently undertaken in June 2025 (AECOM, 2025a) during which groundwater was encountered below the Site between 1 to 5 m bgl, noting these are within the range encountered during the previous Site-wide

GMEs undertaken in August and November 2019 (0.7 m bgl to 6 m bgl), which informed the AECOM (2020a) assessment.

Inferred shallow groundwater contours from the June 2025 gauging data are presented on **Figure F4** in the **Figures** section, noting the inferred groundwater flow direction is generally in a south to southeast direction.

Overall groundwater depths, inferred contours and flow directions, are consistent with those considered in the AECOM (2020a) assessment, and the overall discharge points of groundwater are considered to remain the same (i.e. Sullivans Cove and the River Derwent), thus no change to risk profile is indicated, relative to the AECOM (2020a) assessment.

2.5 Remediation Activities Undertaken since AECOM (2020a)

A brief summary of the remediation activities undertaken at the Site since the AECOM (2020a) assessment is provided below. Further details relating to management of excavated material, validation sampling, backfilling of excavations, and reinstatement of surfaces (where relevant) are available in the reports referenced below.

- **At the Gateway** (AECOM, 2025e), remediation and validation activities were undertaken between March 2024 and January 2025, including:
  - Excavation and removal of all known former pipelines and gasworks-related infrastructure and waste, including brick pits containing gasworks waste and former sumps, but excluding dense non-aqueous phase liquid (DNAPL) noted below.
  - Excavation and removal of approximately 1,800 m^3 of soil with either detected exceedances of Site-specific Remediation Criteria (RC), or suspected of contamination based on field indicators such as tar staining, odours, or elevated readings from field monitoring of volatile organic compounds (VOC) and hydrogen cyanide (HCN).
  - Remediation of two DNAPL-impacted areas, referred to as Tar Plumes A and B, via in situ solidification (ISS). Two additional areas, Tar Plumes C and D, remain *in situ* because they could not be treated via ISS due to exclusion zones associated with a high voltage power cable in these areas. Further details are provided in **Section 2.6**.

  A Detailed Site Investigation (DSI) report (AECOM, 2024a) and remediation validation report (AECOM, 2025e) were previously prepared for the Gateway area. The DSI (AECOM, 2024a) is currently being updated to incorporate recent data and a CUTEP assessment, for consideration by the Auditor as part of the Site suitability assessment.
- **At the Precinct South** (AECOM, 2024c), remediation and validation activities were undertaken between December 2022 and June 2023, including:
  - Demolition and removal from the Site of a former warehouse (the SeaRoad Shed). The slab beneath this structure remained on-Site and intact.
  - Removal of approximately 200 m of redundant fuel pipelines (diesel and oil lines), either entirely or to as close to the Site boundary as practicable, with ends sealed in concrete to prevent potential leakage from off-Site pipelines.
  - Excavation of approximately 1,320 m^3 of impacted or potentially impacted soil surrounding the pipelines, and from two known contamination areas:
    - Northern Excavation Area (lead-impacted soil)
    - Former UST Area (hydrocarbon-impacted soil).

  A DSI (AECOM, 2022) and remediation validation report (AECOM, 2024c) were previously prepared for the Precinct South area. A CUTEP report (AECOM, 2025g) has been prepared for consideration by the Auditor for Site suitability assessment, and is currently undergoing update in response to Auditor comments and additional data collected in 2025.
- **In the central, northern and eastern areas of the Site, including portions of the Goods Shed and Yard, the Promenade and Underground Carpark (UGC), the Precinct North, the Precinct**

South, and Audit Area 4 East (AECOM, 2021d and 2021e), remediation and validation activities were undertaken between December 2019 and November 2020, including:

- Excavation and removal from the Site of approximately linear 500 m of former pipelines used for fuel and oil transfer.
- Excavation of approximately 8,500 m^3 of contaminated and potentially contaminated soil. Approximately 535 m^3 of this soil was remediated and reused as backfill on Site, while the remainder was disposed off-Site to landfill.
- Excavation and removal of approximately 210 m^3 of remnant infrastructure and surrounding soil in the Goods Shed Annexe area (the former Mechanics Shed).

DSI reports (AECOM, 2020c, 2020d, 2021c, and 2021b) and CUTEP reports (AECOM, 2021a and 2021f) were previously prepared for the Promenade and Underground Carpark (at the time referred to as Lot E and UGC) and Precinct North (referred to at the time as Lot B), following which a Site Suitability Statement has been issued by the Auditor. A subsequent review of Site suitability has been undertaken in light of the change in proposed development and submitted to the Auditor for review (AECOM, 2025b).

The remediation activities completed are expected to reduce the overall contaminant mass in the subsurface, and interrupt or remove pathways for contaminant migration, particularly toward the receiving environments at the River Derwent and Sullivans Cove. As a result, groundwater contaminant concentrations are anticipated to decline over time, which may correspond to a reduction in potential off-site ecological risks. Therefore, the data used herein are more likely to over-estimate than under-estimate the potential risks to off-Site aquatic ecology.

2.6 Identified NAPL or Former NAPL Areas

Previous investigations at the Site have identified non-aqueous phase liquids (NAPL), consisting of LNAPL and DNAPL. Detailed descriptions of each source area are documented in the recent AECOM (2025a) investigation report and has not been reproduced herein, although the updated status of each source is summarised in **Table 3** below. LNAPL remediation was undertaken between 2015 and 2017, and DNAPL remediation has been undertaken in the former gasworks area (in the Gateway) between 2024 and 2025.

Table 3 Known Existing or Former NAPL Areas

Plume ID	Location	Inferred Contamination Source
LNAPL		
LNAPL Plume A1	Roundhouse Refuelling Area in the Promenade and Underground Carpark, central portion of the Site	Remediation of this LNAPL plume was undertaken between 2015 and 2017 (AECOM, 2021c) via total fluids extraction (TFE). At completion, further recovery of LNAPL from this plume was assessed as not practicable. During the most recent GME and Site-wide gauging round conducted in June and July 2025, LNAPL was not detectable in any wells within or adjacent to LNAPL Plume A1 or A2 (AECOM, 2025a). LNAPL between 42 and 81 mm thick was identified in wells within LNAPL Plume B in the 2025 GME, but was assessed as non-mobile and impracticable to further remediate, based on LNAPL transmissivity testing conducted as part of the GME (AECOM, 2025a).
LNAPL Plume A2		
LNAPL Plume B	SeaRoad Shed Slab in the Precinct South, south-east portion of the Site	

Plume ID	Location	Inferred Contamination Source
Former LNAPL Plume A3	Roundhouse Refuelling Area in the Promenade and Underground Carpark on the boundary with the Precinct North, central portion of the Site	Remediation of this LNAPL plume was undertaken between 2015 and 2017 (AECOM, 2021c) via TFE. At completion, further recovery of LNAPL from this plume was assessed as not practicable. No LNAPL has been detected in wells in this area since 2017, including during the most recent GME in June/July 2025 (AECOM, 2025a).
DNAPL		
Former Tar Plume A	Former gasworks area in the Gateway, south-west corner of the Site	DNAPL within the Site boundaries, excluding areas in the exclusion zone surrounding a high voltage power cable, was solidified in 2024 and is no longer considered mobile (AECOM, 2025e).
Former Tar Plume B	Former gasworks area in the Gateway, south-west corner of the Site	Coal tar DNAPL was observed within a buried vertical tank base. The walls of this tank remained in place and contained DNAPL, which was solidified in 2024 and is no longer considered mobile (AECOM, 2025e).
Tar Plume C	Former gasworks area in the Gateway, west boundary of the Site	DNAPL has been observed between 1.4 and 1.6 m bgl, and is not considered to be in contact with groundwater. The exclusion zone associated with a high voltage power cable prohibits activities which could disturb DNAPL in this area (AECOM, 2025e).
Tar Plume D	Former gasworks area in the Gateway, west boundary of the Site	DNAPL is not considered to be in contact with groundwater in this area, and the exclusion zone associated with a high voltage power cable prohibits activities which could disturb DNAPL in this area (AECOM, 2025e).

Notwithstanding the outcomes of the AECOM (2020a) assessment, NAPL remains in parts of the Site subsurface which have been subject to remediation to the extent practicable to mitigate potential future risks and to meet the requirements of the Site Environmental Audit.

An LNAPL remediation program has been implemented at the Site and it was concluded that clean-up of LNAPL has been conducted to the extent practicable (refer **Section 2.5**) (AECOM, 2021c). Based on recent assessment of LNAPL plumes in 2025 (AECOM, 2025a), measurable LNAPL was observed in LNAPL Plume B wells (at MW03, PW02, and S8) and sheen was reported in MW185 (LNAPL Plume A2) and MW187 (former LNAPL Plume A3). However, no groundwater concentrations indicative of free-phase LNAPL, or soil vapour concentrations indicative of potentially hazardous vapour generation (other than methane) were detected at the LNAPL Plumes, and LNAPL migration is not considered likely to occur. LNAPL is still considered stable, and further remediation is not considered practicable. Based on the AECOM (2020a) assessment and subsequent data collected, no unacceptable risks to ecological receptors associated with the LNAPL plumes have been identified.

DNAPL impacts associated with the former Gasworks remain *in situ* in the Gateway in areas which could not be practicably treated via ISS (refer **Section 2.6**) (AECOM, 2025e). No further remediation actions have been identified. While the remnant DNAPL impacts do not currently appear to have a complete pathway to potential ecological receptors, the potential risk would need to be reassessed if DNAPL was mobilised or disturbed by future development of the Gateway, for example, if foundations for a future building penetrated buried former gasworks infrastructure which was containing DNAPL. It is noted that future buildings are in the vicinity of remnant DNAPL are not current proposed and would be restricted due to the exclusion zone surrounding the high voltage power lines, and that the location and

management procedures to minimise the potential mobilisation of DNAPL are included in AECOM (2025e) and incorporated in the SEMP (AECOM, 2025c).

2.7 Receiving Environment and Level of Protection

The receiving environment and foreshore area adjacent to the Site at River Derwent and Sullivans Cove was classified in the AECOM (2020a) assessment as a 'highly modified' and 'highly disturbed' marine environment with low ecological value. The ecosystem condition was categorised as 'highly disturbed' based on ANZG (2018) definitions, given its proximity to active shipping ports, regular dredging activities, and urban stormwater inputs. Mapping information from the Tasmanian Government ListMap and assessment by the Southern Natural Resource Management (NRM) Region confirm that the shoreline is artificial and impermeable, of a highly modified geomorphic condition, and deemed to be of minimal natural value.

ANZG (2018) guidance indicates application of 80% or 90% species protection levels is appropriate for highly disturbed ecosystems. In the AECOM (2020a) assessment, the 90% species protection level (or 95% for bioaccumulative chemicals) was adopted. No substantial changes to the use or condition of the receiving environment have occurred since the 2020 assessment that would warrant a revision of the ecosystem classification. Therefore, continuing to apply guideline values based on the above-mentioned species protection levels remains appropriate and protective for the current and ongoing ecological context of the receiving environment as a 'highly disturbed' ecosystem.

Sightings[3] of the critically endangered spotted handfish have recently been recorded in the broader Derwent Estuary. These include one observation near Regatta Point (mapping uncertainty suggests proximity to the shoreline) and another east of TasPorts land as illustrated on **Plate 1**, along with a polygon representing a wider estuary area. In the longer-term an improvement in the overall condition of the ecosystem may be desirable to support the presence of these organisms. Such an improvement would require a wholistic approach at a catchment level and, potentially, changes to the human uses of the waterway and would therefore not be a Site management decision. However, to explore whether the risk profile associated with groundwater emanating from the Site would materially change if catchment-wide measures were put in place to improve the ecosystem condition in the longer-term, a sensitivity analysis has been undertaken as part of this Addendum, by screening groundwater data against ANZG (2018) guideline values for a 'slightly-moderately disturbed' habitat (i.e., default guideline values based on 95% species protection, or 99% species protection for bioaccumulative chemicals). The outcomes of this sensitivity analysis are discussed in **Section 3.5**.

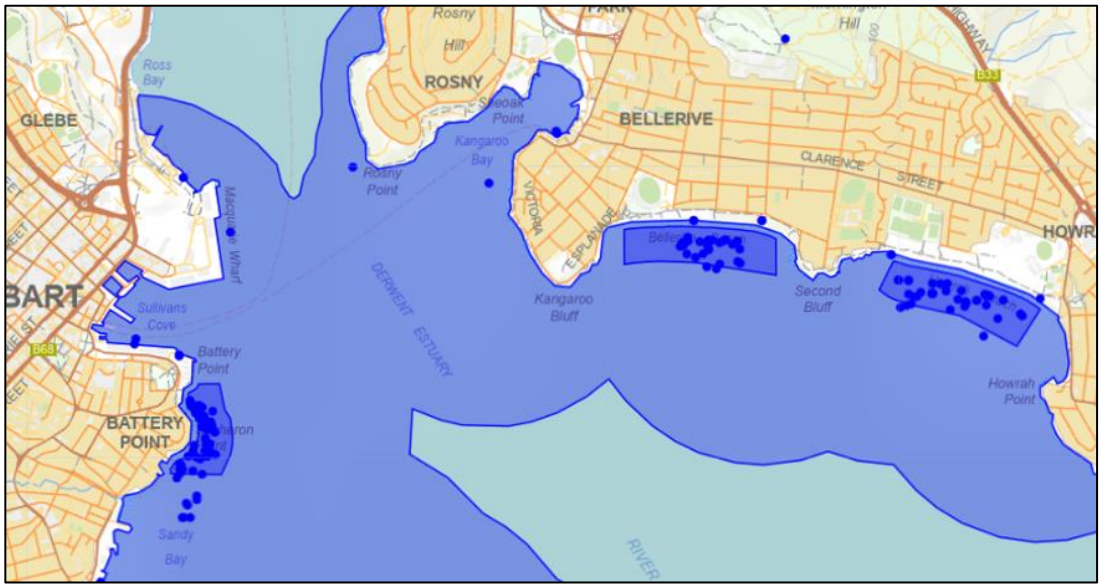

Plate 2 Natural Values Atlas - Species Observations for Spotted Handfish

[3] Natural Values Atlas' species observations, accessed at https://www.naturalvaluesatlas.tas.gov.au/#SpeciesHomePage in July 2025.

2.8 CSM Summary

Based on the review of the updated Site data and information, no substantial changes to the CSM have occurred since the AECOM (2020a) assessment.

The AECOM (2020a) CSM, summarised in **Table 4**, remains applicable to the current Site and off-Site context and is adopted for this Addendum, noting recent remediation works completed and future excavations have the potential to reduce residual contamination mass, potentially lowering groundwater contaminant concentrations and off-Site ecological risks over time.

Table 4 CSM Summary (AECOM, 2020a)

Aspect	Details
Known/ Potential Sources	• Impacted filling materials placed during land reclamation • Historical releases from: - railyard operations - freight handling and storage activities - locomotive maintenance and refuelling activities - fuel storage and transfer infrastructure - concrete batching plant operations - sewer (Main Hobart Pipeline) - the former Hobart Gasworks • Releases from potential existing fuel storage and transfer infrastructure • Releases from current underground sewer infrastructure
Potential Impacted Media	• Soil • Groundwater
Potential Exposure Pathways	Groundwater migration to marine ecological receptors in River Derwent and Sullivans Cove
Potential Ecological Receptors	Aquatic ecosystems in Sullivans Cove to the southeast of the Site, and the River Derwent to the northeast of the Site (refer to **Section 2.7** for further information)

Based on the historical land uses of the Site and the surrounding area, the chemicals that have been previously assessed include metals, inorganics (ammonia, cyanide, nitrate, sulfate), TRHs, PAHs, BTEX, phenolic compounds, OCPs, SVOC, VOC and PFAS.

A review of historical activities undertaken at the Site has previously identified that SVOCs and VOCs may be CoPC associated with land reclamation and freight handling activities. With the exceptions of BTEX, PAH and phenols, previous soil and groundwater analytical results have not identified other SVOCs and VOCs of concern.

AECOM (2020a) reviewed available groundwater data and identified the following CoPC:

- Metals
- Ammonia, cyanide
- TRHs, BTEX
- PAHs
- Phenolic compounds

Review of GMEs conducted since issue of AECOM (2020a) have identified that concentrations of these CoPC may represent potential ecological risks and are considered to require review as part of this Addendum. In addition, since 2020, PFAS has been identified as an additional CoPC which is considered to require assessment for ecological risks.

3.0 Review and Assessment of Potential Impacts

3.1 Assessment Criteria

To enable assessment of potential risks to off-Site aquatic ecology, a Tier 1 screening has been undertaken to identify CoPEC in groundwater that warrant further assessment of potential risk to the receiving marine environment. This initial screening step involves comparing measured chemical concentrations in groundwater against relevant Australian guideline values, specifically those protective of marine species. Tier 1 screening criteria have been adopted from the following sources:

- Default Guideline Values (DGVs) for marine ecosystems as published in the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* (ANZG, 2018), noting:
  - screening against the marine water 90% species protection guidelines (or 95% for bioaccumulative chemicals) is considered sufficiently protective of the current and ongoing 'highly disturbed' ecosystem condition; and
  - screening has also been undertaken against a higher level of protection (95% species protection, or 99% for bioaccumulative chemicals) applicable to 'slightly to moderately disturbed' ecosystems for comparison and sensitivity analysis related to observations of handfish in the vicinity of the Site (refer **Section 2.7** and **Section 3.5**).
- Interim marine ecological water quality guideline values provided in the PFAS National Environmental Management Plan (NEMP) Version 3.0 (HEPA, 2025), noting the 95% species protection level (generally applicable to 'slightly to moderately disturbed systems') has been adopted instead of the 90% species protection level (for 'highly disturbed systems') to account for the bioaccumulative nature of PFAS. For the sensitivity analysis in **Section 3.5**, the 99% species protection level (generally applicable to 'high conservation value systems') has been adopted.
- Where no Australian DGVs were available and concentrations of CoPC have been reported above the laboratory LOR, screening values were sourced from international publications:
  - US EPA (2017) Ambient Water Quality Criteria (chronic – saltwater)
  - US EPA (2006) Region 3 Mid-Atlantic Biological Technical Assistance Group (BTAG) Screening Benchmarks
  - RIVM (2001) Dutch Intervention Values (DIV) for Total Petroleum Hydrocarbons (TPH).

This approach is consistent with the methodology and criteria adopted in the AECOM (2020a) assessment, noting two key updates have been incorporated into this Addendum:

- PFAS compounds have been added to the scope and assessed against the PFAS NEMP (HEPA, 2025) criteria.
- Where DGVs have been revised or newly established under the ANZG (2018) framework since 2020, the updated DGVs have been adopted to align with current guidance.

The adopted Tier 1 screening criteria are presented in **Table T1** (for non-PFAS analytes) and **Table T2** (for PFAS analytes) in the **Tables** section.

3.2 Data Considered

3.2.1 Selection of Representative Data

The data for Tier 1 screening considered in this Addendum include groundwater data collected from 2015 onwards, from across the Site and off-Site areas, from a targeted well-network, rather than considering data from the entire well network associated with the Site. To target the locations considered most relevant to assessing potential off-Site ecological risks, the wells were selected based on a combination of the following criteria:

- Wells near the Site boundary that are considered representative of groundwater concentrations potentially migrating off-Site;
- Wells where groundwater may be likely to interact with or discharge to the surface water bodies;

- Wells situated up-hydraulic gradient of receiving environments;
- Wells located outside of known source zones (e.g. NAPL plumes), but between the source zones and receiving environments.

This focused approach ensures that the screening is aligned with the objective of assessing potential impacts to off-site aquatic ecological receptors, and is consistent with the approach adopted in the AECOM (2020a) assessment. All locations that were included in the AECOM (2020a) assessment were considered in this Addendum, noting the following changes:

- New wells have been installed since 2020, either for investigation of additional areas (i.e. Regatta Point), or to replace lost or destroyed wells, or to address gaps in groundwater monitoring that were identified through previous investigations. Data from these wells have been included herein if they met the above-mentioned criteria.
- At locations where deep and shallow nested pairs of wells existed, only the shallow wells were considered in the AECOM (2020a) assessment. The deep wells have now also been included in the assessment, as it is considered that the Site is underlain by a single aquifer unit, although within multiple lithological units.
- Wells were excluded if they were specifically for delineation of known source zones (i.e. NAPL plumes) or were situated up-hydraulic gradient of source zones, or sufficiently far up-hydraulic gradient of the receiving environments such that they are unlikely to represent groundwater that could discharge off-Site, particularly where more suitable down-gradient wells were available.

Although data exist from prior to 2015, they are not considered to represent current groundwater conditions and therefore have not been considered in this assessment. This is consistent with the approach adopted in the AECOM (2020a) assessment.

The targeted well network considered in this Addendum is presented in **Figure F3**.

The groundwater dataset considered is presented on **Table T1** and **Table T2** in the **Tables** section, including comparison with the adopted Tier 1 screening criteria. Note that while monitoring well MW181 is shown on **Figure F3**, no data groundwater data are available for this location, because it was dry during both GMEs conducted since this well was installed (AECOM, 2025a and 2025f).

3.2.2 Data Quality

Listed below are the previous investigations that pertain to the groundwater data considered in this assessment, noting the complete title for each report is provided in the list of references in **Section 0**:

- January 2015 GME (GHD, 2015a)
- August 2015 GME (AECOM, 2016a)
- July 2016 Site-wide GME (AECOM, 2016b)
- May 2017 Targeted GME (AECOM, 2017a)
- July 2017 Site-wide GME (AECOM, 2018a)
- February 2018 and August 2018 GMEs (AECOM, 2019a)
- August 2019 and November 2019 GMEs 2019 (AECOM, 2020b).
- December 2022 Gateway DSI (AECOM, 2024a)
- December 2023 Precinct South Targeted GME (AECOM, 2024b)
- September 2024 Regatta Point DSI (AECOM, 2025f, in preparation)
- June 2025 Site-wide GME (AECOM, 2025a)

The scope and details of the groundwater investigations undertaken between 2015 – 2025 are detailed in the above-mentioned reports. Data quality assessment and validation have been undertaken and documented in the individual reports, and thus have not been further detailed in this Addendum. The overall quality of the field and analytical data produced is considered to be of an acceptable standard for interpretative use, upon which to draw meaningful conclusions in this Addendum.

3.3 Tier 1 Screening Results - CoPEC

An appraisal of the groundwater dataset (refer **Section 3.2**) has been undertaken to identify CoPEC by screening measured concentrations against the adopted Tier 1 ecological screening criteria (refer **Section 3.1**). The Tier 1 screening results are presented in **Table T1** (for non-PFAS chemicals) and **Table T2** (for PFAS chemicals) in the **Tables** section.

The following chemicals have been identified as CoPEC, based on reported concentrations in one or more groundwater samples exceeding the adopted Tier 1 criteria:

- Metals (aluminium, cadmium, copper, lead, manganese, vanadium, zinc)
- Ammonia (as N), free cyanide, total phosphorus, and pH[4]
- TRH >C10-C40 fraction (sum)
- Monoaromatic hydrocarbons (benzene, ethylbenzene, o-xylene, m&p-xylene, 1,2,4-trimethylbenzene)
- Polycyclic aromatic hydrocarbons (naphthalene, anthracene, phenanthrene, fluoranthene, benzo(a)pyrene)
- 2,4-dimethylphenol
- perfluorooctane sulfonic acid (PFOS).

These CoPEC are consistent with those identified in the 2020 assessment, with the addition of cadmium and PFOS.

Potential risks associated with CoPEC were previously evaluated in AECOM (2020a), based on groundwater concentrations available at the time. **Section 3.4** presents further assessment to evaluate whether the updated groundwater dataset and the additional CoPEC indicate a change in the risk profile to off-Site aquatic receptors.

3.4 CoPEC - Assessment of Potential Risks

A staged approach has been adopted to evaluate whether the updated groundwater dataset indicates a change in the risk profile to off-Site aquatic receptors, and to identify CoPEC that may warrant further ecological consideration, alongside the additional CoPEC (cadmium and PFOS) which are discussed in **Section 3.4.2**.

Stage 1: Screening for increases in groundwater concentrations:

Maximum reported concentrations of each CoPEC for the dataset considered in AECOM (2020a) have been compared with updated maximum concentrations (inclusive of newly collected data) to identify whether there have been material increases in groundwater concentrations, as follows:

- Where the updated maximum is less than or equal to the previous maximum, no increase is noted. In these cases, the previous assessment and conclusions remain valid, and no further evaluation is required.
- Where the updated maximum is greater than the previous maximum, the percentage increase is calculated to determine the significance of the change:
  - If the increase is less than or equal to 20%, it is considered to be within the typical range of field and laboratory measurement uncertainty and not indicative of a material change in risk.
  - If the increase is greater than 20%, the CoPEC and associated data are considered further to assess whether the increase may represent a change in potential ecological risk.

[4] While pH is not a chemical, it has been treated as one for the purpose of assessment of ecological risks.

Stage 2: Further assessment of CoPEC with increased concentrations

For CoPEC with greater than 20% increase in maximum concentrations, additional lines of evidence have been considered to evaluate whether the increase may represent a material change in potential ecological risk, including:

- Spatial context of the monitoring well locations (e.g. proximity to discharge points vs. upgradient locations).
- Chemical-specific properties (e.g. mobility, bioavailability).

3.4.1 Stage 1: Screening for Increases in Groundwater Concentrations

Table 5 presents a comparison of the previous and updated maximum groundwater concentrations reported for each CoPEC.

Table 5 Changes in Maximum Groundwater Concentrations since the AECOM (2020a) Assessment

Analyte	Maximum concentrations reported in groundwater		Have maximum concentrations increased since AECOM (2020a)?	Percent increase (%)
	Previous Maximum (2015 – 2019)	Updated Maximum (2015 – 2025)		
Aluminium (filtered)	1.38 mg/L	1.38 mg/L	No	-
Cadmium (filtered) ^	0.0003 mg/L	0.014 mg/L	No	4,567%
Copper (filtered)	0.034 mg/L	0.076 mg/L	Yes	124%
Lead (filtered)	0.13 mg/L	0.44 mg/L	Yes	238%
Manganese (filtered)	7.27 mg/L	8.49 mg/L	Yes	17%
Vanadium (filtered)	0.2 mg/L	0.2 mg/L	No	-
Zinc (filtered)	0.39 mg/L	1.2 mg/L	Yes	208%
TRH >C10-C40 fraction (sum)	12,200 µg/L	12,200 µg/L	No	-
Benzene	1,080 µg/L	1,080 µg/L	No	-
Ethylbenzene	573 µg/L	573 µg/L	No	-
o-Xylene	425 µg/L	425 µg/L	No	-
m&p-Xylene	137 µg/L	137 µg/L	No	-
1,2,4-trimethylbenzene	96 µg/L	96 µg/L	No	-
Naphthalene	1,170 µg/L	1,170 µg/L	No	-
Anthracene	142 µg/L	142 µg/L	No	-
Phenanthrene	317 µg/L	317 µg/L	No	-
Fluoranthene	254 µg/L	254 µg/L	No	-
Benzo(a)pyrene	98.5 µg/L	98.5 µg/L	No	-
2,4-Dimethylphenol	6.9 µg/L	26 µg/L	Yes	277%
Cyanide (Free)	0.019 mg/L	0.019 mg/L	No	-
Ammonia (as N)	77.5 mg/L	77.5 mg/L	No	-
Total Phosphorus *	1.7 mg/L	1.7 mg/L	No	-
pH (lab-measured) *	11.1 pH Units	11.1 pH Units	No	-
PFOS ^	0.38 µg/L	0.38 µg/L	No	-

Notes: *Dashes indicate no change; ^ Additional CoPEC not previously assessed in the AECOM (2020a) assessment; * While phosphorus is not typically a direct ecological toxicant, and pH is a water quality parameter rather than a toxicant, they have been included herein for consistency with the AECOM (2020a) assessment due to their potential to indirectly influence ecological conditions.*

On the basis of the comparison in **Table 5**:

- No change in maximum groundwater concentrations are reported for the majority of CoPEC, including aluminium, vanadium, TRH >C10–C40, benzene, ethylbenzene, o-xylene, m&p-xylene, 1,2,4-trimethylbenzene, naphthalene, anthracene, phenanthrene, fluoranthene, benzo(a)pyrene, free cyanide, ammonia, total phosphorus and pH. No further assessment is warranted for these CoPEC.
- Manganese showed a minor increase (17%) in maximum groundwater concentrations, which is within the typical range of field and laboratory measurement uncertainty (≤20%) and is not considered significant. The updated maximum was recorded at the same location (MW100) as the previous maximum. No further assessment is warranted for manganese.
- Cadmium, copper, lead, zinc and 2,4-dimethylphenol exhibited notable increases in maximum groundwater concentrations. These CoPEC warrant further assessment – refer to **Section 3.4.2.1**.
- No change in maximum groundwater concentrations is observed for PFOS. However, as PFAS were not included in the AECOM (2020a) assessment, further evaluation is provided in **Section 3.4.2.2** to consider potential ecological risks based on the updated dataset.

3.4.2 Stage 2: Further assessment of Potential Risks

3.4.2.1 CoPEC with Increased Concentrations

For the CoPEC identified in **Section 3.4.1** as warranting further assessment, further discussion is provided below to assess whether the additional data assessed herein may represent a change in potential ecological risk compared to the AECOM (2020a) assessment:

- Cadmium, copper, lead and zinc – Maximum concentrations in groundwater increased markedly for cadmium (by 4,567%) and notably for copper, lead and zinc (ranging from 124% to 238%). These elevated concentrations were recorded at a single monitoring well location, MW180, installed in cobbled fill in the flat carpark area within Regatta Point in September 2024, approximately 25 m up-hydraulic gradient of the River Derwent. Bore logs from MW180 noted the presence of anthropogenic material (brick fragments), indicative of historical fill (AECOM, 2025f). Elevated cadmium was noted in the September 2024 and June 2025 samples. Elevated copper, lead and zinc were noted only in the September 2024 sample (which was collected one week after installation of the well), noting the June 2025 concentrations were significantly lower. It is uncertain whether the September 2024 results from MW180 are representative of groundwater conditions. All other results for these four CoPEC were less than the maximum concentrations assessed in the AECOM (2020a) assessment. Concentrations in samples from co-located well MW178 which is installed in the dolerite were also low. Nearby shallow well MW181 was dry during both September 2024 and June 2025, suggesting that the extent of these elevated metals concentrations in groundwater within the fill is limited.

  Given the results at MW180 are variable and groundwater in the fill appears to be limited, it is not considered conclusive that these concentrations represent an unacceptable risk of harm to aquatic ecology. Given the observed variability, further assessment is recommended as additional data become available and groundwater conditions are better understood.

- 2,4-dimethylphenol – Concentrations of this CoPEC in groundwater exceeding the previous maximum (6.9 µg/L) were reported at two sample locations since 2020:
  - MW132_GHD (same location as the previous maximum) reported a concentration of 19.2 µg/L in December 2022. This increase does not indicate increased risk to off-Site aquatic ecological receptors on the basis of the following:
    - This well is located on Evans Street down-hydraulic gradient of the former Hobart Gasworks area, indicating that detections of this CoPEC are likely to be sourced from gasworks-related wastes. Remediation of tar impacts has since been undertaken via ISS

in the Gateway between 2024 and 2025 (refer **Section 2.5**) up-gradient of MW132_GHD, interrupting pathways for contaminant migration toward the receiving environment at Sullivans Cove. As a result, groundwater contaminant concentrations are anticipated to decline over time, corresponding to a reduction in potential off-site ecological risks. This is demonstrated by the concentration of 2,4-dimethylphenol reported during the most recent June 2025 GME which was <3 µg/L.

  - Concentrations of 2,4-dimethylphenol at wells closest to the inferred points of discharge into Sullivans Cove (MW151, MW152 and MW153) were reported below the laboratory LOR.
  - 2,4-dimethylphenol is readily biodegradable in oxygenated environments, such as groundwater-surface water interfaces. Natural attenuation processes including sorption and biodegradation are likely to reduce concentrations before groundwater discharges to surface water. These processes are expected to further mitigate potential ecological risk.

- MW120A - 26 µg/L (June 2025). Being one of the most up-gradient wells of the Site, concentrations at MW120A are not representative of concentrations likely to be present at the point that groundwater discharges to off-Site surface water and therefore the reported concentration of 2,4-dimethylphenol at this location does not indicate an unacceptable risk to off-Site ecological receptors.

3.4.2.2 PFAS

Based on the PFAS monitoring and Tier 1 screening results presented in **Table T2** in the **Tables** section:

- PFAS have been analysed in 63 groundwater samples from 26 monitoring wells across the Site between 2015 and 2025.
- Perfluorooctanoic acid (PFOA) concentrations range from 0.002 to 0.38 µg/L, with no exceedances of the adopted Tier 1 screening criteria.
- PFOS concentrations range from <0.001 to 0.38 µg/L, noting:
  - Detectable concentrations (0.002 to 0.38 µg/L) were reported in samples from 10 wells (BG1, MW6, MW16, MW60, MW120, MW120A, MW121, MW126A, MW193, MW194). Other wells reported concentrations below the laboratory LORs (<0.001 to <0.01 µg/L)
  - PFOS exceeded the Tier 1 screening value for 95% species protection (0.13 µg/L) at one location - MW16 (0.23 µg/L to 0.38 µg/L), by approximately three times. MW16 is located immediately downgradient of LNAPL Plume B, adjacent to the boundary between the Site and the former Bulk Fuel Terminals.

    At all other locations, detectable PFOS concentrations were below the 95% species protection guideline value.

Exceedance of the Tier 1 screening criterion for PFOS at MW16 does not indicate an unacceptable ecological risk, based on the following lines of evidence:

- PFAS are not known to have been historically used at the Site. A review of historical information has not identified the use of products containing PFAS. There is potential for firefighting foams containing PFAS to have been used at the former Bulk Fuel Terminals, which were located on reclaimed land adjacent to the River Derwent, to the east of the Site, and partially overlapped the eastern portion of the Precinct South, however:
  - It is considered that if use of PFAS-containing foams occurred, as part of emergency response operations or for training purposes, it would have been over a limited timeframe, in the short period between the adoption of PFAS-containing firefighting foam in the USA in 1967, and the cessation of bulk fuel storage in the 1970s.
  - It is not known if a source of PFAS/PFOS associated with the former Bulk Fuel Terminals is present. A review of publicly available information has not identified evidence confirming the use of PFAS-containing foams at the former Bulk Fuel Terminals, nor reference to the use or discharge of such foams on TasPorts land near the Site. The TasPorts (2024) *Port of Hobart*

Environment Report does not identify PFAS among the 'contaminants of concern' detected in soil or groundwater at Macquarie Wharf, and makes no reference to PFAS or PFAS-containing foams in its discussion of 'Significant Environmental Aspects' relating to release of contaminants.

- Should a PFAS/PFOS source exist at the former Bulk Fuel Terminals, it is considered unlikely that substantial volumes would extend or migrate onto the Site, given the limited physical overlap between the footprint of the former Bulk Fuel Terminals and the Site, and the presence of historical sea walls bounding the former terminals to the east and west.

  Historical aerial photographs of bulk fuel storage indicate that the large Aboveground Storage Tanks (ASTs), where any firefighting foam which may have contained PFAS is more likely to have been used, were located outside the Site boundary (see **Plate 3** below).

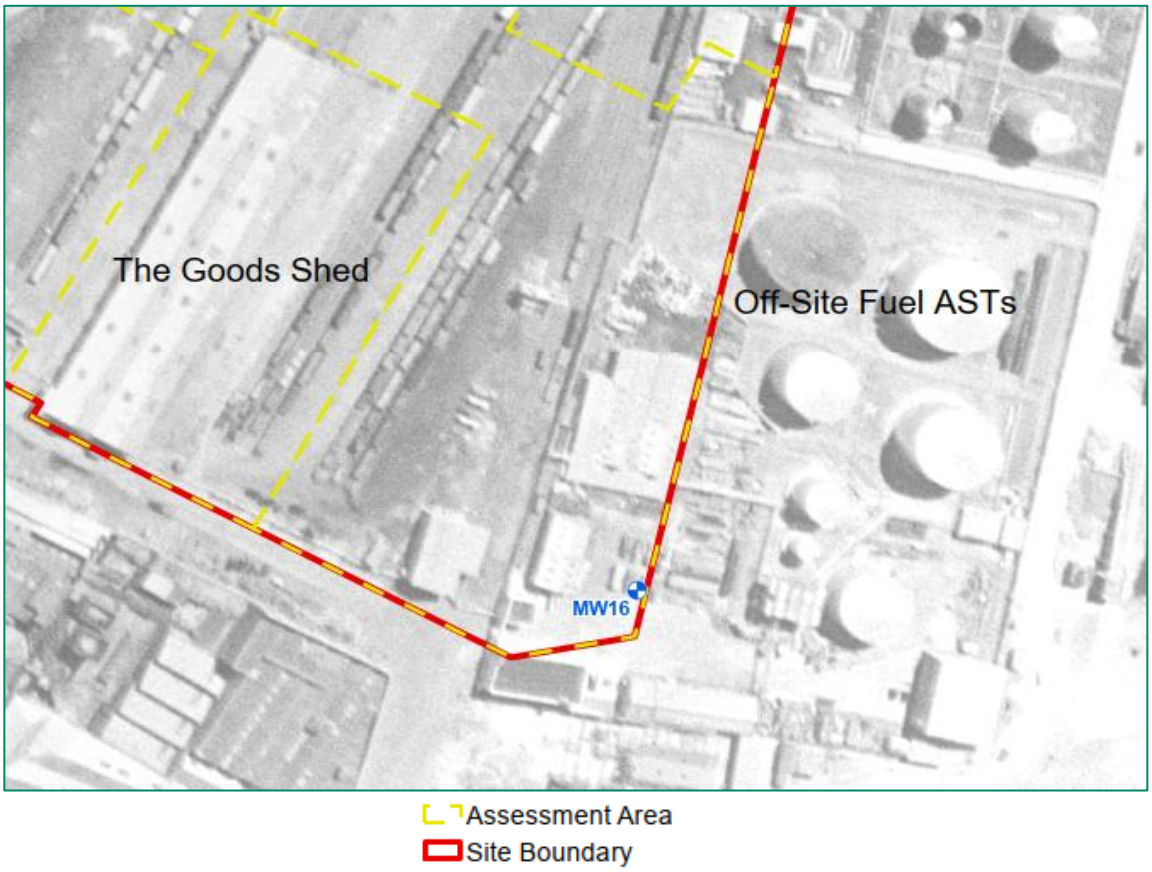

Plate 3 Site Boundary and Historic ASTs (12 February 1957) (AECOM, 2025g)

Thus, any residual PFAS impacts would likely be localised and of limited magnitude, rather than representing a substantial ongoing source of contamination.

- The hydraulic gradient is quite flat across the central and eastern areas of the Site, which can make definition of flow direction difficult on a localised scale. Inferred groundwater contours and flow at the eastern boundary of the Site in the vicinity of MW16 has been inconsistent between monitoring events, and groundwater may pass in either direction across this boundary. While this is not considered to affect the ultimate discharge point of Site groundwater, the Standing Water Level (SWL) of groundwater wells in the vicinity of MW16 has been reviewed to assess if the detection in MW16 represents groundwater entering or leaving the Site.

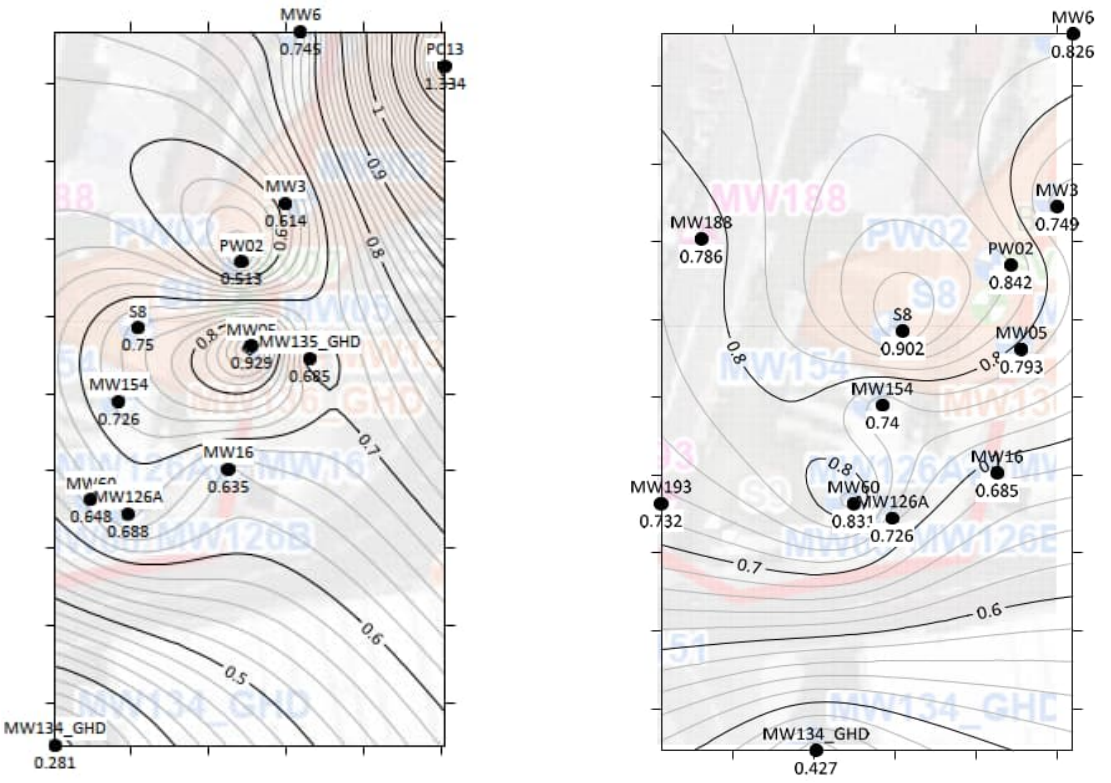
  SWLs recorded during the most recent groundwater gauging events in this area (February 2025 (AECOM, 2025i) and June 2025 (AECOM, 2025a)) are presented on **Table 6** below. Well locations are shown on **Figure F3**.

Table 6 SWLs recorded at and near MW16 in 2025

Well ID	Proximity to MW16		February 2025		June 2025	
	Direction	Approx. Distance (m)	SWL	ΔSWL Relative to MW16	SWL	ΔSWL Relative to MW16
MW16	N/A	N/A	0.635	N/A	0.685	N/A
MW6[1]	North	56	0.745	+0.110	0.826	+0.141
MW05	North	17	0.929[2]	+0.294	0.793[2]	+0.108
PW02	North	26	0.513[2]	-0.122	0.842[2]	+0.157
MW03	North	36	0.614[2]	-0.021	0.749[2]	+0.064
MW188[1]	North-west	48	N/A		0.786	+0.101
MW154	North-west	16	0.726	+0.091	0.74	+0.055
S8	North-west	22	0.750[2]	+0.115	0.902	+0.217
MW60[1]	West	27	0.648	+0.013	0.831	+0.146
MW126A[1]	West	14	0.688	+0.053	0.726	+0.041
MW193[1]	West	42	N/A		0.732	+0.047
MW134_GHD[3]	South	42	0.281	-0.354	0.427	-0.258
PC13[3]	North-east	60	1.334[2]	+0.699	N/A	
MW135_GHD[3]	North-east	16	0.685	+0.050	N/A	

Notes: 1. Groundwater from this well was sampled and analysed for PFAS in 2025; 2. SWL has been corrected for LNAPL present, assuming a specific gravity of 0.76; 3. Off-Site well; A positive ΔSWL indicates groundwater is likely to flow towards MW16 from the well, while a negative indicates that groundwater may flow from MW16 towards the well.

Localised contours around MW16, based on the recorded SWLs during each monitoring event in 2025, are shown on **Plate 4** below.



(a) February 2025 (b) June 2025

Plate 4 Localised Groundwater SWLS and Contours (mAHD) at MW16 in 2025

Based on the most recent two gauging events:

- Groundwater SWL is generally higher to the north, east, west and south of MW16, which include off-Site wells on TasPorts land to the east when monitored.
- Groundwater SWL is significantly lower to the south (in MW134_GHD).

Based on SWL data, it is considered that MW16 is likely to have groundwater input from the north and west (on-Site groundwater) and east (off-Site groundwater). Groundwater is likely to discharge to the south towards MW124_GHD.

- PFOS concentrations in groundwater in excess of the adopted ecological criteria have only been detected at MW16 (up to 0.38 µg/L). Adjacent wells near LNAPL Plume B (MW6, MW60, MW126A, MW188 and MW193) recorded concentrations between 0.002 and 0.012 µg/L. Up-gradient wells (BG1, MW120, MW120A, MW121 and MW194), located approximately 300 m northwest of the plume and considered representative of background or regional groundwater conditions entering the Site, recorded concentrations between 0.014 and 0.03 µg/L.

  PFOS was below LOR in wells NR2, RN2, RN4, S4 (upgradient of LNAPL Plume B), MW123A, MW123B, MW124A, MW124B, MW125A, MW125B, MW126B, MW129, MW188 (cross-gradient), and S9 (down-gradient).

  The PFOS concentration in MW16 are approximately 10-fold greater than those detected in other wells sampled, which are below LOR or similar to the concentrations detected in groundwater entering the Site, suggesting PFOS impacts are localised and have been reasonably delineated on-Site in groundwater surrounding MW16. No groundwater between MW16 and LNAPL Plume B have been sampled for PFOS (noting that there are no wells located in a suitable position to sample), which may be a potential source of PFOS. Based on the PFOS sampling around LNAPL Plume B, where results were below adopted criteria in all locations with the exception of MW16, it is not considered to be a significant source if so.

Off-Site groundwater to the east may also be impacted by PFAS, or be the source of PFOS in MW16 based on inferred groundwater contours. No PFAS sampling data are currently available from off-Site areas within TasPorts land, downgradient of MW16 and LNAPL Plume B. As noted above, if PFOS is present in groundwater located off-Site to east, it is considered likely to be sourced from the historic off-Site uses of that area (i.e., bulk fuel storage) and not to be a result of migration from the Site.

- PFOS exceedance above the 95% species protection level is spatially limited to a single monitoring well (MW16). The magnitude of exceedance is approximately a factor of three, and this within the range of likely attenuation between MW16 and the point of groundwater discharge to the surface water receptor, given that the closest water body is approximately 175 m south-east, and local groundwater has a relatively flat hydraulic gradient.
- The adopted screening value (the PFAS NEMP Version 3.0 interim draft freshwater 95% species protection level) is currently subject to revision and, based on the following, is considered to over-estimate potential risk to the receiving environment:
  - The NEPM Version 3.0 (HEPA, 2025) PFOS screening values are based upon draft screening values published in 2015 by the (former) Department of the Environment and Energy (DoEE, 2015). ANZG (2023) published, for public consultation, revised draft PFOS screening values which incorporate updated scientific data, and the revised draft freshwater 95% species protection level was 0.48 µg/L, indicating that the DoEE (2015) screening value was overly conservative. ANZG subsequently commissioned an independent review (Dawson et al., 2024) of issues raised in public responses to the revised draft PFOS guidelines (ANZG, 2023). This review made several recommendations to be implemented in re-deriving the draft DGVs in order to generate a more reliable species sensitivity distribution (SSD) model, which underpins the guideline values. These recommendations included:
    - removal of some toxicological datapoints,
    - confirmation of some toxicological datapoints as reliable, and
    - re-calculation of other toxicological datapoints.
  - The DoEE (2015) values were calculated using the Burrlioz software which is no longer recommended for use in Australia. In 2025, ANZG recommended that the Shiny ssdtools software be used for the derivation of guideline values in Australia going forward as it employs a technique called model averaging whereas Burrlioz only applied a single model to the data regardless of the goodness of fit. The Shiny ssdtools software therefore provides a technically more defensible estimation of the species sensitivity distribution.
  - AECOM (2025h) presented at the Ecoforum 2025 conference that implementing the recommendations of Dawson et al. (2024) using the Shiny ssdtools software resulted in a recalculated freshwater 95% species protection level of 3.7 ug/L. The work presented by AECOM was subject to independent peer review by an auditor accredited by the Queensland regulatory authority.
  - Although the ANZG default guideline is currently still under revision, the ANZG (2023) revised draft guidelines combined with the work presented by AECOM (2025h) indicates that the PFOS concentrations reported at the Site are unlikely to pose harm to aquatic ecology in the ‘highly disturbed’ receiving environment.
  - The adopted screening value is based on toxicity of PFOS to freshwater species, but research indicates that PFAS pose lower risk to aquatic ecology in marine environments compared to freshwater. For fish, marine species tend to show lower PFAS accumulation than freshwater fish (Taylor et al, 2021; Barbo et al, 2023). There is also evidence to indicate marine organisms are significantly less sensitive to PFOS than freshwater organisms. Simpson et al (2021) derived PFOS screening criteria for marine receptors with a 99% species protection level of 6 µg/L.

Considering the nature and extent of PFOS in groundwater, the characteristics of the receiving environment, the absence of a known PFAS source at the Site of former Bulk Fuel Terminals, and conservatism in the adopted screening criterion, the PFOS exceedance does not indicate an

unacceptable risk to off-Site aquatic ecological receptors. PFOS remains a CoPEC due to its persistence and bioaccumulation potential; however, the available evidence does not indicate an unacceptable ecological risk.

3.5 Sensitivity analysis

The receiving environment adjacent to the Site (Sullivans Cove and the River Derwent) is classified as a 'highly disturbed' marine ecosystem (refer **Section 2.7**) with low ecological value, based on ANZG (2018) definitions. Accordingly, a 90% species protection level (or 95% for bioaccumulative chemicals) was adopted for Tier 1 screening of CoPC. This is considered appropriate and sufficiently protective for the ecological context of the receiving environment.

To explore whether the risk profile associated with groundwater emanating from the Site would materially change if catchment-wide measures were put in place to improve the ecosystem condition in the longer-term, a sensitivity analysis has been undertaken by screening groundwater data against screening criteria commensurate to a slightly-moderately disturbed system, i.e. 95% species protection level (or 99% for bioaccumulative chemicals). Comparative screening results are presented in **Table T1** and **Table T2** in the **Tables** section.

3.5.1 Results – Non-PFAS

Under the increased species protection level for a slightly-moderately disturbed habitat, three additional CoPEC would be identified, in addition to those in **Section 3.3**:

- Chromium - Exceedances are noted at MW123A (June 2025) and MW180 (September 2024), noting:
  - Exceedances are isolated, with limited spatial extent.
  - At MW123A, only one sample collected over a 10 year period exceeded the screening value, therefore this result does not appear to be representative of typical groundwater conditions in this area. Moreover, exceedances are not noted at the nested deep well MW123B and nearby down-gradient wells MW130_GHD, MW131_GHD and MW132_GHD, which are more representative of groundwater conditions at the point of discharge to surface water.
  - As discussed in **Section 3.4.2.1**, the results at MW180 are variable and groundwater in the fill appears to be limited. It is uncertain whether the September 2024 results from MW180 are representative of groundwater conditions. Thus, it is not considered conclusive that the concentrations reported represent an unacceptable risk of harm to aquatic ecology. Further assessment can be undertaken as additional data become available and groundwater conditions are better understood.
- Cobalt – Exceedances (by up to six times the 95% species protection level) observed at several groundwater monitoring locations across the Site. Cobalt concentrations in groundwater may have a natural lithological origin, given the Site is underlain by Jurassic dolerite. Dolerite has been shown to contain trace elements, including cobalt, particularly within iron-rich pyroxene mineral fractions in dolerite sills (Tiller, 1959). Weathering of dolerite and associated minerals can release trace elements into surrounding soils and groundwater, suggesting the cobalt detections in groundwater across the Site may reflect regional lithology and geochemistry of the underlying dolerite, rather than Site-specific contamination.
- o-Xylene and m&p-Xylene – Marginal exceedances are noted at one monitoring location, MW130_GHD in August 2018. Subsequent samples from this well across four GMEs (August 2019, November 2019, December 2022 and June 2025) reported o-xylene concentrations below the adopted screening value, while m&p-xylene concentrations remain above the criteria, noting a level of uncertainty associated with the criteria, i.e. low-reliability freshwater criteria for o-xylene (in the absence of marine criteria) and unknown-reliability marine criteria for m&p-xylene.

Therefore, the inclusion of chromium, cobalt, o-xylene and m&p-xylene as CoPEC does not materially change the risk profile.

3.5.2 Results – PFAS (PFOS)

Under the increased species protection level for a slightly-moderately disturbed habitat:

- PFOA concentrations did not exceed the 99% interim marine guideline value.
- All detectable PFOS concentrations exceed the 99% species protection level interim marine guideline value of 0.00023 µg/L. For non-detect results, laboratory LORs above the 99% interim marine guideline value prevent definitive screening, noting these were predominantly for 2015 – 2017 groundwater data. The interim screening values are currently subject to revision by ANZG, following a period of public consultation on revised draft guideline values published by ANZG in 2023. As discussed in as discussed in **Section 3.4.2.2** the adopted freshwater criterion of 0.00023 µg/L is likely overly-stringent because it was based on data and modelling methods that have been superseded and because research indicates that PFAS are likely to have lower toxicity in marine environments compared to freshwater.

Although all samples may exceed the interim guideline value for 99% species protection, this does not necessarily indicate an unacceptable ecological risk, based on the following:

- The limited spatial extent of exceedances of the 95% protection level and the low likelihood of PFAS sources having been used at the Site indicate there is unlikely to be a significant source mass which could migrate to the off-Site waterways over time.
- As discussed in **Section 3.4.2.2** , except for MW16 where PFOS impacts are elevated (but localised and delineated), PFOS concentrations in all other samples were either below LOR or similar to the concentrations detected in groundwater entering the Site, indicating no distinct source.
- The adopted 99% species protection level is an interim value currently subject to review/revision, and likely to be overly-stringent such that exceedances do not necessarily represent an unacceptable risk of harm to aquatic ecology off-Site.

3.5.3 Summary

The sensitivity analysis demonstrates that the overall risk conclusions would not materially change if the condition of the off-Site receiving environment was improved over time to become consistent with a ‘slightly-moderately disturbed’ habitat, for which a higher level of species protection would be desirable. While additional CoPEC would be identified under these criteria, available evidence indicates that risk to off-Site aquatic ecological receptors remains low.

4.0 Conclusions

The AECOM (2020a) *Assessment of Potential Off-Site Ecological Impacts* concluded, based on a weight-of-evidence approach using the conceptual site model (CSM) and Site data available at the time, that groundwater emanating from the Site boundary is unlikely to pose an unacceptable risk to off-Site aquatic ecological receptors at Sullivans Cove and the River Derwent.

This Addendum has been prepared to review and assess whether the assumptions and outcomes of AECOM (2020a) remain applicable, based on the current environmental condition of the Site and additional information that has become available since the 2020 assessment. The review incorporated updated Site setting, changes to the proposed development plans, updated Site data, recent remediation activities, as well as additional ecological considerations relevant to the receiving environment.

A review of the Site's CSM based on updated data and information confirmed that there have been no substantial changes since the AECOM (2020a) assessment that would influence the off-Site ecological risk profile. This conclusion is based on the following:

- The current and proposed changes in Site layout, setting and development plans since the AECOM (2020a) assessment, including modification of Site title and boundaries, resurfacing works, planned re-levelling of the Site and proposed stadium development, and infrastructure upgrades at and surrounding the Site, are unlikely to adversely impact off-Site aquatic ecological receptors. Development works may influence groundwater levels and flow patterns. Ongoing groundwater monitoring is recommended for the Site in accordance with the SEMP. If future changes in groundwater flow are identified, additional assessment of the potential off-site ecological impacts should be undertaken based on updated monitoring data at the time.
- Recent investigations confirmed the presence of PASS in estuarine soils across parts of the Site, although no AASS were identified. Disturbance of PASS without appropriate management could lead to acidification and increased mobilisation of metals, increasing the potential risk to off-Site aquatic ecological receptors. However, implementation of an ASSMP in accordance with the SEMP is expected to mitigate this risk.
- Groundwater levels, inferred flow directions and discharge points remain consistent with those considered in the AECOM (2020a) assessment. Groundwater has been encountered below the Site between 1 and 5 m bgl, and continues to flow generally in a south to southeast direction, discharging to Sullivans Cove and the River Derwent.
- Targeted remediation and validation works have been completed across multiple areas of the Site since 2020 and involved the removal of contaminated soils and infrastructure, and ISS of DNAPL impacts. The remediation activities completed are expected to reduce the overall mobile contaminant mass and disrupt potential pathways for contaminant migration toward Sullivans Cove and the River Derwent. As a result, groundwater contaminant concentrations are expected to decline over time, and the data used herein are more likely to over-estimate than under-estimate the potential risks to off-Site aquatic ecology.
- NAPL remains in parts of the Site subsurface which have been subject to remediation to the extent practicable, noting:
    - LNAPL plumes are considered stable, with no evidence of free-phase LNAPL or unacceptable vapour risks, and no indication of ongoing migration or unacceptable risk to off-Site ecological receptors.
    - DNAPL in the Gateway has been treated via ISS where practicable. In untreated areas, DNAPL is not in contact with groundwater and no complete pathway to ecological receptors is currently identified. Future disturbance would require appropriate management, and potential risks would need to be reassessed if DNAPL was mobilised or disturbed by future development of the Gateway.
- The receiving environment remains classified as a 'highly disturbed' marine ecosystem. The adopted 90% species protection level (or 95% for bioaccumulative chemicals) remains appropriate and protective for the current and ongoing ecological context of the receiving environment.

Following confirmation that no substantial changes to the CSM have occurred, a Tier 1 screening and further assessment were undertaken to evaluate the ecological risk profile taking into consideration the updated groundwater conditions. The following conclusions are noted:

- The CoPEC based on Tier 1 screening remain consistent with the 2020 assessment, with the addition of cadmium and PFOS.
- The majority of CoPEC showed no change or only minor increases (≤20%) in groundwater concentrations compared to the 2020 assessment, confirming the previous assessment and conclusions remain valid with no further evaluation required for those CoPEC. Maximum groundwater concentrations increased notably (>20%) for cadmium, copper, lead, zinc, and 2,4-dimethylphenol. Based on multiple lines of evidence, these increases do not indicate a change in risk to off-Site aquatic ecological receptors:
    - Cadmium, Copper, Lead, Zinc: Elevated concentrations were observed at MW180 in groundwater within historical fill. Analytical results were variable at this location and the reported maximum concentrations may not be representative of typical groundwater conditions in this area. Given the results at MW180 are variable and groundwater in the fill appears to be limited, it is not considered conclusive that these concentrations represent an unacceptable risk of harm to aquatic ecology. Given the observed variability, further assessment is recommended as additional data become available and groundwater conditions are better understood.
    - 2,4-Dimethylphenol: Elevated concentration was observed at MW132_GHD (December 2022), however, Gateway remediation works have since been completed. Combined with natural attenuation processes, concentrations are expected to decline over time, with more recent results (June 2025) showing concentrations below the laboratory LOR. The elevated concentration at MW120A (June 2025), being one of the most up-gradient wells of the Site, is unlikely to be representative of concentrations discharging off-Site.
- Concentrations of PFOS exceeded the adopted screening criterion at one location (MW16), with concentrations about 10 times higher than other wells, which were either below detection or similar to background levels. Impacts are localised and delineated around MW16. Considering the nature and extent of PFOS in groundwater, the characteristics of the receiving environment, the absence of a known PFAS source at the Site of former Bulk Fuel Terminals, and the conservatism in the adopted screening values, PFOS is not considered to pose an unacceptable ecological risk.

A sensitivity analysis demonstrated that the overall risk conclusions would not materially change if the condition of the off-Site receiving environment was improved over time to become consistent with a ‘slightly-moderately disturbed’ habitat, for which a higher level of species protection would be desirable.

Overall, based on the review of updated Site data and information, the outcomes of the AECOM (2020a) assessment remain valid and suitable for ongoing assessment of the Site. No material changes in the off-Site aquatic ecological risk profile have been identified, and risk to ecological receptors in the River Derwent and Sullivans Cove remains low.

This Addendum is to be read in conjunction with AECOM (2020a). The outcomes of this Addendum will be used to inform subsequent assessments of the Site, including CUTEP and Site-suitability determinations by the Site Environmental Auditor.

Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation, and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract *Macquarie Point Development Project – Proposal Addendums and Report Updates* dated 18 August 2025.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 15-Sep-2025 and 18-Dec-2025 and is based on the available Site data as referenced in the Report at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

Comments and Footnotes

#1 Very high reliability
#2 High reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
#3 Guideline value for Cr(VI)
#4 Very high reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
#5 Low reliability
#6 High reliability
#7 Low reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
#8 Very high reliability
#9 Moderate reliability
#10 Moderate reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
#11 Unknown reliability
#12 Moderate reliability. Ammonia as total ammonia, measured as [NH3-N] at pH 8.
#13 Low reliability. DGV may not protect key test species from acute (and chronic) toxicity. Check toxicant DGV technical brief for spread of data and its significance. This DGV is greater than the value for acute toxicity (Warne et al., 2018).
#14 Very Low reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
#15 Unknown reliability. DGV may not protect key test species from chronic toxicity. Check toxicant DGV technical brief and Read the detail, below, for spread of data and its significance.
#16 High reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species).
#17 Very high reliability. Recommended for application to slightly-to-moderately disturbed ecosystems.
#18 Low reliability. Recommended for application for slightly to moderately disturbed ecosystems.
#19 Very high reliability.Recommended for application for slightly to moderately disturbed ecosystems. However, this DGV may be under-protective for key sensitive species (e.g. bivalve molluscs, cnidarians)
#20 Unknown reliability. Recommended for application for slightly to moderately disturbed ecosystems.
#21 Very Low reliability
#22 High reliability. Recommended for application for slightly to moderately disturbed ecosystems. However, the DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species).
#23 Unknown reliability. To account for the bioaccumulating nature of this toxicant, it is recommended that the 99% species protection level DGV is used for slightly to moderately disturbed systems. Also see General comments.
#24 To account for the bioaccumulating nature of this toxicant, it is recommended that the 99% species protection level DGV is used for slightly to moderately disturbed systems. Refer to Warne et al. (2017) for details.
#25 Unknown LSOP and unknown reliability
#26 Freshwater. Unknown LSOP and unknown reliability
#27 RIVM (2001) Dutch Intervention Value
#28 USEPA (2013) Water Quality Criteria - Aquatic Life (Chronic, Marine)
#29 R3 BTAG Marine Benchmarks
#30 Freshwater. Low reliability
#31 Freshwater. Moderate Reliability. To account for the bioaccumulating nature of this toxicant, it is recommended that the 99% species protection level DGV is used for slightly to moderately disturbed systems. Also see General comments.
#32 Freshwater. Moderate reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
#33 Freshwater. Low reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
#34 Freshwater. Low Reliability. Recommended for application for slightly to moderately disturbed ecosystems (to protect key species from chronic toxicity).
#35 Freshwater. Moderate Reliability. Please refer to comments for TOX LOSP 99%. Also see General comments.
#36 Low Reliability. To account for the bioaccumulating nature of this toxicant, it is recommended that the 99% species protection level DGV is used for slightly to moderately disturbed systems. Also see General comments.
#37 Freshwater. Moderate reliability
#38 Background concentration of Boron typically found in marine water adopted for screening

Table T2 - Groundwater Analytical Results - Tier 1 Screening - PFAS
Assessment of Potential Off-Site Ecological Impacts - 2025 Addendum
Macquarie Point Development Project

1.0 Introduction

1.1 Purpose

This Site Environment Management Plan (SEMP) has been developed by AECOM Australia Pty Ltd (AECOM) on behalf of the Macquarie Point Development Corporation (the Corporation) for implementation at the Macquarie Point site in Hobart, Tasmania (the Site).

The purpose of this SEMP is to identify known areas of contamination on the Site and to provide an overview of appropriate management measures to address potential human health and environmental risks associated with subsurface contamination, and to maintain compliance with relevant environmental management requirements, and related safety management requirements.

The SEMP:

- Documents:
  - The current contamination status of the Site.
  - Environmental management measures (including contaminant management associated with intrusive works such as excavation/disposal of soil, dust and odour control, stormwater and sediment management, noise control and groundwater management).
  - Responsibilities for implementation of the SEMP and for managing identified environmental issues in accordance with the SEMP.
- Defines:
  - Preventative exposure measures for intrusive works (e.g. subsurface excavation) undertaken at the Site.
  - Roles and responsibilities for owner/managers and occupiers/contractors at the Site, or subsections thereof, when undertaking intrusive works.
- Provides a framework for the implementation of measures so that human health and environmental risks to Site users are low and acceptable where the existing preventative exposure barriers and controls remain in place.

All subsurface work and any work that may change the risk profile to receptors on the Site while this SEMP is in place should follow the guidance provided in this SEMP. Maintenance of the SEMP has been identified as a condition of interim Site suitability statements issued as part of the Site Audit (discussed in **Section 1.6**) for management of human health and environmental risks at the Site.

1.2 Applicability

This SEMP applies to the management of contaminated soil, groundwater and soil vapour on the Site. The following parties should be provided with a copy of the SEMP, prior to undertaking any activities which may interact with soil, groundwater or soil vapour:

- Owners or Managers (and delegates) of the Site or subsections of the Site.
- Workers who undertake subsurface work at the Site during which they may be exposed and/or come into contact with contaminated soil and/or groundwater.

It is noted that this SEMP is an active document, which is to be updated as conditions at the Site change (e.g. development changes, changes to the known contamination status, etc.). If activities to be undertaken at the Site are not covered in this SEMP, the Site Owner or Manager, or owner of smaller areas of the Site, should update the SEMP to include those activities.

All future building or structure design must include appropriate environmental management mitigations as specified by the SEMP. If any design variance is proposed as part of Site development, which does not comply with the current wording, it must not be implemented or constructed on-Site unless:

- It has been assessed by a suitably qualified and experienced environmental professional, who has determined that any environmental risks presented by the action or design can be safely managed and does not represent an unacceptable level of risk to human or ecological receptors on- or off-Site; and
- This assessment has been reviewed and verified by a suitably qualified and experienced Contaminated Land Auditor.

A record of the proposed design variance, and verification by a Contaminated Land Auditor, must be maintained by the person responsible for the SEMP (i.e., the Site owner or occupier, or their designated delegate, as defined on **Table 1**), and communicated by them to any contractors or other workers who are undertaking Site activities which may be affected by the design variance.

Within three months of the approval of any design variance by a suitably qualified and experienced Contaminated Land Auditor, the SEMP must be re-issued by the Site owner/occupier (or their designated delegate), with either:

- The record of design variance and Contaminated Land Auditor review and approval added to **Appendix K**; or
- Update of the body text of the SEMP, reviewed and approved by a Contaminated Land Auditor as described in **Section 5.4**.

A description of any design variance, or general changes to the SEMP, must be added to **Appendix K** as part of the update.

Alternatively, should the requirement for a more specific application be determined, a Construction Environment Management Plan (CEMP) may be required which specifically addresses the proposed tasks and a framework to mitigate potential environmental impacts posed by the activities to be undertaken.

If a sale or division of areas at the Site occurs in the future, owners of subdivisions at the Site should communicate changes to owners of other Site subdivisions or develop their own SEMP specific to the subdivision in question. A distribution list is provided in **Appendix B** for tracking the transfer of the SEMP, or copied thereof, if subdivision occurs.

Any significant amendment to this SEMP, such as a change in land use, or changes as part of an Environmental Audit, should be reviewed and verified by a suitably qualified and experienced Contaminated Land Auditor prior to implementation, including by new owners/occupiers if subdivisions occur in the future. Minor changes or reviews should be conducted by a suitably qualified and experienced environmental professional.

1.3 Training and Induction

The appropriate Site representative (i.e. the Owner, Manager or delegates) is to ensure the health, safety and environment (HSE) requirements outlined in this SEMP are met during works. The SEMP should be available to all persons conducting work which may involve contact or disturbance of Site soil or groundwater, and the information about environmental impacts and management requirements in the SEMP incorporated into health and safety documentation for such work.

All persons conducting subsurface work on the Site, including but not limited to Site occupiers, tenants and maintenance workers, will be required to be trained and inducted to this SEMP. All workers should sign the induction form (provided in **Appendix B**) to acknowledge an understanding of the content of this SEMP and completion of the induction and training, or a similar record if the requirements of the SEMP have been incorporated into other environment safety documentation, for example a CEMP.

This training induction recommendation is limited to those personnel and contractors who are in control of the Site (i.e., landowners or managers) or undertaking subsurface works at the Site. It is not the intention that this document be applied to passive users of the Site such as those using it for the purposes of short-term commercial activities (e.g. market holders), car parking, pedestrian thoroughfare or visitors engaging in public uses of the area.

Training should be structured to ensure that relevant workers understand their obligation to exercise due diligence in relation to environmental matters. The following items should be presented in the induction:

- General overview of the work to be conducted
- Overview of Site contamination issues
- Familiarisation with environmental controls
- Chemicals of Potential Concern (CoPC), and associated exposure risks and potential symptoms of exposure
- Hazard identification and prevention
- Personal Protective Equipment (PPE).

Records of all training should be maintained and include:

- Name of the individual receiving training
- When the individual was trained
- Name of trainer
- A general description of the training content.

It should be noted that this SEMP does not preclude the need for a Safe Work Method Statement (SWMS) or equivalent document for each task, but rather should be included as part of the general training for working on the Site and consulted when preparing safety documentation. The requirements and recommendations within this document do not replace or override the responsibility of any other person in ensuring that Site activities are conducted safety and within the requirements of applicable legislation and regulations.

1.4 Responsibilities

The distribution and implementation of this SEMP will be the responsibility of the Owner/Manager of the Site, or of future sub-divisions at the Site. The Site Owner/Manager may at times delegate responsibility for individual items or tasks to maintenance contractors and other persons. However, the Site Owner/Manager retains the overall responsibility for the implementation of this SEMP during any subsurface works and ongoing use of the Site or future subdivisions which they hold responsibilities for.

All contractors, including workers engaged in any subsurface works where groundwater or soil vapour infiltration may occur (such as accessing service conduits or trenches) or works which may come into contact with Site soil or groundwater will be responsible for adhering to the management measures described herein.

Table 1 below provides a summary of the key roles and responsibilities associated with the implementation of this SEMP.

Table 1 Roles and Responsibilities

Role	Key Responsibilities
Site Owner/ Manager (or delegate)	• Provide a full copy of the current version of the SEMP to Site occupiers/ contractors undertaking subsurface works and discuss as part of the Site induction process. • Manage and/or enforce the SEMP for Site occupiers/ contractors undertaking subsurface works. • Implement and complete corrective actions as required. • Complete and keep up to date all necessary registers and records as required in the SEMP. • Undertake reviews and revision of the SEMP every three years (or more frequently, as deemed appropriate based on-Site activities or changes). • Review evidence of compliance to this SEMP every three years (or more frequently, as deemed appropriate).

Role	Key Responsibilities
	• Undertake visual inspections of existing controls, such as hardstand areas every three years. • Review and revise the SEMP to reflect changes that occur at the Site. • Transfer of the SEMP, and any records associated with it, to new Site owners or occupiers in the event of a change in ownership or land transfer.
Site Occupiers / Contractors undertaking subsurface works or works which may come into contact with Site soil or groundwater.	• Implement the requirements of the current version of the SEMP. • Complete all necessary registers and records as required in the SEMP. • Complete all activities at the Site in a safe and environmentally responsible manner. • Implement a Work Health and Safety Plan (WHSP) and ensure that suitable PPE is worn, and monitoring is undertaken, where required, for tasks that involve potential contact with contamination. • Ensure all contractors or subcontractors comply with the requirements of the SEMP.

1.5 Site Environment Management Plan Revision

This SEMP will remain in place indefinitely, and will require revision:

- In the event that areas of the Site undergo remediation or land use changes.
- Following changes to the conditions at the Site which may change the risk of exposure to contamination on the Site.
- In response to additional data to inform the understanding of the contamination status of the Site.

Regardless of the above-listed considerations, this SEMP should be reviewed (and updated if required) every three years. It is recommended that a suitably qualified environmental practitioner be engaged to review evidence of compliance to this SEMP, including records of works on the Site and compliance with the conditions of implementation contained within **Section 5.5** of this SEMP. A visual inspection of the Site should be conducted as part of this review, as described in **Section 5.1**.

1.5.1 Previous SEMPs

This SEMP combines and supersedes the following SEMPs which have been previously issued for some or all of the Site:

- *Site Environmental Management Plan, Macquarie Point Development Project* (AECOM, 2018a)
- *Site Environmental Management Plan, Macquarie Point – Audit Area 1* (AECOM, 2019a)
- *Audit Area 4 – Site Environmental Management Plan, Macquarie Point Development Project* (AECOM, 2020a)
- *Lot E and Underground Carpark – Site Environmental Management Plan, Macquarie Point Development Project* (AECOM, 2021a)

The information and management procedures within the previous documents have been combined in this SEMP, and have been updated to account for changes in proposed Site development and additional environmental information received or management/mitigation measures identified since issue of earlier SEMPs or versions of this SEMP. A record of revisions to this SEMP is provided in the Revision History at the start of this document.

1.6 Environmental Audit

In conjunction with the amendment of the *Macquarie Point Development Corporation Act 2012*, the Corporation has engaged a Contaminated Land Auditor, David Lam of Tetra Tech Coffey (the Auditor). David is included on the Director of the Tasmanian Environment Protection Authority (EPA) Register of

Interstate Contaminated Land Auditors and is considered suitably qualified by EPA to undertake an Environmental Audit to review the progress of environmental assessment, remedial planning and execution works at the Site.

The role of the Auditor is to ensure that the works are carried out in compliance with local Tasmanian legislation and guidelines with consideration given to the requirements of the Victorian EPA Environmental Audit framework in the absence of an Audit scheme in Tasmania. It is noted that Victoria legislation which defines the Audit process was updated and superseded by the *Environment Protection Act 2017* (the EP Act), which came into effect on 1 July 2021, and contains significant changes to Audit methodology and terminology under the Victorian framework. Under Section 478 of the EP Act, existing Audits where an Auditor has been engaged prior to 1 July 2021, and the Audit has not been completed by 1 July 2021, can be conducted under either the EP Act or the previous framework. To maintain continuity with the portions of the Audit already completed, the Site Audit will continue under the previous framework and terminology.

The overarching outcome required for the Environmental Audit is a Contaminated Land Audit Report (i.e. sign off) prepared by the Environmental Auditor confirming that Clean Up to the Extent Practicable (CUTEP) has been achieved and that the Site is suitable for the intended future uses. Site Suitability Statements have been issued by the Auditor for Site sub-areas (described in **Section 2.2**) as part of Site Audit Reports as CUTEP has been achieved, and are listed on **Table 2** below.

It is noted that the proposed future Site uses and development as described in **Section 2.3** have altered since issue of the Site Suitability Statements listed on **Table 2**. A review of new information collected and changes in proposed Site use has been undertaken and provided to the Auditor for review (AECOM, 2026a), however the Auditor has not yet endorsed the update. However, any changes or additional requirements identified have been incorporated into the SEMP.

Table 2 Status of Environmental Audit by Area

Site Area	Approx. Area (ha)	Site Suitability Statement or Remaining Actions and Activities
Site Suitability Statement Issued[1]		
The Goods Shed and Yard (Audit Area 1)	0.86	*Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 1*, issued by Tetra Tech Coffey Pty Ltd on 5 June 2019
The Escarpment (Audit Area 4 West)	1.68	*Contaminated Land Audit Report – Macquarie Point Development Project – Audit Area 4 West*, issued by Tetra Tech Coffey Pty Ltd on 24 September 2020
The Promenade and Underground Carpark (Lot E and UGC)	1.73	*Contaminated Land Audit Report – Macquarie Point Development Project – Lot E and Underground Carpark*, issued by Tetra Tech Coffey Pty Ltd on 23 July 2021
The Precinct North (Lot B)	1.04	*Contaminated Land Audit Report – Macquarie Point Development Project – Lot B*, issued by Tetra Tech Coffey Pty Ltd on 22 November 2021
Site Suitability Statement Not Issued		
The Precinct South	1.40	No remaining remediation actions identified. A CUTEP assessment of the Precinct South was prepared and submitted to the Auditor in late 2024 (AECOM, 2024d). Comments have been received and an additional Site investigation has been completed, and an updated CUTEP report was issued (AECOM, 2025e), and is currently undergoing update in response to Auditor comments to inform a Contaminated Land Audit Report, including a Site Suitability Statement.

Site Area	Approx. Area (ha)	Site Suitability Statement or Remaining Actions and Activities
The Gateway	1.46	Remediation (removal of remnant infrastructure and treatment of gasworks wastes) was undertaken in 2024, and follow-up sampling of groundwater and soil vapour conducted in 2025. No remaining remediation actions have been identified. The existing Gateway DSI (AECOM, 2024a) is currently being updated to include a CUTEP assessment, and will be submitted to the Auditor to inform a Contaminated Land Audit Report, including a Site Suitability Statement.
Audit Area 4 East	1.20	Audit Area 4 East is currently proposed to be split, with the northern portion handed to the Tasmanian Department of State Growth. A DSI and assessment of the suitability of the proposed future development is currently being prepared for the portion of this land to remain in the control of the Corporation.
Regatta Point	0.7	This area is not yet included in the Macquarie Point Environmental Audit but is considered likely to be included in the future. An initial intrusive investigation to allow preparation of a Detailed Site Investigation (DSI) report for this area was conducted in late 2024, and the collected data is currently being assessed and a DSI prepared. Any remediation or further investigation requirements to allow issue of a Site Suitability Statement will be identified in the DSI and inform future work requirements and timeline.
Royal Engineers Building	0.19	This area is not currently included in the Macquarie Point Environmental Audit and is not considered likely to be included. However, Royal Engineers Building and surrounding land parcel is likely to be added to the Site as part of future development plans (see **Section 2.3**). To date, no potentially contaminating land uses have been identified, or intrusive investigation undertaken, at the Royal Engineers Building.

2.0 Site Details and Background

2.1 Site Identification and Layout

The Site details are provided in **Table 3** below. It is anticipated that the areas referred to as Regatta Point and the Royal Engineers Building will be added to the Site in future, but as land transfer has not yet occurred, these areas have been listed separately:

Table 3 Site Details

Item	Description
Macquarie Point	
Site Address	10 Evans Street, Hobart, Tasmania (refer to the Site Location plan provided as **Figure F1** in the **Figures** section)
Site Area	Approximately 9.3 ha
Current Land Owner	State of Tasmania (Crown Land)
Title Details	The Site includes the following land titles: • 179192/2, consisting of land against the northern border of the Site below the Hobart Cenotaph. • 179192/3, consisting of southern portion of the Site. • 179192/4, consisting of land previously proposed for development as a road/transport corridor between 17919/2 and 17919/3. • 45404/1, consisting of a small narrow band of land in front and to the west of the Goods Shed. This title boundary overlaps 179192/3. • 129483/6, consisting of the south-west corner of the Site, historically occupied by the former Hobart Gasworks.
Current Zoning	In accordance with the Hobart City Council (HCC, 2021), the *Sullivans Cove Planning Scheme 1997* notes that the Macquarie Point site falls within the *Macquarie Point Mixed Use Zone* and is subject to the following use areas: • Commercial and Institutional • Mixed Use • Open Space.

Item	Description
Current Uses	The following is noted with regard to current Macquarie Point use and features: • The majority of Macquarie Point is currently vacant. Portions of the north and west of Macquarie Point are currently in use for remediation activities, including stockpiling of excavated materials. • The Goods Shed, a heritage building, is located on the southern boundary of the Site and is subject to intermittent uses including public events. • An office building (8A Evans Street) is located on the western boundary of Macquarie Point and is occupied by the Corporation. • The "Red Shed", located in the south eastern portion of Macquarie Point, is currently used by a microbrewer and includes a public bar. • A warehouse (the SeaRoad Shed) was located in the south-east corner of Macquarie Point but was demolished in 2023. A large slab (the SeaRoad Slab) remains in place and has been used for intermittent storage of construction equipment. • Small retail outlets are located in the area adjacent to the Red Shed (Red Square) which is also used regularly for markets, music and other outdoor events with food vans. • A public car park is present in the south eastern and eastern portion of Macquarie Point. • A roadway (the Northern Vehicular Access) is present on the northern portion of Macquarie Point.
Closest Surface Water Body	• Sullivans Cove to the southwest (170 m) • River Derwent to the southeast (280 m) and to the northeast (25 m).
Site Layout	• **Figure F2** in the Figures Section
Regatta Point	
Address	A street address is not allocated. Located adjacent to McVilly Drive, Queens Domain
Area	Approximately 0.7 ha
Current Land Owners	The land comprised within Regatta Point is under the authority of: • Department of Natural Resources and Environment Tasmania (DNRET) Property Services (Potential Property ID 2513934), under Crown lease Regatta Point is currently being transferred to the control of the Corporation.
Title Details	Title details are not available for the public reserve (Potential Property ID 2513934).
Current Zoning	In accordance with the Hobart City Council (HCC, 2021), the *Sullivans Cove Planning Scheme 1997* notes that the Regatta Point site falls within the *Macquarie Point Wharf & River Zone B* and is subject to the following use areas: • Commercial • Mixed Use • Open Space

Item	Description
Current Uses	The following is noted with regard to current Regatta Point use and features: • A public reserve in the southern portion of Regatta point is used for public open space and recreation. Carparking and access to the River Derwent (via two marine jetties and two boat ramps) are present in this area, and accessible via McVilly Drive. • A pumphouse (under Crown Licence) is present in this area. It is not known if this pumphouse is operational, what use is authorised under its licence, or what historical uses it may have had, but it is assumed to be related to fuel and oil transfer via underground pipelines which are present beneath Regatta Point. • A small two-storey building of unknown use is in this area. • A disused rail line and corridor passes to the west of Regatta Point.
Closest Surface Water Bodies	• The River Derwent is located to the east, immediately adjacent to Regatta Point. • Sullivans Cove is located approximately 560 m to the south at the closest point. Recreational fishing restrictions apply in the waters adjacent to Regatta Point.
Site Layout	**Figure F2** in the **Figures** section
Royal Engineers Building	
Address	2 Davey Street, Hobart, Tasmania
Area	Approximately 0.19 ha
Current Land Owners	State of Tasmania (Crown Land). The Royal Engineers Building is currently being transferred to the control of the Corporation.
Title Details	Land title 20452/2
Current Zoning	In accordance with the Hobart City Council (HCC, 2021), the *Sullivans Cove Planning Scheme 1997* notes that the Royal Engineers Building falls within the *Macquarie Point Mixed Use Zone* and is subject to the following use areas: • Commercial and Institutional • Mixed Use • Open Space. The Royal Engineers Building (described as the Royal Engineers Building and Stone Post) is also noted as a Place of Cultural Significance in Schedule 1 of the Sullivan's Cover Planning Scheme 1997.
Current Uses	The Royal Engineers Building is currently used as office/commercial space, with surrounding open grounds and garden spaces. Portions of the surface are sealed with bitumen or concrete, or cover in crushed rock, for foot and vehicle passage.
Closest Surface Water Bodies	• Sullivans Cove, approximately 400 m to the south. • River Derwent, approximately 380 m north-east.
Site Layout	• **Figure F2** in the **Figures** section

2.1.1 Surrounding Land Uses

The surrounding land use comprises a number of aspects including public access and cultural significance; commercial and professional services; retailing; health care; port facilities; light industry; marine industry; fishing industry; and education. The immediate local setting is summarised in **Table 4**.

Table 4 Surrounding Land Uses

Direction from Site	Land Use
North	• The Site is bound to the north by the Hobart Cenotaph and associated public open space. • The River Derwent is located in a general northeast direction from the Site.
South	• The Site is bound to the south by Evans Street, with residential apartments and commercial properties beyond, which extend towards Hunter Street and Sullivans Cove.
East	• The Site is bound to the east by the TasPorts' port operations and further east by the River Derwent. • A Wastewater Treatment Plan (WWTP) is located in a general northeast direction from the Site. It is understood that planning is currently being undertaken by TasWater to decommission and remove the WWTP and construct a replacement pump station, with excavation of an interment basin commenced by TasWater in 2025.
West	• The Site is bound to the west by a public bike path and Davey Street, with commercial properties beyond.

2.2 Areas of Site

For the purpose of assessment and completion of the Environmental Audit, the Site has been divided into sub-areas for assessment based on the nature of identified contamination, historic activity, and the intended future uses of each area. Each area may have specific development controls or work requirements, which are discussed in **Section 4.0**. The sub-areas of the Site are shown on **Figure 1** below.

It is noted that a division of title is currently underway and the northern portion of Audit Area 4 East is planned to be handed to the control of the Tasmanian Department of State Growth. As this has not occurred yet, this area is still included in this SEMP.

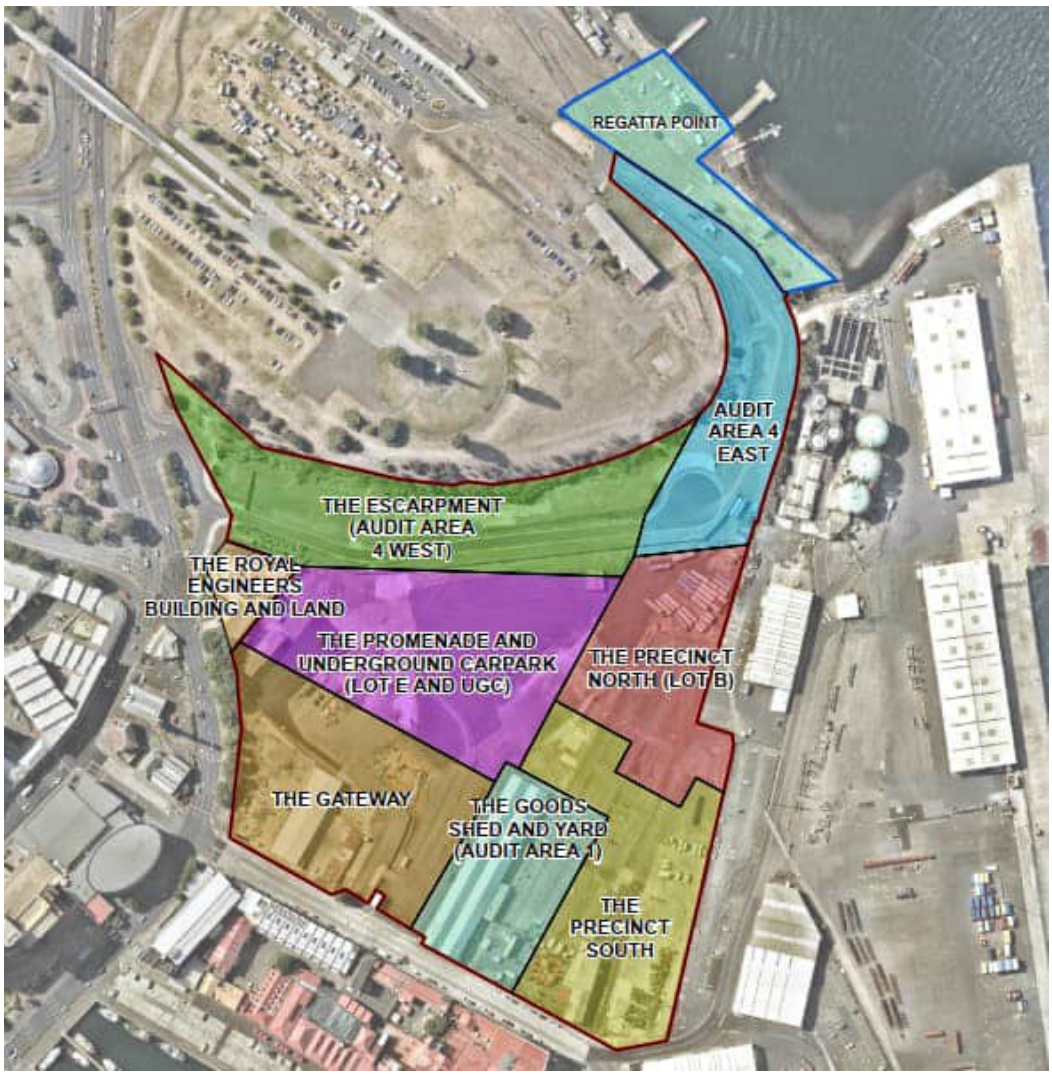

Figure 1 Site Areas

The Site was previously divided into Audit Areas (named Audit Area 1 to Audit Area 7) for assessment. Due to changes in the remediation approach and planned development of the Site, these have been replaced with the sub-areas above. However, the locations of the former Audit Areas are shown on **Figure F2** for reference to earlier documents.

2.3 Future Land Use

Under the previous Site development plan, *New Territory from Old Ground – Macquarie Point Strategic Framework and Masterplan 2015-2030* (the former Masterplan) (MPDC, 2015), the Precinct South was intended for development for a mixture of future uses including residential, commercial and open space.

Environmental assessment and remediation of the Site prior to 2023 was guided by the former Masterplan. However, in September 2022, it was announced by the Tasmanian Government Department of State Growth that the Macquarie Point Site is the preferred location for a future sports stadium and multipurpose area. In August 2024, the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024a) was finalised for the redevelopment of the Site.

The Precinct Plan outlines the concept for the Site which comprises mixed use precincts summarised in **Table 5** below.

Table 5 Precinct Plan - Proposed Development Precincts

Precinct	Likely Land Use
Aboriginal culturally informed zone	Open space and commercial
Multipurpose stadium and associated concourse zone	Open space and commercial, with an underground carpark in the north-eastern corner.
Royal Engineers building and land	Open space and commercial
Complementary integrated mixed use zone, including restaurants, cafes, hotels, medical facilities and commercial office space	Open space and commercial
Antarctic facilities zone including commercial spaces and connections with the complementary integrated mixed use zone	Commercial and underground car parking
Residential development and public foreshore zone accommodating a variety of tenures and housing opportunities, along with a new public promenade and food and beverage offerings	Medium to high density residential, commercial and open space
A transport corridor and roadway linking Regatta Point to the main areas of the Site	Open space / vehicle traffic / foot traffic
A vegetated area along the northern boundary of the Site. It is proposed that the historic Goods Shed, currently located in the southern central portion of the Site, be moved to this area.	Open space and commercial (the Goods Shed)

Subsurface utilities and maintenance activities are anticipated to occur in all Site areas, and the final surface elevation in some areas is planned to be reduced from the current elevations. The change in development plan and proposed modifications to Site surface elevations affect some previously identified environmental management and mitigation measures, which were included in individual area SEMPs and previous versions of this SEMP (see **Section 1.5.1**). This SEMP has been updated to include the revised measures to suitably manage the Site and avoid unacceptable risks to on- or off-Site users and the environment.

The concept layout of the Site in the Precinct Plan is shown in **Figure 2** below, and on **Figure F2**. The current and proposed final surface elevations are shown on **Figure F3**.

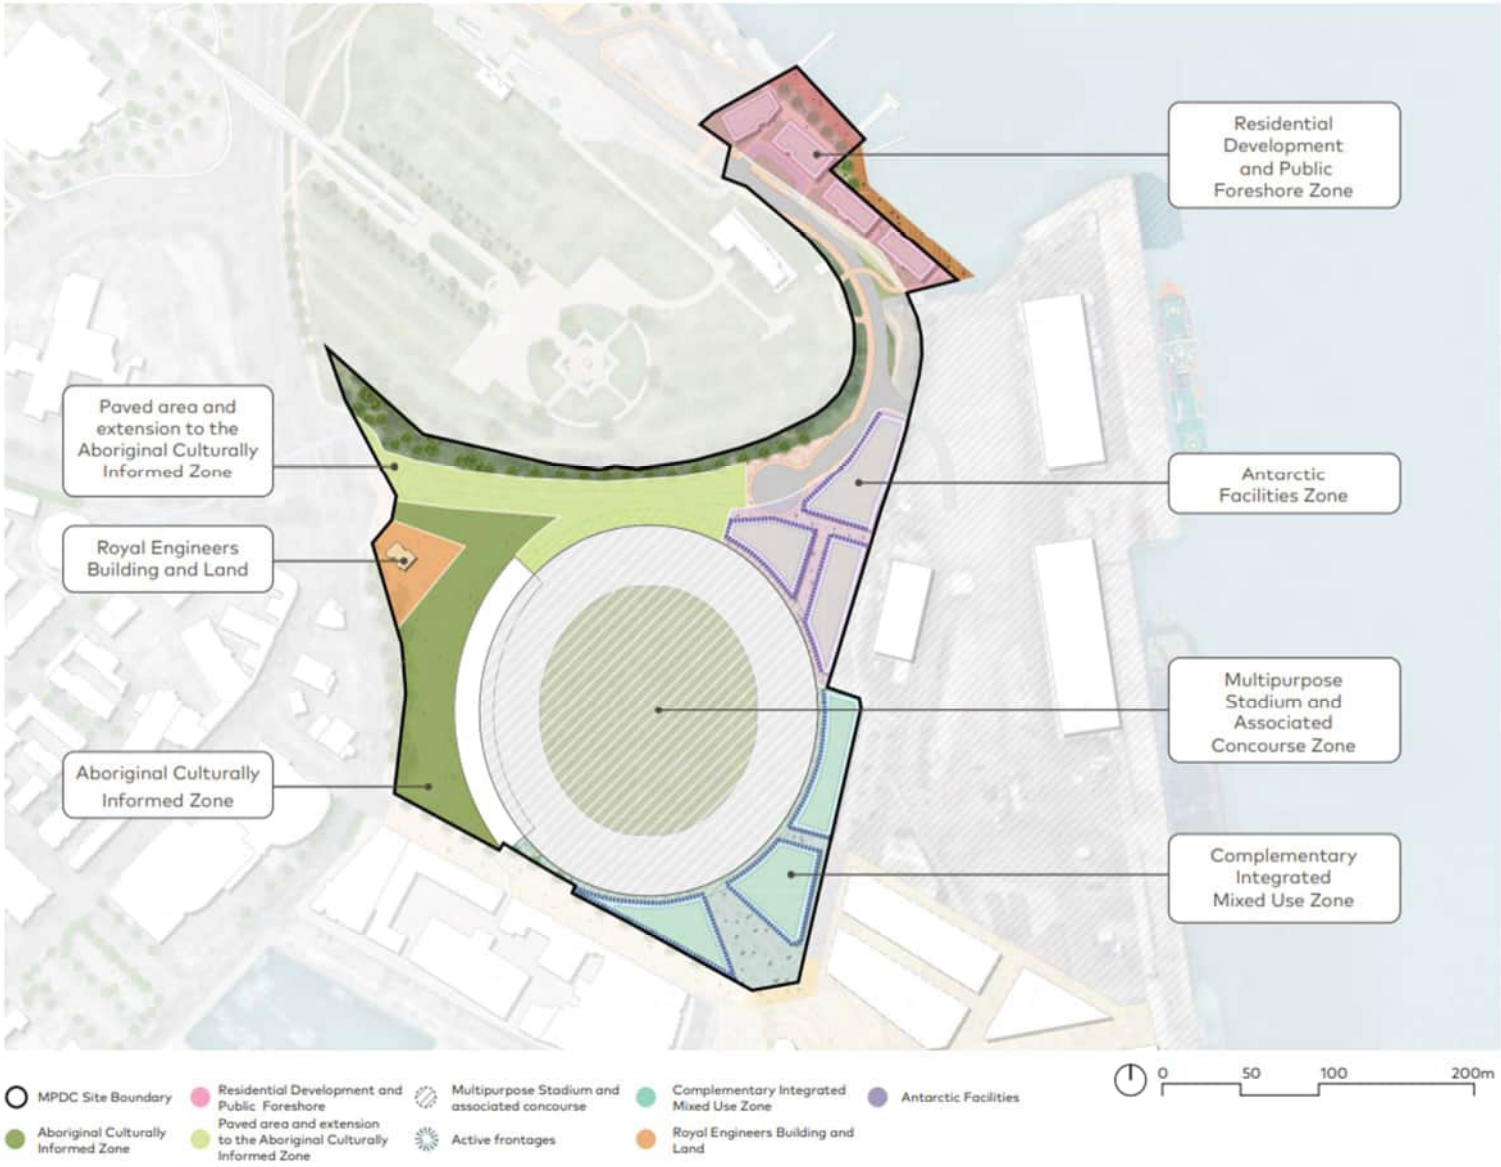

Figure 2 Mac Point Precinct Plan (MPDC, 2024)

The development or future use of the Site may interact with contamination at the Site through contact with potentially impacted soil or groundwater via:

- Excavation of soil.
- Construction of building foundations.
- Extraction of groundwater.
- Construction over or within contaminated soil and groundwater.
- Intrusive maintenance works such as installation or access to buried conduits or pipelines.
- Vapour intrusion into structures or conduits.

2.4 Subsurface Features

Table 6 below provides a summary of currently known subsurface features that may present contaminant source risks or influence subsurface hydrogeology/contaminant transport mechanisms. A plan showing the current known location of subsurface infrastructure is presented in **Figure F5**.

It should be noted that during Site investigations, the Corporation has encountered redundant pipe works and other abandoned services which are not on any records and the origin and purpose of which remains unknown. The potential for unidentified pipe networks or other features to be present below the Site should be considered during future excavation works.

Table 6 Subsurface Feature Summary

Feature	Comment
Gasworks Infrastructure	Historical gasworks infrastructure is located beneath the Gateway area and former gasworks subsurface infrastructure has been backfilled as part of previous Site development. Remediation (via removal) and validation of identified infrastructure which represents a potential source of contamination in the Gateway, was undertaken in 2024 (AECOM, 2025b), and all known pipelines and services related to gasworks operations were removed from the Site. However, the potential remains for unknown pipelines to be present, and should be considered when planning works in this area. Buried concrete slabs may also be encountered in soil in the Gateway area. As part of the same work program, two areas of gasworks waste were remediated by *in situ* solidification and are discussed in **Section 3.4**. Notably, a buried tank base is present around the area of solidified material referred to as Tar Plume B.
Roundhouse	A former Roundhouse was located in the western portion of the Site on the boundary of the Gateway and the Promenade and Underground Carpark areas, and subsurface infrastructure associated with the Roundhouse was backfilled as part of previous Site development. Parts of remaining Roundhouse infrastructure (the central turntable) were excavated and exposed by works in 2021, but other features, such as the maintenance bays, may remain *in situ*.
Buried Railways	During remediation work in 2023, a buried section of railway located between the Red Shed and the SeaRoad Shed Slab was uncovered and removed from the Site. Assessment of samples from the buried railway sleepers reported PAH concentrations below the laboratory limit of reporting (LOR), and as a result it is not considered likely that the railway was treated by creosote and represented a potential source of impact to soil or groundwater. Removal of other Site railway lines was conducted in 2017. However, review of historical aerial photographs identified that the potential exists for two

Feature	Comment
	additional buried railway lines to be located in the Precinct South if not removed as part of this program - one north of the Red Shed, and one beneath the carpark on the western boundary. Potential buried railways are not considered to represent a potential source of environmental risk, as they are from the same time period.
Underground Storage Tanks (USTs)	While no USTs are currently known to exist on the Site, previous known or suspected UST locations are described below and shown on **Figure F5**. • Six USTs were located or suspected to have been historically located to the west of the Goods Shed. - The exact number and location of UST 1 to UST 5 is not known, but based on a historic marked-up plan titled *Hammond Palmer Transport Hobart Tasmania New Pumps & Tanks* and dated 12 June 1984, which indicated fuel tanks associated with freight vessel refuelling may have been present in this area. Investigation of this area in 2017 (AECOM, 20218b) using ground penetrating radar (GPR), Non-Destructive Digging (NDD), and collection and analysis of soil samples, located evidence of former USTs, including backfill sand and fragments of concrete rubble with a metal diesel fill point tag, but did not identify any USTs or hydrocarbon contamination in soil, and later groundwater sampling from wells MW122 and MW148 in the area has not detected any fuel impacts in groundwater. No record of the installation or removal of USTs in this area have been identified, however it is considered unlikely that they are present. - UST 6 was excavated and removed in 2019 (AECOM, 2019b), and is confirmed as no longer present on the Site. • Two USTs (labelled as UST 7) and associated infrastructure were previously located in the central southern portion of the Precinct South and have been removed. A backfilled former UST pit, and associated hydrocarbon odour and residual impact, were identified during the target investigation undertaken in this area in 2014, and excavated and removed in 2023. • A review of historical information indicates that potentially two USTs and associated infrastructure were planned for installation in the north western portion of the Escarpment, in the vicinity of the current StairLink connecting the Site to the Hobart Cenotaph. The exact location of USTs was not provided in the documentation, and no record of UST installation has been located. However, as dolerite bedrock is shallow (approx. 0.5 m bgl) in this area, no indications of fuel impact have been observed in soil or groundwater, and no evidence of USTs were observed during construction of the StairLink in 2021, it is considered unlikely that a UST is present. There is the potential that more USTs are present at the Site that have not yet been identified.

Feature	Comment
Fuel Transfer Lines	Disused fuel transfer lines are known to be currently present in the northern portion of Audit Area 4 East and Regatta Point. Removal of the fuel line in Regatta Point is considered likely to occur as part of remediation of this area of the Site in the future. However, the remaining section of pipeline within Audit Area 4 East is within the land proposed to be handed to the control of the Tasmanian Department of State Growth, as discussed in **Section 1.6**. Portions of fuel lines present in the Precinct North, the Precinct South, and in the eastern section of the Promenade and Underground Carpark area have been excavated and removed in between 2019 and 2023. Removal of pipeline excavations have been validated (noting that Auditor acceptance of validation of pipelines in the Precinct South is still pending). Where pipelines could not be fully removed, they have been plugged with concrete as part of the removal process. At some locations where pipelines exited the Site, pipelines could not be fully removed to the Site boundary due risk of undermining fences or buildings, or high risk subsurface services along Evans Street, and sections of up to 2m in length may remain on Site. Locations where this occurred are noted on **Figure F5**.
Sewer (Main Hobart Pipeline)	The Sewer (Main Hobart Pipeline) currently traverses the central portion of the Site from southwest to northeast. Lead impacts are known to be present in soil around this sewer in the Precinct North area. A realignment of this sewer is planned to occur as part of the replacement of the WWTP to the east of the Site discussed in **Section 2.1.1**. The new sewer alignment will not be within Site boundaries, but will fall below Evans Street to the south and TasPorts land to the east. A sewer line also runs from the Main Workshop area connecting to the Sewer (Main Hobart Pipeline) in the general central portion of the Site. It is understood that both these sewer lines will be removed as part of the Site development.
Stormwater	Stormwater infrastructure is located in the general central portion of the Site traversing the Site in a north-south and east–west direction.
Seawalls/ Engineers Jetty	Seawalls: Historically established for land reclamation purposes. Engineers Jetty: Constructed on the historical outer edge of the former slaughter yard. GHD, 2014 identified the likely location of the Engineers Jetty in the general central portion of the Site and a seawall on the eastern Site boundary.
Former Building Footings	Remnant infrastructure associated with former buildings (such as footings) located across the Site. It is noted that select structures may have archaeological significance.
Telecommunication services	Telecommunications enter the Site in the north western portion of the Escarpment. An exclusion zone of 2 m applies around this telecommunications cable, and works should not be completed within this radius without consultation with the asset owner (Telstra Tasmania). Soil with lead impacts is known to be present within the exclusion zone. The depths of these services are typically between 0.6 m – 1.2 m below ground level (m bgl).
Other Services	Water, electricity, gas and communications services are located across the Site.

Feature	Comment
	Notably, a two power cable (one high voltage and one low voltage) are located within a single conduit in the south-western corner of the Site. A 3 m exclusion zone is in place around the high voltage power line, and maintenance of this exclusion zone is considered required due to the presence of gasworks impacts below the power lines.
Areas of notable impact	Soil and contamination treated by *in situ* solidification (ISS) as part of remediation in 2024 is located in the south-west portion of the Site. Non-Aqueous Phase Liquid (NAPL) impacts are present in soil or groundwater in the southern and central portions of the Site and are described in **Section 3.4**. Some areas of notable higher soil contamination have been identified, at locations where, due to either depth or Site boundaries, remediation excavation could not be continued to fully chase out and removed impacts. Areas of notable contamination are discussed in more detail in **Section 3.0**

2.5 Geology

2.5.1 Fill Material

The Site has been subject to significant filling (controlled or otherwise) since the early 1800's with up to 600 m of land reclaimed in stages from the original 1800's shoreline (Department of the Environment, *Australian Heritage Database*, 2007). Fill material has been encountered across the Site to depths of up to approximately 12.0 m bgl.

Fill material has been described as generally containing a combination of clays, sands, gravels, cobbles and bricks. Virgin Excavated Natural Material (VENM) consisting of crushed dolerite, or reused inert construction materials (crushed concrete and bitumen), has been used as backfill in areas in the Escarpment, the Precinct North, and the Promenade and Underground Carpark Area. The thickness of fill is variable across the Site (0.2 – 12.0 m bgl) and generally increases from north to south across the Site consistent with historical land reclamation activities.

Deeper fill material generally consists of silty sands, similar to the underlying natural marine deposits, indicating that the deeper fill material may be associated with reworked natural material or dredged material.

Staining and odours consistent with gasworks and fuel storage has also been encountered in fill material at select locations.

2.5.2 Natural Soil

Two main natural soil types have been encountered at the Site including marine deposits (silty sands) and slope deposits (weathered Dolerite including clays, gravels and cobbles).

Marine deposits have generally been encountered in the south east portion of the Site, ranging in depth from 3.7 to 15.0 m bgl. Slope deposits generally underlay the marine deposits (with the exception of the northern portion of the Site where the marine deposits are absent). The slope deposits are generally encountered at near surface to 1.4 m bgl in the northern portion of the Site and 11.2 to 19.0 m bgl in the south eastern portion of the Site.

Dolerite bedrock underlies the fill and natural soils at the Site. Dolerite has generally been encountered at near surface in the northern portion of the Site and slopes down in the southerly and south easterly direction and has been encountered at depths up to 25.0 m bgl (GHD, 2014). GHD, 2014 also notes that there are potentially three bedrock highs (i.e. 'reefs') in the general central portion of the Site. The dolerite has been described as of high strength and slightly to highly fractured. A dolerite hill is located to the north of the Site, with the ground of the Hobart Cenotaph present, and exposed dolerite from quarrying of this area in the early 1800s is visible on the escarpment face along this boundary.

In the following instances, the interface between various natural soil types has been difficult to distinguish:

- Between fill material and natural marine sediments given the similar material type, and the possibility that natural soil of similar characteristics may have been used as fill on the Site previously.
- Between the changes from slope deposits to the underlying dolerite bedrock given the weathering of the slope deposits, which consist of fine to coarse cobbles and boulders similar to the dolerite.

The Site is mapped as having a low probability (6-70%) of Potential Acid Sulfate Soils (PASS), as indicated on LISTmap's Coastal Acid Sulfate Soils (0 – 20m AHD) layer (DNRET, 2025). PASS has been detected in saturated estuarine soils and will require management if excavated or disturbed.

2.5.3 Hydrogeology

The River Derwent is located approximately 280 m southeast of the Site boundary and Sullivans Cove is located approximately 170 m south west of the Site boundary.

Based on investigations completed to date, the Site is underlain by a single aquifer unit extending to greater than 25.0 m bgl (the maximum depth assessed). Groundwater has generally been encountered in fill material in the central, southern and eastern portions of the Site, extending into the underlying natural material including marine deposits, slope deposits and fractured Dolerite.

Observations from intrusive investigations have not identified any consistent confining layers between the fill material, natural sediments or the fractured Dolerite to indicate that the lithologies are hydraulically separated. This is supported by similar standing water levels (SWLs) reported for nested groundwater wells screened within different portions of the aquifer, which may indicate that the shallow and deeper portions are likely to be hydraulically connected.

During the last Site-wide groundwater monitoring event (GME), undertaken in June 2025 (AECOM, 2025c), groundwater was encountered below the Site between 1 to 5 m bgl, with deeper groundwater in the north-west corner. Groundwater elevations ranged between 4.684 mAHD in BG1 in the northern portion of the Site, to 0.423 mAHD in off-Site well MW152, south of the south-east corner of the Site in an off-Site carpark.

Groundwater elevation contours generally followed the pattern of topographic elevation across the Site, indicating a relatively steep up-gradient flow direction to the south-east, prior to flattening out to a very gentle gradient across the central and south-eastern down-gradient areas. Groundwater flow direction followed the steep north-easterly slope towards Regatta Point further around the headland to the far north of the Site.

Groundwater is inferred to have southeast and southerly components of flow in the main area of the Site, with some westerly flow along the eastern boundary with TasPorts land which may be due to a buried seawall in this area, and northeasterly from Regatta Point. The inferred ultimate discharge points of Site groundwater are the River Derwent and Sullivans Cove

Other subsurface structures such as sewer mains (understood to be at a depth of approximately 4.0 m bgl), stormwater pipes, former fuel transfer lines and former sea walls may cause localised variations in groundwater flow direction, and the Hobart Rivulet, which passes north of the Site and through the northern portion of Audit Area 4 East, is considered to present a barrier to groundwater flow.

3.0 On-Site Contamination

Remediation of the Site has been conducted at the Site to address impacts from contamination and enable future development. However, residual impacts remain on the Site where remediation could not be practicably conducted to completely remove contamination.

Residual impacts are not considered to represent unacceptable risks to users or the environment of the Site or surrounding areas, if managed in accordance with this SEMP.

The following sections of the SEMP provide a description of known residual contamination at the Site to inform those responsible for planning and conducting future Site activities.

3.1 Chemicals of Potential Concern

Based on the known Site history, **Table 7** below presents a summary of the Chemicals of Potential Concern (CoPC) that may be present based on known historical activities or uncovered during investigation of the Site

Table 7 Chemicals of Potential Concern Summary

Area	Historical Land Uses	Chemicals of Potential Concern
Goods Shed and Yard	• Freight storage and handling • Vehicle Maintenance. • Fuel Storage and Handling • Land Reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Chlorinated solvents associated with vehicle maintenance activities. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.
The Escarpment	• Locomotive refuelling comprising fuel storage and transfer facilities • Railway maintenance workshop • Rail corridor and fuel transfer infrastructure historically located within the area • Concrete batching plant • Land reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Chlorinated solvents associated with locomotive maintenance activities and the storage of hazardous materials. • Heavy metals, chlorinated solvents and hydrocarbons associated with workshop and maintenance areas. • Phosphorus and sulphur associated with locomotive washing. • ACM sourced from historical structures (i.e. cladding). • Hydrocarbons associated with the truck wash. • Heavy metals, chlorinated solvents and hydrocarbons sourced from the historical incineration of paint/ solvents. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.
The Promenade and Underground Carpark	• Locomotive refuelling comprising fuel storage and transfer facilities. • Locomotive maintenance. • Freight storage and handling. • Land reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel (diesel) storage and transfer activities. • LNAPL has been detected on groundwater. • Chlorinated solvents associated with locomotive maintenance activities. • Heavy metals, asbestos and PAHs sourced from materials used to backfill Roundhouse structures. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.

Area	Historical Land Uses	Chemicals of Potential Concern
The Precinct North	• Freight storage and handling. • Fuel storage and handing • Land reclamation	• TPHs, BTEXN, PAHs, and phenolic compounds associated with historical fuel (diesel) storage and transfer activities. • Chlorinated solvents associated with locomotive maintenance activities. • LNAPL has been detected on groundwater. • Metals[1] inferred to be due to historic land reclamation have been detected in fill. • PFAS associated with bulk off-Site fuel handing[2]
The Precinct South	• Freight storage and handling. • Fuel storage and handling • Land reclamation	• TPHs, BTEXN, PAHs, phenolic compounds, and lead associated with historical fuel storage and transfer activities undertaken adjacent to the Site's eastern boundary. • LNAPL has been detected on groundwater. • Metals[1] inferred to be due to historic land reclamation have been detected in fill. • PFAS potentially associated with bulk fuel handing which extended to the east of the Site, although portions of the Precinct South formed part of the bulk fuel storage facility[2]
The Gateway	• Former Hobart Gasworks. • Locomotive refuelling comprising fuel storage and transfer facilities. • Railway maintenance workshop. • Land reclamation	• TPHs, PAHs, BTEXN and phenols sourced from coal tar and tar oils, or from historical fuel storage and transfer activities. • Heavy metals, chlorinated solvents and hydrocarbons associated with workshop and maintenance areas. • Phosphorus and sulphur associated with locomotive washing. • ACM sourced from historical structures (i.e. cladding). • Chlorinated solvents associated with locomotive maintenance activities and the storage of hazardous materials. • Complex cyanides, free cyanides and metals sourced from spent oxides. • TPHs, PAHs and metals sourced from coke, coke breeze, ash and clinker residues. • TPHs and BTEX associated with light and drip oils. • DNAPL has been detected in soil. • Phenols, nitrates, sulphates, sulphides, ammonia and PAHs sourced from ammoniacal recovery wastes. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.

Area	Historical Land Uses	Chemicals of Potential Concern
Audit Area 4 East	• Rail corridor and fuel transfer infrastructure historically located within the area. • Land reclamation	• TPHs, BTEXN, PAHs and phenolic compounds associated with historical fuel storage and transfer activities. • Buried ACM has been identified in a section of Audit Area 4 East and is currently temporally capped with a concrete layer. • Metals[1] inferred to be due to historic land reclamation have been detected in fill
Regatta Point	• Public boating, yachting, and port activities. • Rail corridor • Fuel pipeline • Land reclamation • Metals	• Heavy metals, TPH/TRH, PAH, BTEXN, phenolic compounds, SVOC, VOCs, TBT, OCPs, cyanide, ammonia and ACM have all been identified as potential CoPC in Regatta Point based on current and historical uses. Field investigations of Regatta Point were conducted in late 2024, and a DSI with the outcomes is being prepared but is not yet issued. • Metals[1] inferred to be due to historic land reclamation have been detected in fill.

Notes: TPHs – total petroleum hydrocarbons; TRH – total recoverable hydrocarbons; PAHs – polycyclic aromatic hydrocarbons; BTEXN – benzene, toluene, ethylbenzene, xylene, naphthalene; ACM – asbestos containing material; VOC – volatile organic compounds; SVOC – semi VOC; TBT – tributyl tin; OCP – organochlorinated pesticides; PFAS – Per- and Poly-Fluoroalkyl Substances; LNAPL – Light Non-Aqueous Phase Hydrocarbons; DNAPL – Dense Non-Aqueous Phase Hydrocarbons; 1 – aluminium, arsenic, cadmium, chromium, copper, lead, manganese, nickel and zinc; 2 - While review of historical information has not identified the use of products containing PFAS, PFOS has been detected in soil and groundwater in this area. There is potential for firefighting foams containing PFAS to have been applied as part of emergency response operations or for training purposes during bulk fuel storage in the short period between the adoption of PFAS-containing firefighting foam in the USA in 1967, and the cessation of bulk fuel storage in 1970.

In addition:

- Methane has been detected in soil vapour sampling, and at concentrations in groundwater which could potentially generate hazardous concentrations of vapour. It is considered likely that methane is present primarily due to the anaerobic degradation of organic materials in natural soil (former river- and sea-bed) which was buried during historic land reclamation, although fuel hydrocarbon impacts in soil and groundwater may also contribute some methane mass.

  While methane is non-toxic, it can accumulate and represent a risk of fire or explosion in structures or buried services.

- PASS has been detected in saturated natural soils.

Appendix C contains areas specific fact sheets which provide more detailed information on CoPC in each area of the Site which has had a CUTEP submission to the Environmental Auditor. The following areas have fact sheets prepared:

- The Goods Shed and Yard
- The Escarpment (Audit Area 4 West)
- The Promenade and Underground Carpark
- The Precinct North
- The Precinct South

The remaining areas of the Site, consisting of the Gateway and Audit Area 4 East, and Regatta Point and the Royal Engineers Building, if added to the Site, will have fact sheets prepared and added to this SEMP as investigation and remediation of these areas are completed.

3.2 Identified Soil Impacts

3.2.1 Fill Material

Shallow soil across the majority of the Site consists of fill material used for land reclamation or construction during the Site's history.

Soil samples collected during the investigation of the Site have been assessed against adopted Tier 1 Criteria for the following uses:

- Maintenance of Modified/Highly Modified Ecosystems
- Human Health
  - Low and Medium/High Density Residential
  - Recreation/Open Space
  - Commercial Industrial
  - Intrusive Maintenance Workers
- Buildings and Structures
- Aesthetics

The following CoPC have been detected in excess of one or more of the adopted Tier 1 criteria in soil samples collected from the Site:

- TRH – C_6–C_{16}, C_{10}-C_{40}
- Benzene, naphthalene, total xylenes
- PAHs – benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs
- Metals – arsenic, cadmium, chromium, copper, lead, nickel, zinc
- PFAS - PFOS

Further information on exceedances of the adopted Tier 1 Criteria for areas of the Site where a CUTEP submission has been made can be found in **Appendix C**. Although exceedances of the Tier 1 criteria are present in these areas, they may be managed by implementation of the safety and environmental control measures in this SEMP.

3.2.2 Natural Soil

The AECOM soil investigations undertaken between 2015 and 2025 identified a combination of copper, lead, nickel, zinc and TRH at concentrations in excess of the adopted Tier 1 screening criteria for the assessment of risk to human health and ecological receptors in natural soils at select locations.

In addition, assessment has identified PASS within saturated natural estuarine/alluvial soils below the water table (AECOM, 2025d).

3.2.3 Areas of Notable Impact

As part of the Environmental Audit process for sub-areas of the Site, the following areas of notable impact to soil have been identified:

Table 8 Soil Impacts - Areas of Notable Impact

Area	CoPC	Description
The Goods Shed and Yard	Lead	Areas of lead-impacted soil which may present a risk to future Intrusive Maintenance Workers (i.e. workers installing or maintaining subsurface conduits) were identified in soil proposed for removal as part of Site development and adjustment of the surface elevation of the Site. While removal of this soil is considered likely to occur as part of the development of the Site, these impacts should be considered in planning works prior to excavation or if the proposed development plan is altered.
The Promenade and Underground Carpark	Lead	Areas of lead-impacted soil which may present a risk to future Intrusive Maintenance Workers (i.e. workers installing or maintaining subsurface conduits) are present in the Promenade and Underground Carpark Area, generally at a depth of >2 m bgl. While removal of this soil is considered likely to occur as part of the development of the Site, these impacts should be considered in planning works prior to excavation or if the proposed development plan is altered. Lead-impacted soil may be present following development at two locations, G14 and H12, and should be considered in planning excavation activities.
	Asbestos	Isolated fragments of Asbestos Containing Material (ACM) have been uncovered in fill in this area. Anecdotal evidence indicated that trenches and service pits associated with the former Roundhouse which was present in this area may have been backfilled with building rubble including ACM, although investigation to date has not uncovered any.
The Escarpment	Lead	Lead-impacted soil which may present a risk to future Intrusive Maintenance Workers (i.e. workers installing or maintaining subsurface conduits) is present in the exclusion zone surrounding a telecommunications cable in this area.

Area	CoPC	Description
The Precinct North	Lead	Lead impacted soil which may present a risk to future Intrusive Maintenance Workers is present: • On the eastern site boundary • In the soil surrounding the Main Hobart Sewer line • In some soil locations at depths which are anticipated to be removed by Site development. • In one location (N10), lead impacted soil may be present at the base of the excavation following development. • At depths >2 m below the current Site surface elevation.
	Petroleum Hydrocarbons	Hydrocarbon impacted soil which may present a risk to future Intrusive Maintenance Workers is present on the eastern site boundary.
The Precinct South	Lead	Lead-impacted soil which may present a risk to future Intrusive Maintenance Workers (i.e. workers installing or maintaining subsurface conduits) may be present in the Precinct South at: • In some soil locations at depths which are anticipated to be removed by Site development. • At depths >2 m below the current Site surface elevation.
The Gateway	Coal Tar/DNAPL	Coal tar, associated with the historic Hobart Gasworks, has been detected in soil in the south and southwest sections of the of the Gateway area. Notable areas have been identified beneath the high voltage power cable exclusion zone on the western boundary of the Gateway, and trace tar may be present in soil in the area. In addition, tar plumes treated by ISS (Plume B, and the majority of Plume A) form hardened soil monoliths which have higher levels of contamination and should be treated as such if encountered by excavation.
	Lead	Lead-impacted soil which may present a risk to future Intrusive Maintenance Workers (i.e. workers installing or maintaining subsurface conduits) may be present in the Precinct South at: • In some soil locations at depths which are anticipated to be removed by Site development. • At depths >2 m below the current Site surface elevation. • In two locations (in validation samples collected from the base of the excavation which removed UST 6 and in BH88, which was advanced to assess the area where UST 1 to UST 5 were located [see **Table 6**]), lead impacted soil may be present at the base of the excavation following development.
Audit Area 4 East	Asbestos	Fragments of corrugated roofing materials between 5 and 300 mm in size were detected within an embankment within Audit Area 4 East, adjacent to the boundary with the Escarpment.

In addition:

- Notably impacted soil is present in the vicinity of known NAPL impacts, as discussed in **Section 3.4**.
- As part of assessment and remediation prior to the update of the Site development plans in 2024, which informed the Contaminated Land Audit Reports for the Goods Shed and Yard, the Escarpment, the Promenade and Underground Carpark, and the Precinct North (see **Table 2**), it was not considered probable that intrusive maintenance workers would come into contact with soil greater than 2 m below the Site surface at the time of investigation, as changes in surface elevation (**Section 2.3**) were not planned at that time. Soil contamination which may represent a risk to intrusive maintenance workers, notably lead, may be present in soil greater than 2 m below the current surface.

These areas are shown on **Figure F5**. Further detail on the location and extent of these impacts, and management controls required for safe future works in the vicinity of these impacts, can be found in the area fact sheets in **Appendix C**, and should be consulted for prior to subsurface works in these areas.

If any future investigation, assessment, or development activity at the Site identifies other notable soil impacts, the SEMP must be updated to include these details in **Table 8** unless removed from the Site, with any such soil removal validated and recorded.

3.3 Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) were routinely conducted for monitoring groundwater wells located on-Site between January 2015 and November 2019. Targeted GMEs have been conducted in 2022 in the Gateway and in 2023 in the Precinct South, and the most recent Site-wide GME was conducted in June 2025 (AECOM, 2025c).

Groundwater sample analytical results have been assessed against adopted Tier 1 Criteria for the following uses:

- Drinking water
- Irrigation
- Industry
- Stock watering
- Ecosystem protection
- Recreation - Primary and Secondary Contact
- Aesthetics
- Buildings and Structures
- Vapour Intrusion – Residential and Commercial/Industrial.

The following CoPC have been detected in excess of one or more of the adopted Tier 1 criteria in soil samples collected from the Site:

- Total Dissolved Solids (TDS)
- TPH - C_{10}-C_{36},
- TRH - C_{10}-C_{40}
- Benzene, naphthalene
- PAHs – anthracene, benz(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, chrysene, pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, dibenzofuran, phenanthrene, fluoranthene, 2.4-dimethylphenol
- Metals – aluminium, arsenic, boron, cobalt, copper, iron, lead, manganese, vanadium, zinc
- Ammonia (as N), chloride, sodium, phosphorus, sulphate

- Cyanide
- PFAS – PFOS
- Methane
- E. Coli[1]
- pH[1].

Further information on exceedances of the adopted Tier 1 Criteria for areas of the Site where a CUTEP submission has been made can be found in **Appendix C**. Although exceedances of the Tier 1 criteria are present in these areas, they may be managed by implementation of the safety and environmental control measures in this SEMP.

3.4 Non-Aqueous Phase Liquids (NAPL)

NAPL, consisting of both Light Non-Aqueous Phase Liquid (LNAPL) and Dense Non-Aqueous Phase Liquid (DNAPL), is currently known to be present in five locations on the Site, consisting of:

- LNAPL Plumes A1 and A2, in the Promenade and Underground Carpark area.
- LNAPL Plume B, in the Precinct South
- Tar (DNAPL) Plumes C and D, and a portion of Tar Plume A, in the Gateway

NAPL was previously known to be present in the following areas, but has been removed or immobilised by remediation work:

- LNAPL Plume A3, in the Precinct North
- The majority of Tar Plume A, and Tar Plume B, in the Gateway

The location and status of each NAPL Plume is listed on **Table 9**, and current or historic locations are shown on **Figure F5**.

Table 9 Known NAPL Impacts

ID	Location	Contaminants Identified	Inferred Contamination Source
Current NAPL Plumes			
LNAPL Plume A1	Central portion of the Site, Promenade and Underground Carpark	Metals, TPH, PAH	LNAPL (likely diesel) has been identified at the water table and is likely associated with locomotive refuelling activities (AECOM, 2017c).
LNAPL Plume A2	Central portion of the Site, Promenade and Underground Carpark		No detectable LNAPL was present in wells associated with these plumes during gauging in June 2025, although other indicators (such as small volumes of LNAPL during well development or sheen on groundwater) were recorded.

[1] While E. Coli and pH are not “chemicals” of potential concern, they have been treated as such in assessment.

ID	Location	Contaminants Identified	Inferred Contamination Source
LNAPL Plume B	South eastern portion of the Site, Precinct South		LNAPL (likely a combination of diesel and petrol) has been identified at the water table and is likely associated with locomotive refuelling activities (AECOM, 2017c). LNAPL in this area is considered co-sourced with the TasPorts land to the east, where the historic bulk fuel storage considered the original source of LNAPL in this area also occurred.
Tar Plume A (partial) (DNAPL)	The south-western boundary of the Site, the Gateway	Metals, TPH, PAH, BTEX, Phenolics	DNAPL is associated with tar from the production of coal gas which was previously undertaken in the Gateway and off-Site to the west. Tar Plumes C and D, and a portion of Tar Plume A, are located beneath the exclusion zone of a high voltage and power conduit and are not directly accessible. DNAPL is not considered mobile (AECOM, 2024a).
Tar Plume C (DNAPL)	The western boundary of the Site, the Gateway		
Tar Plume D (DNAPL)	The western boundary of the Site, the Gateway		
Former NAPL Plumes			
LNAPL Plume A3	Western portion of the Precinct North	Metals, TPH, PAH	LNAPL (likely diesel) has been identified at the water table and is likely associated with locomotive refuelling activities (AECOM, 2017c).
Tar Plume A (partial) (DNAPL)	The location of a former horizontal retort in the south-west corner of the Site, the Gateway	Metals, TPH, PAH, BTEX, Phenolics	DNAPL is associated with tar from the production of coal gas which was previously undertaken in the Gateway and off-Site to the west. Remediation via ISS of these plumes was conducted in 2024 (AECOM, 2025b), and the remaining material is considered solidified and at no risk of mobilisation. The solidified Tar Plume B is further located within an intact tank base and walls which act as an additional layer of protection against any ongoing impact.
Tar Plume B (DNAPL)	The location of a former tar tank in the south-west portion of the Site, the Gateway		

A detailed assessment of LNAPL impacts and remediation conducted at Site has been reported in the *Assessment of LNAPL Remediation End-Points* (AECOM, 2021c). This report concluded that:

- Further recovery of LNAPL is considered to be impracticable.
- The remaining LNAPL plumes are sufficiently stable and are not migrating.
- Based on the current development plan for the Site, no unacceptable risks to current or future human or ecological receptors from LNAPL appears to be present, assuming that a SEMP or

similar is implemented in order to minimise and manage potential risks for any interactions between groundwater, LNAPL and future Site users.

The status of LNAPL Plumes was reviewed using updated data collected between 2020 and 2025 (AECOM, 2025c), which concluded that the status of the plumes was the same as in the previous assessment. No LNAPL was detected in wells associated with LNAPL Plumes A1, A2 and former LNAPL Plume A3, although indicators of LNAPL such as odours, staining, sheen, and LNAPL in groundwater removed during development were observed and trace LNAPL may remain in soil in the vicinity. LNAPL Plume B remains present on and extending beyond the Site boundary in the south-east and should be consider

The *Remediation Work Plan – The Gateway* (AECOM, 2023a) was developed in 2023 to provide a framework and methodology, among other works, for remediation of DNAPL impacts in the Gateway via *in situ* solidification (ISS).

Tar Plume B, and the majority of Tar Plume A, were treated by ISS in 2024 (AECOM, 2025b), and analytical and field data indicates that ISS was successful in increasing the unconfined compressive strength (UCS) and reducing the hydraulic permeability of soil in and surrounding the tar plumes such that detected DNAPL is not accessible and has limited risk of ongoing impact.

Initially, ISS was intended to be undertaken on all four identified Tar (DNAPL) plumes. However, Tar Plumes C and D, and a portion of Tar Plume A, were identified as not being accessible for ISS (AECOM, 2024c) due to the presence of an exclusion zone surrounding an active high voltage power cable along the western and southern boundary of the Gateway. These areas are not considered to be mobile or represent a risk to future on- or off-Site receptors under the proposed development of the Site, however, the locations of potential DNAPL and the cable exclusion zone, shown on **Figure F5**, should be considered during any future works in these areas and additional controls on future works in these areas which may disturb tar have been recommended and are included in **Section 4.9.**

In addition, controls around residual impacts relating to gasworks, including soil management and soil vapour intrusion, have been identified by investigation following ISS remediation and are included in **Section 4.8**.

However, on the basis of the above, further LNAPL or DNAPL remediation is not practicable or required for the proposed future development, noting that Auditor acceptance of DNAPL remediation is still pending. Restoration of groundwater Protected Environmental Values (PEVs) is not practicable, and groundwater management will be required as discussed in **Section 4.13**.

3.5 Soil Vapour

Soil vapour monitoring events have been conducted at targeted locations across the Site between 2015 and 2025 at locations where concentrations of VOCs and SVOCs in soil or groundwater were in excess of the Tier 1 vapour intrusion criteria selected (as noted in **Section 3.2** and **3.3**), or in the vicinity of the LNAPL and DNAPL impacts (**Section 3.4**) to enable assessment of potential risks posed by soil vapour to potential future users of this area.

Assessment of potential vapour intrusion risks conducted as part of the Site Suitability Statements issued between 2019 and 2021 (see **Section 1.6**), and in subsequent investigations and assessments, including re-assessment of data in light of proposed changes in Site development made in 2024 (**Section 2.3**), has concluded that:

- Assessment of soil vapour impacts associated with LNAPL plumes conducted between 2015 and 2019 concluded that LNAPL does not represent an unacceptable risk to future Site users via vapour intrusion at the Site surface elevations present at the time of assessment (AECOM, 2021c).

  However, a review of vapour intrusion, as part of the assessment of changes to risks from the updated development plan (AECOM, 2026a), identified that, due to the decrease in distance between hydrocarbons and building slab, and a reduced vadose zone, hydrocarbon species (such as TRH and BTEXN) may represent a risk to future Site users.

- Soil vapour concentrations of benzene, naphthalene, and TRH >C8-C10 (aromatic) in the former gasworks area (the Gateway) represent an unacceptable risk to future users of the Site under the

proposed development. Assessment and remediation of the Gateway was not complete when earlier versions of the SEMP were issued.

- Methane concentrations have been detected in soil vapour and groundwater which represents a hazard to future buildings and structures in the central, southern, and eastern areas of the Site, in all assessment areas excluding the Escarpment, Audit Area 4 East, and Regatta Point.

  The methane risks beneath parts of the Site have been assessed at Characteristic Situation 3 (CS3) (AECOM, 2026a), as defined in *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020).

- Soil vapour has the potential to migrate under the base of large structures which extend across multiple areas of the Site, and could present risks in adjacent assessment areas following migration. Unlike the current proposed Site development (see **Section 2.3**), the Site development proposed prior to 2024 did not include structures which extended across multiple assessment areas. As a result, some vapour protection measures identified for individual areas are now considered to be required for adjacent areas.

Table 10, below, provides a summary of the assessed potential vapour risks for each assessment area. It is noted that:

- Any requirement for vapour mitigation or protection for each assessment area also applies to the entirety of any buildings or structures (including utility conduits) which are within and extend beyond the boundary of the assessment area, and under which soil vapour may potentially accumulate and migrate.
- Previous investigations have assessed that, where concentrations of TRH/BTEXN above vapour intrusion criteria have been reported in soil samples collected from below the water table, partitioning of TRH/BTEXN to the vapour phase will be dominated by groundwater concentrations. TRH/BTEXN vapour protection or mitigation is considered to be required for any structures which include excavation and construction below the water table.
- Vapour mitigation or protection may not be required if future assessment can demonstrate that no unacceptable risk to Site users is presented. Any such assessment must be prepared by a suitably trained and experienced environmental professional, and verified by an independent Environmental Auditor.

Table 10 Vapour risks identified by Assessment Area

Assessment Area	Summary of Vapour Risks	Vapour Protection or Mitigation Required	
		TRH/BTEX	Methane
The Goods Shed and Yard (Audit Area 1)	• No unacceptable TRH/BTEXN vapour risks have been detected for proposed development land uses (commercial) or less sensitive land uses such as industrial or open space at the current surface elevation. However, changes in elevation could alter risk profiles by reducing the distance between the Site surface and detected hydrocarbons (including hydrocarbons in soil) in this area. • Sub-slab vapour sampling within the Goods Shed in 2015 did not detect potentially hazardous concentrations of methane, and methane intrusion has been assessed as not presenting an unacceptable risk for this building. However, methane concentrations in groundwater and in soil vapour in this area exceed adopted criteria and are considered to represent a methane ground gas risk of CS3 (EPA NSW, 2022). Future structures may not have the same ventilation as the Goods Shed (previously assessed in 2015), and methane may represent a risk in new structures or if the ground elevation is altered.	Yes, if surface elevation is lowered from 2025 levels.	Yes[2]
The Escarpment (Audit Area 4 West)	• No TRH or BTEXN concentrations in soil have been detected at any depth which exceed the adopted vapour intrusion criteria for 0 – 1 m bgl for the proposed development land uses (commercial) or less sensitive land uses such as industrial or open space. As such, changes in Site elevation are not considered to represent a change in risk of TRH/BTEXN vapour intrusion from soil. • TRH/BTEXN concentrations in groundwater are below the Site specific RC, which consider potential vapour intrusion as a risk pathway and an assumption of 1 m distance between groundwater and the bottom of building slabs. • No methane concentrations above criteria have been detected in groundwater in this area.	Yes - for structures where groundwater is ≤1 m below the bottom of building slabs.	No

Assessment Area	Summary of Vapour Risks	Vapour Protection or Mitigation Required	
		TRH/BTEX	Methane
The Promenade and Underground Carpark (Lot E and UGC)	• No unacceptable TRH/BTEXN vapour risks have been detected for proposed development land uses (commercial) or less sensitive land uses such as industrial or open space at the current surface elevation. However, changes in elevation could alter risk profiles by reducing the distance between the Site surface and detected hydrocarbons (including hydrocarbons in soil and LNAPL plumes) in this area. • Methane concentrations in groundwater and in soil vapour exceed adopted criteria and are considered to represent a methane ground gas risk of CS3 (EPA NSW, 2022).	Yes, where surface elevation is lowered from 2025 levels.	Yes
The Precinct North (Lot B)	• No unacceptable TRH/BTEXN vapour risks have been detected for proposed development land uses (commercial) or less sensitive land uses such as industrial or open space at the current surface elevation. However, changes in elevation could alter risk profiles by reducing the distance between the Site surface and detected hydrocarbons (including LNAPL plumes) in this area. • Methane concentrations in groundwater and in soil vapour exceed adopted criteria and are considered to represent a methane ground gas risk of CS3 (EPA NSW, 2022).	Yes, where surface elevation is lowered from 2025 levels.	Yes
The Precinct South[1]	• No unacceptable TRH/BTEXN vapour risks have been detected for proposed development land uses (commercial) or less sensitive land uses such as industrial or open space at the current surface elevation. However, changes in elevation could alter risk profiles by reducing the distance between the Site surface and detected hydrocarbons (including LNAPL plumes) in this area. • Sub-slab vapour and indoor air sampling within the existing Red Shed, and previous structure the SeaRoads Shed, in this area between 2015 and 2025 did not detect potentially hazardous concentrations of methane, and methane intrusion has been assessed as not presenting an unacceptable risk for these buildings. However, methane concentrations in groundwater and in soil vapour exceed adopted criteria and are considered to represent a methane ground gas risk of CS3 (EPA NSW, 2022). Methane may represent a risk in new structures or if the ground elevation is altered.	Yes, if surface elevation is lowered from 2025 levels.	Yes[3]

Assessment Area	Summary of Vapour Risks	Vapour Protection or Mitigation Required	
		TRH/BTEX	Methane
The Gateway[1]	• Benzene, naphthalene, and TRH >C8-C10 (aromatic) have been detected in soil vapour above the adopted criteria for commercial/industrial and residential uses, and DNAPL and trace impacts from former gasworks operations are present in soil and groundwater this area which may represent a risk of TRH/BTEXN vapour generation. • Methane has not been detected above adopted criteria in soil, groundwater, or soil vapour in this area. However, exceedances of criteria have been detected in adjacent areas, including in soil vapour and in up- and cross-gradient groundwater, and the presence of gasworks hydrocarbons which may degrade under anaerobic conditions and indicate a risk of methane generation in future.	Yes	Yes
Audit Area 4 East[2]	Environmental assessment of this area is not yet issued.	To be specified in future	
Regatta Point[2]	Environmental assessment of this area is not yet issued.	To be specified in future	

Notes: TRH – Total Recoverable Hydrocarbons; BTEXN – Benzene, Toluene, Ethylbenzene, Xylene, Naphthalene; 1. Environmental Auditor assessment of these areas is not yet complete; 2. Environmental assessment of this area is not yet issued; 3. Methane has been assessed as not representing an unacceptable risk in existing buildings in this area. However, risks may be present for future structures as different construction or ventilation may be present.

Further detail of the requirements to be fulfilled for mitigations are presented in **Section 4.8**.

3.6 Asbestos

Asbestos or ACM fragments have previously been observed in the following locations at the Site:

- Isolated small ACM fragments have been observed at the surface and encountered in fill material in the Promenade and Underground Carpark, and the Escarpment areas and have been collected and removed by the Corporation or a licensed asbestos subcontractor.
- Larger ACM fragments (5 to 300 mm in size) have been encountered in the side of an embankment in Audit Area 4 East, and are currently beneath a capped area to prevent contact by Site users.
- ACM was detected in piping cladding in a former fuel line which was present beneath the Precinct North and Precinct South areas, but was removed by remediation work in 2020 and 2023. No sections of this pipeline with ACM cladding remaining are known to remain on-Site.
- Asbestos has been observed within the Goods Shed building in the southern portion of the Site.
- Anecdotal reports have identified that ACM may be present in service bays buried beneath the former Roundhouse in the Promenade and Underground Carpark area. No ACM has been observed in service bays which have been excavated and inspected to date, however.

An Asbestos Management Plan and Asbestos Register have been prepared for the Site (Appendix J), and should be referred to prior to undertaking works on the Site.

In the event that potential ACM is encountered in soil during subsurface works, all activities are to cease immediately in the immediate work area. The Asbestos Management Plan should be consulted and utilised to develop an appropriate response to the handling and management of ACM.

4.0 Management of Environmental Risks

4.1 Overview

The following sections provide details of measures to be implemented to manage potential human health risks from the environmental condition of the Site.

This SEMP provides a framework for soil and groundwater management measures associated with subsurface works such as the excavation, disposal and/ or reuse of soil and importation of fill material, as well as the requirements and maintenance of barriers designed to mitigate direct and indirect contact with contaminated soils.

As previously noted, should any activities need to occur at the Site that are not currently covered in the SEMP, then the Site Owner/ Manager should update the SEMP to include these activities, where relevant. Alternatively, should the requirement for a more specific environmental management application be determined, a Construction Environment Management Plan (CEMP) may be required which addresses the proposed tasks and how the works shall comply with the general requirements of the SEMP. It is likely that a CEMP will be required during any future significant construction or development programs which occur on the Site.

The following is a list of appropriate legislative and regulatory guidelines that have been considered in the production of this SEMP:

- National Environment Protection Council, *National Environment Protection (Assessment of Site Contamination) Measure 1999* (as amended in May 2013) [ASC NEPM]
- Tasmanian Government *Environmental Management and Pollution Control (Waste Management) Regulations 2010*
- Tasmania EPA (2018) Information Bulletin No. 105, *Classification and Management of Contaminated Soil for Disposal* (IB105).

4.2 Preventative Exposure Measures

Preventative exposure measures provided in this SEMP can be categorised as follows:

- **Physical Barriers**: Placement/maintenance of a permanent barrier (i.e. concrete, asphalt, clean soil etc.) to mitigate unrestricted access/exposure to the underlying contamination (as described in **Section 4.6**) and a vapour mitigation barrier to prevent vapour intrusion (as discussed in **Section 4.8**).
- **Administrative Measures** such as:
  - Management plans/documents (such as this SEMP or a WHSP) that provide control of the activities and/or use of the areas of the Site as described in **Section 4.3**.
  - Planning controls as described in **Section 4.4**.
  - Exclusion zones as described in Section **4.9**.
  - Site inductions.
- **Personal Protective Equipment (PPE)** as described in **Section 4.5** to mitigate exposure to potentially harmful chemicals in soil and groundwater during subsurface works.

In some cases, it may be necessary to employ multiple preventative exposure measures, beyond the SEMP, that act as a contingency (or 'fail-safe'). For example, two physical barriers (e.g. concrete and plastic marker layer), or a physical barrier (concrete) combined with an administrative barrier (management plan).

4.3 Work Health and Safety Plan

It is recognised that as part of current and proposed future uses of the Site, it may be necessary to undertake intrusive works. Such activities increase the exposure to potentially impacted materials and therefore protective measures are to be adopted prior to work commencing.

Any works conducted on the Site should be undertaken in accordance with a WHSP. This WHSP should provide guidance with respect to the minimum PPE requirements where workers are likely to come into contact with potentially contaminated materials. Specific Safe Work Method Statements (SWMS) for each task to be performed should also be included in the WHSP.

ANY COMPANY/CONTRACTOR ENGAGED TO CONDUCT SUBSURFACE WORKS AND/OR EARTHWORKS ON THE SITE MUST PREPARE A SITE-SPECIFIC WHSP COVERING THEIR WORKERS AND PLANNED ACTIVITIES.

The following is an overview of WHS considerations for any works that may be undertaken, at a minimum, at the Site:

- Identification of WHS roles and responsibilities
- Evaluation of the Site hazards and the risks associated with these hazards
- Risk assessment methods and the risk control measures
- Details on work practices and restrictions, assessment of anticipated protection levels (including PPE), controls on access to the Site and decontamination
- Methodology for handing and management of soil and groundwater in accordance with **Section 4.12** and **Section 4.13** (if required)
- Detail regarding appropriate ventilation of the work area
- First aid and emergency procedures
- The notification of accidents and other matters
- Environmental monitoring protocols.

Appropriate WHS measures should be established by the contractors for personnel involved in subsurface works at the Site. The levels of protection and the procedures specified in this section are related to contamination issues only and do not represent a WHSP for the Site.

The ultimate responsibility and authority for the health and safety of the individual rests with the individual themselves and their colleagues. Each worker is responsible for exercising utmost care and good judgement in protecting his or her own health and safety and that of fellow workers. It is the responsibility of Site owners and those working on Site to bring any observed potentially unsafe condition or situations to the attention of any worker or contractor. Should workers find themselves in a potentially hazardous situation, they should immediately discontinue the hazardous procedure and take effective corrective or preventative action.

All incidents and/or near misses pertaining to works carried out on Site should be reported immediately to the owner or occupier of the area of the Site in which they occur.

4.4 Planning Controls

Development of the Site as described in **Section 2.3** is intended under the following restrictions:

- Development of an area will not proceed without an area-specific Contaminated Land Audit Report and Site Suitability Statement issued by an Environmental Auditor approved under Section 37 of the *Macquarie Point Development Act 2012*.

  Currently, Auditor approval is being sought for the Site uses described in **Section 2.3** and shown on **Figure F2**. Modifications in Site uses or development (i.e. planning for residential uses in an open space area) will require approval by a Contaminated Land Auditor and may require other controls or management measures. The SEMP must be updated if there are any changes in land use, or in controls or mitigations for environmental risks.

- The Site surface will be covered with either hardstand and/or an engineered break layer, as specified in **Section 4.6** of this SEMP, which shall be implemented to provide a framework for ongoing maintenance and management of the Site during future use. This break layer should be instated if any existing Site structures are removed (i.e., such as the proposed relocation of the Goods Shed to the Escarpment)
- ACM has been previously identified within the Goods Shed building (see **Section 3.6** and the Site Asbestos Register attached as **Appendix J**). Prior to commencement of building-related works within the Goods Shed, or any other structures or areas where ACM is identified (i.e., old pipe lagging), a suitably qualified occupational hygienist must be consulted to confirm the nature and extent of ACM in the work area (if any), and to provide advice regarding the locations and management of ACM, including removal if practicable.
- If the Goods Shed is not relocated as proposed, the existing hardstand and flooring (including the slab, raised platform areas, crawl spaces and hard coverings etc.) must remain *in situ*.
- Any conduits or services at a depth of >2 m below the current Site level must be installed in protective shrouds or in trenches/corridors of clean fill. It is noted that as part of the proposed development of the Site, surface elevations in some areas of the Site will be decreased by up to 4.5 m in some areas of the Site (see **Figure F3**), and protective shrouds/clean soil corridors should be considered required for all subsurface services in areas where surface elevation is decrease by more than 1 m from the current level.
- The potential exists for methane, TRH and/or BTEXN migration into buildings or structures within the Promenade and Underground Carpark, the Precinct North, the Precinct South, and the Gateway areas(including continuous structures which extend beyond these areas). Protection against vapour intrusion must be included in work planning and in building and service design and installation, as described in **Section 4.8**.
- The proposed final surface elevations of the northern and north-western portion of the Multipurpose Stadium and Associated Concourse, and of the underground carpark in the north-west of the Site, have the potential to approach or be below the inferred groundwater elevation in these areas.

  Where future development causes (or is expected to cause) surface levels to be lowered or groundwater levels to rise in parts of the Site, such that the depth to groundwater beneath a building slab becomes less than 1 m bgl, design and construction must include measures to prevent:

  - Groundwater entering into buildings and structures, or reaching the Site surface. If groundwater drainage is included in protective measures, any drained groundwater must be considered potentially contaminated waste and be removed by a licensed waste transporter, discharged under a trade waste agreement, or otherwise disposed of in a manner which does not represent any unacceptable environmental risk.
  - Drainage infrastructure and management of groundwater must consider the potential for dissolved methane to off-gas and the risks which may be generated if this occurs, and include management or mitigation measures.

  Any dewatering must also consider potential exposure and oxidation of PASS in saturated soil, as described in **Section 4.12.3**.

4.5 Personal Protection Equipment

It is the responsibility of the contractor carrying out the works on-Site to develop SWMS for works to be undertaken, including the relevant PPE to be worn by the Site workers. This SWMS should be approved by the owner or occupier of the area of Site where works are occurring. The typical minimal level of PPE required for subsurface works includes:

- Neck to toe high visibility clothing
- Hard hat when working with plant equipment (i.e. excavator or similar)

- Protective gloves (Note: Impervious gloves are to be worn if there is potential for contact with potentially contaminated soil and/or groundwater. Gloves should be checked regularly for wear and tear and replaced when necessary).
- Steel-toed boots
- Safety glasses.

Additional PPE for areas of notable contamination should be assessed by Site Safety representatives, including:

- Dust masks, or other measures to mitigate against potential soil dust inhalation, for areas of notable soil contamination noted in **Section 3.2.3** and shown on **Figure F5**.
- Breathing protection and protection such as disposable coveralls for work near NAPL or former gasworks areas.

A first-aid kit, with eye wash bottle and manual should also be available in the work area for intrusive works.

VOC emissions, consisting of fuel hydrocarbon or methane vapours, may become present during excavation, stockpiling and remediation activities involving impacted soils. Vapour monitoring, for example by use of handheld multi-gas monitors, should be undertaken during works where vapour may be generated, with equipment procedures for operation and calibration and applicable action levels must be included in WHSPs.

4.6 Physical Barriers

At present, the Site surface consists of a mixture of:

- Intact concrete or asphalt covering, in:
  - The south, south-east and eastern areas around the Goods Shed, Red Square, the carpark area, and the former SeaRoad Shed Slab.
  - The central western area around 8A Evans Street.
  - The northern portion of the Site along the Escarpment
- Crushed concrete gravel or imported clean VENM over areas of previous excavation, including:
  - The south-west corner (crushed concrete from a former warehouse slab in the area)
  - The centre of the Site (imported VENM).

The following is to be considered with regard to the management of potential human health risks at the Site:

- The Site surface should be maintained with hardstand or an earthen cap to prevent direct human access to soil. In the event that the existing hardstand is partly or wholly removed, and/or changes to the configuration and/or penetrations are made, the following would be required:
  - Further assessment to evaluate potential impact to future users.
  - Reinstatement of hardstand, or placement of an earthen cap.

  It is noted that confirmation of the design of all proposed hardstand or earthen cap areas (i.e. thickness and material type) with a Contaminated Land Auditor is required prior to placement.
- In the event that the existing hardstand is partly or wholly removed, and/or changes to the configuration and/or penetrations are made, the following minimum design barrier shall be installed, unless otherwise agreed to with a Contaminated Land Auditor. Note that consideration will need to be given to the intended use of the hardstand area during the design process to ensure the hardstand is suitable for the anticipated loads (e.g. light or heavy vehicles):
  - *Layer 1*: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users/ maintenance workers.

  - *Layer 2*: Sub-grade/ base material (minimum 0.6 m) certified as 'Fill Material' in accordance with Tasmanian EPA Bulletin 105 and be geotechnically suitable.
  - *Layer 3*: Surface covering such as concrete or asphalt at a thickness suitable for the intended use (e.g. light or heavy vehicles). Asphalt shall be a minimum 30 mm thickness to allow for longevity of the barrier.
- Any drains in future basement or subterranean structures must have a physical barrier (i.e., a grate or mesh) to prevent direct contact with any potential groundwater infiltration to drains.

Modifications of the land use and/or the configuration of the Site surface may result in a potential human health risk due to exposure to contamination in the subsurface. This includes (but is not limited to) the following:

- Construction of new buildings.
- Modification of existing buildings.
- Any subsurface excavation works.
- Modification of the existing surface profile (specifically with respect to excavation and/or levelling of soil).
- Modification of the existing surface coverings (e.g. replacing a concrete area with turf).

Section 4.12 provides further guidance with respect to conducting excavation works on the Site. It is critical that in the event that the existing physical barriers are modified or removed during any future works, then they must be reinstated to a minimum of the same standard/quality that exists at that location currently.

In the event that variation from the barrier requirements within this SEMP are required, the suitability of the proposed barriers should be confirmed with a Contaminated Land Auditor prior to implementation.

4.7 Establishment of Plants and Vegetation

Where possible, landscaped areas and gardens should be established in above ground planter boxes on hardstand and not directly over exposed soil.

Where gardens are proposed in-ground, if proposed planting consists of shallow rooted vegetation only, the following barrier system shall be installed as a minimum:

- *Layer 1*: Orange mesh para-webbing (or similar) placed as an indicator barrier over exposed soils to alert Site users.
- *Layer 2*: Earthen cover (minimum 0.6 m) certified as 'Fill Material' in accordance with Tasmanian EPA Bulletin 105.
- *Layer 3*: Surface coverage (comprising shallow rooted vegetation).

If establishment of deeper rooted vegetation, including the establishment of trees, garden and vegetation area design must conform to the designs attached as **Appendix I**, and meet the following requirements:

- Soil imported for in-ground planting must be Level 1 – Fill Material, as defined in Information Bulletin No 105 – Classification and Management of Contaminated Soil for Disposal (IB105) (EPA, 2018).
- No plants intended for consumption are to be included in any in-ground planting on the Site, and no plants grown in-ground should be consumed.
- The potential size of plant root structures should be considered when selecting species for cultivation on the Site. Planting structures should have sufficient volume for the plants to develop without requiring root structures to penetrate the earthen liners and extend beyond the clean-fill soil.
- The earthen liner and barrier layers included in planting designs are to be installed above the Site water table.

- In-ground planting is only to occur in open space use areas. No in-ground planting is to occur within Site buildings (i.e., within atriums, foyers, or arboretums).
- Trees, or any other deep-rooted plants, which are cultivated on the Site should be excavated and removed as soon as possible if any of the following occurs:
  - Death or significant rot/reduction in size;
  - Toppling/knocking over by wind or impact;
  - Any other event which whereby the original Site soil may be accessible to Site users
- In the event that plant removal occurs:
  - Removal of all root structures must be included.
  - If root structures have extended and pierced the earthen liner and/or indicator barrier layer, these must be repaired and restored as part of removal of the plant(s).

Any alternative planting arrangement must be reviewed by a suitably qualified and experienced environmental professional, and documented as unlikely to represent an unacceptable environmental risk to users of the Site or adjacent areas prior to installation.

4.8 Vapour Intrusion Protection

Known Site contamination or former uses have introduced contamination which may present a risk of vapour generation at hazardous levels.

For construction or other short to medium term intrusive Site modification or improvement projects, WHSPs must include a consideration of monitoring of vapour levels of work zone, with particular consideration of:

- Hydrocarbon and fuel vapours (including both concentrations harmful to health, and potential explosive concentrations) for work in the area of NAPL plumes (including solidified DNAPL plumes) or fuel/gasworks infrastructure.
- Hydrogen cyanide (HCN) gases in disturbance of the former gasworks area of the Site.
- Soil methane is unlikely to accumulate in open excavations or trenches, as dissipation from wind or natural air movement typically exceeds any accumulation which may occur from diffusion from soil impacts. However, potential methane accumulation in small or enclosed structures should be considered.

WHSPs should document monitoring requirements and identified action levels based on health or risk documentation for vapours during works, as discussed in **Section 4.4**.

In addition, as discussed in **Section 3.5**, vapour mitigation or protection systems for TRH/BTEXN and methane are considered required for any new structures within or extending beyond the boundaries of the Goods Shed and Yard, the Gateway, the Precinct South, the Precinct North, and the Promenade and Underground Carpark areas.

Future building and utility design in these areas, or any structures which include these areas in their footprint, must have gas protection systems in place as follows:

- Methane – The protection system must include the sufficient protection measures for CS3, as defined in *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020).

  Table 8 in EPA NSW (2020) provides required gas protection guidance values based on the land use. Based on the current proposed development of the Site, a gas protection guidance value of 2 is considered required (AECOM, 2026a).
- TRH/BTEXN – A vapour mitigation system that provides a protection level equivalent to that specified for CS3 is considered appropriate for VOCs (EPA NSW, 2020), including TRH/BTEXN, if it is:

  - Suitably resistant to Site-specific CoPC identified, TRH and BTEXN, including long-term durability.
  - Has at least one layer of redundancy, where each layer is capable of independently providing the protection required.
  - Has calculated vapour fluxes or venting rates (if a ventilation layer is used) which demonstrate no unacceptable risk to users of the building or structure, as described in EPA NSW (2020).
- Design and construction documentation must include:
  - Demonstrated compliance with the required gas protection guidance value.
  - A documented testing and verification method for vapour intrusion mitigation measures, with reference to Appendix 7 – Verification and construction quality assurance, of EPA NSW (2020).
  - Have documented procedures for ongoing maintenance and inspection of vapour protection systems, including post-construction monitoring of venting layers if used, and requirements for restoration of any vapour protection systems which are damaged or penetrated by future activities.

As noted in **Section 4.7**, inground plants (such as atrium vegetation) must not be established over gas protection systems, to prevent potential roots from penetrating protection layers.

Any design and/or installation of vapour protection measures will require independent oversight and sign-off by an Environmental Auditor, or other suitably qualified and independent verifier.

Scoring and description of potential vapour mitigation measures, taken from Table 9 of EPA NSW (2020), are provided on **Table 11** below, with further detail on each measure found in EPA NSW (2020). A required vapour protection guidance value may be met by a combination of measures but must equal or exceed the requirement.

Table 11 Gas Protection Guidance Values (EPA NSW, 2020)

Measure or System Element	Score	Comments
Venting and dilution measures		
Passive sub-floor ventilation with very good performance – the steady-state concentration of methane over 100% of the ventilation layer remains below 1% v/v at a wind speed of 0.3 metres per second (m/s)[(a)]	2.5	The design of the venting layer (i.e. granular medium with inlet/outlet pipes versus open-void or modular drainage system)[(b)] must be considered when modelling steady-state concentrations
Passive sub-floor ventilation with good performance – the steady-state concentration of methane over 100% of the ventilation layer remains below 1% v/v at a wind speed of 1 m/s and below 2.5% v/v at a wind speed of 0.3 m/s)[(a)]	1.5	If post-installation testing of passive ventilation indicates that it cannot meet this requirement, inlets and outlets must be upgraded. If this is unsuccessful, it will be necessary to retrofit an active system
Sub-floor ventilation with active abstraction or pressurisation	2.5	Not appropriate for NEPM HIL A residential settings because robust management systems, including alarms, must be in place to ensure long-term operation and maintenance. Achieving the full score requires a design with adequate redundancy and full coverage of the building footprint.
Ventilated car park (basement or undercroft)	4.0[(d)]	Assumes that the car park is vented to deal with exhaust fumes in accordance with BCA[(c)] requirements. The design of a car-park and the specifications of its ventilation system need to be considered in assigning an appropriate score of up to four.

Measure or System Element	Score	Comments
Horizontal soil barriers beneath building footprint		
Horizontal clay or amended soil barriers designed to achieve defined permeability and diffusivity of the gases of concern placed, compacted and tested under appropriate engineering supervision	(d)	Requires appropriate engineering input and integration with the building design from the earliest possible stage. This must consider the effects of any proposed piling on the gas regime
Floor slabs		
Reinforced concrete ground-bearing floor slab or waffle pod slab	0.5	At a minimum, it is good practice to install ventilation in all foundation systems to relieve pressure. Breaches in floor slabs, such as joints, have to be effectively sealed against gas ingress to maintain performance
Reinforced concrete ground-bearing foundation raft slab with limited service penetrations cast into slab	1.0	
Reinforced concrete cast in situ or post-tensioned suspended slab with minimal service penetrations and water bars around all penetrations and at joints	1.5	
Fully tanked basement	2.0(d)	The design of a basement and the specifications of its ventilation system need to be considered in assigning an appropriate score. Fully tanked means designed to be waterproof under the range of groundwater conditions likely at the site, to the extent that supplementary internal drainage is not required
Membranes		
Proprietary gas-resistant membrane with a gas transmission rate for the gases of concern on the site that is certified and appropriate to the overall design of the gas protection system. It should be installed by a specialist to an appropriate level of workmanship with documented internal construction quality control (CQC), including integrity testing (e.g. tracer gas or smoke testing), under independent construction quality assurance (CQA) carried out by a certified specialist(e) or appropriately qualified and experienced professional with independent verification of the entire process(f)	2.0	Membrane performance depends on the membrane material and thickness specified, design and quality of the installation, protection from and resistance to damage after installation, and the integrity of joints in membranes that require joints. Materials that offer some degree of self-sealing and repair are preferred. Long-term performance depends on the durability of the material, including its resistance to chemical degradation in the environment in which it is installed
Monitoring and detection (alarms)		
Intermittent monitoring using hand-held equipment	0.5	Monitoring and alarm systems are only valid as part of a combined gas protection system. Where fitted, permanent systems should be installed in the underfloor venting system but can also be provided in the occupied space as a back-up
Permanent monitoring system installed in the occupied space of the building	1.0	
Permanent monitoring system installed in the underfloor venting or dilution system	2.0	

Measure or System Element	Score	Comments
Pathway intervention external to building footprint		
Vertical barrier	(g)	Required for residential and public buildings at CS 4 and above
Vertical venting systems (source depressurisation)	(g)	

Notes: *(a) Verified by post-construction monitoring; (b) See Appendix 6 of EPA NSW (2020); (c) Building Code of Australia; (d) Score depends on site-specific conditions and design; (e) For example, Geosynthetic Certification Institute – Inspectors Certification Program; (f) See Appendix 7 of EPA NSW (2020); (g) Score depends on site-specific conditions and design, but scores of 4.0+ should be achievable*

4.9 Exclusion Zones

Exclusion zones related to sensitive underground services are currently present on the Site and require controls and consideration in work planning. The known services with established exclusion zones are listed on **Table 12** below, and shown on **Figure F5**.

It is noted that other potential exclusion zones, or underground services which represent a risk if disturbed by intrusive works, may be present or installed by other parties in the future. Any intrusive works undertaken on the Site should consider the potential for underground services in work planning.

Table 12 Known Exclusion Zones

Exclusion Zone	Extent and Area	Requirements and Comments
Hobart Main Pipeline (Sewer) Asset owned by TasWater	3 m around the Hobart Main Pipeline, which passes through the central portion of the Site.	Approval from TasWater is required to undertake construction or groundwater disturbance activities within the exclusions zone, with requirements described in *Guidelines for Building near Sewer or Water Pipelines* (TasWater, 2017). It is noted that this sewer line is being realigned off-Site, and is expected to be removed as part of Site development.
Telecommunication Cables Assets owned by Telstra Tasmania	2 m around the telecommunication cables in the Escarpment in the north-west area of the Site.	Any requirements to work near these assets should be confirmed with the asset owner prior to commencement. It is noted that these cables are likely to be removed as part of development of the Site, although it is not known if this has been explicitly proposed or discussed with the asset owner.
High voltage (HV) and low voltage (LV) power cables in a single conduit. Assets are owned by TasNetworks	3 m around the HV cable 0.5 m around the LV cable The cables are located on-Site, or have exclusion zones which extend onto the Site, in the south-west corner within the Gateway	Any requirements to work near these assets should be confirmed with the asset owner prior to commencement. It is noted that areas of potentially elevated contamination have been identified within these exclusion zones, and additional controls (below this table) are required for any activity in the exclusion zones, or if the cables are removed as part of future development.

It is noted that:

- Lead concentrations in soil within the sewer and telecommunication exclusion zones exceeds the Site derived Remediation Criteria (RC), listed in **Appendix G**, for intrusive maintenance workers, and potential exposure to lead in soil should be considered when planning intrusive work within the exclusion zones.

In the event that these services are disconnected and/or removed from the Site:

- Remediation of soil via excavation may be considered. Any such remediation would require validation by a suitability qualified and experienced environmental professional.
- If lead impacted soil is not removed and validated, the records that these areas should be considered as having potentially elevated soil contamination (**Section 3.2.3**) should be maintained. Any subsurface services within these areas should be installed in clean soil corridors or protective shrouds to reduce potential exposure during future intrusive maintenance works.

- Potential NAPL and former gasworks waste, referred to as Tar Plumes A (in part), C and Tar Plume D and described in **Section 3.4**, has been identified within the exclusion zone around the power cables in the south-west corner of the Site.

  In the event that intrusive works are undertaken within the exclusion zone around these power cables:

  - PPE and monitoring requirements suitable for work near potential DNAPL should be incorporated in safety documentation and procedures. At a minimum, monitoring for volatile organic compounds (VOCs) and hydrogen cyanide (HCN) with appropriately maintained and calibrated monitoring equipment should be undertaken, with suitable action levels for any detectable concentrations of potentially hazardous vapour.
  - The high and low voltage cables are understood to be installed within a conduit of clean soil. Tar was not encountered at the base of the conduit during installation. In the event that maintenance on the cables is required, work should be limited to within this soil conduit and vertical excavation should be limited to the extent practicable.
  - If the conduits are removed or otherwise decommissioned and the exclusion zone removed, documentation of Tar Plumes C, D, and the portion of Tar Plume A not treated by ISS should be maintained in the SEMP and considered in planning intrusive work in those areas.

    A barrier layer should be maintained over the areas of potential impact as described in **Section 4.6**.

4.10 Chemical Exposure

The following CoPC have been identified in soil, groundwater, and soil vapour at concentrations above the adopted assessment criteria in past investigations and may pose a potential human health risk during future intrusive work:

- Heavy metals
- PAHs
- TRHs
- BTEXN
- ACM
- Methane
- NAPL, including solidified NAPL

A summary of the potential symptoms of exposure is provided in **Appendix D**. Potential exposure to these CoPC should be managed through the implementation of measures provided in a Site-specific WHSP (refer **Section 4.3**).

Other CoPC which may be present at the Site based on historical uses and information, but which have not been detected at potentially hazardous concentrations, are listed in **Section 3.1**.

4.11 Unexpected Finds

In the event that unexpected finds are encountered during intrusive works which have the potential to cause harm to human health or the environment, works shall cease and the area isolated. The Site supervisor and owner/occupier should then immediately be informed.

An unexpected find may include (but not be limited to):

- ACM (see **Section 3.6**)
- USTs
- Redundant pipework and abandoned services (as discussed in **Section 2.4**)
- Historic artifacts (Aboriginal and European) (see **Section 4.11.1**).
- Former gasworks infrastructure
- Stained, odorous, or discoloured soil
- Groundwater at a shallow depth than anticipated.

The material should be appropriately assessed by an experienced environmental or health and safety practitioner (depending on what the material is) and disposed/treated in a suitable manner with consideration to the guidance outlined in **Section 4.12**. Historic or artifact finds should be managed as described in **Section 4.11.1**

It should be noted that during previous Site investigations, redundant pipes and other abandoned services have been encountered which are not on any records and the origin and purpose of which remains unknown. There remains further potential for unidentified pipes to be discovered during subsurface works, and ACM has been detected in bituminous cladding of some pipelines previously removed from the Site. Underground service location surveys are to be completed prior to the commencement of subsurface works and due caution taken as part of any excavation.

Further to the above, if subsurface works are to be undertaken within the Gateway area, or in proximity to the former Hobart Gasworks, reference is made to recommendations provided in Workplace Standards Tasmania *Safety Alert No. 1 September 2010* with regard to working near historical gas infrastructure.

4.11.1 Protocol for Management of Unanticipated Archaeological Discoveries

The potential exists for unexpected Aboriginal and European artifacts to exist in Site soil. Portions of the Escarpment, Gateway and Promenade and Underground Carpark areas have been identified as a Place of Archaeological Significance in the *Sullivans Cove Planning Scheme.*

The following outlines the protocol for managing Unanticipated Historic (European) Archaeological Discoveries. Separate legislative and procedural requirements exist for Aboriginal heritage and these are documented in the Unanticipated Discovery Plan (attached as **Appendix H**).

Archaeological investigations have taken place at Macquarie Point since 2008 through a series of test and controlled excavations, principally at the western end of the site. These works assist in understanding subsurface archaeological conditions and the potential of certain locations within Macquarie Point to contain archaeological features. Based on these insights, some inferred judgements have been made on:

- The potential, or likelihood for particular areas to contain subsurface archaeology; and
- The likely significance of such features or deposits.

Figure 3 shows the inferred areas archaeological sensitivity of the Site based on works completed to date (MPDC, 2024b), consisting of:

- High Sensitivity. High archaeological sensitivity is present within a single location of Macquarie Point in an area of the original ground surface with demonstrated or historically documented high levels of preservation. This area is highly sensitive both in terms of Aboriginal and early colonial archaeological potential.

- Moderate Sensitivity. Areas of moderate archaeological sensitivity include two places that are within or near to the original shoreline but may not have been heavily or moderately disturbed by twentieth century or late nineteenth century industrial development. These areas may be covered by fill or built upon by later development but there remains a reasonable probability that significant historical or Aboriginal materials are retained, although it is likely they are in a disturbed or secondary context. Any significant archaeological materials that are present may be intermittent or truncated. While twentieth century or late nineteenth century construction has left structural remnants that has not resulted in the total removal of the early soil profile.
- Area Cleared Through Excavation. The archaeological potential of these areas has been previously realised through past archaeological excavations.
- Low Sensitivity. These areas are distinguished by disturbances associated with twenty-first, twentieth century or late nineteenth centuries' industrial development. The pre-colonisation ground surface in this area may be entirely removed or stripped back to bedrock. These locations may also be the site of significant land reclamation. The potential for isolated pockets of redeposited archaeological material remains but is considered to be very small. There is a very low likelihood for Aboriginal cultural material to be present even in secondary contexts.
- Indeterminate or Nil Sensitivity. This rating of sensitivity reflects a lack of determination or a positive assessment of nil archaeological sensitivity across the broader areas of the site as documented in earlier reports and sensitivity mapping. It denominates areas for which detailed subsurface information is lacking but which have not been considered to contain any significant archaeological material. The inclusion of an area within this level of sensitivity rating is not intended as a definitive statement of its sensitivity but rather indicates that while previous sensitivity mapping may have considered the historical development of this area, there has been no assertion of archaeological potential.

The "Royal Engineers Building and Stone Post" (shown on **Figure 3** as 2 Davey Street 'Royal Engineers Building') and the Goods Shed are listed on the Tasmanian Heritage Register and require additional protection and consideration of heritage for development. The Goods Shed is proposed to be moved to the north of the Site, and no development of the Royal Engineers Building is proposed at this time. The former location of Lord's House adjacent to the Royal Engineers Building and the Rivulet Diversion Tunnel (referred to elsewhere in this document and other reports as the Hobart Rivulet) are also of historic interest, but are not registered as heritage features.

Areas of Aboriginal sensitivity, where shell middens have been observed, are also known to be present in Regatta Point.

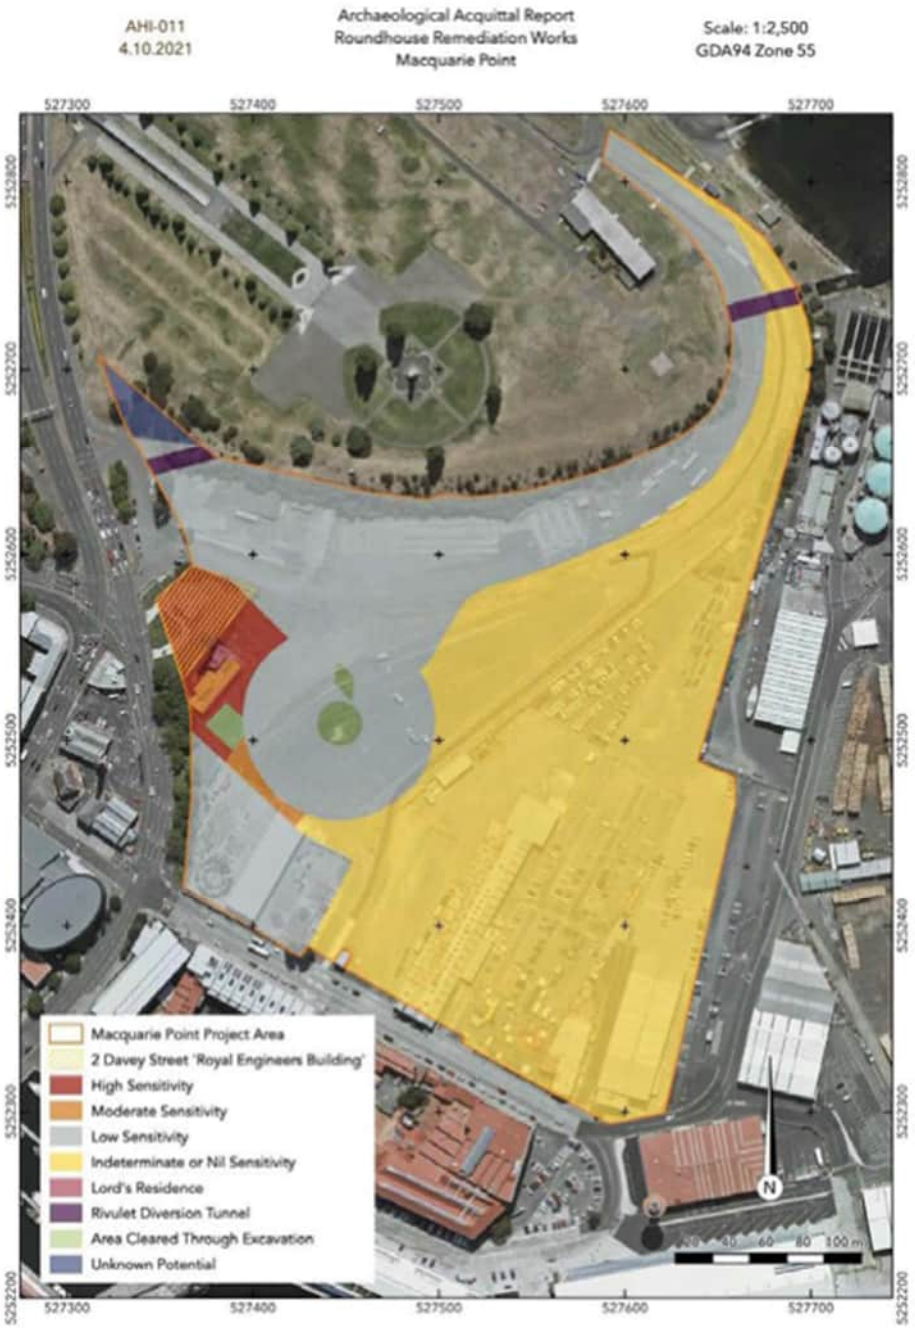

Figure 3 Areas of Inferred Archaeological Sensitivity (MPDC, 2024b)

However, it is highly likely that unanticipated archaeology will be encountered during excavation works because of the diversity and widespread nature of past development on the site and the limited insights available from historical research and excavations.

To account for such finds, project specifications for works must consider the potential for dealing with unanticipated discoveries. The Sullivans Cove Planning Scheme 1997 includes specific requirement as part of its requirements for Archaeological Sensitivity Reports, terming such protocols a ‘watching brief’.

Features may include but not be limited to the exposure of handmade clay bricks or sandstone blocks forming walls or surfaces, or artefacts such as fragments of ceramic, bottle glass, bone, shell or other items. Where such material is found, or where doubt exists, excavations within the area should cease pending attendance on site and receipt of advice from a qualified archaeologist, at which point, depending on the findings, it may also be necessary to involve Hobart City Council in discussions.

What if any further archaeological management is required will depend on the significance of the discovery. This will largely be a question of its thematic context; its potential to provide new and important information; and its condition. Management may vary from no further action, to recording of exposed features, to further archaeological monitoring, testing or controlled excavation in accordance with Parts 4 to 8 of the Tasmanian Heritage Council's *Practice Note 2: Managing Historical Archaeological Significance in the Works Application Process.*

4.12 Soil Management Plan

The management of soils at the Site must have regards to the provision of both the *Environmental Management and Pollution Control Act 1994* and IB105.

4.12.1 Excavated Material

In the event soil needs to be excavated, the contamination status of the soil must be determined and a waste classification assessment completed (discussed in **Section 4.12.4**).

If excavated materials are stored on-Site, they must be stockpiled in a designated area, or otherwise stored in soil drums, waste skip or other containment which prevents contact with Site surfaces or loss of soil via erosion, and must be labelled as contaminated, until the material is removed, reinstated, or otherwise disposed of.

The stockpiling area is to be on hardstand or high-density polyethylene (HDPE) sheeting. Stockpiles should be appropriately managed to prevent the loss of suspect soils as dust (via wind erosion), or stormwater runoff.

This may involve:

- Covering, or spraying the stockpiles to keep the soil damp to mitigate wind erosion.
- Construction of silt fences and other measures to capture and prevent runoff from the area.
- Establishment of exclusion zones or barriers to prevent access and contact with soil by unauthorised people.

Stockpiling for an extended period of time should be avoided in order to mitigate potential environmental impacts such as dust and odour generation, and stormwater and sediment run off. Exclusion zones or barriers should be maintained around excavations to prevent access by unauthorised people who may fall into excavations or come into contact with the soil.

Soils with potentially high levels of contamination encountered during excavation work must be separated and stockpiled from other non-odorous, visibly clean soils, and assessed by a suitably experienced environmental practitioner. Soils which should be separated in this way may be identified by one or more of the following attributes:

- Containing coke, ash, coal tar, ACM fragments, or other visually evident contamination
- Highly odorous (i.e. putrescible, aromatic or hydrocarbon odours)
- Visibly stained (i.e. hydrocarbon staining or other)
- Soil which appears to have been in contact with groundwater
- Soil excavated from the areas of notable soil impacts as noted in **Section 3.2.3**.

4.12.2 Dust Management

This section is applicable to works associated with subsurface excavation and soil movement. It is expected that normal operation of the Site, or intended future uses, will not require the implementation of dust and odour controls.

The following measures that can be undertaken to assist with mitigating issues associated with dust and odours should be considered when planning soil excavation or movement on the Site:

- Minimise movement of vehicles on exposed surface areas
- Minimise excavation and movement of soils

- Dampen down vehicle tracks with water or undertake wheel washing
- Trucks transporting soil around and off-Site should have their loads covered with tarpaulins (or similar) to prevent the emission of dust and/or odour
- Dampen down exposed soil in excavations, or in stockpiles, to minimise dust generation
- Dampen down exposed soil, stockpile, or loads, with an environmentally appropriate odour suppressant solution
- Avoid excavating soil on windy days, due to the increased likelihood of dust and odour generation and transport
- Cover exposed soil (i.e. stockpiles) with netting, matting or plastic sheeting if necessary, to minimise generation of dust and odours.

4.12.3 Acid Sulfate Soil

This section is applicable to works associated with subsurface excavation and movement of soil at or near the water table, where greater than 100 m^3 in volume of soil will be disturbed or potentially exposed to atmospheric oxygen.

PASS located in saturated materials at or near the water table has the potential to oxidise and form Actual Acid Sulfate Soil (AASS) if disturbed or exposed to oxygen. The extent and characteristics of PASS detected at the Site are described in *Acid Sulfate Soil Investigations* (AECOM, 2025d).

Any Site activities where disturbance of soil is identified must have an Acid Sulfate Soil Management Plan prepared, which should be prepared with reference to the *Tasmanian Acid Sulfate Soil Management Guidelines* (DPIPWE, 2009) and must detail:

- Measures taken to eliminate or avoid disturbance and potential acidification of PASS.
- Storage, handling and containment measures for any PASS which is excavated.
- Measures to be taken to neutralise or prevent acidification of PASS, both any which is excavated, and any which remains *in situ* but may be exposed to a potentially oxidising environment.

It is noted that update of *Acid Sulfate Soil Investigations* (AECOM, 2025d) is underway to include additional details on required controls and measures, and is expected to be issued in November 2025. The SEMP will be updated with these measures when available.

4.12.4 Characterisation for On-Site Reuse/ Off-Site Disposal

Tasmanian EPA Information Bulletin No. 105, *Classification and Management of Contaminated Soil for Disposal* (IB105) (EPA, 2018) provides guidance with regard to the classification of contaminated soil for disposal purposes. Two categories of Fill Material were introduced by amendment of the *Environmental Management and Pollution Control Act 1994* (the EMPCA) and the *Environmental Management and Pollution Control (Waste Management) Regulations 2020* in 2021, and clarified by *Clean fill Type 1 and type 2 – Declaration of pollutant levels* (EPA, 2022).

Soil at the Site excavated and removed from the Site as part of remediation work between 2015 and 2024 has typically been characterised as Level 2 – Low Level Contaminated Soil due to the presence of:

- Metals (arsenic, cadmium, chromium (total), copper, lead, mercury, nickel, tin, zinc)
- TPH (>C10-C36)
- PAHs

It is noted that total concentrations of PAHs (generally benzo(a)pyrene and Sum of PAHs) and lead in excess of the Level 2 criteria have been detected in Site soil. However, Section 2 of IB105 states that "*Generally, where a leachable concentration is prescribed in Table 2* [of IB105] *that value takes precedence over the total concentration and is used as the sole determinant of the final classification for disposal…*"

Leachate concentrations of benzo(a)pyrene, benzo(a)pyrene toxicity equivalence quotient (TEF), and lead have typically been reported below the Level 2 criteria. However, total concentrations of these CoPC have been, and should be for future soil, considered when determining disposal scenarios.

Based on analytical results available for soil which remains *in situ* at the Site, it is expected that remaining soil will have similar characteristics. Small areas of other possible characterisations may exist, consisting of:

- Level 1 – Fill Material, which has been identified on-Site in:
  - Areas where clean fill has been imported and no contaminating activities have occurred, such as bedding sand beneath recent slabs.
  - Natural rock (dolerite bedrock) which has been excavated and crushed.
- Level 3 – Contaminated Soil, which has been identified on-Site in:
  - Areas of elevated hydrocarbon impact where bulk fuel storage has previously occurred, such as proximity to known LNAPL plumes.
  - Areas of elevated metals concentration in fill material.
  - Areas of leachable PAHs or tar traces in the former gasworks area in the southwest corner of the Site (the Gateway).

Due to the heterogeneous nature of soil at the Site, excavated soil or other materials from the Site must be stockpiled (or stored within a skip/drums) and appropriately characterised for on-Site reuse or off-Site disposal by a suitable qualified environmental practitioner on a case by case basis.

It is noted that in accordance with IB105, on-Site remediation, treatment and/or reuse is the preferred approach to the management of contaminated soil.

A recommended approach for characterising excavated materials is provided in the following sections.

4.12.4.1 Soil Assessment and Sampling

Any assessment of soil, including any sampling program to determine acceptable on-Site reuse or off-Site disposal scenarios, should be planned and undertaken by a suitability qualified and experienced environmental practitioner.

Any such assessment should consider the history of the source area and potential sources of contamination, and any previous investigations or available analytical data, in order to identify CoPC in the soil to be assessed. Additional sampling, if required, should be conducted in line with the guidelines and practices in the ASC NEPM and other guidance or commonly accepted reference methodologies, and should include quality assurance and quality control sampling such as intra- and inter-duplicate samples and analytical blanks.

Soil should be sampled at a suitable rate for assessment and identification of contaminants. IB105 defines 1 sample per 25 m^3 for waste classification, but statistical assessment methodologies, such the approach provided in *IWRG702 - Industrial Waste Resource Guidelines: Soil Sampling for Waste Soils* (IWRG702) (EPA Victoria, 2024) may be appropriate for larger volumes with EPA approval.

4.12.4.2 On-Site Reuse

To assess the suitability for excavated materials to be reused on Site, it is recommended that soil data be screened against the Site derived Remediation Criteria (RC) developed by AECOM (refer AECOM, 2016, 2025a) and listed in **Appendix G**. The RC are based on generic assumptions regarding future land use including:

- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of Maintenance Workers) to have direct contact with soils or groundwater.
- Groundwater extraction will not be undertaken except for investigative or remediation purposes.
- A SEMP (this document) will be in place in the future to maintain/manage the surface cover. The SEMP is likely to be included as part of the Site suitability statement provided by the Site Environmental Auditor.

- Adjacent off-Site land uses include open space, commercial/industrial and residential areas. As these potential land uses have been considered on the Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g. via groundwater migration beyond the Site boundary).
- It is considered that potential exposure to workers undertaking remediation and/or development activities can effectively be mitigated through the implementation of an appropriate Construction Environmental Management Plan. The CEMP will be prepared during the planning stage for any future remediation and/or development activities.

Soil should be analysed for, at a minimum:

- Heavy Metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, vanadium, and zinc)
- TPH
- BTEX
- PAH
- Cyanide
- Phenolic compounds.

In addition:

- At least 30% of samples should be analysed for a full suite of the compounds listed in IB105, with the exception of tributyltin, which has not been detected or historically used on Site.
- If it is suspected that other contaminants may be present (e.g. asbestos), these should also be included in the analytical suite.
- If >100 m^3 of soil has been excavated from below or within 1 m of the water table, it should be managed as PASS as described in **Section 4.12.3**. Soil should only be considered for reuse if neutralisation of any potential acidification has been confirmed by laboratory analysis, typically by either chromium reducible sulfate (CRS) or suspension peroxide oxidation and combined acidity sulfate (SPOCAS) analysis.

Where compounds are reported below the interim RC, soils may be reused on-Site and covered with an impervious barrier (i.e. placement of physical hardstand). In cases where compounds are reported above the interim RC, an appraisal as to whether the material is suitable for on-Site reuse (with consideration to the implementation of additional management controls) should be undertaken by an appropriately experienced environmental practitioner.

4.12.4.3 Off-Site Disposal

If off-Site disposal of excavated material is planned, stockpiles or waste in soil drums must be sampled and analysed for waste characterisation purposes prior to removal from Site in accordance with IB105.

Material should be sampled at a rate of 1 sample per 25 m^3 (or three samples as a minimum) and analysed for compounds listed on Table 2 of IB105. Alternative sampling suites and/or density may be accepted by EPA and waste disposal facilities, but any change from the sample suites and sample density should be determined by a suitably qualified environmental practitioner.

If >100 m^3 of soil has been excavated from below or within 1 m of the water table, it should be managed as PASS as described in **Section 4.12.3**, and neutralisation should be confirmed by laboratory analysis prior to any off-Site disposal.

Table 13 below provides an overview of soil disposal options with reference to IB105.

Table 13 IB105 – Waste Classification Summary

EPA Classification	Disposal/ Treatment Options	Requirements
Level 4 (Contaminated Soil for Remediation)	• On-Site remediation • Off-Site remediation • Storage pending availability of treatment	• No direct disposal to landfill • EPA Environmental Approval and transport certificates must be used • Vehicles must hold EPA permit (unless exemption issued)
Level 3 (Contaminated Soil)	• On-Site remediation • Off-Site remediation • Licensed landfill	• Disposal to licensed facility • EPA Environmental Approval and transport certificate system must be used • Vehicles must hold EPA permit (unless exemption issued)
Level 2 (Low Level Contaminated Soil)	• On-Site remediation • Off-Site remediation • Licensed landfill	• Disposal to licensed landfill • EPA Environmental Approval and transport certificate system must be used • Vehicles must hold EPA permit (unless exemption issued)
Level 1 (Fill Material)	• Unrestricted	• Disposal should not adversely impact the environment or human health

A Waste Management Plan (as detailed in Section 5.2 of IB105) must be prepared and submitted to EPA for approval for disposal of any material which is classified as *Level 2 (Low Level Contaminated Soil)* or above.

Soils and excavated materials classified as *Level 4 (Contaminated Soil for Remediation)* must be remediated (either on-Site or off-Site) and are typically unable to be disposed directly to landfill without treatment.

Any proposed disposal site must be legally able to accept the quantities and contaminant profile of any material proposed for off-Site disposal.

4.12.5 Imported Material

Any materials imported to the Site for use as fill will be required to meet the environmental and geotechnical requirements specified for the particular end use. Material should comply with the requirements for reuse as defined in IB105 and should be assessed and below the site specific RC as defined in **Appendix G**.

Compaction of backfill should be applied such that the reinstated areas will not settle.

4.12.6 Surface Reinstatement and Barrier Restoration

Where hardstand has been removed to facilitate excavation activities, it is recommended that the surface be reinstated with like materials (i.e. concrete with concrete), or with a physical barrier which fulfils the requirements described in **Section 4.6**.

4.12.7 Material Tracking

A record of excavated soil and stockpile movements, including, but not limited to, the location of materials excavated, quantities, descriptions of materials encountered (including observations of potential contamination), laboratory test certificates, disposal location, and tip dockets, should be maintained by the Site owner or occupier for any work involving the import, excavation, or other movement of soil at the Site. This tracker should be kept with Site records for future reference.

The form of tracking may be determined by those managing or conducting the works, however an example materials tracking register is attached as **Appendix E**.

4.13 Groundwater Quality Management Plan

A Site-specific Groundwater Quality Management Plan (GQMP) is attached as **Appendix F**, and must be implemented at the Site in order to allow:

- Maintenance of knowledge on the condition of Site groundwater elevation, flow direction, and chemical characteristics and record any changes which may arise over time or as Site condition changes.
- Assess if unacceptable risks to on- and off-Site human and ecological receptors may be presented by changes in groundwater conditions, and to identify what additional assessment, mitigation, or remediation actions are required.

The GQMP includes:

- A summary of the regulatory framework applicable to the assessment and management of groundwater at the Site.
- Data Quality Objectives (DQOs) for groundwater monitoring events (GMEs) at the Site.
- Methodologies for ongoing monitoring and sampling of groundwater.
- Key groundwater risks.
- Trigger levels and contingencies.

The GQMP should be reviewed and updated at the same frequency and conditions as the SEMP (**Section 5.4**), or as otherwise identified within the GQMP. Ongoing groundwater monitoring at the Site within the GQMP may only cease with Environmental Auditor verification of the final GME report which recommends cessation of groundwater monitoring.

4.14 Noise Control

Works with heavy plant or other equipment which has the potential to cause noise above background levels should be conducted in accordance with the most recent version of the Corporation's Construction Noise and Vibration Management Plan (CNVMP) (Hanson, 2025), or have otherwise documented procedures and methodologies which comply with the *Environmental Management and Pollution Control (Noise) Regulations 2016*.

Noise and vibration controls should consider and include:

- Receptors on- and off-Site who may be affected by noise and vibration.
- Acceptable levels of noise and vibration generation, including Noise Management Levels and alarm levels
- Potential sources of noise and vibration, and allowable hours of operation
- Mitigation and monitoring procedures

5.0 Implementation

The SEMP is an active document, which needs to be considered by all parties/stakeholders who may plan or undertake works which come into contact with Site soil or groundwater or access confined spaces where groundwater or soil vapour infiltration may occur. Any parties carrying out such works at the Site shall satisfy themselves that suitable safety and environmental controls have been implemented as part of their proposed works program.

Should any activities by the Site owner or occupier, or with their consent, need to occur on the Site that is not currently covered in the SEMP, then the SEMP should be updated to include these activities. Alternatively, as stated in **Section 4.1**, a CEMP may be required which specifically addresses the proposed tasks and how the works shall comply with the general requirements of the SEMP.

5.1 Site Inspection

Visual inspections of the Site should be undertaken by the Site owner or occupier (or nominated representative) annually to assess the surface condition of the Site. Where excavations have taken place, and excavations have been backfilled, the surface is to be reinstated with an impervious barrier (i.e. placement of physical hardstand).

If significant works are undertaken, or breaches or damages to surface protections are detected, inspection of the affected area should be undertaken at the time of works, and at the completion of modifications of the area, or repairs to damaged surface coverings.

Where this has not been undertaken, corrective actions will be required to reduce the risk to an acceptable level to such an extent that it no longer presents an unacceptable risk to human health or the environment.

A register of the completion of visual inspections and documentation associated with works completed subsequent to inspections identifying the need for corrective actions should be maintained by the Site owner or occupier, as noted in **Section 5.5**.

The register of inspections should include (but not be limited to) the following:

- Time and date of the inspection and/or incident
- Details of any visual indications of changes to surface conditions at the Site
- Details regarding the cause (suspected or known) of the breach
- Details and documentation associated with works undertaken in the reinstatement of surface condition
- Details of any systems or procedures implemented to prevent similar breaches or deteriorations in the future.

5.2 Incident Management

All environmental incidents should be recorded, and if an incident or potential incident is likely to cause significant impacts to people or the environment, the Site owner or occupier should be immediately notified.

Environmental incidents, accidents or mishaps include:

- An incident or actual environmental impact.
- A near miss, where an incident has occurred, but no environmental impact occurred.
- Observations of potentially hazardous or unsafe situations.

Records shall be kept by the Site owner or occupier of any environmental incidents, hazardous situations, unusual events and the corrective action taken. A representative of the Site owner or occupier should investigate the cause of any emergency so that necessary changes in work practices can be made to prevent the incident recurring.

5.3 Corrective Actions

In the event that Site conditions result in an accidental or unintentional risk to human health or the environment without implementation of appropriate exposure minimisation measures, isolation of the affected area should be undertaken and steps taken by the most suitable and effective means to prevent exposure to Site personnel or the environment.

Following this, the SEMP should undergo a review of all procedures to minimise the potential for future exposure of impacted material. Corrective actions should be completed in a manner and timing as directed by the Site owner or occupier.

Following the incident or accident, a documented review of the incident should be undertaken by the Site owner or occupier (or their nominated representative). The review should be tasked with identifying the cause of the incident and providing recommendations on alternative procedures or systems to be implemented at the Site and/or within the SEMP to prevent/minimise the likelihood of the incident reoccurring.

5.4 Document Revision

A review of the SEMP should be undertaken by the Site owner/occupier:

- Every three years, based on the range of 1 to 5 years provided in *Environmental Management Plan Guidelines* (DCCEEW, 2024).
- If significant changes in Site use or environmental condition (i.e., a chemical release) occur.
- If significant changes to environmental legislation occur
- Within three months of any design variance being reviewed and accepted by a suitably qualified and experienced Contaminated Land Auditor prior to construction (**Section 1.2**).

Reviews should consider the following, and identify if any update or revision of the SEMP is required:

- Any non-compliances with the SEMP that have not been rectified
- Means of improving environmental compliance
- Changes legislation or guidelines that impact any part of the SEMP or use of the Site
- Proposed changes in the way the areas of the Site are used or any changes in the surrounding land use which may impact upon exposure pathways.
- Any design variances (i.e., proposed designs which did not comply with the wording of the SEMP) which have been reviewed and verified as not introducing any unmanaged or unacceptable environmental risks by a suitably qualified and experienced Contaminated Land Auditor (see **Section 1.2**).

Any changes or updates to the SEMP should be recorded in **Appendix K**. The Site owner/occupier (or their designated delegate) must communicate any changes and provide the most recent version of the SEMP to any contractors or other workers who are undertaking Site activities which may come into contact with soil or groundwater.

5.5 Record Keeping

The Site owner or occupier will be responsible for keeping documents relating to the implementation of the SEMP, including (but not limited to):

- Documentation generated by the activities in **Section 5.1** to **5.3**, including records of Site inspections, environmental incidents, and corrective actions.
- The outcomes of additional environmental assessments or modifications in the future Site uses.
- Any design variances (i.e., proposed designs which did not comply with the wording of the SEMP which have been reviewed and verified as not introducing any unmanaged or unacceptable environmental risks by a suitably qualified and experienced Contaminated Land Auditor (see **Section 1.2**).

- A SEMP maintenance register (including superseded versions of the SEMP), Site inspection documents, permits and approvals for environmental work, and training records of people who have been inducted onto the SEMP.
- Documentation of the following:
    - Materials tracking and disposal
    - Unexpected finds
    - Environmental incidents which occur on Site
    - Any other environmental investigations or records, such as records of annual GMEs conducted under the GQMP (**Appendix F**).

The SEMP and any records of environmental activities must be provided by the previous Site owner to the new owner in the event of any land sale or transfer, which changes control of all or a portion of the Site.

7.0 Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract titled *Macquarie Point Development Project – Proposal for Report Updates – Acid Sulfate Soil and SEMP* dated 19 September 2025.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report is dated 16-Feb-2026, and is based on the information reviewed and referenced in the Report text at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

1.0 Goods Shed and Yard Contamination Summary

Historical activities undertaken within The Goods Shed and Yard area have resulted in the presence of residual soil and groundwater contamination. Multiple phases of soil, groundwater and soil vapour investigations have been undertaken to assess the nature and extent of contamination. The following sections provide an overview of identified soil and groundwater impacts in this area of the Site.

No further remediation of the Goods Shed and Yard is planned or considered required at this time.

1.1 Identified Soil Impacts

Fill has been identified beneath the Goods Shed and Yard area from the surface to depths of 7 – 10 m below ground level (bgl). Field observations indicated that fill material is heterogeneous comprising silts, sands with dolerite gravels and cobbles with occasional rubble, glass, metal fragments, coal, coke and ash. A slight hydrocarbon odour was noted at two sampling locations (BH36 and MW127), and a slight hydrocarbon sheen was also noted during the drilling of the soil bore for groundwater well MW127.

The field observations and the presence of Chemicals of Potential Concern (CoPC) above the adopted soil investigation (Tier 1) criteria are likely to have occurred as a result of the placement of fill material associated with the former Hobart Gasworks, or potentially from impacted fill material imported to the site for land reclamation.

Concentrations of Polycyclic Aromatic Hydrocarbons (PAHs), Total Petroleum Hydrocarbons (TPH) / Total Recoverable Hydrocarbons (TRH) and select metals were reported in soil above the adopted Tier 1 criteria for the following Protected Environmental Values (PEVs):

- Residential, Recreation/ Open Space or Commercial/ Industrial Land Uses
- Maintenance of Modified and Highly Modified Ecosystems.

Table 1 below provides a range of concentrations of CoPC (or general CoPC groups) identified within the Goods Shed and Yard area that have been reported above the adopted Tier 1 criteria.

Table 1 Summary of Soil Analytical Results – The Goods Shed and Yard

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Lead	<5	1,640
Nickel	<2	77
Copper	<5	248
Zinc	6	2,820
TRH (C_{10}-C_{40})	<50	10,500
Benzene	<0.1	0.8
Total PAHs	<0.5	2,310

1.1.1 Shallow Lead Impacted Soil

The presence of shallow lead-impacted soil has been identified at some locations within the Goods Shed and Yard area at depths <2.0 m below ground level (bgl), with some isolated impacts also noted at depths >2.0 m bgl at locations K14, L18, L13, M13 and M14. As a result, there is potential for Intrusive Maintenance workers within the Promenade and Underground Carpark area to come in contact with these soils.

However, based on the overall statistical assessment of shallow lead impacts in this area conducted against the Maintenance Workers Site Derived RC, remediation of these impacts is not considered as required (AECOM, 2021a). It is further noted that these locations will be excavated and removed as part of Site development.

Following Site development, any services or conduits that will be installed within soil at a depth of >2.0 m bgl (i.e. below or in deeper soil next to the Underground Carpark) must be installed in protective shrouds or in trenches/corridors of clean fill to prevent contact with Site soil.

Maintenance Workers should use appropriate PPE (i.e. dust masks and gloves) to reduce potential exposure to lead in soil. Soil management requirements are discussed in the main body of the SEMP

1.1.2 Asbestos

Whilst asbestos has not been identified in soil during previous environmental investigations, there is potential that Asbestos Containing Material (ACM) may be encountered during intrusive works or require management as part of building refurbishment activities within the Goods Shed and Yard area.

Asbestos has been noted within the Goods Shed building.

1.2 Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) have been routinely conducted for wells located within the Goods Shed and Yard area since January 2015.

Over this timeframe, groundwater samples have had concentrations reported of a combination of arsenic, cobalt, iron, manganese, zinc, ammonia, sodium, chloride, TDS and sulphate, above the adopted Tier 1 assessment criteria for groundwater PEVs.

Table 2 below provides a range of CoPC concentrations (or general CoPC groups) identified within The Goods Shed and Yard area that have been reported above the adopted Tier 1 criteria.

Table 2 Summary of Groundwater Analytical Results – the Goods Shed and Yard

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Arsenic	<0.001	0.021
Cobalt	<0.001	0.012
Iron	0.46	34
Manganese	0.004	2.48
Zinc	<0.005	0.23
Ammonia	<0.001	26
Total Dissolved Solids (TDS)	38	3,650
Sodium	<1	930
Chloride	3	4,400
Sulphate	<1	930

2.0 The Escarpment (Audit Area 4 West) and Audit Area 4 East Contamination Summary

Historical activities undertaken within the Escarpment and the Audit Area 4 East areas have resulted in residual soil and groundwater contamination. Multiple phases of soil and groundwater investigations have been undertaken to assess the nature and extent of contamination.

The following sections provide an overview of identified soil and groundwater impacts at these areas of the Site. It is noted that remediation of soil impacts in the Escarpment area was conducted in late 2019 and early 2020 as reported in *Audit Area 4 – Remediation Validation* (AECOM, 2020b).

No further remediation of the Escarpment is planned or considered required at this time. However, further remediation and Auditor approval is required for Audit Area 4 East prior to future development.

2.1 Identified Soil Impacts

In the Escarpment and Audit Area 4 East areas, fill material consists of crushed stone/ballast, silt and clayey gravels with occasional rubble, brick and wood fragments.

Concentrations of Polycyclic Aromatic Hydrocarbons (PAHs), Total Petroleum Hydrocarbons (TPH) / Total Recoverable Hydrocarbons (TRH) and select metals were reported in soil above the adopted Tier 1 criteria for the following Protected Environmental Values (PEVs):

- Residential, Recreation/ Open Space or Commercial/ Industrial Land Uses
- Maintenance of Modified and Highly Modified Ecosystems.

Table 3 below provides the range of concentrations of Chemicals of Potential Concern (CoPC) (or general CoPC groups) identified within the Escarpment and Audit Area 4 East areas that have been reported above the adopted Tier 1 investigation criteria.

Table 3 Summary of Soil Analytical Results – the Escarpment and Audit Area 4 East

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Lead	<5	1,070
Nickel	3	62
Arsenic	<5	552
Copper	12	828
Zinc	16	1,220
TPH (C_{16}-C_{34})	<100	4,170
TPH (C_{10}-C_{16})	<50	5,680
TPH (C_{10}-C_{16}) (minus Naphthalene)	<50	5,670
TPH (C_6-C_{10}) (less BTEX[1])	<10	53
Benzo(a)pyrene	<0.5	46.4
Total PAHs	<0.5	464
Naphthalene	<0.5	17
Dibenz(a,h)anthracene	<0.5	7.1
Indeno(1,2,3-c,d)pyrene	<0.5	24.3

Note: 1. BTEX – benzene, toluene, ethylbenzene and xylenes

2.1.1 Lead Impacted Soil in Telecommunications Cable Exclusion Zone (the Escarpment)

During remediation works in the Escarpment, a lead concentration of 1,600 mg/kg was reported in soil validation sample CB-EX-41, collected from the boundary of the 2 m buffer zone surrounding the major telecommunications cable in the former Concrete Batching Plant area of the Escarpment. The location of the lead detection is shown on **Plate 1** below.

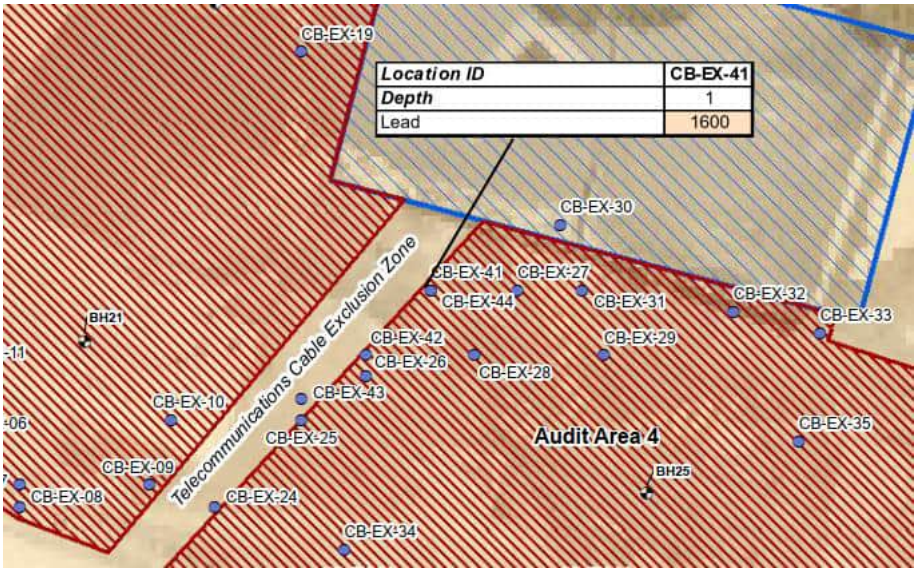

Plate 1 Location of lead in soil detection in telecommunication cable exclusion zone

Due to the risk of damage to the cable from excavations in this area, the asset owner (Telstra) did not give approval for excavation of soil in the exclusion zone. The impact was assessed as localised and not typical of the material in the exclusion zone in the Remediation Validation report (AECOM, 2020b), and soil present within the exclusion zone has been isolated from clean fill using a 200 µm plastic liner (shown on **Plate 2** below).

Plate 2 The Escarpment - Liner on the Western Boundary of the Telecommunications Cable

Future works in this area should consider the potential for lead impacts to be present if this soil is to be disturbed.

2.1.2 Asbestos in Audit Area 4 East

On 9 July 2020, contractors (Pitt & Sherry Pty Ltd) working for the Macquarie Point Development Corporation detected fragments of Asbestos Containing Material (ACM) in the embankment within Audit Area 4 East adjacent to the boundary with the Escarpment. The following was noted with regard to these fragments:

- The ACM encountered consisted of fragments of corrugated roofing material between 5 to 300 mm in size.
- ACM was typically encountered 400 – 600 mm below the ground surface.

All encountered ACM and surrounding soil were removed when encountered and the area was assessed by an occupational hygienist to be free of visual ACM. The hygienist indicated that the number of ACM fragments present appeared to increase in the northwest of the area cleared and may be present in the adjacent embankment in that direction.

The location where ACM was detected, and the potential area to the northwest, has been added to the Site Asbestos Register, and both areas are shown on **Plate 3** below.

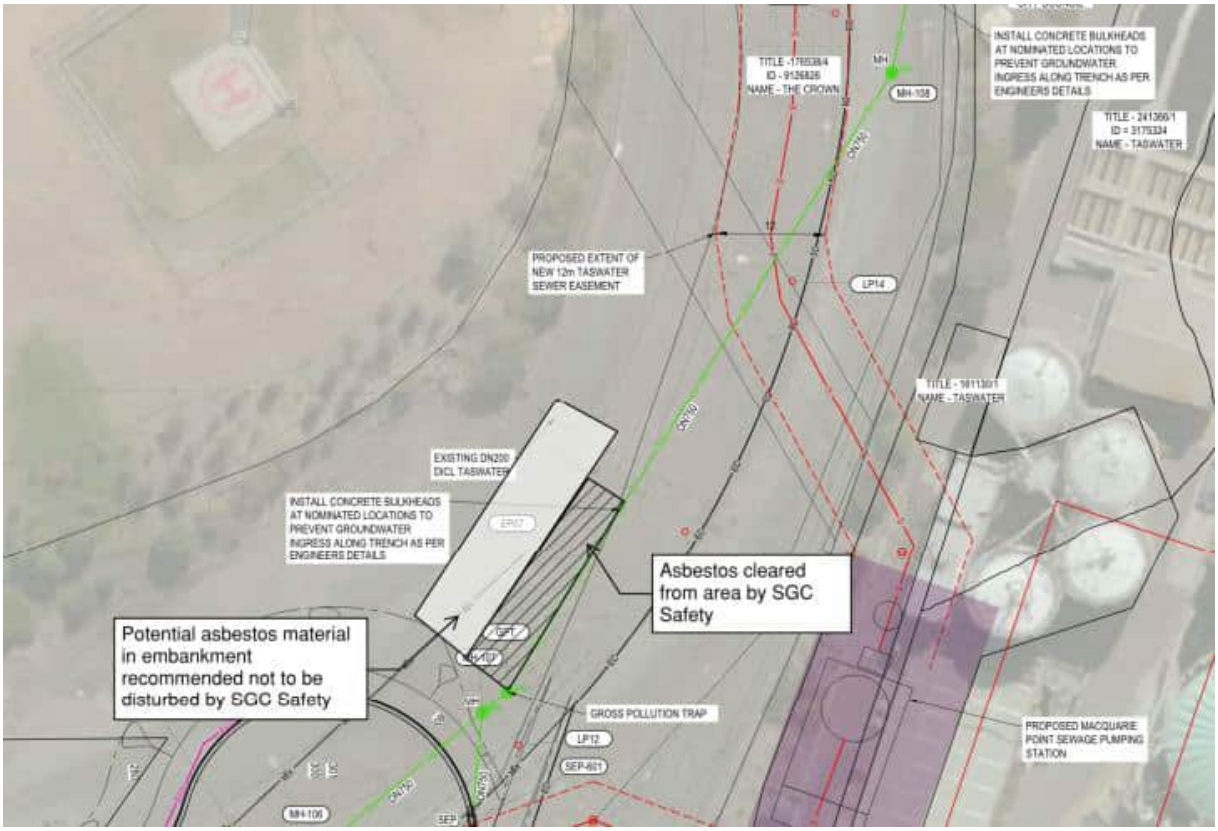

Plate 3 Audit Area 4 East - Area of ACM Encountered

2.2 Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) have been routinely conducted for wells located within these areas since February 2015.

Over this timeframe, groundwater samples have reported concentrations of a combination of aluminium, iron, manganese, arsenic, boron, copper, vanadium, zinc, phosphorus, ammonia, total dissolved solids (TDS), chloride, sodium, BTEXN, TRH and PAHs above the adopted Tier 1 assessment criteria for select groundwater PEVs.

Table 4 below provides a range of CoPC concentrations (or general CoPC groups) identified within the Escarpment and Audit Area 4 East that have been reported above the adopted Tier 1 criteria.

Table 4 Summary of Groundwater Analytical Results – the Escarpment and Audit Area 4 East

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Aluminium (Filtered)	1.38	1.38
Iron (Filtered)	<0.05	6.22
Manganese (Filtered)	<0.001	5.1
Arsenic (Filtered)	0.001	0.019
Copper (Filtered)	<0.001	0.03
Vanadium (Filtered)	<0.01	0.18
Zinc (Filtered)	<0.005	0.143
Phosphorus	1.2	1.2
Ammonia as N	<0.01	3.84
Total Dissolved Solids (TDS)	460	9010
Chloride	10	8890
Sodium	30	6300
Benzene	<0.001	0.003
Naphthalene	<0.001	0.332
Dibenzofuran	<0.005	0.015
pH (pH units)	7.21	11.1
TPH C10 - C36 (Sum of total)	<0.05	1.57
TPH >C10 - C40 (Sum of total)	<0.1	1.55
TPH >C_{10}-C_{16} minus Naphthalene (F2)	<0.05	1.59
Anthracene	<0.001	0.007
Fluoranthene	<0.001	0.007
Phenanthrene	<0.001	0.035
PFAS		

3.0 The Promenade and Underground Carpark Contamination Summary

Historical activities undertaken within the Promenade and Underground Carpark area have resulted in the presence of residual contamination within soil and groundwater. Multiple phases of soil, groundwater, light non-aqueous phase liquid (LNAPL) and soil vapour investigations have been undertaken to assess the nature and extent of contamination. The following sections provide an overview of identified soil, groundwater, LNAPL and soil vapour impacts at the Promenade and Underground Carpark area.

Remnant infrastructure associated with a former rail Roundhouse may be present in the central area of the Promenade and Underground Carpark.

Soil, groundwater and LNAPL remediation works have been undertaken in or adjacent to this area, as discussed in the *Remediation Validation Report – Audit Areas 2 and 7 and Pipeline Removal* (AECOM, 2021d) and the *Goods Shed Remediation Validation Report* (AECOM, 2021e). The *Assessment of LNAPL Remediation End-Points* (AECOM, 2021c) report contains a detailed assessment LNAPL remediation conducted.

No further remediation of the Promenade and Underground Carpark is planned or considered required at this time.

3.1 Identified Soil Impacts

Within the Promenade and Underground Carpark area and the surrounding buffer zone, fill material typically consisted of sand and gravel with occasional anthropogenic material including coal, coke, slag, ceramics, glass, metal fragments, wire, timber/wood, bone, rubber and general building rubble including brick, concrete and pipes.

Concentrations of a combination of Chemicals of Potential Concern (CoPC) including Polycyclic Aromatic Hydrocarbons (PAHs) [naphthalene, benzo(a)pyrene, benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, sum of PAHs], Total Recoverable Hydrocarbons (TRHs) [TRH >C_{10}-C_{16}, TRH >C_{16}-C_{34}, TRH >C_{34}-C_{40}, aliphatic TRH >C_{10}-C_{12}, aromatic TRH >C_{10}-C_{12}, aliphatic TRH >C_{12}-C_{16}, aromatic TRH >C_{12}-C_{16}, TRH C_6-C_{10} (minus BTEX) (F1), TRH >C_{10}-C_{16} (minus Naphthalene) (F2)] and metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc) in soil were reported above the adopted Tier 1 criteria for the following Protected Environmental Values (PEVs) and Site Derived Remediation Criteria (RC):

- Human Health – Direct Contact – Residential (low, and medium/high density), Recreation/ Open Space, and Commercial/ Industrial land uses.
- Human Health – Vapour Intrusion – Residential and Commercial/ Industrial land uses.
- Maintenance of Modified and Highly Modified Ecosystems.
- Aesthetics.
- Remediation Criteria – Residential (slab-on-grade with unknown construction or multi-storey building, low rise slab-on-grade, and building with basement), Commercial (slab-on-grade with unknown construction or multi-storey building, and working within a basement) and Maintenance Workers.

Table 5 below provides the range of CoPC concentrations (or general CoPC groups) identified within the Promenade and Underground Carpark area that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 5 Summary of Soil Analytical Results – the Promenade and Underground Carpark

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Arsenic	<2	576
Cadmium	<0.4	29
Chromium	<2	314
Copper	<5	2,280
Lead	<5	20,100
Nickel	3	86
Zinc	8	55,70
TRH >C10-C16	<50	15,500
TRH >C16-C34	<100	15,500
TRH >C34-C40	<100	2,920
Aliphatic TRH >C10-C12	<10	504
Aromatic TRH >C10-C12	<10	114
Aliphatic TRH >C12-C16	<10	2,790
Aromatic TRH >C12-C16	<10	1,170
TRH C6-C10 (minus BTEX) (F1)	<10	114
TRH >C10-C16 (minus Naphthalene) (F2)	<50	15,500
Naphthalene	<0.5	39.7
Benzo(a)pyrene	<0.05	156
Benz(a)anthracene	<0.5	157
Benzo(b)fluoranthene	0.9	4.6
Benzo(k)fluoranthene	<0.5	64.7
Dibenz(a,h)anthracene	<0.5	20
Indeno(1,2,3-cd)pyrene	<0.5	66.2
Sum of PAHs	<0.5	1,810

3.1.1 Shallow Lead Impacted Soil

The presence of shallow lead-impacted soil has been identified at some locations within the Promenade and Underground Carpark area at depths <2.0 m below ground level (bgl), with some isolated impacts also noted at depths >2.0 m bgl at locations J06, J08, J10, J12, I13, H10, H12, H12, G11, G13 and F11. As a result, there is potential for Intrusive Maintenance workers within the Promenade and Underground Carpark area to come in contact with these soils. These locations will

be excavated and removed as part of the Site development, however elevated lead may be present at the base of the excavation at I13 and G13.

Following Site development, any services or conduits that will be installed within soil at a depth of >2.0 m below the current Site level must be installed in protective shrouds or in trenches/corridors of clean fill to prevent contact with Site soil.

Maintenance Workers should use appropriate PPE (i.e. dust masks and gloves) to reduce potential exposure to lead in soil. Soil management requirements are discussed in the main body of the SEMP.

3.1.2 Asbestos

Anecdotal information indicates that pits and service trenches in the southern portion of the Promenade and Underground Carpark area were backfilled with building rubble including asbestos. No bulk asbestos or Asbestos Containing Material (ACM) has been encountered in investigations to date, however minor ACM has been encountered as seven isolated fragments. Under current and proposed future development, while the Site is maintained with hardstand or an engineered break, potential ACM within the soil does not have a complete source-pathway-receptor linkage to Site users. However, the potential for ACM to be present should be considered in future works which may disturb soil in this area and managed as discussed in the Site Environment Management Plan (SEMP).

3.2 Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) have been routinely conducted for monitoring groundwater wells located within the Promenade and Underground Carpark area since January 2015.

Since 2015, groundwater samples have reported concentrations of a combination of CoPC including total dissolved solids (TDS), metals (arsenic, copper, iron, lead, manganese, zinc), inorganics (ammonia, sodium, boron), TRH [TRH C_{10}-C_{36} fraction (sum), TRH >C_{10}-C_{40} fraction (sum), TRH C_{10}-C_{16} fraction (sum) (minus naphthalene)] and PAHs [naphthalene, benz(a)anthracene, benzo(a)pyrene, anthracene, phenanthrene, fluoranthene] above the following adopted Tier 1 assessment criteria for groundwater PEVs and Site Derived RC:

- Drinking water (health and aesthetics)
- Recreation (primary and secondary contact)
- Maintenance of Ecosystems (90% ecosystem protection level)
- Irrigation
- Vapour Intrusion (from groundwater)
- Remediation Criteria – Residential (unknown construction or multi-storey building)

Table 6 below provides a range of CoPC concentrations (or general CoPC groups) identified within the Promenade and Underground Carpark area that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 6 Summary of Groundwater Analytical Results – the Promenade and Underground Carpark

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Total Dissolved Solids	40	5,420
Arsenic	<0.001	0.032
Copper	<0.001	0.011
Iron	<0.05	6.72
Lead	<0.001	0.017
Manganese	0.002	5.47

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Zinc	<0.001	0.063
Ammonia (as N)	<0.01	8.43
Sodium	3.7	363
Boron	<0.05	0.78
TRH C10-C36 fraction (sum)	<0.050	4.05
TRH >C10-C40 fraction (sum)	<0.100	3.95
TRH C10-C16 fraction (minus naphthalene) [F2]	<0.050	2.01
Naphthalene	<0.001	0.0015
Benz(a)anthracene	<0.001	0.0014
Benzo(a)pyrene	<0.0005	0.0011
Anthracene	<0.001	0.0054
Phenanthrene	<0.001	0.016
Fluoranthene	<0.001	0.0069

3.3 Identified LNAPL Impacts

Environmental investigations completed on the Site to date have historically identified three Light Non-Aqueous Phase Liquid (LNAPL) plumes in or adjacent to the Promenade and Underground Carpark area, referred to as LNAPL Plume A1, LNAPL Plume A2 and LNAPL Plume A3.

The LNAPL in these plumes is understood to comprise predominantly diesel fuel, as well as fuel oils associated with diesel engine operation (e.g. lubricants, engine oils). The probable source of LNAPL is historic locomotive refuelling activities during operation the Roundhouse Refuelling Area.

No measurable LNAPL was present in any wells in the vicinity of these plumes when last gauged in June 2025, although indicators of LNAPL, including sheen, odours, and small volumes of LNAPL when developing wells in the vicinity were observed. Measurable LNAPL was last detected in LNAPL Plumes A1 and A2 in November 2019, and in LNAPL Plume A3 in July 2017, although no monitoring was conducted on the plumes between 2019 and 2025 due to Site activities.

A detailed assessment of LNAPL impacts and remediation conducted at the Site has been reported in the *Assessment of LNAPL Remediation End-Points* (AECOM, 2021c), and was reviewed in *Soil, Groundwater and Soil Vapour Investigation 2025* (AECOM, 2025c). Both these reports concluded that:

- Further recovery of LNAPL is considered to be impractical.
- The LNAPL plumes are sufficiently stable.
- Based on the current development plan for the Site, no unacceptable risks to current or future human or ecological receptors from LNAPL appears to be present, assuming that a SEMP or similar is implemented in order to minimise and manage potential risks for any interactions between groundwater, LNAPL and future Site users.

On this basis, further LNAPL remediation is not practicable or required. However, restoration of groundwater PEVs is not practicable, and groundwater management will be required as discussed in the main body of the SEMP.

3.4 Identified Soil Vapour Impacts

Soil vapour monitoring events have been conducted across the Site between 2015 and 2019, including at soil vapour wells within and immediately adjacent to the Promenade and Underground Carpark area, at locations where concentrations of Volatile Organic Compounds (VOCs) and Semi-VOCs (SVOCs) in soil or groundwater were in excess of the Tier 1 vapour intrusion criteria selected, or in the vicinity of the LNAPL plumes to enable assessment of potential risks posed by soil vapour to potential future users of this area.

Assessment of potential vapour intrusion risks associated with the LNAPL plumes undertaken in *Soil Vapour and Indoor Air Investigations 2019* (AECOM, 2021b) surmised that soil vapour impacts associated with the LNAPL plumes do not present an unacceptable risk to the planned future uses of the Promenade and Underground Carpark area.

Soil vapour investigations identified that methane exists in potentially hazardous concentrations in the subsurface within the Promenade and Underground Carpark area (at SV12, SV27S and SV27D) as well as the surrounding area (at SV14 and SV16). The risk from soil methane in the area assessed has been calculated as CS2 – Low Risk, as defined by *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020), and appropriate mitigation measures should be included in future building design in this area or when conducting works in potentially enclosed spaces, such as pits, trenches or conduits, in these areas.

It is noted that if the Underground Carpark is ventilated in accordance with Building Code of Australia (BCA) requirements to deal with exhaust fumes, it should also provide sufficient protection from methane infiltration as per EPA NSW, 2020. If the Underground Carpark is not designed and constructed to BCA standards, methane protection measures should be advised by a qualified environmental practitioner and approved by a Contaminated Land Auditor.

4.0 The Precinct North Contamination Summary

Historical activities undertaken within the Precinct North area have resulted in the presence of residual contamination within soil and groundwater. Multiple phases of soil, groundwater, light non-aqueous phase liquid (LNAPL) and soil vapour investigations have been undertaken to assess the nature and extent of contamination. The following sections provide an overview of identified soil, groundwater, LNAPL and soil vapour impacts at the Precinct North area.

Soil, groundwater and LNAPL remediation works have been undertaken in or adjacent to this area, as discussed in the *Remediation Validation Report – Audit Areas 2 and 7 and Pipeline Removal* (AECOM, 2021d) and the *Goods Shed Remediation Validation Report* (AECOM, 2021e). The *Assessment of LNAPL Remediation End-Points* (AECOM, 2021c) report contains a detailed assessment LNAPL remediation conducted.

No further remediation of the Precinct North is planned or considered required at this time.

4.1 Identified Soil Impacts

Subsurface investigations have identified that the Precinct North area is underlain by fill material extending up to 8.2 m below ground level (bgl). Fill material is described as silty sand with dolerite gravels and cobbles with a range of anthropogenic materials including rubble, glass and metal fragments, coal, coke, ash, brick, rubber, timber, wires and fabric. Following remediation and soil excavation in 2020 (AECOM, 2021d), portions of the Precinct North area have been backfilled with fill material and crushed dolerite sourced from either other sections of the Site or imported Virgin Excavated Natural Material (VENM). Underlying the fill material is natural sands, clays, gravels and dolerite bedrock.

During historic land reclamation activities undertaken across the broader Site, sea walls were constructed consisting of a combination of timber and stone. A sea wall is understood to run approximately parallel to the eastern boundary of the Precinct North area.

Concentrations of a combination of Chemicals of Potential Concern (CoPC) including Polycyclic Aromatic Hydrocarbons [PAHs] (benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, 7,12-dimethylbenz(a)anthracene, indeno(1,2,3-cd)pyrene, Sum of PAHs), Total Recoverable Hydrocarbons [TRH] (aliphatic C_{10}-C_{12}, aliphatic C_{12}-C_{16}, aromatic C_{10}-C_{12}, aromatic C_{12}-C_{16}, C_6-C_{10}, C_{10}-C_{16}, C_{16}-C_{34}, C_{34}-C_{40}), naphthalene, and heavy metals (arsenic, copper, lead, nickel, zinc) in soil were reported above the adopted Tier 1 criteria for the following Protected Environmental Values (PEVs) and Site Derived Remediation Criteria (RC):

- Human Health – Direct Contact – Residential (low, and medium/high density), Recreation/ Open Space, and Commercial/ Industrial land uses.
- Human Health – Vapour Intrusion – Residential and Commercial/ Industrial land uses.
- Maintenance of Modified and Highly Modified Ecosystems.
- Aesthetics.
- Remediation Criteria – Residential (slab-on-grade with unknown construction or multi-storey building, low rise slab-on-grade, and building with basement), Commercial (slab-on-grade with unknown construction or multi-storey building, and working within a basement) and Maintenance Workers.
- Remediation Criteria - Potential Future Residential, Commercial/Light Industrial Workers or Intrusive Maintenance Workers

Table 7 below provides the range of CoPC concentrations (or general CoPC groups) identified within the Precinct North area that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 7 Summary of Soil Analytical Results – The Precinct North

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Arsenic	<2	184
Copper	<5	1,800
Lead	<5	1,340
Nickel	3	68
Zinc	8	10,200
TRH C_6-C_{10} (minus BTEX[1])	<10	152
TRH >C_{10}-C_{16} (minus Naphthalene)	<50	17,995
TRH >C_{10}-C_{16}	<50	18,000
TRH >C_{16}-C_{34}	<100	16,000
TRH >C_{34}-C_{40}	<100	3,310
Aliphatic TRH >C_{10}-C_{12}	<50	1,420
Aromatic TRH >C_{10}-C_{12}	<50	140
Aliphatic TRH >C_{12}-C_{16}	<50	6,590
Aromatic TRH >C_{12}-C_{16}	<50	2,540
Naphthalene	<0.5	184
Benzo(a)pyrene	<0.5	141
Benz(a)anthracene	<0.5	148
Benzo(b)fluoranthene	2.1	128
Benzo(k)fluoranthene	<0.5	68.9
Chrysene	<0.5	140
Dibenz(a,h)anthracene	<0.5	18.7
7,12-dimethylbenz(a)anthracene	<0.5	3.8
Indeno(1,2,3-cd)pyrene	<0.5	59.2
Sum of PAHs	<0.5	2,330

Note: 1. BTEX – benzene, toluene, ethylbenzene and xylenes

4.1.1 Shallow Lead Impacted Soil

The presence of shallow lead-impacted soil has been identified at some locations within the Precinct North area at depths <2.0 m below ground level (bgl), with some isolated impacts also noted at depths >2.0 m bgl at K06, L08, M09 and N10. As a result, there is potential for Intrusive Maintenance workers within the Precinct North area to come in contact with these soils. These locations will be excavated and removed as part of the Site development, however elevated lead may be present at the base of excavation at N10.

Following Site development, any services or conduits that will be installed within soil at a depth of >2.0 m bgl (i.e. below or in deeper soil next to the Underground Carpark) must be installed in protective shrouds or in trenches/corridors of clean fill to prevent contact with Site soil.

Maintenance Workers should use appropriate PPE (i.e. dust masks and gloves) to reduce potential exposure to lead in soil. Soil management requirements are discussed in the main body of the SEMP.

4.1.2 Boundary Impacts

Soil samples collected at seven locations on the eastern boundary of the Precinct North area reported exceedances of Site Derived RC for proposed future uses:

- Two locations (OL-EX-288/1.5 and OL-EX-59/0.9) reported exceedances of the RC for Future Commercial Workers for Total Petroleum Hydrocarbons (TPH) C_{10}-C_{16} (minus Naphthalene).
- Five locations (OL-EX-75/0.5, OL-EX77/1.0, OL-EX-79/0.2, OL-EX-293/1.15, OL-EX-294/1.05) reported exceedances of the RC for Future Intrusive Maintenance Workers for lead.

These samples do not represent an unacceptable risk for future uses of the area as the impacted areas are limited and delineated by samples within 5 m from within the excavation boundary or base, and impacted soils which had the potential to extend onto the Site were excavated and removed during remediation works in 2020 (AECOM, 2021d). These areas should be considered when conducting works along the Site boundary in these areas.

4.1.3 Hobart Main Sewer Soils

During remediation works in 2020 (AECOM, 2021d), excavation of impacted soils was limited by the presence of the Main Hobart Pipeline, a sewer line which runs through the Precinct North area. The owner of the sewer, TasWater, required an exclusion zone for excavation which did not allow excavation to depths of greater than 1 m below ground level (bgl) within 3 m of the sewer location.

Soil was excavated to a depth of 1 m bgl in this exclusion zone. However, lead concentrations in excess of the RC for Future Intrusive Maintenance Workers for lead were detected in the soil within the exclusion zone and should be considered and appropriate controls put in place for future works in this area.

4.2 Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) have been routinely conducted for monitoring groundwater wells located within the Precinct North area since January 2015.

Since 2015, groundwater samples have reported concentrations of a combination of CoPC including: total dissolved solids (TDS), metals (arsenic, boron, copper, iron, lead, manganese, zinc), inorganics (ammonia, chloride, cyanide, sodium), TRH (C_{10}-C_{16}, C_{10}-C_{36}, C_{10}-C_{40}), PAHs (naphthalene, benz(a)anthracene, benzo(a)pyrene, anthracene, phenanthrene, fluoranthene, 2,4-dimethylphenol, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, pyrene) and E. Coli above the following adopted Tier 1 assessment criteria for groundwater PEVs and Site Derived RC:

- Drinking water (health and aesthetics)
- Recreation (primary and secondary contact)
- Maintenance of Ecosystems (90% ecosystem protection level)
- Irrigation
- Buildings and Structures
- Vapour Intrusion (from groundwater)
- Remediation Criteria – Residential (unknown construction or multi-storey building)

Table 8 below provides a range of CoPC concentrations (or general CoPC groups) identified within the Precinct North area that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 8 Summary of Groundwater Analytical Results – the Precinct North

CoPC	Minimum Concentration (mg/L)	Maximum Concentration (mg/L)
Total Dissolved Solids	240	1,690
Arsenic	<0.001	0.009
Boron	0.2	0.69
Copper	<0.001	0.011
Iron	15.5 (one sample only)	
Lead	<0.001	0.013
Manganese	0.026	2.46
Zinc	<0.005	0.134
Ammonia (as N)	<0.01	22.1
Chloride	11	664
Cyanide	<0.004	0.29
Sodium	8	547
TRH C10-C36 fraction (sum)	<0.05	12.6
TRH >C10-C40 fraction (sum)	<0.1	12.2
TRH C10-C16 fraction (minus naphthalene)	<0.1	6.19
Naphthalene	<0.005	0.232
Benz(a)anthracene	<0.001	0.095

4.3 Identified LNAPL Impacts

Environmental investigations completed on the Site to date have historically identified three LNAPL plumes in or up groundwater gradient of the Precinct North area, referred to as LNAPL Plume A1, LNAPL Plume A2 and LNAPL Plume A3.

No measurable LNAPL was present in any wells in the vicinity of these plumes when last gauged in June 2025, although indicators of LNAPL, including sheen, odours, and small volumes of LNAPL when developing wells in the vicinity were observed. Measurable LNAPL was last detected in LNAPL Plumes A1 and A2 in November 2019, and in LNAPL Plume A3 in July 2017, although no monitoring was conducted on the plumes between 2019 and 2025 due to Site activities.

A detailed assessment of LNAPL impacts and remediation conducted at the Site has been reported in the *Assessment of LNAPL Remediation End-Points* (AECOM, 2021c), and was reviewed in *Soil, Groundwater and Soil Vapour Investigation 2025* (AECOM, 2025c). Both these reports concluded that:

- Further recovery of LNAPL is considered to be impractical.
- The LNAPL plumes are sufficiently stable.
- Based on the current development plan for the Site, no unacceptable risks to current or future human or ecological receptors from LNAPL appears to be present, assuming that a Site Environment Management Plan (SEMP) or similar is implemented in order to minimise and manage potential risks for any interactions between groundwater, LNAPL and future Site users.

On this basis, further LNAPL remediation is not practicable or required. However, restoration of groundwater PEVs is not practicable, and groundwater management will be required as discussed in the main body of the SEMP.

4.4 Identified Soil Vapour Impacts

Soil vapour monitoring events have been conducted across the Site between 2015 and 2019, including at soil vapour wells within and immediately adjacent to the Precinct North area, at locations where concentrations of Volatile Organic Compounds (VOCs) and Semi-VOCs (SVOCs) in soil or groundwater were in excess of the Tier 1 vapour intrusion criteria selected, or in the vicinity of the LNAPL plumes to enable assessment of potential risks posed by soil vapour to potential future users of this area.

Assessment of potential vapour intrusion risks associated with the LNAPL plumes undertaken in *Soil Vapour and Indoor Air Investigations 2019* (AECOM, 2021b) surmised that soil vapour impacts associated with the LNAPL plumes do not present an unacceptable risk to the planned future uses of the Precinct North area.

Soil vapour investigations identified methane exists in potentially hazardous concentrations in the subsurface within the Precinct North area (at SV14, SV16, SV17 and SV18). The risk from soil methane in the area assessed has been calculated as CS2 – Low Risk, as defined by *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020), and appropriate mitigation measures should be included in future building design in this area or when conducting works in potentially enclosed spaces, such as pits, trenches or conduits, in these areas.

5.0 The Precinct South Contamination Summary

Historical activities undertaken within Precinct South have resulted in the presence of residual contamination within soil and groundwater. Multiple phases of soil, groundwater, light non-aqueous phase liquid (LNAPL) and soil vapour investigations have been undertaken to assess the nature and extent of contamination. The following sections provide an overview of identified soil, groundwater, LNAPL and soil vapour impacts at the Promenade and Underground Carpark area.

Soil, groundwater and LNAPL remediation works have been undertaken in or adjacent to this area, as discussed in the *Remediation Validation Report – Audit Areas 2 and 7 and Pipeline Removal* (AECOM, 2021d), the *Goods Shed Remediation Validation Report* (AECOM, 2021e) and the *Precinct South Remediation Validation Report* (AECOM, 2024d). The *Assessment of LNAPL Remediation End-Points* (AECOM, 2021c) report contains a detailed assessment LNAPL remediation conducted.

No further remediation of the Precinct South is planned or considered required at this time.

5.1 Identified Soil Impacts

Subsurface investigations have identified that the Precinct South is underlain by fill material extending up to 12 m below ground level (bgl). Fill material is described as silty sand with dolerite gravels and cobbles with a range of anthropogenic materials including rubble, glass and metal fragments, coal, coke, ash, brick, rubber, timber, wires and fabric. Following remediation and soil excavation in 2020 and 2023, portions of the Precinct South have been backfilled with fill material and crushed dolerite sourced from either other sections of the Site or imported Virgin Excavated Natural Material (VENM). Underlying the fill material is natural sands, clays, gravels and dolerite bedrock.

During historic land reclamation activities undertaken across the broader Site, sea walls were constructed consisting of a combination of timber and stone. A sea wall is understood to run approximately parallel to the eastern boundary of the Precinct South. Buried rail lines may be present in the eastern and southern portions of the Precinct South.

Concentrations of a combination of Chemicals of Potential Concern (CoPC) including metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc), cyanide (total), TRH, PAHs, MAHs, and PFAS in soil were reported above the adopted Tier 1 criteria for the following Protected Environmental Values (PEVs) and Site Derived Remediation Criteria (RC):

- Human Health – Direct Contact – Residential (low, and medium/high density), Recreation/ Open Space, and Commercial/ Industrial land uses.
- Human Health – Vapour Intrusion – Residential and Commercial/ Industrial land uses.
- Maintenance of Modified and Highly Modified Ecosystems.
- Aesthetics.
- Remediation Criteria – Residential (slab-on-grade with unknown construction or multi-storey building, low rise slab-on-grade, and building with basement), Commercial (slab-on-grade with unknown construction or multi-storey building, and working within a basement) and Maintenance Workers.
- Remediation Criteria - Potential Future Residential, Commercial/Light Industrial Workers (working within a basement) or Intrusive Maintenance Workers

Table 9 below provides the range of CoPC concentrations (or general CoPC groups) identified within the Precinct South that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 9 Summary of Soil Analytical Results – The Precinct South

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Arsenic	<4	374
Cadmium	<1	28

CoPC	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)
Chromium	<2	33
Copper	<5	1,360
Lead	<5	905
Nickel	<2	157
Zinc	<5	13,000
Cyanide (total)	<1	1,040
TRH C_6-C_{10} (minus BTEX[1])	<10	847
TRH >C_{10}-C_{16} (minus Naphthalene)	<50	6,910
TRH >C_{16}-C_{34}	<100	20,700
TRH >C_{34}-C_{40}	<50	3,550
Aliphatic TRH >C_8-C_{10}	<5	918
Aliphatic TRH >C_{10}-C_{12}	<50	636
Aromatic TRH >C_{10}-C_{12}	<50	204
Aliphatic TRH >C_{12}-C_{16}	<50	2,440
Aromatic TRH >C_{12}-C_{16}	<50	1,910
Naphthalene	<1	273
Benzo(a)pyrene	<0.05	639
Benz(a)anthracene	<0.5	477
Benzo(b)fluoranthene	<0.5	87.2
Benzo(k)fluoranthene	<0.5	39.7
Chrysene	<0.5	386
Dibenz(a,h)anthracene	<0.5	60.1
Indeno(1,2,3-cd)pyrene	<0.5	164
Sum of PAHs	<0.5	7,800
PFOS	<0.0005	0.0132

Note: 1. BTEX – benzene, toluene, ethylbenzene and xylenes

5.1.1 Shallow Lead Impacted Soil

The presence of shallow lead-impacted soil has been identified at some locations within the Precinct South area at depths <2.0 m below ground level (bgl), with some isolated impacts also noted at depths >2.0 m bgl at location M12. As a result, there is potential for Intrusive Maintenance workers within the Precinct North area to come in contact with these soils. However, based on the overall statistical assessment of shallow lead impacts in this area conducted against the Maintenance Workers Site Derived RC, remediation of these impacts is not considered as required (AECOM, 2021a). It is further noted that these locations will be excavated and removed as part of the Site development.

Following Site development, any services or conduits that will be installed within soil at a depth of >2.0 m bgl (i.e. below or in deeper soil next to the Underground Carpark) must be installed in protective shrouds or in trenches/corridors of clean fill to prevent contact with Site soil.

Maintenance Workers should use appropriate PPE (i.e. dust masks and gloves) to reduce potential exposure to lead in soil. Soil management requirements are discussed in the main body of the SEMP

5.2 Identified Groundwater Impacts

Groundwater Monitoring Events (GMEs) have been routinely conducted for monitoring groundwater wells located within the Precinct South area since January 2015.

Since 2015, groundwater samples have reported concentrations of a combination of CoPC including: total dissolved solids (TDS), metals (arsenic, boron, copper, iron, lead, manganese, zinc), inorganics (ammonia, chloride, cyanide, sodium), TRH (C_{10}-C_{16}, C_{10}-C_{36}, C_{10}-C_{40}), PAHs (naphthalene, benz(a)anthracene, benzo(a)pyrene, anthracene, phenanthrene, fluoranthene, 2,4-dimethylphenol, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, pyrene) and E. Coli above the following adopted Tier 1 assessment criteria for groundwater PEVs.

- Drinking water (health and aesthetics)
- Recreation (primary and secondary contact)
- Maintenance of Ecosystems (90% ecosystem protection level)
- Irrigation
- Buildings and Structures
- Vapour Intrusion (from groundwater).

No exceedances of Site derived RC have been detected in groundwater.

Table 10 below provides a range of CoPC concentrations (or general CoPC groups) identified within the Precinct South area that have been reported above the adopted Tier 1 criteria and Site Derived RC.

Table 10 Summary of Groundwater Analytical Results – the Precinct South

CoPC	Unit	Minimum Concentration	Maximum Concentration
Total Dissolved Solids	mg/L	150	28,000
Arsenic	mg/L	<0.001	0.014
Aluminium	mg/L	<0.01	32
Boron	mg/L	<0.05	1.71
Cadmium	mg/L	<0.0001	0.0002
Chromium	mg/L	<0.001	0.127
Cobalt	mg/L	<0.001	0.002
Copper	mg/L	<0.001	0.245
Iron	mg/L	23	42.5
Lead	mg/L	<0.001	0.15
Manganese	mg/L	0.198	6.35
Zinc	mg/L	<0.001	7.29
Ammonia (as N)	mg/L	0.71	60

CoPC	Unit	Minimum Concentration	Maximum Concentration
Total nitrogen (as N)	mg/L	6	47.8
Chloride	mg/L	4	14,100
Sodium	mg/L	12	3,420
Sulphate (as SO_4)	mg/L	<1	1.510
Calcium	mg/L	19	3,070
Phosphorus	mg/L	<0.01	1.7
E.coli	mg/L	<1	1,700
TRH C_6-C_{10} (minus BTEX)	µg/L	<20	3,040
TRH C_{10}-C_{16} fraction (minus naphthalene)	µg/L	<50	4,530
TRH >C_{10}-C_{40} fraction (sum)	µg/L	<100	8,240
Aliphatic TRH >C_8-C_{10}	µg/L	<20	2,080
Aliphatic TRH >C_{10}-C_{12}	µg/L	<20	1,040
Benzene	µg/L	<0.5	7
Ethylbenzene	µg/L	<1	4
Naphthalene	µg/L	<1	57
Benz(a)anthracene	µg/L	<1	63
Benzo(a)pyrene	µg/L	<0.3	42
Anthracene	µg/L	<1	135
Phenanthrene	µg/L	<1	336
Fluoranthene	µg/L	<1	174
1-methylnaphthalene	µg/L	<2	2,040
Chrysene	µg/L	<1	64
Indeno(1,2,3-cd)pyrene	µg/L	<1	15
Pyrene	µg/L	<1	191
PFOS	µg/L	<0.001	0.38
PFHxS	µg/L	<0.001	0.04
PFOA	µg/L	<0.01	0.06
Methane	µg/L	4,390	13,200

5.3 Identified LNAPL Impacts

Environmental investigations completed on the Site to date have historically identified one LNAPL plume within the Precinct South, referred to as LNAPL Plume B, and three LNAPL plumes up groundwater gradient of the Precinct South, referred to as LNAPL Plume A1, LNAPL Plume A2 and LNAPL Plume A3.

Measurable LNAPL has not been detected in LNAPL Plumes A1 and A2 since November 2019, and in LNAPL Plume A3 since July 2017, although it is noted that these plumes were not monitored between 2019 and 2025 due to other Site activities in the area. LNAPL was present in LNAPL Plume B in June 2025 (AECOM, 2025c), consisting of:

- 20-50 mm in MW3
- 20-42 mm in PW02
- 62-81 mm in S8

LNAPL globules were also noted on the interface probe when gauging well MW154, and limited LNAPL (4-70 mm) has been intermittently detected in MW5 in December 2023 and February 2024.

A detailed assessment of LNAPL impacts and remediation conducted at the Site has been reported in the *Assessment of LNAPL Remediation End-Points* (AECOM, 2021c), and was reviewed in *Soil, Groundwater and Soil Vapour Investigation 2025* (AECOM, 2025c). Both these reports concluded that:

- Further recovery of LNAPL is considered to be impractical.
- The LNAPL plumes are sufficiently stable.
- Based on the current development plan for the Site, no unacceptable risks to current or future human or ecological receptors from LNAPL appears to be present, assuming that a Site Environment Management Plan (SEMP) or similar is implemented in order to minimise and manage potential risks for any interactions between groundwater, LNAPL and future Site users.

On this basis, further LNAPL remediation is not practicable or required. However, restoration of groundwater PEVs is not practicable, and groundwater management will be required as discussed in the main body of the SEMP.

5.4 Identified Soil Vapour Impacts

Soil vapour monitoring events have been conducted across the Site between 2015 and 2025, including at soil vapour wells within and immediately adjacent to the Precinct South area, at locations where concentrations of Volatile Organic Compounds (VOCs) and Semi-VOCs (SVOCs) in soil or groundwater were in excess of the Tier 1 vapour intrusion criteria selected, or in the vicinity of the LNAPL plumes to enable assessment of potential risks posed by soil vapour to potential future users of this area.

Assessment of potential vapour intrusion risks associated with the LNAPL plumes undertaken in *Soil Vapour and Indoor Air Investigations 2019* (AECOM, 2021b) surmised that soil vapour impacts associated with the LNAPL plumes may represent an unacceptable risk to the planned future uses of the Precinct South area for Commercial / Light Industrial workers within basements. However, soil methane mitigations, discussed below, are considered suitable for preventing hydrocarbon vapours from impacting workers.

Soil vapour investigations identified methane exists in potentially hazardous concentrations in the subsurface within the Precinct South area. The risk from soil methane in the area assessed has been calculated as CS2 – Low Risk, as defined by *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases* (EPA NSW, 2020), and appropriate mitigation measures should be included in future building design in this area or when conducting works in potentially enclosed spaces, such as pits, trenches or conduits, in these areas.

Appendix D

Summary of CoPC

Summary of Chemicals of Potential Concern

The following information has been compiled from the June 1997 National Institute of Occupational Health and Safety (NIOSH) *Pocket Guide to Chemical Hazards*, 1998 American Conference of Governmental Industrial Hygienists (ACGIH) *Guide to Occupational Exposure Values, Agency for Toxic Substances & Disease Registry* (ATSDR), the Australia Government *Asbestos Safety and Eradication Agency*, and representative material safety data sheets (MSDS).

Polycyclic Aromatic Hydrocarbons (PAHs)

PAHs are formed as a result of the incomplete burning of organic material. The most common health effects associated with PAHs are linked to its carcinogenic effects. The primary route of exposure to PAHs during this project is contact with contaminated soils which can lead to entry through ingestion, inhalation (dust) or open wounds. This necessitates the use of appropriate protective clothing and proper decontamination procedures.

Total Petroleum Hydrocarbons (TPH)

TPH is a term used to describe several hundred chemical compounds that originate from crude oil. The compounds in various TPH fractions can affect the body in different ways. Health effects include central nervous system depression, irritation of the throat, skin, eyes, and stomach, breathing difficulties, in addition to impacts on blood, immune system, liver, spleen, kidneys, developing foetus, and lungs. The primary route of exposure to TPH during this project will be through handling tar impacted material. Appropriate PPE must be worn at all times while handling TPH contaminated material.

Phenolic Compounds

Phenolic compounds, also known as phenols, are a wide range of chemical compounds characterised by one or more hydroxyl groups bonded directly to an aromatic hydrocarbon ring. Phenolic compounds naturally occur in biological processes (typically by plants and micro-organisms) in small quantities, but can be generated in higher quantities by industrial processes such as manufacturing of drugs, resins, dyes, fertilisers, explosives, paint removers, textiles, and coke.

Phenolic compounds may have a diverse range of exposure indicators, but typically cause irritation in the nose, throat, eyes, and skin. Acute exposure to phenol (the simplest and most commonly used phenolic compound) causes an increased respiration rate, followed by a decreased respiration rate, decreased body temperature, cyanosis, muscular weakness, weak or occasionally rapid pulse, coma, and/or death. Chronic exposure to phenol is typified by systemic problems. These include vertigo, digestive difficulties, skin eruptions, nervous problems and headaches. Death may occur when liver or kidney problems become severe.

Phenolic compounds will enter the body by breathing, through the skin or by ingestion.

Benzene, Toluene, Ethyl-benzene, and Xylenes (BTEX)

These chemicals are often found in products such as paints and coatings, and are constituents of petroleum products, particularly gasoline, jet fuels, kerosene. All of the BTEX chemicals can produce neurological impairment, and exposure to benzene can additionally cause haematological effects including aplastic anaemia and acute myelogenous leukemia. The primary route of exposure to BTEX during this project is the inhalation of vapours. This necessitates the use of appropriate protective clothing including respiratory equipment where necessary.

Chlorinated Solvents

Chlorinated solvents are a large family of chemical compounds that contain chlorine, for example, carbon tetrachloride, trichloroethylene (TCE), or methylene chloride. They are used for a wide variety of commercial and industrial purposes, including degreasers, cleaning solutions, paint thinners, pesticides,

resins, glues, and a host of other mixing and thinning solutions. Exposures can lead to short-term or long-term health effects, depending on the manner by which they entered your body and the amount of exposure. Short-term side effects may include dizziness, fatigue, headaches, and/or skin rashes. Long-term side effects may include chronic skin problems, and/or damage to the nervous system, kidneys, or liver. Some chlorinated solvents are also known to cause cancer, in both humans and animals.

Workers can be exposed to chlorinated solvents through the absorption of solvents, through inhalation and skin contact.

Heavy Metals

Large amounts of heavy metals may cause acute or chronic toxicity (poisoning). Heavy metal toxicity can result in damaged or reduced mental and central nervous function, lower energy levels, and damage to blood composition, lungs, kidneys, liver, and other vital organs. Heavy metals may enter the human body through ingestion, inhalation, or absorption through the skin. Appropriate protective equipment must be worn and proper decontamination procedures must be adhered to.

Total Dissolved Solids (TDS)

TDS consist of inorganic salts and small amounts of organic matter that are dissolved in water. **TDS** comprise sodium, potassium, calcium, magnesium, chloride, sulfate, bicarbonate, carbonate, silica, organic matter, fluoride, iron, manganese, nitrate, nitrite and phosphates. No health effects have been associated specifically with or directly attributable to high TDS concentrations, although the health effects of individual components of TDS must be considered separately. Indirectly, high TDS water, being less palatable, might discourage consumers from drinking tap water, leading to use of potentially less healthy water (from alternative sources, natural or manufactured) and/or other less healthy drinks.

Sodium

Sodium is a natural component of water and essential to human life. The guideline value for sodium in drinking water is based on aesthetic considerations (taste threshold); while high sodium may be likely to give water a salty taste, it is unlikely to present a health concern. When consumed, sodium is readily absorbed by the body. It is present in all body tissues and fluids and its concentration is maintained by the kidney. High concentrations give rise to the sensation of thirst. Excessive sodium intake, usually via diet, can aggravate chronic congestive heart failure and increase blood pressure. Reduced sodium intake can reduce the blood pressure of some individuals with hypertension.

Asbestos Containing Material (ACM)

Asbestos is a naturally occurring mineral fibre which is strong, flexible, and can insulate from heat and electricity. Because of these properties, historically asbestos has been commonly used in the construction of homes and buildings and is understood to have been used in roofing material as bonded asbestos at Macquarie Point. It can be encountered as friable (generally crumbling material with potential to generate fibres) or non-friable (bonded). Asbestos is a known carcinogen and exposure to asbestos fibres can lead to a number of diseases, including pleural disease, asbestosis, lung cancers, and mesothelioma. In the event that potential asbestos containing material (ACM) is encountered in soils during intrusive works, all activities are to cease immediately in the work area. A suitably experienced occupational hygienist should be consulted to provide advice regarding the removal and management of ACM in soils prior to works re-commencing.

Methane

Methane is a colourless, odourless and highly flammable gas. It can be produced in soil from the decay under anoxic (low oxygen) conditions of carbon containing materials, including nature materials such as plant or animal matter, or from carbon impacts such as TPH.

Low levels of methane are not expected to cause adverse health effects. Higher concentrations can reduce oxygen levels in the air and lead to mood changes, slurred speech, vision problems, memory loss, nausea, vomiting, facial flushing and headaches. In severe cases, low oxygen levels can lead to

changes in breathing and heart rate, balance problems, unconsciousness and, if over a long period, death.

Methane is also potentially flammable in higher concentrations. If present in soil, methane has the potential to pool in confined spaces

Per- and Poly-fluoroalkyl Substances (PAHs)

PFAS are manufactured chemicals that have been used for more than 50 years. PFAS makes products non-stick, oil- and water-repellent, and fire, weather- and stain-resistant, and has been used in a range of consumer products, such as carpets, clothes, food packaging and paper, and have also been used in firefighting foams, pesticides and stain repellents.

PFAS encapsulates a broad recognised range of compounds which can have different chemical, environmental and biological properties. However, PFAS are typically soluble, very stable and tend to resist degradation, and may bioaccumulate in humans or ecological receptors.

PFAS is widespread and it is likely that most people in Australia have low levels of different PFAS in their bodies following exposure to everyday household objects, primarily through inhalation, ingestion, or skin contact.

There is currently limited evidence of human disease or other clinically significant harm from PFAS exposure. Some studies have found association between people exposed to specific PFAS chemicals and increased cholesterol or uric acid levels in the blood, reduced kidney function, altered indicators of immunological function, altered levels of thyroid and sex hormones, lower birth weights, later ages for starting menstruations/earlier menopause, and increased risk of testicular/kidney cancer.

It is noted that the noted associations have not been determined as direct health causes at this time.

Plate 1	SPoWQM Table 1 - Environmental Values and Uses of Groundwater Classified by the Levels of TDS (mg/L)	9

1.0 Introduction

1.1 General

The Macquarie Point Development Corporation (MPDC; the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation and ongoing oversight of a remediation strategy for the Macquarie Point site in Hobart, Tasmania (the Site). The Site location is presented on **Figure F1**, and layout on **Figure F2**.

This Groundwater Quality Management Plan (GQMP) has been prepared to document the requirements for ongoing groundwater monitoring and management at the Site.

1.2 Purpose and Objectives

The overall purpose of the GQMP is to document the requirements and provide a framework for ongoing groundwater monitoring at and adjacent to the Site, in order to allow identification of any changes in groundwater condition which may affect the risk status associated with groundwater within or emanating from the Site.

To meet this purpose, the objectives of the actions to be undertaken under this GQMP are to allow:

- Maintenance of knowledge on the condition of Site groundwater elevation, flow direction, and chemical characteristics and record any changes which may arise over time or as Site condition changes.
- Assess if unacceptable risks to on- and off-Site human and ecological receptors may be presented by changes, and to identify what additional assessment, mitigation, or remediation actions are required.

This GQMP forms part of, and should be read in conjunction with, the Site Environment Management Plan (SEMP) (AECOM, 2026). The SEMP documents:

- Stakeholder roles and responsibilities
- Relevant Site setting information
- Ongoing environmental management requirements.

If as part of future revisions, the GQMP is separated from the SEMP or the Site is sub-divided and separate GQMPs are developed for sub-areas, the information from the SEMP and any changes which have occurred must be incorporated into the new or updated GQMP.

The GQMP includes the following to support the SEMP and overall management of environmental impacts at the Site:

- A summary of the regulatory framework applicable to the assessment and management of groundwater at the Site.
- Data Quality Objectives (DQOs) for groundwater monitoring events (GMEs) at the Site.
- Methodologies for ongoing monitoring and sampling of groundwater.
- Key groundwater risks
- Trigger levels and contingencies.

1.3 Use of Groundwater at the Site

Groundwater at the Site has impacts and contamination from historic industrial land use, and should not be extracted or used for any purpose other than:

- Environmental monitoring, assessment, or remediation.

- Short-term removal during development or construction of the Site (i.e., removal of groundwater in slurry from pile installation, removal of groundwater which has entered excavations)
- Groundwater drainage measures for structures, which meet the requirements described in Section 4.4 of the SEMP.

Any groundwater extracted at the Site should be considered as potentially contaminated, and removed by a licensed waste contractor, or alternatively treated and disposed to sewer under a Site-specific Trade Waste Agreement (subject to regulatory approval). The potential for dissolved methane in groundwater to degas and enter surrounding air should be considered in any handling of Site groundwater.

2.0 Regulatory Framework

2.1 Environmental Management and Pollution Control Act 1994

The *Environmental Management and Pollution Control Act 1994* (the EMPCA) forms the basis of environmental legislation in Tasmania.

Any activities undertaken must comply with the EMPCA.

2.2 State Policy on Water Quality Management 1997

The *State Policy on Water Quality Management 1997* (the SPoWQM) was issued:

To achieve the sustainable management of Tasmania's surface water and groundwater resources by protecting or enhancing their qualities while allowing for sustainable development in accordance with the objectives of Tasmania's Resource Management and Planning System.

The SPoWQM defines Protected Environmental Values (PEVs) for Tasmanian groundwater, which have been assessed for the Site in **Section 4.1**.

2.3 Macquarie Point Development Corporation Act 2012 and the Site Environmental Audit

In 2015, the *Macquarie Point Development Corporation Act 2012* (the Act) was amended to enable the accreditation of an environmental auditor under Tasmanian legislation. The amended Act enables the Director of the Tasmanian Environment Protection Authority (EPA) to accredit an auditor. Mr David Lam of Tetra Tech Coffey has been appointed as the Environmental Auditor for the Site and has been accredited as an auditor recognised by the amended Act.

Where there is limited, or a lack of, suitable guidance in Tasmania for the audit, the amended Act allows for the Auditor to defer to other suitable interstate guidance. In this instance, the guidelines supporting the Victorian EPA Environmental Audit Framework have been adopted, as it is the home state of the appointed Auditor.

It is noted that Victorian legislation which defines the Audit process was updated and superseded by the *Environment Protection Act 2017* (the EP Act), which came into effect on 1 July 2021, and contains significant changes to Audit methodology and terminology under the Victorian framework. Under Section 478 of the EP Act, existing Audits where an Auditor has been engaged prior to 1 July 2021, and the Audit has not been completed by 1 July 2021, can be conducted under either the EP Act or the previous framework defined in the *Environment Protection Act 1970*. To maintain continuity with the portions of the Audit already completed, the Site Audit is currently continuing under the previous framework and terminology.

The role of the Auditor is to review the progression of investigation, and remedial planning and execution works at the Site. It is understood that the Auditor shall ensure that the works are carried out in compliance with local Tasmanian legislation and guidelines with consideration given to the requirements of the Victorian EPA Environmental Audit Framework.

The ultimate outcome of the Environmental Audit is to obtain a Site Suitability Statement as part of a Contaminated Land Audit Report for each area of the Site. Each Site Suitability Statement contains, or is expected to contain, requirements for implementation of the SEMP which this GQMP forms part of.

2.4 State Policies and Projects (Macquarie Point Precinct) Order 2025

The Tasmanian Government Department of State Growth announced in September 2022 that the Site is the preferred location for a mixed-use precinct, including a multipurpose stadium. Details of the proposed development of the Site were released in the Precinct Plan (MPDC, 2024).

The proposed development of a multipurpose stadium at the Site was classified as a Project of State Significance (PoSS) by the Governor of Tasmania on 16 October 2024, and *State Policies and Projects (Macquarie Point Precinct) Order 2025*, (the Order) was introduced to Tasmanian State Parliament in October 2025. The Order was approved by the Tasmanian House of Assembly on 13 November 2025

and by the Tasmanian Legislative Council on 4 December 2025 and provides conditions and approval for development of the Multipurpose Stadium at the Site.

Schedule 5 of the Order provides general environmental conditions for development of the Site. The conditions in the Schedule, and in the Order in general, are consistent with the *Macquarie Point Development Corporation Act 2012*, and in general require completion of a Site Suitability Statement for each area of the Site prior to development of that specific area.

No changes to the Environmental Audit of the Site, or the overall process and requirements for issue of Site Suitability Statements, arise from the Order. The Order does require that Site Suitability Statements be issued and implemented for each area of the Site where development is to occur.

3.0 Data Quality Objectives

Guidance regarding the development of Data Quality Objectives (DQOs) has been referenced from the following primary documents:

- National Environment Protection Council, *National Environment Protection* (*Assessment of Site Contamination*) Measure 1999, *Schedule B2: Guideline on Site Characterisation* (as amended May 2013) [ASC NEPM].
- New South Wales Environment Protection Authority (NSW EPA) *Contaminated Land Guidelines: Sampling Design Part 1 – Application* (EPA NSW, 2022).
- United States Environmental Protection Agency (US EPA), *Guidance on Systematic Planning Using the Data Quality Objectives Process* (EPA QA/G-4) (US EPA, 2006).

The process of establishing appropriate DQOs is defined by the seven-step planning approach presented in the ASC NEPM and summarised in **Table 1** below.

Table 1 Data Quality Objectives

Step	Data Quality Objective Step Summary
1	***State the Problem*** – Summarise the problem that will require new environmental data, identify the resources available to resolve the problem and develop a conceptual site model (CSM) based on available information prior to the commencement of the site investigation.
2	***Identify the Goal of the Study*** – Identify the decisions that need to be made and the new environmental data required to support the identified decisions. Develop a decision statement linking the principal project objective(s) to the possible actions that will address the problem.
3	***Identify Information Inputs*** – Identify the information needed to support any decision and whether new environmental data will be needed.
4	***Define the Boundaries of the Study*** – Specify the spatial and temporal aspects of the environmental media that the data must represent to support decision(s).
5	***Develop the Analytical Approach*** – Define the parameter of interest, specify the action level, and integrate information from Steps 1–4 into a single statement that gives a logical basis for choosing between alternative actions.
6	***Specify Performance or Acceptance Criteria*** – Specify the decision-maker's acceptable limits on decision errors, which are used to establish performance goals for limiting uncertainties in the data.
7	***Develop the Plan for Obtaining Data*** – Identify the most resource-effective sampling and analysis design for generating the data that is required to satisfy the DQOs.

The GQMP scope and methodology have been designed to meet the nominated DQOs. Discussion regarding the approach to be adopted, relative to the seven steps presented in **Table 1,** is provided in the following sections.

3.1 Step 1 – State the Problem

At completion of the Environmental Audit, the Site must be considered suitable for the proposed use. However, Site development or changes in the future may change groundwater conditions and the risk profile of groundwater contamination. Groundwater conditions must be monitored and assessed during and following development to allow identification of any changes in condition which may alter the level of risk assessed from groundwater impacts.

This GQMP has been developed to document the approach to the ongoing monitoring and assessment of groundwater quality at the Site, in order to identify if changes in groundwater conditions occur in the

future which may represent potential risks to users of the Site or adjacent land or water bodies. Preparation, maintenance, and implementation of the GQMP is a requirement of the SEMP (AECOM, 2026), and of the Site Suitability Statements issued for the Site.

3.2 Step 2 – Identify the Goal of the Study

The decision identification component of the DQO process represents the key issues that need to be considered to resolve the problems identified in Step 1. These include:

- Is groundwater elevation and flow consistent with historical conditions and with the assumptions which form part of assessment of the risk profile for groundwater at the Site?
- Are analyte concentrations within surface water and groundwater above background levels?
- Do the concentrations identified exceed the relevant criteria and do they indicate a change in risk or the potential for an unmanaged risk at the Site, which required action?
- Are the contaminants identified consistent with the understanding of the Site history?
- Is the investigation approach scientifically suitable and defensible and is it consistent with relevant guidelines?
- Are any of the trigger conditions met and are further actions required?

Overall, the decision making statement for this GQMP is:

- *Potential risks from Site groundwater must be monitored and sufficient information gathered to assess and monitor potential risks. If changes occur which introduce unacceptable risks, a process to enable implementation of suitable management measures is required.*

3.3 Step 3 – Identify the Information Inputs

To allow assessment of the data against the decision goals listed in **Section 3.2**, various inputs will be considered as follows:

- Field observations of aesthetic impacts or potential contamination (e.g., odours and phase separated hydrocarbons [light non-aqueous phase liquids; LNAPL]) and of groundwater elevation and inferred flow directions.
- Laboratory analysis of representative groundwater samples.
- Planned and implemented changes to the Site and surrounding areas, such as development activities, land use, and any other features of note relating to groundwater.
- Anecdotal information and previous investigation data (where available)

3.4 Step 4 – Define the Boundaries of the Study

The spatial boundaries (geographical limits) and lateral extent for data collection and decision making for the investigations are defined and illustrated by the Site boundaries and off-Site groundwater monitoring wells shown on **Figure F3**.

The vertical extent works will be limited the maximum depth of groundwater wells listed on **Table T1**.

The temporal bound of each study will be the period of groundwater sampling, with reference to historic Site groundwater data collected between 2015 and 2025.

3.5 Step 5 – Develop the Analytical Approach (or Decision Rule)

Data collected via implementation of the GQMP must be sufficiently representative of the media sampled to satisfy the purpose and inform the conclusions and recommendations of each GME, and further develop the CSM.

The following analytical approach will be undertaken:

- The scope of each GME will be developed with consideration of previous investigations, recommendations, data gaps, and overall Site knowledge (refer to **Section 6.1**).
- All samples will be collected by suitably qualified/experienced field scientists.
- All samples will be analysed for the target chemicals of potential concern (CoPC), which will be identified prior to each GME. Analysis must be conducted by analytical laboratories, which have current accreditation from the National Association of Testing Authorities (NATA) for the analysis requested.
- All sample analysis results will be compared to the adopted criteria (refer to **Section 4.0**).
- Field and laboratory quality assurance/quality control (QA/QC) sampling requirements will be identified prior to each GME.
- Data quality indicators (DQIs) (**Section 4.4**) will be used to validate the data quality.

The decision rules will be:

- If comparison of groundwater data to the relevant screening criteria (outlined in **Section 4.0**) identifies exceedances, increasing concentration trends, or data gaps or discrepancies from the proposed sampling plan, the contamination impacts will be subject to further investigation, assessment, remediation, or management; otherwise, environmental conditions will be deemed suitable for the proposed future uses and environmental values associated with the Site based on the available data.
- If the GME results suggest potential unacceptable risk, or if there remains insufficient information, recommendations shall be made on further assessment, management, or remediation measures.
- If the QA/QC data meets the Data Quality Indicators (DQIs) adopted (outlined in **Section 4.4.1**) to assess the precision and accuracy of the data, the data will be considered to be suitable for interpretive use. Data that fail to meet the DQIs will be assessed for their significance, then if required, managed using corrective actions (where possible) such as re-analysis of suspect samples, re-analysis of data and/or procedures, acceptance of data with acknowledged limitations/bias, or the data may be discarded.

3.6 Step 6 – Specify Performance or Acceptance Criteria

A decision error in the context of the decision rule presented in Step 5 would lead to either underestimation or overestimation of the potential risks associated with a particular analyte. Decision errors may include:

- Limitations in available Site history information
- Constraints associated with the ability to access certain areas of the Site, or off-Site locations
- Errors in the sampling plan
- Collection of samples that are not representative of the subject media
- Analytical errors
- Data not representative of Site conditions.

It is intended that the findings of the groundwater quality monitoring will provide sufficient information to inform decision making regarding potential risks, for example:

- Data will be reviewed and outliers within data sets will be identified and discussed in the context of Site characterisation for potential risks to human health and the environment
- If the criteria are not exceeded and the potential risk is considered acceptably low, an appropriate risk close out statement will be used
- If the criteria are exceeded, appropriate further assessment and contingency actions will be identified to further evaluate and, if necessary, manage the potential risk.

The quality of the data collected will be assessed on a range of factors including:

- Documentation and data completeness
- Reference to relevant guidance documents
- Consistency of methodology
- Data quality including comparability, representativeness, precision, and accuracy for data collection and analysis.

Assessment criteria for groundwater DQIs are listed in **Section 4.4**.

3.7 Step 7 – Develop the Plan for Obtaining Data

This GQMP has been developed to document the plan to obtain the required data, in order to meet the data quality objectives of this investigation identified in Steps 1 to 6 above.

The scope of works will be carried out to a level of accuracy and confidence consistent with the requirements of the ASC NEPM.

4.0 Environmental Values and Assessment Criteria

4.1 Protected Environmental Values

An appraisal of PEVs of groundwater has been undertaken with reference to the SPoWQM.

Table 1 from the SPoWQM (presented on **Plate 1** below) identifies PEVs for groundwater which are possible to be achieved on the basis of the groundwater total dissolved solids (TDS) concentrations.

Table 1 Environmental Values and Uses of Groundwater Classified by the Level of Total Dissolved Solids (mg/L)

Category TDS (mg/L)	A Less than 1000	B 1000-3500	C 3500-13000	D greater than 13000
Protected Environmental Value				
Drinking Water (1)	*			
Irrigation	*	*		
Industry	*	*	*	
Stock	*	*	*	
Ecosystem Protection	*	*	*	*

"*" Denotes an environmental value which can be achieved given the level of dissolved solids

(1) Where groundwaters have TDS levels below 500 mg/L, TDS levels should be maintained below these levels wherever practicable.

Plate 1 SPoWQM Table 1 - Environmental Values and Uses of Groundwater Classified by the Levels of TDS (mg/L)

Based on the reported TDS concentrations during previous groundwater investigations, Site groundwater is considered to be representative of Category A in accordance with the SPoWQM. For the purposes of ongoing assessment, all PEVs should be considered.

In addition, recreation (primary and secondary contact), aesthetics, buildings and structures, and human health (vapour intrusion) have been included as PEVs for groundwater at the Site.

4.2 Tier 1 Assessment Criteria

Groundwater assessment criteria have been identified for each groundwater PEV considered relevant for the Site, as discussed in **Section 4.1**, using the reference documents provided in **Table 2** below.

Adopted criteria values for specific CoPC are provided in **Appendix C**.

The Tier 1 assessment criteria have been derived to initially screen and identify precluded PEVs. The risk-based Remediation Criteria (the RC) presented in **Section 4.3** have been derived on a Site-specific basis for assessment of risks to the human health from groundwater impacts.

Table 2 Adopted Tier 1 Screening Criteria - Groundwater

Protected Environmental Value	Adopted Assessment Criteria	Rationale
Drinking Water	• NHMRC Australian Drinking Water Guidelines (amended 2018) Aesthetics • NHMRC Australian Drinking Water Guidelines (amended 2018) Human Health • PFAS NEMP (2025) Where no high reliability NHMRC guideline values are available, screening values have been adopted from the following sources: • WHO (2017) Guidelines for Drinking-Water Quality: Fourth Edition Incorporating the First Addendum • US EPA RSLs (2020) Tap Water Quality • Health Canada (2020) • NZMH (2018) Drinking Water Standards	• Whilst it is noted that groundwater at the Site is unlikely to be extracted for drinking water purposes, this PEV has been conservatively considered for the purposes of groundwater assessment.
Irrigation	• ANZECC (2000) Short Term Trigger Values (STV) for Irrigation Water	• STV have been adopted on the basis of the surrounding land use, where ongoing irrigation of plants and garden beds is unlikely to occur. STV can be tolerated for up to 20 years of irrigation.
Industry	• Due to the wide and varied potential industrial uses of groundwater, water quality requirements for use in industrial processes are assessed on an industry-specific basis.	• Groundwater at the Site is unlikely to be used for industrial purposes. In the absence of any standard or reliable criteria to apply for this PEV without a specific planned industrial use, this PEV has not been considered.
Stock	• ANZECC (2000) Livestock Drinking Water Quality	• Based on the Site setting, it is unlikely that groundwater would be used for stock watering purposes. However, for the purpose of assessing this PEV, the ANZECC (2000) guidance has been adopted.

Protected Environmental Value	Adopted Assessment Criteria	Rationale
Ecosystem Protection	• ANZG (2018) 90% level of ecosystem protection (marine water) • PFAS NEMP (2025) Interim Marine 95% (slightly to moderately disturbed) level of ecosystem protection (interim marine) Where no high reliability guideline values are available in ANZG (2018), screening values have been adopted from the following sources: • ANZG (2018) low to moderate reliability trigger values (marine) • ANZG (2018) 90% level of ecosystem protection (marine water) draft guidelines released for public comment on 29 June 2020 • US EPA (2013) Ambient Water Quality Criteria (chronic – Marine) • US EPA (2006a) Region 3 Mid-Atlantic Biological Technical Assistance Group (BTAG) Screening Benchmarks (marine) • RIVM (2001) Dutch Intervention Values (DIV) for TPH • There are currently no relevant Australian guidelines for TRH in groundwater. Therefore, for the purpose of this assessment, the Netherlands Ministry of Housing - DIV (2000) for Mineral Oil has been adopted	• The nearest surface water ecosystems that may receive groundwater discharge, i.e. River Derwent and Sullivans Cove, would be characterised as a moderately to highly disturbed (i.e. active port area) marine environment according to the ANZECC (2000) definitions. As such, the assessment criteria based on 90% level of ecosystem protection (marine) have been adopted, with the exception of identified bioaccumulative CoPC where the 95% level of ecosystem protection (interim marine) has been conservatively adopted, consisting of: - PFAS - Mercury - PAHs (anthracene, phenanthrene, fluoranthene, and benzo(a)pyrene).
Recreation (Primary Contact)	• NHMRC (2008) Guidelines for Managing Risk in Recreational Water • PFAS NEMP (2025)	• NHMRC (2008) recommends applying Australian Drinking Water Guidelines - *Health* (NHMRC, 2018), adjusted for a 10 fold decrease in ingestion of water.
Recreation (Secondary contact)		• Primary Contact Recreation criteria have been conservatively adopted to assess secondary contact.
Aesthetics	• NHMRC Australian Drinking Water Guidelines (amended 2018) Aesthetic	• This may relate to aesthetic issues associated with the presence of objectionable odours, colours, taints, visible floating material, foam, oil or grease or ‘dirty’ water.

Protected Environmental Value	Adopted Assessment Criteria	Rationale
Buildings and Structures	• AS 2159 – 2009	• Building and structures have been assessed on the basis of concrete piles in a mild exposure classification scenario in high permeability soils. • In addition to a pH of 5.5, sulphate and chloride concentrations of 1,000 mg/L and 6,000 mg/L respectively have been adopted to assess potential impacts to concrete piles.
Human Health - Vapour Intrusion	CRC CARE (2011) Groundwater HSLs for vapour intrusion including: • Residential - HSL A/B (sand, depth to groundwater 2.0 – <4.0 m bgl) • Recreation/ Open Space - HSL C (sand, depth to groundwater 2.0 – <4.0 m bgl) • Commercial/ Industrial - HSL D (sand, depth to groundwater 2.0 – <4.0 m bgl) • Intrusive Maintenance Worker- HSL: (sand, depth to groundwater 2.0 – <4.0 m bgl) The British Geological Survey (BSG) (UKRI, 2024) value for assessing risk of methane intrusion from groundwater.	• Groundwater HSLs for vapour intrusion for TRH fractions have been developed based on typical petroleum mixtures and consider the solubility limits of petroleum mixtures. HSLs cannot be applied to non-petroleum sources such as pure solvents or gasworks wastes, where solubility limits are much higher. The HSL (infinite) values presented in Appendix F of CRC CARE, 2011 have been adopted in accordance with CRC CARE guidance. The theoretical solubility of the pure compound in water was used instead to identify vapour limiting HSLs (i.e. chemicals where a vapour inhalation risk was calculated to be only present at concentrations exceeding the theoretical solubility). Whilst it is noted that petroleum products do exist at the Site, given the varying types of hydrocarbon impact (i.e. gasworks, diesel, and petrol) the HSL infinite values have been adopted as a conservative approach. • HSLs associated with depths to groundwater of between 2.0 and <4.0 m bgl in sand lithology were selected to assess groundwater analytical results as the Tier 1 criteria have been conducted as an initial screening only. The Site specific remediation criteria (**Section 4.3**) are considered protective of groundwater at 1 m bgl, based sensitivity analysis (AECOM, 2025a). • The BSG methane criteria assumes all methane in water will outgas to form an explosive atmosphere.

Notes: *NHMRC – National Health and Medical Research Council; PFAS – Per- and Polyfluoroalkyl Substances; NEMP – National Environmental Management Plan; WHO – World Health Organisation; US EPA – United States Environmental Protection Agency; RSL – Regional Screening Level; NZHM – New Zealand Health Ministry; ANZECC – Australian and New Zealand Environment and Conservation Council; STV – Short Term Trigger Value; ANZG – Australian and New Zealand Guidelines; BTAG – Biological Technical Assistance Group; RIVM – Rijksinstituut voor Volksgezondheid en Milieu; TRH – Total Recoverable Hydrocarbons; CRC CARE – Cooperative Research Council for Contamination Assessment and Remediation of the Environment; BSG – British Geological Survey; HSL – Health Screening Level*

4.3 Site Specific Remediation Criteria

Site Specific Remediation Criteria (RC), to inform remediation and management works required at the Site, for the protection of human health were initially derived in 2016 (AECOM, 2016), and reviewed updated in 2025 (AECOM, 2025a). The RC adopted for groundwater are presented in **Appendix C**.

The RC consider the following scenarios and land uses which are considered applicable to the currently proposed future development based on the review of RC (AECOM, 2025d)*:*

- High density residential development (slab-on-grade buildings and buildings with a communal basement car park)
- Recreation / open space
- Multi-storey car park
- Commercial/light industrial (slab-on-grade buildings and working within a basement car park).

It is noted that residential development is now only proposed in Regatta Point. However, high density residential land use is known to occur off-Site and hydraulically down-gradient along Evans Street to the south of the Site, and the potential exists for groundwater migration from the Site to reach this area. As such, the RC protective of residential use should be applied to groundwater data from the Site in assessment of off-Site risks.

Potential risks to ecological receptors were not considered in the RC and were separately assessed (AECOM, 2020), and reviewed in 2025 (AECOM, 2025b) noting that the only potential ecological receptors identified for the Site are off-Site aquatic receptors via groundwater migrations.

The risk-based Site RC are derived based on generic, conservative exposure assumptions protective of on-Site and off-Site human health under the above-mentioned potential future land use conditions at the Site, and incorporated the following key assumptions:

- NAPL impacts at the Site will be remediated to the extent practicable and therefore risks associated with exposure to NAPL, and volatile contaminants derived from NAPL were not considered in the derivation of the RC.
- Intrusive maintenance work at up to 1 m below ground level (bgl) may be undertaken in all land uses.
- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of maintenance workers) to have direct contact with soils.
- A reticulated water supply will be available, based on the urban setting of the Site, and abstraction of groundwater for any purposes other than remediation or monitoring, or temporary extraction during construction, will not be required. Potential exposure to contaminants in groundwater during any construction, remediation, or monitoring will be managed by task specific safety documentation informed by the SEMP.
- Groundwater will be 1 m or more below the final surface of the Site.
- A SEMP will be prepared and put in place to maintain/manage surface cover. It is noted that this GQMP has been prepared as an attachment to the SEMP.
- With regard to basements:
    - Use of any future basements is assumed to be limited to car parking. If basements are constructed for other purposes, a risk assessment specific to the intended use should be conducted.
    - Where basements are associated with future residential or commercial buildings, it is assumed that these will be communal areas for multiple properties, for example, as part of a strata scheme that is managed by a body corporate. Private basements will therefore not be associated with individual residences.
    - Where there is access to a basement car park, it is assumed that any groundwater seepage collects in floor drains and a physical barrier is present, and therefore, groundwater will not be

directly contacted by basement users, with the exception of maintenance workers. It is assumed that individual tenants will not be involved in the maintenance of any associated services, including drainage pumps or sumps.

- For potential future multi-storey car park users, the most sensitive receptor in this scenario would be considered to be a parking attendant present at the Site for a typical eight hour working day. It is considered that RC derived for potential future commercial/light industrial workers (working within a basement) would be protective of all other basement users. This includes multi-storey car park users and residential tenants who access basement car parks and are likely to have lower frequency and duration of exposure, therefore the multi-storey car park users scenario is not evaluated separately in this assessment.
- Adjacent off-Site land uses include open space, commercial/industrial, and residential areas. As these potential land uses have been considered on-Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g. via groundwater migration beyond the Site boundary), as:
  - Extractive groundwater use is not known to occur within 2 km of the Site, based on review of registered groundwater bores undertaken in 2024, and the urban setting and reticulated water supply indicate that groundwater extraction and use is unlikely to occur.
  - No basements are known to be present in the surrounding off-Site buildings, and are considered unlikely due to the additional costs which would be required for basement construction, based on shallow groundwater elevation, hydraulically downgradient of the Site.
- It is considered that potential exposure to workers undertaking remediation and/or development activities can effectively be mitigated through the implementation of an appropriate Construction Environmental Management Plan (CEMP). The CEMP should be prepared during the planning stage for any future remediation and/or development activities.
- A separate assessment of the potential risks to on-Site visitors was not undertaken as it was considered that the chronic exposure duration assessment of commercial/light industrial workers or residents is sufficiently protective of the shorter exposure duration visitor scenario.

These assumptions, including controls and requirements for future development, are currently documented as requirements of the SEMP (AECOM, 2026), and should be maintained in future SEMPs. Additional assessment of risks to users, and potentially further remediation, would be required in the event of any proposed development or Site use which does not conform to these assumptions.

4.4 Quality Assurance / Quality Control

A QA/QC program has been developed to ensure that data collected is sufficiently accurate, precise and reproducible for the purposes of the assessment program. The objective of the QA/QC program is to provide an assessment of the reliability of the data presented for interpretation. **Table 3** below summarises the QA/QC for investigations conducted as part of implementation of the GQMP.

Table 3 Aspects of the QA/QC Program

Aspect	Description
Use of Experienced Personnel	Field work will be undertaken by trained personnel with previous experience in contaminated site assessment. Field personnel will be familiar with: • Field sampling techniques • Task- and Site-specific health and safety protocols.
Field Methodology	Field activities will be conducted in accordance with the AECOM standard procedures provided in **Appendix D**.
Equipment Calibration	Where applicable, field equipment will be calibrated daily prior to use in the field. Certificates of calibration in accordance with manufacturer requirements will be provided from equipment suppliers as part of hire/procurement.

Aspect	Description
Record Keeping	Date, field personnel details, observations and findings of field activities including (but not limited to) general Site conditions (including weather), groundwater level and water quality measurements, groundwater sampling, and equipment calibration details will be recorded on project-specific data sheets.
Sample Collection	Non-dedicated sampling equipment (e.g. groundwater sampling pump, water level meter and water quality meter) will be decontaminated prior to mobilisation to Site and between sampling locations. Dedicated sampling equipment (e.g. tubing and sample containers) will be used for the collection of groundwater and QA/QC samples.
Duplicates	Field duplicate (inter and intra-laboratory) samples will be collected at a rate of one each for every 20 primary samples, for each sample media, with the exception of field duplicates of PFAS samples, which will be collected at a rate of one every 10 primary samples, in accordance with the PFAS NEMP (HEPA, 2025).
Sample Labelling	A unique sample identification number will be used for each sample to specify the sample origin (monitoring well number and date).
Chain of Custody	Standard Chain of Custody (CoC) procedures will be adopted for sample transfers. CoC documentation includes sample numbers; date of sampling/ collection; analyses required; and release and receipt of parties accepting sample custody.
Sample Storage	Samples will be collected in appropriate sample containers supplied by the analytical laboratory. Where required, sample containers will be prepared with preservation solutions based on the analyte of interest. Samples will be placed in cool storage prior to transfer to the laboratory.
Decontamination	All non-dedicated field equipment used in the sampling process will be subject to appropriate decontamination procedures, generally consisting of a non-phosphate and non-PFAS containing detergent solution wash followed by a deionised, distilled, or clean water rinse. The decontamination procedures will be performed prior to first use onsite and between each sampling location.

The quality of the data collected will be assessed on a range of factors including:

- Documentation and data completeness
- Reference to relevant guidance documents
- Consistency of methodology
- Data quality including comparability, representativeness, and accuracy for data collection and analysis.

4.4.1 Data Quality Indicators

The Data Quality Indicators (DQIs) to be adopted to assess the precision and accuracy of the data include:

- Assessment of the reproducibility of the data by calculation of the Relative Percent Difference (RPD) for laboratory and field duplicate samples. This will provide an indication of the precision of the data. The RPD is calculated from the absolute difference between results of the duplicate pair divided by the mean value of the duplicate pair as presented below:

  RPD (%) = 100 x (D1-D2) / ((D1+D2) / 2)

  Where: D1 = primary sample analysis

D2 = duplicate sample analysis

- Assessment of the analytical results for laboratory quality control samples. This will provide an indication of the accuracy of the data.
- Collection of rinsate blanks (at a rate of one per day of sampling) to provide an indication of accuracy related to potential for cross contamination of samples during sampling.
- Collection of field blanks (at a rate of one per day of sampling) to assess ambient conditions during sampling. Field blanks will be kept on hold unless rinsate results report detections above the laboratory limit of reporting (LOR).
- Analysis of trip blanks (at a rate of one per esky) to provide an indication of accuracy related to potential for cross contamination of samples during transport.

Assessment criteria for data quality indicators for sampling undertaken during the investigations implemented as part of this GQMP are listed below in **Table 4**.

Table 4 Acceptance Criteria for Data Quality Indicators

Data Quality Indicator	Acceptance Criteria
Rinsate blanks	Less than the laboratory LOR
Intra and inter laboratory field duplicates (1) (3)	Relative percent difference (RPD) less than 30%
Laboratory duplicates (2) (3) (4)	RPDs less than: - 20% for high level laboratory duplicates (i.e., >20 x LOR) - 50% for medium level laboratory duplicates (i.e., 10 to 20 x LOR)
Matrix spikes (5) (6) (7)	Recoveries between 70-130%
Method blanks (7)	Less than the laboratory LOR
Trip blanks	Less than the laboratory LOR
Laboratory control samples (7) (8)	Recoveries between 70-130%.
Surrogate spikes	See Note 6

Notes:

1. *Potential exceptions may occur where the analyte concentrations are close to the LOR. The 30% RPD is obtained from the NEPM, Schedule B3, where it is advised that when an RPD exceeds 30% then a review should be conducted to ascertain the cause.*
2. *If the results are close to the LOR, then higher results will be accepted.*
3. *Assumes that samples are homogeneous and the background analyte level is less than 20% of the spike level (refer to USEPA Method 8000B). Note that there is no requirement for matrix spikes to pass as certain matrices may preclude recovery of spiked compounds. In this case data will be accepted if the laboratory control sample (LCS) data meets the acceptance criteria.*
4. *Laboratory duplicates taken 1 per 10 samples.*
5. *80% of the compounds tested must fall within the control limits. Control limits are dynamic and vary for individual tests as per USEPA Method 8000B.*
6. *Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for individual tests but are within the criteria described in USEPA Method SW846.*
7. *Taken 1 per batch or 1 per 20 samples (whichever is smaller).*
8. *Recoveries for surrogates are test dependent and are based on USEPA Method SW846. Control limits are dynamic and vary for tests but are within the criteria described in USEPA Method SW846.*

4.4.2 Corrective Actions

Analytical data that fail to meet the predetermined DQIs and acceptable limits of accuracy and precision will be managed using one or more of the following corrective actions (where possible) on a case-by-case basis:

- Assess significance of DQI failure to consider whether further actions are necessary
- Reanalyse suspect samples, provided sample or extract is within holding time
- Evaluate and amend sampling and/or analytical procedures
- Resampling and reanalysis
- Accept the data as an estimate with an acknowledged level of bias and imprecision
- Discard the data.

In the event that data of questionable reliability are used, restrictions and limitations associated with the use of such data will be clearly identified. Failure to meet the DQIs will be reported and the significance to the outcome of the sampling and investigation works will be assessed.

5.0 Groundwater Conceptual Site Model

The ASC NEPM states that a CSM is an essential part of all site contamination assessments. A CSM provides a representation of site-related information regarding contamination sources, receptors and exposure pathways between those sources and receptors, and a framework for identifying how the site became contaminated and how potential receptors may be exposed to contamination either in the present or the future.

The development of a CSM is a dynamic and iterative process, where all information and data from each stage of an assessment is integrated to refine the CSM and inform subsequent decisions on whether further investigation or management is necessary.

Sections 5.1 to **5.4** below present the current CSM for groundwater at the Site, based on current Site knowledge of contamination as summarised in Section 3 of the SEMP.

The CSM should be reviewed as part of GME reporting (see **Section 6.8**). Proposed development of the Site, in particular the lowering of the Site and management of shallow groundwater in the north-east section of the proposed Stadium (**Section 6.4.4**) has the potential to alter groundwater flow and may affect NAPL and dissolved phase contaminant mobility, or expose and allow the oxidation of PASS.

5.1 Sources of Contamination

Based on current identified Site contamination and impacts (see Section 3 of the SEMP), the sources of contamination in groundwater listed in **Table 5** below are considered to have the potential to represent potential risks to receptors:

Table 5 Groundwater Potential Sources of Contamination

#	Type	Description
1	Dissolved phase contaminants	Concentrations of the following CoPC have been detected in groundwater above one or more of the adopted Tier 1 criteria for assessment of PEVs (see **Section 4.0**): • TDS • TPH - C_{10}-C_{36} / TRH - C_{10}-C_{40} • Benzene, naphthalene • PAHs – anthracene, benz(a)anthracene, benzo(k)fluoranthene, benzo(a)pyrene, chrysene, pyrene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, dibenzofuran, phenanthrene, fluoranthene, 2.4-dimethylphenol • Metals – aluminium, arsenic, boron, cobalt, copper, iron, lead, manganese, vanadium, zinc • Ammonia (as N), chloride, sodium, phosphorus, sulphate, cyanide • PFAS – PFOS • Methane • E. Coli and pH[1] In particular: • TRH/TPH and other hydrocarbon related contaminants (such as benzene, naphthalene and PAHs) are generally in the vicinity of LNAPL plumes and the former gasworks area in the south-west of the Site, but have been detected in groundwater in other areas. • PFOS above Tier 1 criteria has been detected in the south-east corner of the Site in one well (MW16), although detects above LOR but below criteria have been detected in wells on the north and north-east side of the Site. • Methane in groundwater is widespread, but generally in areas where land reclamation has occurred and buried, saturated natural soils are present, and may represent a risk if volatilised methane accumulates in enclosed spaces or structures.

[1] While E. Coli and pH are not “chemicals” of potential concern, they have been treated as such in assessment.

#	Type	Description
2	NAPL	NAPL has been detected as: • LNAPL in four plumes: - LNAPL Plumes A1, A2 and A3 in the central portion of the Site. - LNAPL Plume B in the south-east corner of the Site, and inferred to be co-sourced and extend off-Site to the east. LNAPL was remediated by Total Fluids Extraction (TFE) between 2015 and 2017. • DNAPL in four plumes in the former gasworks area in the south-east area of the Site. DNAPL was remediated via *in situ* solidification (ISS) in two areas in 2024. NAPL may represent a risk if directly contact with receptors occurs, or if secondary contact occurs via NAPL-derived dissolved phase or vapours. NAPL is not currently considered mobile (see Section 3.4 of the SEMP), but potential mobilisation due to groundwater disturbance should be considered in assessment.
3	PASS	PASS has been detected in natural soils (sands/silts) at the Site, generally in saturated soil below the water table, but also in some pockets of unoxidised material in unsaturated fill. While PASS is not considered a "contaminant" arising from human activities, but is instead a natural condition of soils at the Site, management of PASS is considered to form part of the overall management of the environmental condition of groundwater. If disturbed or dewatered, PASS has the potential to acidify and lower groundwater pH, which may directly impact receptors, or mobilise other contamination, especially metals.

Notes: *CoPC – Chemical of Potential Concern; TDS – Total Dissolved Solids; TPH – Total Petroleum Hydrocarbons; TRH – Total Recoverable Hydrocarbons; PAH – Polycyclic Aromatic Hydrocarbon; PFAS – Per- and Polyfluoroalkyl Substances; PFOS - Perfluorooctane Sulfonic Acid; E. coli - Escherichia Coli; NAPL – Non-Aqueous Phase Liquid; LNAPL – Light NAPL; DNAPL – Dense NAPL; TFE – Total Fluids Extraction; PASS – Potential Acid Sulfate Soil.*

5.2 Potential Receptors

Based on the current and proposed future uses of the Site, the receptors listed in **Table 6** below are considered to have the potential to come into contact with groundwater within or discharging from the Site.

Table 6 Potential Receptors of Groundwater

#	Type	Description
1	Human health – Residents (off-Site only), commercial/industrial workers and visitors at the Site or adjacent properties	• Residents of land to the south or west of the Site, which is zoned to allow a mix of residential and commercial uses. Apartments (first floor and above) are located along Evans Street, south of the Site. • Commercial or industrial workers at the Site or adjacent businesses such as shops and offices to the south and west, or the TasPorts facility to the east. • Visitors to residences, businesses, or open spaces at the Site or adjacent properties It is assumed that potential receptors in this category will not be undertaking intrusive works or activities.
2	Intrusive Maintenance and Construction Workers (On- and Off-Site)	• Workers undertaking intrusive maintenance (such as accessing sub-surface pipes or utility conduits) or construction activities.
3	Recreational users of nearby waterways (Off-Site only)	• Boating, fishing or other recreational uses of Sullivan's Cove or the River Derwent.

#	Type	Description
4	Ecological Receptors (Off-Site only)	• No ecological receptors (terrestrial or aquatic) are present on-Site or proposed as part of future development. Potential plants and vegetation on-Site will be managed as described in Section 4.7 of the SEMP to limit groundwater interaction. • No terrestrial ecosystems have been identified off-Site or are considered likely. • Aquatic ecosystems (assessed as “high disturbed”) are present in Sullivans Cove and the River Derwent.

5.3 Potential Pathways

Table 7 below lists the identified pathways whereby sources of contamination may come into contact with receptors.

Table 7 Potential Receptors of Groundwater

#	Type	Description
1	Direct contact	Ingestion, washing, or other direct contact with groundwater/ NAPL (either on-Site or which has migrated off-Site), or with surface water which Site groundwater has discharged to.
2	Vapour inhalation or accumulation	Inhalation of groundwater derived vapour, or accumulation of non-toxic vapour which represents an explosion risk (methane) in enclosed structures.

Risks associated with groundwater may be present on-Site, or off-Site where groundwater with contamination has migrated beyond the Site boundaries.

As noted in Section 2.5.3 of the SEMP, Site groundwater elevation contours generally followed the pattern of topographic elevation across the Site, indicating a relatively steep up-gradient flow direction to the south-east, prior to flattening out to a very gentle gradient across the central and south-eastern down-gradient areas. Groundwater flow direction followed the steep north-easterly slope towards Regatta Point further around the headland to the far north of the Site.

Groundwater is inferred to have southeast and southerly components of flow in the main area of the Site, with some westerly flow along the eastern boundary with TasPorts land which may be due to a buried seawall in this area, and northeasterly towards Regatta Point. The inferred ultimate discharge points of Site groundwater are the River Derwent and Sullivans Cove.

5.4 Source-Pathway-Receptor Assessment

An exposure pathway describes the course a chemical or physical agent takes from its source to an exposed individual or ecological receptor. In order for a receptor to be exposed to a chemical contaminant from a site, a complete exposure pathway must exist, which generally includes the following elements:

- A source and mechanism of chemical release
- A retention or transport medium (or paths where chemicals are transferred between media)
- A point of potential human or ecological contact with the contaminated medium
- An exposure route (i.e., inhalation, ingestion or dermal contact for the entity) at the point of exposure.

In cases where one or more of the above elements is missing, the exposure pathway is considered to be incomplete. Such circumstances are not considered to pose a risk of harm to receptors. **Table 8** below provides assessment on the status of source-pathway-receptor (SPR) linkages for groundwater at Macquarie Point.

The following assumptions have been made when considering SPR linkages:

- This GQMP and the SEMP will be implemented and maintained at the Site, including the following controls related to groundwater:
  - On-Site Groundwater use will be limited, as required in **Section 1.3**, to:
    - Environmental monitoring, assessment, or remediation;
    - Short-term removal during construction;
    - Groundwater drainage systems for structures.
  - Groundwater drainage and vapour intrusion protection (as required in Sections 4.4 and 4.8 of the SEMP) will be installed and maintained as part of future structures where required.
  - Safety documentation and procedures (such as Construction Environmental Management Plans [CEMPs], Work Health and Safety Plans [WHSPs], and/or task specific Job Safety Analysis [JSAs] or Safe Work Method Statements [SWMSs]) will be prepared and implemented for all intrusive works at the Site, as required in Section 4.3 of the SEMP.
  - Work planning will consider and identify potential disturbance of PASS, and preparation of a suitable Acid Sulfate Soil Management Plan (ASSMP), which may include a Dewatering Management Plan (DWMP), as required in Section 4.12.3 of the SEMP.
  - Potential risks and assumptions about use relating to groundwater will be communicated to adjacent landowners and properties, as required in **Section 6.8**.
- Due to the developed urban nature of the area and available reticulated water supply, groundwater (whether on-Site or in adjacent areas) will not be extracted for drinking, irrigation, recreational, or industrial purposes.

Table 8 Groundwater Source-Pathway-Receptor Linkage Assessment

Exposure Pathway	Residents (off-Site only), commercial/industrial workers and visitors		Intrusive Maintenance or Construction Workers		Recreational Users of Surface Water	Aquatic Ecosystems
	On-Site	Off-Site	On-Site	Off-Site	Off-Site	Off-Site
Incidental ingestion of contaminated groundwater	×(a)	×(a)	✓(d)	✓(d)	✓ (e)	✓(f)
Dermal contact with contaminated groundwater	×(a)	×(a)	✓(d)	✓(d)	✓ (e)	✓(f)
Inhalation of contaminated groundwater-derived vapours in indoor air	×(b)	×(b)	✓ (d)	✓ (d)	N/A	N/A
Accumulation of non-toxic groundwater-derived vapours (methane) to potentially hazardous levels in enclosed spaces.	×(b)	✓(b)	✓(d)	✓(d)	N/A	N/A
Inhalation of contaminated groundwater-derived vapours in outdoor air	✓ (c)	×(c)	✓(d)	× (c)	×(c)	N/A
Ingestion of contaminated groundwater used as potable water supply	×(a)	×(a)	×(a)	×(a)	×(a)	✓ (f)
Inhalation of contaminated groundwater vapours during irrigation/showering	×(a)	×(a)	×(a)	×(a)	×(a)	N/A
Ingestion of vegetables, plants or animals fed by contaminated groundwater	×(a)	×(a)	×(a)	×(a)	✓(f)	✓ (f)

Notes: × : incomplete pathway; ✓: potentially complete pathway; N/A : Not applicable

a) No on-Site or down-gradient off-Site bores used for agricultural / domestic purposes have been identified in previous investigations. The current SEMP restricts the use of Site groundwater to monitoring or remediation purposes or for dewatering (temporary or on-going), and based on the land use off-Site and downgradient, and the reticulated water supply available, use or handling of groundwater off-Site as potable water, or for irrigation, showering, stock watering, or other uses by humans, is considered unlikely.

b) On-Site development includes design and verification of vapour protection systems to prevent hazardous vapour intrusion, including consideration of potential vapour management for long-term drainage systems. No concentrations of CoPC which are considered to represent a potentially hazardous concentration of groundwater-derived vapours in indoor spaces have been detected in groundwater emanating from the Site, with the exception of methane, which is considered co-sourced from off-Site conditions (buried sea- and river-bed) and not sourced from the Site in off-Site areas.

c) No concentrations of CoPC which are considered to represent a potentially hazardous concentration of groundwater-derived vapours in outdoor spaces have been detected in groundwater within or emanating from the Site.

d) Risks to on-Site intrusive maintenance or construction workers will be managed by safety and environmental management documents as required by the SEMP. As part of implementation of the GQMP, off-Site landowners/controllers will be informed of potential risks to inform their own safety planning and management.

e) Potential surface water which may be subject to recreational use (the River Derwent and Sullivans Cove) are between 130 to 270 m from the Site boundary, and it is assessed that attenuation is likely to reduce CoPC concentrations below adopted criteria across these distances.

f) No potential impacts to off-Site ecological receptors are considered likely (see **Section 6.4.5**), which would include animals (i.e., fish) potentially consumed by off-Site recreational users of surface water.

6.0 Groundwater Monitoring Events

6.1 Scope Development and Schedule

In order to monitor the groundwater at and adjacent to the Site, and meet the purpose and objectives of the GQMP, as described in **Section 1.2**, Site-wide GMEs should be conducted at a minimum initial frequency of annually. The first GME is scheduled to occur in June 2026, noting that scheduling may be affected by Site development activities.

Each GME should be conducted with consideration of the following information:

- The environmental investigations which informed Site Suitability Statements / Contaminated Land Audit Reports, the SEMP, and the overall state of knowledge related to Site groundwater contamination.
- The key potential risk areas described in **Section 6.4** below.
- Any changes in Site condition or use, such as development, land use, and activities on neighbouring sites.
- Results and recommendations of previous GMEs.
- Any other recommendations, requirements, or data gaps relating to groundwater conditions which have been identified as part of other investigations or Site activities.

Sections 6.2 to **6.8** provide an initial scope and methodology for GMEs, with proposed groundwater wells to be gauged and selected analytical suites provided on **Table T2**. Groundwater well locations and proposed monitoring actions are shown on **Figure F5**.

Any modification of this scope for future GMEs must be justified as described in **Section 7.0**.

6.2 Well Maintenance and Repair

Groundwater wells at the Site are to be maintained in a functional condition. The following inspections will be made as part of the each GME:

- Inspect condition of concrete pad for signs of damage
- Inspect gatic cover or metal stickup cover for signs of damage
- Inspect well cap to assess if it is appropriately sealed.

Should any of the inspections identify damage to a well which could allow surface water ingress, cross-contamination of groundwater and/or to inhibit future use, work to repair the well will be undertaken.

Gatic covers are to be maintained to prevent the ingress of surface water and gatic bolts are to be replaced when showing signs of wear or damage.

The integrity of the groundwater wells should be maintained so far as reasonably practicable during normal operations or any Site development work. If wells cannot be located during sampling or gauging events, appropriate measures, such as use of a metal detector or engagement of a licensed surveyor to locate the recorded co-ordinates of a well, should be undertaken.

If a lost well cannot be relocated, a damaged well cannot be repaired and used for ongoing monitoring, or removal of groundwater well is required for the purpose of Site development:

- The groundwater well network should be assessed to determine if a replacement is required and is practicable, noting that as Site development progresses direct replacement may not be possible, or if remaining wells can be used to provide suitable information for monitoring groundwater condition.

  Replacement should be conducted as part of any other larger scale maintenance activities as discussed below.
- If the groundwater well location is known and a groundwater well is to be removed from the monitoring network (due to damage or no longer being required), the groundwater well must be

decommissioned in accordance with National Uniform Drillers Licensing Committee (NUDLC) Minimum Construction Requirements for Water Bores in Australia, Fourth Edition (2020) decommissioning requirements.

Minor maintenance requirements (such as replacing missing bolts) will be undertaken immediately during GMEs. Larger scale maintenance requirements (such as gatic replacement, redevelopment if excess siltation has occurred, or well replacement if required) will be scheduled for completion prior to, or during, the following GME.

Any new groundwater well, or groundwater well which has had the maintenance or repair activities undertaken that affects the well casing elevation, a licensed surveyor will be engaged to re-survey the top of casing location with reference to Map Grid of Australia (MGA) Zone 55) and elevation with reference to the Australian Height Datum (AHD).

A summary of groundwater well maintenance requirements completed or identified during each GME must be documented in the report described in **Section 6.8**.

6.3 Groundwater Gauging and Sampling Methodology

AECOM SOPs for development, low-flow sampling, and gauging of groundwater wells are attached as **Appendix D**. GME activities should be conducted with reference to and in accordance with these documents, or with suitable procedures which have been developed in accordance with the following documents:

- *AS NZS 5667.1.1998 – Water Quality Sampling – Part 1 Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples*
- *AS NZS 5667.11,1998 – Water quality - Sampling guidance on sampling of groundwaters*
- *EPA Victoria Publication 669.1: Groundwater sampling guidelines* (EPA Victoria, 2022)
- *The Per- and Polyfluoroalkyl Substances National Environmental Management* Plan (the PFAS NEMP) (HEPA, 2025)
- The ASC NEPM

If the above documents are updated or superseded in the future, any groundwater sampling methodologies should be formulated or updated with reference to the most recent relevant guidelines.

During GMEs:

- A gauging round should be conducted prior to sampling. The gauging round should be completed in as short a time as practicable (ideally within one day).

  During gauging, the concentration of Volatile Organic Compounds (VOCs) and potential flammable compounds in each wellhead should be recorded using an appropriately calibrated photo-ionisation detector (PID) and Lower Explosive Limit (LEL) detector.

  The time at which each well is gauged should be recorded and potential tidal influence considered when assessing data.

- Sampling of each groundwater should be conducted once the gauging round is complete for all wells. Groundwater sampling should:
  - Include collection of field groundwater parameters with an appropriately calibrated water quality meter. Parameters which should be recorded include:
    - Physical appearance and characteristics of groundwater, such as colour, turbidity, and odour.
    - Field pH
    - Electrical Conductivity (EC)
    - Temperature
    - Oxygen Reduction Potential (ORP)

- Dissolved Oxygen (DO)

- Be undertaken using low-flow methodologies for consistency with previous GMEs and historical data, unless justification for an alternative methodology, including assessment of potential differences which may arise in groundwater results, is provided.

6.4 Potential Elevated Risk Areas

Groundwater at the Site has impacts from a number of historic industrial land uses on- and off-Site, as discussed in the SEMP. The following areas have been identified in previous investigations as having detected contamination, Site characteristics, or proposed development which may introduce elevated groundwater risks.

6.4.1 Non-Aqueous Phase Liquid Areas

NAPL has been detected at the Site as both Light Non-Aqueous Phase Liquid (LNAPL) and Dense NAPL (DNAPL), as described in Section 3.4 of the SEMP.

Where practicable, GMEs should include gauging and sampling of wells within and hydraulically up-, down- and cross-gradient of NAPL areas. **Table 9** below presents existing groundwater wells which are within or immediately adjacent to inferred NAPL areas, with groundwater well locations shown on **Figure F3**.

For the purpose of the initial GME scope presented on **Table T2**, all groundwater wells on **Table 9** are included in the gauging scope, and collection and analysis of groundwater is included for all wells which are screened across the shallow aquifer.

However, collection and analysis of groundwater samples is not considered required from MW123B, MW126B, MW128B, MW129, MW131_GHD, MW136_GHD. Each of these wells are screened below the water table for assessment of the deeper aquifer, and are either in a nested bore, or <5 m, from a groundwater wells screened in the shallower aquifer which is included in the sampling scope for the GME. As the Site has a single continuous aquifer, and any contamination to the deeper portions of the aquifer would have to pass through shallower groundwater in order to reach receptors, collection and analysis of groundwater from the shallower screened wells is considered suitable for assessment and monitoring of groundwater condition.

Table 9 NAPL Monitoring Wells

NAPL Area	Groundwater Well Location			
	Within inferred plume extent	Up-gradient	Down-gradient	Cross-gradient
LNAPL Plume A1	MW183	MW103A	MW182, MW191	MW177, MW187, MW184
LNAPL Plume A2	MW185	MW191, MW184,	MW187, MW146, RN4, MW176, MW175	MW186, MW36
LNAPL Plume A3	MW187	MW182, MW177, MW183	MW155, MW146, RN4,	MW185
LNAPL Plume B	MW3, PW02, S8, PC13[1]	MW164, MW6[2], MW188	MW5[2], MW135_GHD[1], MW136_GHD[1,3], MW16, MW126A, MW126B[3], MW154[2], MW60, MW193, MW134_GHD[1]	-

NAPL Area	Groundwater Well Location			
	Within inferred plume extent	Up-gradient	Down-gradient	Cross-gradient
Tar Plume A	-	MW128A, MW128B	MW196, MW123A, MW123B[3], MW130_GHD, MW131_GHD[3], MW132_GHD	-
Tar Plume B	-	MW196, MW198	MW100, MW129[3] MW197, MW133_GHD, RS6	MW132_GHD
Tar Plume C	-	MW101	MW128A, MW128B[3], MW196	MW102
Tar Plume D	-	-	MW101, MW102, MW198	MW121

Notes: *1. Off-Site well on third party land with limited access granted; 2. LNAPL has been historically detected in this well; 3. Groundwater wells screened below the water table to assess the deeper portion of the aquifer.*

6.4.2 Per- and Polyfluoroalkyl Substances (PFAS)

While no direct record of PFAS usage or storage on the Site exists, PFAS has been identified as a CoPC arising from bulk fuel storage.

PFAS analysis has been conducted on samples collected from 33 groundwater wells across the Site between 2015 and 2025.

PFAS has not been reported above the laboratory LOR in the following 21 groundwater wells when included in laboratory analysis: MW101, MW123A, MW123B, MW124A, MW124B, MW25A, MW125B, MW126B, MW127A, MW127B, MW128A, MW128B, MW129, NR2*, R2*, R3*, RN2, RS6, S4*, S9*, TW03. Wells marked with a * have been lost or destroyed.

PFAS has been detected above LOR in 14 wells, as summarised on **Table 10** below. It is noted that other PFAS congeners have also been detected in the wells listed on **Table 10**, but do not have adopted criteria. 6:2 Fluorotelomer sulfonic acid (FTS) has only been included as no other PFAS has been detected in RN4.

Table 10 Detectable PFAS in Groundwater

Well	Date	Detectable PFAS (µg/L)				Comment(s)
		PFHxS	PFOS	PFOA	6:2 FTS	
Ecosystem Protection		NC	0.13	220	NC	
Drinking Water		0.07	0.07	0.2	NC	
MW16	19 Jul 2016	<0.02	0.09	0.02	<0.05	MW16 in the south-east corner of the Site, cross/down-hydraulic gradient of LNAPL Plume B. Hydraulic contours and groundwater elevations in surrounding wells indicate that groundwater at this well may be coming from the north and west (on-Site) and from the east (off-Site), and is likely to be discharging in a southerly direction.
	18 Jul 2017	0.04	0.38	0.06	<0.05	
	23 Jun 2025	0.01	0.30	0.02	<0.05	

Well	Date	Detectable PFAS (µg/L)				Comment(s)
		PFHxS	PFOS	PFOA	6:2 FTS

Notes: *NC - No criteria; PFHxS - Perfluorohexane sulfonic acid; PFOS - Perfluorooctane sulfonic acid; PFOA - Perfluorooctanoic acid; FTS - Fluorotelomer sulfonic acid.*

Exceedances of adopted the criteria for drinking water and protection of marine ecosystems (95% species protection level) have been detected in one well, MW16 in the south-east corner of the Site. **Table 11** below lists wells in the vicinity of MW16.

Table 11 Wells in the vicinity of MW16

Groundwater Well ID	Inferred Hydraulic Direction[1]	PFAS Detected above LOR in Well Previously?
MW154	Up-gradient	Not analysed
S8	Up-gradient	Not analysed (LNAPL in well)
MW60	Cross- to down-gradient	Yes
MW126A	Cross- to down-gradient	Yes
MW134_GHD	Down-gradient	Not analysed. Off-Site well with limited access granted by third party landowner
MW135_GHD	Cross- to up-gradient	Not analysed. Off-Site well with limited access granted by third party landowner

Groundwater Well ID	Inferred Hydraulic Direction[1]	PFAS Detected above LOR in Well Previously?
MW136_GHD	Cross- to up-gradient	Not analysed. Off-Site well with limited access granted by third party landowner
PC12	Cross- to down-gradient	Not analysed. Off-Site well with limited access granted by third party landowner
MW193	Cross-gradient	Yes
MW151	Down-gradient	Not analysed

Notes: 1. Inferring groundwater flow direction is complex in the vicinity of MW16, as groundwater elevation is relatively flat and a seawall has been identified

For the purpose of the initial GME scope presented on **Table T2**, all groundwater wells on **Table 10** and **Table 11** have been included in the gauging scope, and selected for PFAS analysis.

6.4.3 Potential Acid Sulfate Soil (PASS)

If disturbed by excavation or dewatering, PASS located beneath the Site has the potential to oxidise and acidify. Any such disturbance requires an Acid Sulfate Soil Management Plan (ASSMP) as described in the SEMP, which may include requirements for ongoing monitoring of groundwater.

However, any such requirements will be specific to the area and extent of disturbance, and should be documented in the ASSMP or DWMP and implemented outside of the SEMP and GQMP.

6.4.4 Groundwater Elevation Relative to Buildings and Structures

As described in **Section 4.3**, the Site Specific RC include an assumption that groundwater will be greater than 1 m below building slabs.

As part of the proposed design, lowering of the Site surface elevation and construction of buildings is proposed and an area (shown on **Figure F4**) has been identified where groundwater may be present within 1 m of the base of the proposed structures (and above the base in some areas). Design and construction in this area must include protection against groundwater or groundwater-derived vapour entering buildings, as required by Section 4.4 of the SEMP, and it is understood that this is currently proposed to be achieved by a combination of a drainage layer and vapour barrier.

Any future changes in design shown on **Figure F4**, which may affect the distance between groundwater and the base of building slabs, should be considered for implications to the GQMP.

The timeframe for when construction of this layer will occur is not yet specified, but is anticipated to occur in 2027/2028, with initial excavation occurring in 2026. Groundwater monitoring during and after construction must assess if groundwater is being lowered and is not a risk of reaching the surface.

For the purpose of the initial GME scope presented on **Table T2**, gauging of all groundwater wells has been included.

6.4.5 Potential Impacts to Off-Site Ecological Receptors

A Site-wide assessment of potential off-Site impacts to ecological receptors, namely the River Derwent and Sullivans Cove was conducted in 2019/2020 and is reported in the *Assessment of Potential Off-Site Ecological Impacts* (AECOM, 2020). *Assessment of Potential Off-Site Ecological Impacts – 2025 Addendum* (AECOM, 2025b) was prepared in 2025 in order to incorporate additional data collected since initial issue of this assessment on the Site's environmental condition.

The objective of the *Assessment of Potential Off-Site Ecological Impacts* was to assess the potential risk posed to off-Site aquatic receptors with respect to the nature and extent of contaminant discharge *via* groundwater from contaminant sources at the Site.

Based on the outcomes of the weight-of evidence assessment conducted in this assessment, and the review and addendum prepared in 2025, it is unlikely that the Chemicals of Potential Ecological Concern (CoPEC) concentrations in groundwater beneath the Site are presenting a potentially

unacceptable risk to off-Site aquatic ecological receptors (if present) at the inferred points of discharge on the basis that:

- The assessed adjacent aquatic habitats are artificial, of low ecological value and considered to be 'highly disturbed' environments. A sensitivity analysis demonstrated that the overall risk conclusions would not materially change if the condition of the off-Site receiving environment was improved over time to become consistent with a 'slightly-moderately disturbed' habitat, for which a higher level of species protection would be desirable.
- The following chemicals have been identified as CoPEC at the Site, based on reported concentrations in one or more groundwater samples exceeding the adopted Tier 1 criteria:
  - Metals (aluminium, cadmium, copper, lead, manganese, vanadium, zinc)
  - Ammonia (as N), free cyanide, total phosphorus, and pH[2]
  - TRH >C10-C40 fraction (sum)
  - Monoaromatic hydrocarbons (benzene, ethylbenzene, o-xylene, m&p-xylene, 1,2,4-trimethylbenzene)
  - Polycyclic aromatic hydrocarbons (naphthalene, anthracene, phenanthrene, fluoranthene, benzo(a)pyrene)
  - 2,4-dimethylphenol
  - PFOS

  It is noted that cadmium and PFOS were not identified as CoPEC in the initial assessment (AECOM, 2020), but were identified and considered in the 2025 update (AECOM, 2025b).
- Concentrations of CoPEC were reported below adopted screening levels near Sullivans Cove and the River Derwent, were likely to attenuate further prior to discharge into these areas, or were associated with background conditions. Concentrations of CoPEC did not increase significantly (>20%) compared between 2020 and 2025, and no new exceedances of adopted ecological criteria were detected, with the exception of:
  - Elevated concentrations of cadmium, copper, lead, and zinc were observed in groundwater collected from MW180, a new groundwater well installed at Regatta Point in 2024 and screened across historical fill.

    Concentrations in excess of adopted criteria were inconsistent across the two sampling events conducted to date.
  - 2,4-Dimethylphenol: Elevated concentrations were observed at
    - MW132_GHD, located on Evans Street to the south of the Site in December 2022.

      Remediation of gasworks impacts in the Gateway was conducted in 2025 and, combined with natural attenuation processes, concentrations are expected to decline over time. During the most recent GME (June 2025) concentrations of 2,4-dimethylphenol were below the laboratory LOR in MW132_GHD.
    - MW120A, located in the north-west corner of the Site in June 2025.

      MW120A is one of the most hydraulically up-gradient wells on the Site and is located close to where groundwater is inferred to enter the Site. Concentrations in this groundwater wells are unlikely to be representative of groundwater discharging from the Site.
- Hydrocarbon fingerprinting of an LNAPL sample collected from within Plume B suggests that the LNAPL is dominantly composed of weathered diesel and lube oil. No new sources of LNAPL were identified. The plume is considered stable and no significant TRH-signature is evident downgradient near the receiving environment at Sullivans Cove.

[2] While pH is not a chemical, it has been treated as one for the purpose of assessment of ecological risks.

- Disturbance of PASS in Site soil without appropriate management could lead to acidification and increased mobilisation of metals, and increase the potential risk to off-Site aquatic ecological receptors. However, implementation of an ASSMP in accordance with the SEMP is expected to mitigate this risk.
- A mixing zone indicating estuarine/saline water interaction noted near Sullivans Cove is likely to result in the reduction of groundwater concentrations of key CoPEC prior to the point of discharge into the receiving environments.
- The Hobart Rivulet (which passes north of the Escarpment, through Audit Area 4 East, and south of Regatta Point) has concrete walls are understood to be below the groundwater level beneath the Site and may act as a barrier to groundwater flow in the direction of the point of discharge to River Derwent.
- Groundwater is inferred to predominately discharge through cracks and protrusions in the seawalls. No obvious groundwater seepage through the concrete seawall was noted near Sullivans Cove or the River Derwent during low tide inspections as part of the initial 2020 assessment, and no development or modification of seawalls is known to have occurred since then.

In summary, the *Assessment of Potential Off-Site Ecological Impacts* considered multiple lines of evidence to assess the potential risk posed to off-Site aquatic ecological receptors (i.e. marine ecosystems within the River Derwent and Sullivans Cove) with respect to the nature and extent of contaminant discharge via groundwater from contaminant sources at the Site.

Based on the outcomes of AECOM (2020), including the review conducted as part of AECOM (2025b), it is considered that groundwater emanating from the Site boundary is unlikely to pose an unacceptable risk to off-Site aquatic ecological receptors at Sullivans Cove and the River Derwent.

GMEs must include:

- Gauging and groundwater sampling at groundwater wells located (at a minimum) on the Site boundary where groundwater may be discharging from the Site towards aquatic ecological receptors (Sullivans Cove and the River Derwent).
- Analysis of the following to improve understanding of ecological risks:
  - Cadmium, copper, lead, and zinc in MW180
  - 2,4-dimethylphenol in MW120A and MW132_GHD.

6.5 Sample Analytical Suites

6.5.1 General Suite

Previous groundwater investigations have generally assessed samples for the following analytical suites, which is considered suitable to refresh Site groundwater data and allow assessment of potential risks to receptors:

- Total Petroleum Hydrocarbons (TPH) C6-C40
- Benzene, Toluene, Ethylbenzene, Xylenes and Naphthalene (BTEXN)
- Phenols
- Metals (aluminium, arsenic, cadmium, chromium, copper, iron, lead, mercury, nickel, manganese and zinc)
- Cations/Anions (calcium, magnesium, sodium, chloride, sulfate, alkalinity and ionic balance)
- Acidity
- Cyanide (total, free and weak acid dissolvable [WAD])
- Ammonia
- Methane

- Total dissolved solids

The general suite should be undertaken for all groundwater samples collected as part of the GME, unless otherwise justified as part of review of groundwater data following the GME.

6.5.2 Per- and Poly-Fluoroalkyl Substances (PFAS)

PFAS analysis should be conducted on groundwater collected from wells which have previously had detectable concentrations of PFAS, and satellite wells in the vicinity of MW16, which has reported concentrations of PFOS in excess of adopted criteria, as described in **Section 6.5.2**.

6.5.3 Laboratory Limits of Reporting

Laboratory analytical suites must be selected with suitable LORs to allow assessment against the adopted criteria. Current criteria are presented in **Appendix C**, but LORs must consider any changes in criteria which arise as a result of future investigations and assessments, reference sources, or other actions which lead to changes in adopted criteria.

6.6 Waste Management

All wastewater, such as extracted groundwater and equipment wash water, is to be collected within temporary storage containers such as jerry cans or waste drums.

All solid waste products derived during each sampling event (for example filters, tubing, bladders and gloves) are to be disposed of in prescribed waste bins.

Wastewater and solid wastes are to be disposed of as potentially contaminated waste at the conclusion of each GME.

6.7 Triggers and Contingencies

Table 12, **Table 13** and **Table 14** below summarise the trigger levels and applicable contingency actions for NAPL and dissolved phase concentrations in groundwater, and for groundwater gauging.

The results of any groundwater monitoring should be assessed against these trigger levels and the contingency actions undertaken if triggers have been identified.

Table 12 NAPL Triggers and Contingency Actions

Trigger	Contingency Action
New occurrence of NAPL in a well	• Further gauging to confirm the presence of NAPL. • Assess the potential source and if there is any potential for a new release to have occurred. • Assess for potential changes to the CSM and assess whether there is a potential change in risk profile. • Develop a scope to further assess and implement appropriate NAPL management activities, if required. Actions may include, but are not limited to, sampling and fingerprinting of NAPL, testing of NAPL mobility and transmissivity, and/or removal/remediation of NAPL from groundwater.

Trigger	Contingency Action
Increase in NAPL thickness that cannot be attributed to groundwater level fluctuation (i.e., not within historical NAPL thickness or groundwater elevation).	• Review historical groundwater data. • Evaluate NAPL thickness in adjacent wells and changes in NAPL gradients. • Assess for potential changes to the CSM and assess whether there is a potential change in risk profile. • Develop a scope to further assess and implement appropriate NAPL management activities, if required. Actions may include, but are not limited to, sampling and fingerprinting of NAPL, testing of NAPL mobility and transmissivity, and/or removal/remediation of NAPL from groundwater.
First time identification of dissolved phase petroleum hydrocarbon compound concentrations exceeding solubility limits in groundwater from a well downgradient from a NAPL containing well.	• Review historical groundwater data. • Evaluate NAPL thickness in adjacent wells and changes in NAPL gradients. • Assess for potential changes to the CSM and assess whether there is a potential change in risk profile. • Develop and implement appropriate management and assessment activities, if required.

Table 13 Dissolved Phase Triggers and Contingency Actions

Trigger	Contingency Action
CoPC result(s) exceed criteria, where previously there was no exceedance.	• Assess whether the quality of the data is acceptable. • Assess the significance of criteria exceedance to consider whether further actions are necessary • Assess if any on- or off-Site activities can be identified which may have introduced the trigger result. • Assess whether the CSM is still valid. • If the CSM has potentially changed, assess whether there is a potential change in risk profile, and if so, develop a scope to confirm results, and further assess and implement mitigation measures, if required. • Develop and implement appropriate management, assessment activities and/or remediation, if required.
Increase in CoPC concentrations by an order of magnitude, compared to the most recent previous GME at this location.	
CoPC results show an increasing trend based on application of the Mann-Kendall statistical technique.	

Table 14 Groundwater Elevation and Flow Direction Triggers and Contingency Actions

Trigger	Contingency Action
Groundwater elevation is detected or inferred to be less than 1 m below the bottom of a building slab.	• Determine if the building or structure has mitigations, as required by Section 4.4 of the SEMP, and confirm that they have been maintained and are operational. • If the building or structure does not have suitable mitigations, develop and implement an assessment of risks to building users from shallow groundwater, which may include but is not limited to further groundwater sampling and assessment, soil vapour or indoor air sampling. • Prepare and implement appropriate management measures to mitigate any risks identified.
Groundwater elevations have significantly decreased	• Assess the area of elevation decrease and assess if PASS may have been exposed. • If PASS may have been exposed, develop and implement appropriate management, assessment, and/or remediation activities, if required.
Groundwater flow direction and inferred discharge points have significantly altered	• Assess if change in flow direction alters CSM and if any risks to potential sensitive receptors (i.e., aquatic ecosystems in the River Derwent or Sullivans Cove) are elevated. • Prepare and implement appropriate assessment, management and/or remediation measures to mitigate any risks identified.

6.8 Reporting

A GME report should be prepared following each GME by the organisation who conducted the groundwater sampling. The GME report should include at a minimum (where applicable):

- Background information on the Site and setting, including any changes at the Site (such as development, construction, or land use) which have occurred since the previous GME.
- Confirmation that the scope prepared for the sampling event has been fulfilled or otherwise provide the rationale for any variations.
- Sample collection and analysis data, including:
  - Field records of groundwater level, field parameters, groundwater well condition and/or repair, calibration of any instrumentation used, decontamination, and any other activities conducted in the field.
  - Laboratory analysis documentation, including Chain of Custody, Certificates of Analysis, and any laboratory conducted QA/QC checks.
  - Any other field records relevant to the groundwater investigation conducted.
- Tabulation of groundwater depths and field parameters, and of analytical results against criteria.
- Site maps or figures showing monitoring points, inferred groundwater contours, and criteria exceedances.
- Assessment on the status of groundwater impacts, assessment of potential changes to the impact areas or extents, concentration and stability, and potential changes to the risk profile.
- Review of the data against triggers levels and contingency actions and recommendations for any action that may be required.

- Review of the frequency of sampling and if any modification to the scope for the next GME are warranted, such as increase or decrease in number of wells to be gauged and sampled, or changes in proposed analytical suites.

  Analytical suites or overall monitoring frequency may be modified and decreased, if it is assessed and can be demonstrated that:

  - There is sufficient data to establish risk status.
  - Groundwater concentrations trends are established.
  - No works or development of the Site or surrounding areas which may disturb groundwater or which represent an ongoing risk of groundwater contamination are occurring or anticipated.
  - Possible changes to groundwater condition and potential risks to receptors can be adequately monitored by other data collection.

  Updates to the scope of GMEs are not considered to trigger a requirement to update or issue new versions of the GQMP or SEMP. Any changes should be captured in the review of these documents, which occurs at a minimum of every three years (see **Section 7.0**)
- Review of whether the Site CSM is still accurate or requires update, or if any update of this GQMP is required (i.e., a new or significantly altered environmental risk in groundwater has been identified).
- Scope recommended activities to be undertaken during or prior to the next GME, including any well maintenance, repair or replacement required.

If not previously conducted, any risks to potential off-Site users from groundwater identified based on the results of the GME, or assumptions on groundwater use by occupiers of off-Site land which form part of the assessment of groundwater data, should be communicated to the owners/controllers of those areas.

7.0 Review and Update Process

The approach to monitoring the quality of groundwater as outlined in this GQMP must be reviewed with the SEMP as described in Section 5.4 of the SEMP, namely:

- Every three years, based on the range of 1 to 5 years provided in *Environmental Management Plan Guidelines* (DCCEEW, 2024).
- If significant changes in Site use or environmental condition (i.e., a chemical release) occur.
- If significant changes to environmental legislation occur.

In addition, as part of reporting on the annual GME (**Section 6.8**), groundwater data should be considered and assessed to considered if a GQMP update is required if a new or significantly altered environmental risk in groundwater has been identified, if the groundwater CSM requires significant changes, or if other information has been uncovered which .

As part of this review, the condition and usage of the Site and surrounding land, and the CSM, should be considered and the risk profile and adopted criteria for groundwater reassessed and updated if required. Any changes in legislative or regulatory requirements or recommended practices should be incorporated into the GQMP for ongoing monitoring or management of groundwater.

If as part of future revisions, the GQMP is separated from the SEMP or the Site is sub-divided and separate GQMPs are developed for sub-areas, the information on roles and responsibilities, Site background, and any ongoing environmental management requirements relating to groundwater must be incorporated into the new or updated GQMP.

Ongoing monitoring should only cease if it can be demonstrated that:

- There is sufficient data to characterise the groundwater at the Site.
- Groundwater elevations and inferred flow are stable and unlikely to have meaningful change.
- Any contamination of groundwater remaining, including dissolved chemicals or NAPL in groundwater, is stable and not migrating, and does not represent any unacceptable risk to human health or ecological receptors on- or off-Site.
- No works or development of the Site or surrounding areas which may disturb groundwater or which represent an ongoing risk of groundwater contamination are occurring or anticipated.

Cessation of ongoing groundwater monitoring must only occur if the above has been documented and verified by an Environmental Auditor.

Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared subject to the terms and conditions outlined in the executed *Contract for Supply of Consulting Services Related to Construction – Mac Point Site Wide Environmental Remediation Consultancy Services* between AECOM and the Corporation dated September 2022.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report is dated 16-Feb-2026, and is based on the information reviewed and referenced in the Report text at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

Notes:

m bgl - metres below ground level
TOC - top of casing
AHD - Australian Height Datum
SWL - Standing Water Level
GC - Good condition
NO - No odour
HC - Hydrocarbon
LEL - Lower explosive limit
H20 - Water
NS - no sheen
NAPL - non-aqueous phase liquid

[1] *The Easting and Northing coordinates presented are the MGA94 Coordinates*
[2] *SWL values in wells containing LNAPL have been corrected for the depression of the LNAPL/water interface in the well by multiplying the apparent LNAPL thickness in the well an LNAPL specific gravity of 0.76*

Table T2 - GME Scope

AECOM

Area	Well ID	Easting (MGA94)	Northing (MGA94)	Top of Casing (m AHD)	Approximate Well Depth (m bgl)	Screened Interval (m bgl)	Screened Lithology	GME Activities			Purpose and Area	Potential LNAPL Well?
								Gauge?	Sample			
									General Suite	PFAS Suite		
1. The Goods Shed Yard	MW124A	527507.730	5252350.790	3.767	5.00	2.0-5.0	Fill	Yes			Groundwater on southern boundary of the Site.	
1. The Goods Shed Yard	MW124B	527507.670	5252350.790	3.738	11.30	9.4-11.4	Alluvial/ Marine Deposits	Yes			Deep (>10 m bgl) groundwater on southern boundary of the Site. Aquifer is interconnected. Shallow well MW123A used for assessment of groundwater in this area	
1. The Goods Shed Yard	MW127A	527529.640	5252393.950	3.896	4.70	1.8-4.8	Fill	Yes	Yes		Groundwater adjacent to the Goods Shed and downgradient of fuel storage and the former Goods Shed Annexe mechanics workshop	
1. The Goods Shed Yard	MW127B	527529.680	5252393.990	3.866	16.80	15.6-16.6	Slope Deposits	Yes			Deep (>10 m bgl) groundwater adjacent to the Goods Shed and downgradient of fuel storage and the former Goods Shed Annexe mechanics workshop Aquifer is interconnected. Shallow well MW127A used for assessment of groundwater in this area	
1. The Goods Shed Yard	MW149	527483.676	5252374.243	4.024	4.70	2.0-5.0	Fill	Yes			Located in the southern portion of the Site on the western site of the Goods Shed. Well installed to assess groundwater quality down-inferred hydraulic gradient of the Sewer (Main Hobart Pipeline) and former UST locations.	
1. The Goods Shed Yard	MW55	527548.733	5252422.331	3.789	5.00	3.0-6.0	Fill	Yes	Yes		Located in the southern portion of the Site on the western site of the Goods Shed. Well installed to assess groundwater quality down-inferred hydraulic gradient of the Sewer (Main Hobart Pipeline) and the Goods Shed Annexe (former mechanics workshop	
2. The Escarpment	BG1	527493.615	5252617.707	7.492	3.44	0.5-3.5	Fill / Dolerite	Yes	Yes	Yes	Located on northern boundary, upgradient of Site land. Installed to assess groundwater entering the Site. Screened across fill and dolerite	
2. The Escarpment	MW103A	527523.755	5252582.928	6.299	5.00	2.0-5.0	Dolerite bedrock	Yes			Located in the central eastern portion of the Site, up-gradient of LNAPL plumes A1, A2 and former LNAPL Plume A3 and down-gradient of previous soil impacts in the Escarpment, to assess shallow groundwater quality.	
2. The Escarpment	MW120A	527378.983	5252633.983	7.942	8.51	2.0-9.0	Dolerite bedrock	Yes	Yes	Yes	Replacement well for MW120 to assess groundwater entering the north-west corner of the Site.	
2. The Escarpment	MW194	527498.158	5252616.538	7.465	5.96	1.5-6.0	Dolerite bedrock	Yes	Yes	Yes	New well adjacent to BG1 to assess groundwater in dolerite entering the Site.	
3. Audit Area 4 East	MW159	527693.238	5252689.962	5.757	7.58	3.5-8.0	Bedrock	Yes	Yes		Located in the northeastern portion of the Site. Assess shallow groundwater quality in the vicinity of the WWTP	
3. Audit Area 4 East	MW160	527666.699	5252766.390	7.306	9.48	3.5-8.0	Bedrock	Yes	Yes		Located in the northeastern portion of the Site. Assess shallow groundwater quality in the upgradient of Regatta Point	
3. Audit Area 4 East	MW161	527657.800	5252774.319	7.634	6.45	3.5-6.5	Bedrock	Yes	Yes		Located in the northeastern portion of the Site. Assess shallow groundwater quality in the upgradient of Regatta Point	
3. Audit Area 4 East	MW177A	527598.808	5252815.946	9.497	7.15	4.3-7.3	Bedrock	Yes	Yes		Located at the northern portion of the Site. Assess groundwater entering Regatta Point	
3. Audit Area 4 East	MW189	527678.261	5252654.104	5.233	6.55	2.7-6.5	Bedrock	Yes			New well on the eastern boundary of the Site to replace NR4 and assess groundwater entering the Site from the WWTP	
3. Audit Area 4 East	NR1	527648.559	5252654.045	8.295	8.00	3.5-8.0	Bedrock	Yes	Yes		Located in the northeastern portion of the Site. Assess shallow groundwater quality in the vicinity of the former Northern Refuelling Area.	
3. Audit Area 4 East	NR2A	527665.785	5252626.689	5.073	5.92	1.5-6.0	Fill / Sand	Yes	Yes		Located in the eastern boundary of the Site. Assess shallow groundwater quality at the Site boundary adjacent to WWTP and the former Oil and Diesel Pipelines. Replacement for TW01 and NR2	
4. The Promenade and Underground Carpark	MW121	527391.610	5252556.420	6.957	5.00	2.0-5.0	Weathered Dolerite	Yes	Yes	Yes	Located on the western boundary of the Site. Assess shallow groundwater entering the Site.	
4. The Promenade and Underground Carpark	MW146	527552.111	5252507.052	4.186	5.49	2.5-5.5	Fill	Yes			Located in the central portion of the Site. Delineate and assess groundwater quality down-gradient of LNAPL Plumes A1 and A2.	
4. The Promenade and Underground Carpark	MW175	527517.100	5252456.440	3.904	4.00	1.5-4.5	Fill	Yes			Central portion of the Site, downgradient of bulk fuel storage and LNAPL Plumes A1, A2 and former LNAPL Plume A3, and in vicinity of Hobart Sewer.	
4. The Promenade and Underground Carpark	MW176	527537.900	5252479.310	4.036	4.58	1.5-4.5	Fill	Yes			Central portion of the Site, downgradient of bulk fuel storage and LNAPL Plumes A1, A2 and former LNAPL Plume A3, and in vicinity of Hobart Sewer.	
4. The Promenade and Underground Carpark	MW177	527579.184	5252554.472	4.529	4.50	1.5-4.5	Fill	Yes			Central portion of the Site, cross- to downgradient of bulk fuel storage and LNAPL Plumes A1, A2 and former LNAPL Plume A3, and in vicinity of Hobart Sewer.	
4. The Promenade and Underground Carpark	MW182	527571.272	5252571.919	4.858	5.62	2.0-6.0	Fill	Yes	Yes		Groundwater well to delineate LNAPL Plume A1 to the north-east	
4. The Promenade and Underground Carpark	MW183	527544.466	5252562.171	5.052	5.82	1.5-6.0	Fill	Yes	Yes[1]		Groundwater well to intersect LNAPL Plume A1	Yes
4. The Promenade and Underground Carpark	MW184	527531.675	5252541.194	4.864	5.85	1.5-6.0	Fill	Yes	Yes		Groundwater well to delineate LNAPL Plume A1 to the south-west and LNAPL Plume A2 to the north-east	
4. The Promenade and Underground Carpark	MW185	527518.554	5252510.048	4.638	5.80	2.0-6.0	Fill	Yes	Yes[1]		Groundwater well to intersect LNAPL Plume A2	Yes
4. The Promenade and Underground Carpark	MW186	527504.381	5252492.922	4.832	5.91	2.0-6.0	Fill	Yes	Yes		Groundwater well to delineate LNAPL Plume A2 to the south	
4. The Promenade and Underground Carpark	MW191	527490.356	5252549.038	5.659	4.58	1.5-6.0	Dolerite (weathered to fresh)	Yes	Yes		Groundwater well to delineate LNAPL Plume A1 and A2 to the west.	
4. The Promenade and Underground Carpark	MW36	527525.300	5252509.000	5.647	6.57	4.0-7.0	Fill/Bedrock	Yes	Yes		Located in the central portion of the Site. Delineate and assess groundwater quality cross- and up-gradient of LNAPL Plume A2.	
5. The Precinct North	MW155	527625.037	5252516.399	3.929	4.51	1.5-4.5	Fill	Yes	Yes		Located in the central eastern portion of the Site. Assess shallow groundwater quality at the boundary of the Site in the vicinity of the former oil pipeline.	
5. The Precinct North	MW167	527658.873	5252563.922	4.164	4.83	2.0-5.0	Fill	Yes	Yes		Located on the central eastern Site boundary to assess groundwater quality and potential vapour risks associated with previously identified TRH impacts in soil at BH126/MW156 near the water table.	
5. The Precinct North	MW187	527578.434	5252529.858	4.258	9.35	2.0-6.5	Fill	Yes	Yes[1]		Groundwater well to intersect former LNAPL Plume A3 (if present)	Yes
5. The Precinct North	MW190	527611.266	5252584.652	4.703	4.93	1.5-5.0	Fill	Yes	Yes		Groundwater well to assess general groundwater condition in the north-east portion of the Site	
5. The Precinct North	MW192	527637.744	5252480.774	3.601	5.89	1.5-6.0	Fill	Yes	Yes		Groundwater well on the eastern boundary to replace TW03 and assess groundwater entering the Site from the WWTP / TasPorts	
5. The Precinct North	RN2	527645.786	5252526.638	4.182	5.36	1.0-5.0	Fill	Yes	Yes		Located on the eastern boundary of the Site. Assess shallow groundwater quality at the boundary of the Site in the vicinity of the former oil pipeline.	
5. The Precinct North	TW02	527638.679	5252542.362	4.086	5.76	2.4-5.5	Fill	Yes	Yes		Located on the eastern boundary of the Site. Assess shallow groundwater quality at the boundary of the Site in the vicinity of the former oil pipeline.	
6. The Precinct South	MW03	527629.967	5252344.531	2.596	8.63	2-7.5	Fill	Yes			Located on the eastern boundary of the Precinct South to assess shallow groundwater quality. LNAPL previously detected in this well	Yes
6. The Precinct South	MW05	527625.558	5252326.180	2.663	4.33	1.4-4.4	Fill	Yes			Located on the eastern boundary of the Precinct South to assess shallow groundwater quality. LNAPL previously detected in this well	Yes
6. The Precinct South	MW125A	527553.730	5252320.260	3.306	5.99	2.0-5.0	Fill	Yes	Yes		Southern boundary of the Precinct South. South western boundary of the Red Shed. Assess shallow (<10 m bgl) groundwater quality down hydraulic gradient of LNAPL Plume B.	
6. The Precinct South	MW125B	527553.730	5252320.260	3.309	15.28	13.8-15.3	Marine Deposits	Yes			Southern boundary of the Precinct South. South western boundary of the Red Shed. Assess deep (>10 m bgl) groundwater quality down hydraulic gradient of LNAPL Plume B. Aquifer is interconnected. Shallow well MW125A used for assessment of groundwater in this area	
6. The Precinct South	MW126A	527609.600	5252304.450	2.857	5.13	2.1-5.1	Fill	Yes	Yes	Yes	South east boundary of the Precinct South. Assess shallow <>10 m bgl) groundwater quality down hydraulic gradient of LNAPL Plume B.	
6. The Precinct South	MW126B	527609.600	5252304.450	2.831	18.88	15.9.0-18.9	Slope Deposits	Yes			South east boundary of the Precinct South. Assess deep (>10 m bgl) groundwater quality down hydraulic gradient of LNAPL Plume B. Aquifer is interconnected. Shallow well MW126A used for assessment of groundwater in this area	
6. The Precinct South	MW154	527608.419	5252318.975	2.827	3.80	1.0-4.0	Fill	Yes	Yes[1]	Yes[1]	Located in the south eastern portion of the Precinct South. To further delineate LNAPL plume B and/or assess ground water quality impacts.	Yes
6. The Precinct South	MW16	527622.576	5252310.246	2.630	4.91	3.0-6.0	Fill	Yes	Yes	Yes	Located on the eastern boundary of the Precinct South to assess shallow groundwater quality and flow conditions, in proximity to the sea walls and former bulk fuel storage areas.	
6. The Precinct South	MW162	527561.725	5252463.136	4.079	4.73	2.0-5.0	Fill	Yes			Located in the Precinct South down-hydraulic gradient of the former Goods Shed Annexe area (former mechanics area).	
6. The Precinct South	MW163	527644.415	5252427.853	2.837	3.82	0.95-3.95	Fill	Yes			Eastern boundary of the Site to assess groundwater flow and quality at Site boundary	
6. The Precinct South	MW164	527634.673	5252386.218	2.685	3.86	0.5-4.0	Fill	Yes	Yes		Eastern boundary of the Site to assess groundwater flow and quality at Site boundary	
6. The Precinct South	MW188	527586.042	5252340.345	3.080	4.95	1.0-5.0	Fill	Yes	Yes	Yes	Groundwater well to delineate LNAPL Plume B to the west	
6. The Precinct South	MW193	527581.087	5252306.338	2.924	5.48	1.0-5.0	Fill	Yes	Yes	Yes	Groundwater well to delineate LNAPL Plume B to the west	
6. The Precinct South	MW6	527631.882	5252366.709	2.896	4.89	2.0-5.0	Fill	Yes	Yes	Yes	Located on the eastern boundary of the Precinct South. Assess shallow groundwater quality and flow conditions at the Site boundary and in proximity to the sea walls and former bulk fuel storage.	
6. The Precinct South	MW60	527604.842	5252306.320	2.864	6.00	3.0-6.0	Fill	Yes	Yes	Yes	Located in the south eastern portion of the Precinct South. Assess shallow groundwater quality and gain further insight into LNAPL impacts at the southern Site boundary.	
6. The Precinct South	PW02	527624.264	5252337.008	2.723	6.00	1.5-6.0	Fill	Yes			Located on the eastern boundary of the Precinct South. Assess shallow groundwater quality and flow conditions at the Site boundary and in proximity to the sea walls. Gain insight into LNAPL impacts at the Site boundary	Yes
6. The Precinct South	RN4	527563.308	5252490.930	4.045	5.17	1.5-6.0	Fill/Marine Deposits	Yes	Yes		Central portion of the Site, upgradient of Goods Shed Annexe and downgradient of former bulk fuel storage and LNAPL Plumes A1, A2 and former LNAPL Plume A3.	
6. The Precinct South	S8	527610.904	5252328.497	2.830	5.20	1.2-5.2	Fill	Yes			Located in the eastern portion of the Precinct South within SeaRoad Shed Slab. Assessing shallow groundwater quality and assess LNAPL.	Yes
6. The Precinct South	S9	527588.943	5252302.383	2.910	4.00	1.0-4.0	Fill	Yes			Located on the south-eastern boundary of the Site. Assessing shallow groundwater quality downgradient of LNAPL Plume B.	
7. The Gateway	BH2_PS	527483.786	5252435.896	5.286	7.03	Unknown	Fill/Marine Deposits	Yes	Yes		Located in the south-western portion of the Site, cross-gradient to LNAPL Plume A2 and former gasworks areas.	
7. The Gateway	MW100	527434.926	5252397.121	4.006	11.50	3.0-9.0	Fill	Yes			Located in the southern portion of the Site, down-gradient of gasworks area and cross-gradient to DNAPL Plume B	
7. The Gateway	MW101	527370.927	5252477.012	5.317	3.60	1.6-4.6	Fill	Yes	Yes		Located on the south-western boundary of the Site, between DNAPL Plumes C and D. Assess groundwater entering the Site.	
7. The Gateway	MW102	527400.582	5252491.493	5.778	4.49	1.6-4.6	Fill/Weathered Dolerite/Slope Deposits	Yes	Yes		In the central western portion of the Site. Assess groundwater in the vicinity of the former Roundhouse and cross-gradient of gasworks.	
7. The Gateway	MW122	527495.560	5252422.980	3.933	4.00	2.0-4.0	Fill	Yes	Yes		Located in the central southern portion of the Site. Provides indication of potential impact from sewer infrastructure and LNAPL Plume A2 (i.e. located down/cross inferred hydraulic gradient).	
7. The Gateway	MW128A	527368.319	5252452.571	5.207	2.98	1.8-4.8	Slope Deposits/Bedrock	Yes	Yes		Located on the western boundary of the Site. Assess shallow groundwater entering the Site in the former gasworks area.	
7. The Gateway	MW128B	527368.350	5252452.570	5.229	3.50	10.0-13.0	Bedrock	Yes			Located on the western boundary of the Site. Assess deep (>10 m bgl) groundwater entering the Site in the former gasworks area. Aquifer is interconnected. Shallow well MW128A used for assessment of groundwater in this area	
7. The Gateway	MW129	527457.190	5252377.340	3.800	16.00	14.0-16.0	Slope Deposits	Yes			Located adjacent to the central southern boundary of the Site. Assess deep groundwater quality at the Site boundary in proximity to sewer infrastructure and former UST location.	
7. The Gateway	MW148	527477.706	5252417.844	3.786	4.90	2.0-5.0	Fill	Yes	Yes		Located in the south-west portion the Site, to assess potential impact sourced from former UST locations.	
7. The Gateway	MW173	527443.426	5252486.041	5.928	4.92	2.0-5.0	Fill/Marine Deposits	Yes	Yes		In the central western portion of the Site. Assess groundwater in the vicinity of the former Roundhouse and cross-gradient of gasworks.	
7. The Gateway	MW196	527383.693	5252415.008	3.299	6.03	1.5-6.0	Fill	Yes	Yes		Groundwater well to assess groundwater condition at Brick Pit12, downgradient of Tar Plume A	
7. The Gateway	MW197	527421.438	5252392.726	3.290	5.90	3.7-6	Marine Deposits	Yes	Yes		Groundwater well to assess groundwater condition downgradient of Tar Plume B	
7. The Gateway	MW198	527426.182	5252432.536	3.201	5.21	2.0-6.0	Fill	Yes	Yes		Groundwater well to assess groundwater condition at Brick Pit12, downgradient of Tar Plume B	
7. The Gateway	RS6	527456.344	5252374.791	3.792	5.50	1.5-6.0	Fill	Yes			Located adjacent to the central southern boundary of the Site, to assess groundwater quality at the Site boundary in proximity to sewer infrastructure and the UST location. MW129 is a newer well at the same location.	
8. Regatta Point	MW178	527640.962	5252835.628	1.282	4.85	2.7-5.0	Bedrock	Yes	Yes		Located on Regatta Point. Assess shallow groundwater in dolerite	
8. Regatta Point	MW179	527671.789	5252789.467	2.273	5.39	1.5-5.5	Bedrock	Yes	Yes		Located on Regatta Point. Assess shallow groundwater in dolerite	
8. Regatta Point	MW180	527640.331	5252836.358	1.243	1.89	0.7-2.2	Fill	Yes	Yes		Located on Regatta Point. Assess shallow groundwater in fill (if present)	
8. Regatta Point	MW181	527671.149	5252790.232	2.261	0.85	0.4-0.95	Fill	Yes	Yes		Located on Regatta Point. Assess shallow groundwater in fill (if present)	

Table T2 - GME Scope

Area	Well ID	Easting (MGA94)	Northing (MGA94)	Top of Casing (m AHD)	Approximate Well Depth (m bgl)	Screened Interval (m bgl)	Screened Lithology	GME Activities			Purpose and Area	Potential LNAPL Well?
								Gauge?	Sample			
									General Suite	PFAS Suite		
9. Offsite	C1	527657.503	5252456.170	3.142	4.50	1.0-4.5	Fill	Yes[2]			Located east of the Precinct South in TasPorts land. Limited access has been historically provided to assess groundwater flow and monitoring.	
9. Offsite	MW123A	527393.270	5252399.740	3.223	3.65	1.8-3.8	Fill	Yes	Yes		Located along Evans Street, south of the former gasworks area.	
9. Offsite	MW123B	527393.230	5252399.730	3.278	17.45	14.6-17.6	Fill	Yes			Located along Evans Street, south of the former gasworks area. Screened to assess deep (>10 m bgl) groundwater	
9. Offsite	MW130_GHD	527382.450	5252393.370	2.728	4.71	2.0-5.0	Marine Deposits	Yes[3]	Yes[3]		Located along Evans Street. Assess groundwater quality off-Site and downgradient of gasworks	
9. Offsite	MW131_GHD	527398.420	5252384.860	2.611	9.66	6.7-9.7	Marine Deposits	Yes[3]	Yes[3]		Located along Evans Street. Assess deep groundwater quality off-Site and downgradient of gasworks Aquifer is interconnected. Shallow well MW123A used for assessment of groundwater in this area	
9. Offsite	MW132_GHD	527399.600	5252384.260	2.631	3.89	2.5-4.5	Fill/Marine Deposits	Yes[3]			Located along Evans Street. Assess groundwater quality off-Site and downgradient of gasworks	
9. Offsite	MW133_GHD	527454.400	5252353.360	3.127	4.45	2.0-3.0	Fill	Yes[3]	Yes[3]		Located on western end of Evans St to the south of Site. Assess shallow groundwater quality within Evans St (former Hobart Rivulet) and down-hydraulic gradient of Site.	
9. Offsite	MW134_GHD	527600.190	5252274.580	3.057	5.99	4.0-7.0	Fill	Yes[2]	Yes[2]	Yes[2]	Located along Evans Street. Assess groundwater quality off-Site and downgradient of LNAPL Plume B	
9. Offsite	MW135_GHD	527632.940	5252353.790	2.597	5.00	2.0-5.0	Fill	Yes[2]	Yes[2]	Yes[2]	Located on TasPorts land to the east. Assess adjacent groundwater quality	
9. Offsite	MW136_GHD	527633.060	5252324.500	2.549	13.50	10.2-13.50	Fill	Yes[2]			Located on TasPorts land to the east. Assess adjacent deep (>10 m bgl)groundwater quality Aquifer is interconnected. Shallow well MW135_GHD used for assessment of groundwater in this area	
9. Offsite	MW150	527528.454	5252319.791	3.265	4.39	1.0-5.0	Fill / Marine Deposits	Yes[3]	Yes[3]		Located on eastern end of Evans St to the south of Site. Assess shallow groundwater quality within Evans St (former Hobart Rivulet) and down-hydraulic gradient of Site.	
9. Offsite	MW151	527567.708	5252282.430	2.553	4.87	1.0-5.5	Fill / Marine Deposits	Yes	Yes	Yes	Located on eastern end of Evans St to the south of Site. Assess shallow groundwater quality within Evans St (former Hobart Rivulet) and down-hydraulic gradient of Site.	
9. Offsite	MW152	527564.181	5252262.443	2.563	4.98	1.0-5.5	Fill/Marine Deposits	Yes	Yes		Located in UniTas carpark to the south and east of Site. Assess shallow groundwater quality down hydraulic gradient of Site towards Sullivans Cove.	
9. Offsite	MW153	527557.540	5252240.934	2.449	4.42	1.0-4.6	Fill/Marine Deposits	Yes	Yes		Located in UniTas carpark to the south and east of Site. Assess shallow groundwater quality down hydraulic gradient of Site towards Sullivans Cove.	
9. Offsite	PC05	527726.727	5252600.326	Unknown	3.28	No data	Fill	Yes[2]	Yes[2]		Located on TasPorts land to the east. Assess adjacent groundwater quality	
9. Offsite	PC08	527746.787	5252222.601	Unknown	2.10	No data	Fill	Yes[2]	Yes[2]		Located on TasPorts land to the east. Assess adjacent groundwater quality	
9. Offsite	PC10	527817.921	5252666.445	Unknown	4.42	No data	Fill	Yes[2]	Yes[2]		Located on TasPorts land to the east. Assess adjacent groundwater quality	
9. Offsite	PC11	527779.795	5252522.473	Unknown	4.56	No data	Fill	Yes[2]	Yes[2]		Located on TasPorts land to the east. Assess adjacent groundwater quality	
9. Offsite	PC12	527651.691	5252296.989	Unknown	4.98	No data	Fill	Yes[2]	Yes[2]	Yes[2]	Located on TasPorts land to the east. Assess adjacent groundwater quality	
9. Offsite	PC13	527650.528	5252362.247	2.636	4.33	No data	Fill	Yes[2]	Yes[1,2]	Yes[1,2]	Located on TasPorts land to the east. Assess adjacent groundwater quality	Yes
9. Offsite	PC14	527642.432	5252230.789	Unknown	2.20	No data	Fill	Yes[2]	Yes[2]		Located on TasPorts land to the east. Assess adjacent groundwater quality	
9. Offsite	PC15	527668.146	5252518.054	3.489	4.38	No data	Fill	Yes[2]	Yes[2]		Located on TasPorts land to the east. Assess adjacent groundwater quality	
							Total	**95**	**69**	**16**		

Notes
1. Sample if LNAPL is not present
2. Access approval from third party (TasPorts) required
3. Traffic management generally required

Adopted Groundwater Criteria

Table C1 - Tier 1 Groundwater Criteria - Drinking Water (Health)
Groundwater Quality Management Plan
Macquarie Point Development Project

ChemCode	ChemName	Matrix Type	Adopted Criteria	Source
100-00-5	Chloronitrobenzene, p-	Water	1.2 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
100-01-6	Nitroaniline, 4-	Water	3.8 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
100-21-0	~Phthalic Acid, P-	Water	9400 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
100-25-4	Dinitrobenzene, 1,4-	Water	2 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10034-93-2	Hydrazine Sulfate	Water	0.026 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
100-41-4	Ethylbenzene	Water	0.3 mg/L	NHMRC ADWG (amended 2025) Human Health
100-42-5	Styrene (vinylbenzene)	Water	0.03 mg/L	NHMRC ADWG (amended 2025) Human Health
10043-92-2	radon	Water	100 Bq/L	NZ Drinking Water 2008
100-44-7	Benzyl Chloride	Water	0.089 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
100-51-6	Benzyl Alcohol	Water	2000 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
100-52-7	Benzaldehyde	Water	19 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
100-61-8	Monomethylaniline	Water	38 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
100-75-4	Nitrosopiperidine [N-]	Water	0.0082 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10102-45-1	Thallium (I) Nitrate	Water	0.2 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
101-14-4	Methylene-bis(2-chloroaniline), 4,4'-	Water	0.16 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
101200-48-0	Tribenuron-methyl	Water	160 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
101-21-3	Chlorpropham	Water	71 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10124-56-8	~Sodium hexametaphosphate	Water	20000 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
101-61-1	Methylene-bis(N,N-dimethyl) Aniline, 4,4'-	Water	0.7 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
101-77-9	Methylenebisbenzenamine, 4,4'-	Water	0.047 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10213-10-2	Sodium Tungstate Dihydrate	Water	16 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
1024-57-3	Heptachlor Epoxide	Water	0.0014 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10265-92-6	Methamidophos	Water	1 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
102-76-1	Triacetin	Water	1600000 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10279-59-1	~Sodium aluminum phosphate (anhydrous)	Water	100000 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10294-34-5	Boron Trichloride	Water	42 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10294-40-3	Barium Chromate	Water	0.041 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10305-76-7	~Sodium aluminum phosphate (tetrahydrate)	Water	70000 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
103-23-1	Di(2-ethylhexyl)adipate	Water	65 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
103-33-3	Azobenzene	Water	0.12 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
103-65-1	Propylbenzene	Water	660 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
104-51-8	Butylbenzene, n-	Water	1000 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10453-86-8	Resmethrin	Water	67 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
105-60-2	Caprolactam	Water	9900 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
105-67-9	Dimethylphenol, 2,4-	Water	360 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10588-01-9	Sodium Dichromate	Water	0.041 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10595-95-6	Nitrosomethylethylamine, N-	Water	0.00071 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
10599-90-3	Monochloramine	Water	3 mg/L	NHMRC ADWG (amended 2025) Human Health
10605-21-7	Carbendazim	Water	0.09 mg/L	NHMRC ADWG (amended 2025) Human Health
106-37-6	Dibromobenzene, 1,4-	Water	130 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
106-42-3	Xylene, P-	Water	190 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
106-43-4	Chlorotoluene, p-	Water	250 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
106-44-5	Cresol, p-	Water	370 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
106-46-7	1,4-dichlorobenzene	Water	0.04 mg/L	NHMRC ADWG (amended 2025) Human Health
106-47-8	Chloroaniline, p-	Water	0.37 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
106-49-0	Toluidine, p-	Water	2.5 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
106-50-3	Phenylenediamine, p-	Water	20 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
106-88-7	Epoxybutane, 1,2-	Water	42 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
106-89-8	Epichlorohydrin	Water	0.0005 mg/L	NHMRC ADWG (amended 2025) Human Health
106-93-4	EDB	Water	0.001 mg/L	NHMRC ADWG (amended 2025) Human Health
106-99-0	Butadiene, 1,3-	Water	0.071 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-02-8	Acrolein	Water	0.042 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-04-0	Bromo-2-chloroethane, 1-	Water	0.12 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-05-1	Allyl Chloride	Water	0.73 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-06-2	1,2-dichloroethane	Water	0.003 mg/L	NHMRC ADWG (amended 2025) Human Health
107-07-3	Chloroethanol, 2-	Water	400 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-13-1	Acrylonitrile	Water	0.052 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-15-3	Ethylenediamine tetraacetic acid (EDTA)	Water	0.25 mg/L	NHMRC ADWG (amended 2025) Human Health
1071-83-6	Glyphosate	Water	1 mg/L	NHMRC ADWG (amended 2025) Human Health
107-18-6	Allyl Alcohol	Water	0.21 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-19-7	Propargyl Alcohol	Water	40 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-20-0	Chloroacetaldehyde, 2-	Water	0.29 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-21-1	Ethylene Glycol	Water	16000 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-30-2	Chloromethyl Methyl Ether	Water	0.0065 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
107-98-2	Propylene Glycol Monomethyl Ether	Water	3200 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-05-4	Vinyl Acetate	Water	410 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-10-1	Methyl Isobutyl Ketone (4-methyl-2-pentanone)	Water	6300 µg/L	US EPA RSL NOV 2024 - Tap Water Quality

ChemCode	ChemName	MatrixType	Adopted Criteria	Source
108-20-3	Diisopropyl Ether	Water	1500 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-31-6	Maleic Anhydride	Water	1900 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-36-1	Dibromobenzene, 1,3-	Water	5.3 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-38-3	Xylene, m-	Water	190 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-39-4	Cresol, m-	Water	930 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-45-2	Phenylenediamine, m-	Water	120 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-60-1	Bis(2-chloro-1-methylethyl) ether	Water	710 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-62-3	Metaldehyde	Water	0.02 mg/L	NHMRC ADWG (amended 2025) Human Health
108-67-8	Trimethylbenzene, 1,3,5-	Water	60 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-86-1	Bromobenzene	Water	62 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-88-3	Toluene	Water	0.8 mg/L	NHMRC ADWG (amended 2025) Human Health
108-90-7	Chlorobenzene	Water	0.3 mg/L	NHMRC ADWG (amended 2025) Human Health
108-91-8	Cyclohexylamine	Water	3800 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-94-1	Cyclohexanone	Water	1400 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-95-2	Phenol	Water	5800 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
108-98-5	Benzenethiol	Water	17 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
109-66-0	Pentane, n-	Water	2100 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
109-69-3	Chlorobutane, 1-	Water	640 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
109-77-3	Malononitrile	Water	2 µg/L	US EPA RSL NOV 2024 - Tap Water Quality
109-78-4	Ethylene Cyanohydrin	Water	1400 µg/L	US EPA RSL NOV 2024 - Tap Water Quality

108-70-3	1,3,5-Trichlorobenzene	Water	20 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
108-88-3	Toluene	Water	230 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
108-90-7	Monochlorobenzene	Water	100 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
108-95-2	Phenol	Water	520 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Low reliability
115-29-7	Endosulfan	Water	0.02 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Moderate reliability
118-74-1	Hexachlorobenzene	Water	0.2 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
120-12-7	Anthracene	Water	1.5 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
120-82-1	1,2,4-Trichlorobenzene	Water	140 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Moderate reliability
127-18-4	1,1,2,2-Tetrachloroethylene	Water	100 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
142-28-9	1,3-Dichloropropane	Water	1400 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
16065-83-1	Chromium (CrIII)	Water	49 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Low reliability
18540-29-9	Chromium (CrVI)	Water	20 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Very high reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
206-44-0	Fluoranthene	Water	1.7 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
2921-88-2	Chlorpyrifos	Water	0.04 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Low reliability. DGV may not protect key test species from acute (and chronic) toxicity. Check toxicant DGV technical brief for spread of data and its significance. This DGV is greater than the value for acute toxicity (Warne et al., 2018).
330-54-1	Diuron	Water	0.83 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - High reliability
3383-96-8	Temephos	Water	0.4 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Moderate reliability
50-32-8	Benzo(alpha)pyrene	Water	0.4 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
56-23-5	Carbon tetrachloride	Water	320 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
60617-06-3	Corexit 9527	Water	2200 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Moderate reliability
608-93-5	Pentachlorobenzene	Water	2.5 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
634-66-2	1,2,3,4-Tetrachlorobenzene	Water	6 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
634-90-2	1,2,3,5-Tetrachlorobenzene	Water	7 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
67-66-3	Chloroform	Water	1100 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability. DGV may not protect key test species from chronic toxicity. Check toxicant DGV technical brief and Read the detail, below, for spread of data and its significance.
688-73-3_as_Sn	Tributyltin	Water	0.02 µg Sn/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - High reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species).
71-43-2	Benzene	Water	900 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Moderate reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
71-55-6	1,1,1-Trichloroethane	Water	400 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Unknown reliability
72-20-8	Endrin	Water	0.01 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Moderate reliability
7429-90-5	Aluminium	Water	72 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Very high reliability
7439-92-1	Lead	Water	6.6 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Low reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
7439-97-6	Mercury (inorganic)	Water	0.7 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Very high reliability
7440-02-0	Nickel	Water	200 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - High reliability
7440-22-4	Silver	Water	1.8 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Moderate reliability

ChemCode	ChemName	MatrixType	Adopted Criteria	Source
7440-43-9	Cadmium	Water	14 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - High reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
7440-47-3	Chromium (III+VI)	Water	20 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Guideline value for Cr(VI)
7440-48-4	Cobalt	Water	14 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - High reliability
7440-50-8	Copper	Water	3 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Very high reliability. DGV may not protect key test species from chronic toxicity (this refers to experimental chronic values or geometric mean for species). Check toxicant DGV technical brief for spread of data and its significance.
7440-62-2	Vanadium	Water	160 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - High reliability
7440-66-6	Zinc	Water	12 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Very high reliability
74-90-8	Cyanide	Water	7 µg/L	ANZG (2018) Marine Water 90_LOSP Toxicant DGVs (June 2025) - Very Low reliability. Cyanide as un-ionised HCN, measured as [CN].

Q4AN(EV)-402-PR1

1.0 Purpose and Scope

To develop groundwater monitoring wells appropriately to ensure a representative sample of the groundwater quality can be obtained, accurate aquifer parameters can be determined and/or to maximise well efficiency.

This Fieldwork Instruction (FI) describes the broad methodology for groundwater well development. The aim is to remove from the annulus, between the screen and hole wall, clays or compacted material resulting from the drilling operations, as well as the fine material from the water-bearing formation itself[1]. Well development is necessary to remove the finer grained material from the well screens and gravel pack that may otherwise interfere with water quality analyses, and to improve the hydraulic efficiency and characteristics of the gravel pack or hydrologic unit adjacent to the well screens. The methods of development may vary according to the physical characteristics of the hydrological units in which the monitoring well is screened and with the drilling method used. Well development may be undertaken by a variety of techniques, including the following:

- Bailing (see FQM Groundwater Sampling – Bailer – ANZ - ENV)
- Power Pack or Waterra Footvalve pumps (e.g. Waterra) with surge block (see FQM - Groundwater Sampling – Hydrasleeve – ANZ - ENV – in preparation)
- Suction pumps
- Airlifting (not to be used for groundwater monitoring wells)

The choice of well development method will depend upon factors such as the well design (diameter and depth), drilling technique and well purpose (production or monitoring).

3.0 Responsibilities

Role	Responsibility
Fieldwork Staff	To apply the methods detailed in this Fieldwork Instruction. To ensure equipment is in good working order prior to use, is maintained according to supplier's advice and is appropriately calibrated or verified. Any faults shall be reported to the Project Manager or the equipment supplier as soon as they are identified.
Project Manager	The Project Manager (PM) is responsible for ensuring equipment used are fit for purpose and developing work scope and services to be delivered to a client within the designated timeline.
Regional SH&E Manager	The Regional Safety, Health and Environment (SH&E) Manager is an assigned person in each office and is responsible for reviewing and approving the project specific risk assessment (Project Safety Plan/Safe Work Method Statement), monitoring the implementation of SH&E Plans, interface with PMs in matters of health and safety, investigating reports of incidents or accidents and approving drilling contractors to undertake the proposed works.

4.0 Equipment and Materials

4.1 Equipment

All well development techniques require:

- Oil water interface probe or water level meter;
- Water Quality Meter (WQM); and
- Imhoff cone or white dish.

The specific equipment required for bailing and foot valve/surge block methods are outlined in the individual FIs for these techniques. The equipment required for airlifting includes:

- Compressor; and
- Airlines/tubing or drill rods.

Optional or supplemental equipment required to complete this task may include:

- Photo Ionisation Detector (PID);
- Lower Explosive Limit (LEL) Detector; and
- T-piece or diversion head.

4.1.1 Electronic Dip Meter

An electronic dip meter is suitable for the measurement of groundwater levels only. Where NAPL is expected or suspected to be present in groundwater wells an oil/water interface meter should be used. A short beeping sound is made when the electronic dip meter intersects the standing water level.

© AECOM Restricted

4.1.2 Oil/Water Interface Meter

The oil/water interface probe should be used where LNAPL or DNAPL are expected or suspected to be present in the wells. The probe emits two different sounds for distinguishing the depth to NAPL (continuous tone) and the standing water level (short beeping). In the case of LNAPL, the continuous tone will occur typically before the beeping tone; with DNAPL, the continuous tone would occur towards the base of the well, after the beeping tone.

Additional equipment required for groundwater well development depends on the technique adopted. A discussion of the equipment required for bailing and Waterra pumping is provided in the individual work Instructions for these techniques. The following discussion refers to equipment required for well development using airlifting only.

4.1.3 Water Quality Meter

A water quality meter will typically comprise instrument probes to measure electrical conductivity (EC), pH, temperature, oxidation reduction potential (ORP) and dissolved oxygen (DO). When renting a water quality meter, the rental company should supply a calibration certificate indicating that the equipment has been cleaned, calibrated and is ready for use. The calibration sheet should be kept with the project notes, scanned and filed at the end of the field program. If calibration has not been undertaken, or there is no evidence of calibration, this will need to be completed prior to commencing fieldworks. Calibration of the water quality meter should also be undertaken weekly and should be recorded on calibration sheets (FQM Water Quality Meter Calibration Record – ANZ – ENV). Calibration solutions should be available onsite at all times to allow probe readings to be confirmed. This is particularly important if the readings appear to be erroneous compared to historical results, typical aquifer water quality or are unrealistic. Additional information on using and calibrating a water quality meter is found in FQM Groundwater Quality Measurements – ANZ - ENV.

4.1.4 Compressor

A compressor is typically supplied by the drilling contractor but may also be hired as a trailer mounted or portable system. When developing, a filter should be used to prevent volatile hydrocarbon gases produced by compressor operation from contaminating the compressed air which is injected into the well.

4.1.5 Drill rods

Air can be introduced to the groundwater bore by forcing it inside drilling rods. This is only possible where the drill rig is present on site. Drill rods are often used for development of deep bores to mitigate manual handling issues. Where hydrocarbon compounds are contaminants of interest associated with the groundwater, consideration should be made to the types of lubricants used on these rods i.e. silicon based rod grease or “chicken fat” should be used to lubricate rod threads, canola oil or similar should be used to lubricate rotary hammer bits.

4.1.6 Airlines / Tubing

Airlines usually take the form of poly pipe or HDPE. These need to be long enough to reach the bottom of the well, with extra length at the surface. The diameter of the pipe used will depend on availability of materials, depth to water, depth of bore and bore diameter. The poly pipe needs to be able to with stand high pressures caused by use of compressed air and have appropriate fittings to connect to the compressor. Before installation, the airlines should be checked for any blockages. Airlines are usually supplied by the drilling contractor.

4.1.7 Photo Ionisation Detector (PID)

Refer to FQM Photo-Ionisation Detector (PID) – ANZ - ENV, for applicability, operation and calibration of a PID.

4.1.8 Lower Explosive Limit (LEL) Detector

Refer to FQM Lower Explosive Limit (LEL) Detector – ANZ - ENV, for applicability, operation and calibration of a LEL.

4.1.9 T-piece or Diversion Head

A t-piece is usually made out of PVC and forms an “L” shape which forces groundwater to flow away from the bore. A diversion head is similar but often involves use of an end cap with a tap or outlet to divert water from the bore. This will usually be made and supplied by the drilling contractor. These methods are ways to control the normally violent expulsion of water during airlifting. Where contamination (including high salinity) is a concern, this allows groundwater to be diverted into an appropriate container (lined pit or IBC) and collected for offsite disposal.

© AECOM Restricted

4.2 Materials

Materials and consumables that may be required to complete this task include:

- Buckets
- Potable water
- Phosphate free detergent (e.g. Decon 90)
- Deionised water
- Scrubbing brush
- Paper towels
- Liquid contaminated waste container
- Spray bottle for deionised water
- Solid contaminated waste bags
- Alcohol wipes
- Steel brush

5.0 Background

The purpose of groundwater well development is to:

- Remove any drilling fluids (water or mud) introduced into the aquifer during drilling;
- Stabilise the gravel filter pack; and
- Ensure groundwater obtained during sampling events is representative of groundwater from the aquifer.

Well development should be vigorous enough to ensure these objectives are met, but not so vigorous as to cause any damage to the bore.

Groundwater well development should be undertaken as soon as practical following well installation i.e. once grout has set.

Observations made during well development can assist in determining groundwater sampling rates and techniques and flow rates for aquifer testing purposes.

Groundwater levels and chemistry should be allowed to stabilise for at least 1 week prior to water level measurement, aquifer testing or water quality sampling.

Groundwater bore volumes involve talking into account the volume of water in the well and the volume of water in the filter pack, as per the following equation:

$$V = ((\rho \times \pi (R_1^2 - R_2^2) \times h) + (\pi \times R_2^2 \times h)) \times 1000$$

V = bore volume (L)

ρ = porosity of filter pack (assumed to be approximately 0.2)

R_1 = Radius of borehole (half of drilling bit diameter) (m)

R_2 = Radius of casing (half internal casing diameter) (m)

h = Water column (depth of well – depth to water) (m)

© AECOM Restricted

The following table provides an indication of approximate multiplication factors to be used when calculating bore volumes (L) for typical groundwater bore installations by the following equation:

V = MP x (depth of well – depth to water)

Table 1 Multiplication Factors to be used when calculating bore volumes for typical casing and borehole diameters

	Casing Diameter (mm)								
Bore Diameter (mm) (approximate inches)	32	50	100	125	150	175	200	225	250

6.0 Fieldwork Instruction

(PRINT THIS SECTION FOR USE IN THE FIELD)

This section details the step by step processes for completing the task and should accompany AECOM field personnel in the field. Any variations to this Fieldwork Instruction required to meet project specific objectives should be identified by the Project Manager prior to fieldworks and an amended uncontrolled instruction provided to fieldwork staff. Variations made in the field by fieldwork staff should be documented in the site notes and communicated to the Project Manager.

Note that if samples are to be collected for the analysis of Per- and Polyfluoroalkyl Substances (PFAS) additional equipment and clothing restrictions must be provided by the Project Manager.

Olfactory assessment (smelling) of groundwater shall not be undertaken due to the potential for atmospheric hazards of unknown type and concentration to be present. Only ambient odours should be recorded.

6.1 Decontamination

Any equipment placed into a groundwater well for development purposes shall be decontaminated prior to use and between each groundwater well location by the following procedure.

- Scrub the equipment with a stiff steel brush to remove excess dirt prior to decontamination. Collect the dirt over a waste bag and dispose in the bag. Wipe the equipment using disposable alcohol wipes. Dispose of the alcohol wipes into a contaminated waste bag.
- Aggressively wash the equipment using a plastic scrubbing brush in a bucket with a solution of potable water and detergent (phosphate free and biodegradable, e.g. Decon 90).
- Rinse the equipment with potable water over another bucket and collect the rinse water for later disposal as contaminated waste.
- Rinse the equipment with deionised water (spray this over it generously with a plastic spray bottle) over a bucket for later disposal as contaminated waste. The deionised water should preferably be supplied by the laboratory with a batch number for traceability.
- The wash solution needs to be renewed when the decontamination process becomes ineffective, e.g. product on the probe after rinsing or sheen in the wash solution buckets.

Where equipment is large and cumbersome such as drilling rods used for development, this equipment should be decontaminated prior to installation in the well, between each location and at the end of the well development program. Decontamination should involve:

- Removing large soil fragments from the equipment using a steel brush or by scraping. Any contaminated dirt should be collected over a waste bag or bund and disposed of in bags or contaminated waste drums.
- The equipment should be washed with high pressure potable water, preferably with a solution of potable water and detergent (phosphate free and biodegradable, e.g. Decon 90).
- High pressure potable water should be used for a final rinse of the equipment. The water used for decontamination purposes should be collected in a bunded area (either permanent or portable) and pumped into a liquid container for disposal offsite as a contaminated liquid.

6.2 Groundwater Well Development

6.2.1 Methods

The most often used methods of well development include mechanical surging and bailing for pumping, over pumping, airlift pumping and jetting. An important factor in any method is that the development work be started slowly and gently and increased as the well is developed. Most methods of well development requires the application of sufficient energy to disturb the gravel pack, thereby freeing the fines and allowing them to be drawn into the well. The coarser fraction settles and stabilizes the surrounding foundation.

When an air compressor is used, it should be equipped with an oil air filter or oil trap to minimize the introduction of oil into the well. The use of vegetable based oils should be considered if required of the contractor.

The well development method employed should be more vigorous than the proposed sampling method. However, development procedures for wells completed in fine sand and silt strata should involve methods that

© AECOM Restricted

are relatively gentle so the strata material will not be incorporated into the gravel pack. Vigorous surging during development can produce mixing of the fine strata and gravel pack and produce turbid samples.

Development methods should be carefully selected based on the potential contaminants present, the quality of waste water generated, and the requirements for containment and treatment of waste water. The specific methods include:

- Mechanical surging – water is forced to flow into and out of the well screens by operating a plunger or surge block, or bailer up and down in the well casing. A pump or bailer should then be used to remove dislodged sediments from the well (the use of a Waterra foot-valve pump in small diameter well screens can in itself have a mechanical surging effect)
- Air lift pumping – an air lift pump is operated by cycling the air pressure on and off for short periods of time. This operation will produce a surging action that will dislodge fine-grained particles. Applying a steady, low pressure will remove the fines that have been drawn into the well by the surging action. Efforts should be made to avoid pumping air into the gravel pack and adjacent unit as the air may inhibit future sampling efforts or alter ambient water chemistry. High pressure should be avoided to prevent damage to small diameter PVC casings, screens and gravel packs. The sudden evacuation of water stored in the casing by airlift will create substantial hydrostatic imbalance between the formation and inside of the casing which may lead to screen collapse and failure.
- Over pumping – a submersible pump is used to stress the formation and force water out the formation from a larger radius than would otherwise be affected.

6.2.2 Generic Step – by Step

This step provides the methodology for general well development. Details of bailing and foot valve pump techniques are outlined in the individual work instructions indicated in Section 2 above. Short, general description of the mechanics of development (keywords: gentle start, dislodging sediment, surging action etc.).

1. The wells least likely to be contaminated should be targeted first so as to minimise any potential cross – contamination between wells.
2. Appropriate air monitoring for gases and volatile compounds should be undertaken (PID, LEL, landfill gas) prior to commencing and throughout the course of the well development where applicable.
3. -Standing water levels and total depth of the well should be measured using an oil water interface probe or water level meter. This is used to calculate groundwater bore volumes.
4. The chosen development apparatus should be installed into the well (bailer, airlifting lines, waterra tubing). Using the chosen development method, water should be removed from the well and contained in the appropriate containers for disposal. This may involve collecting water into a bucket or jerry can during bailing or waterra. When airlifting is being used, removed groundwater can be diverted via a T-piece or diversion head into an IBC. Where groundwater contamination, including elevated salinity levels, is not of concern, groundwater may be disposed of to ground with appropriate environmental considerations and approvals.
5. Water quality parameters (pH, EC, DO, ORP and temperature) should be measured and observations of colour, turbidity and odour made periodically during the well development. This should be recorded on the FQM Groundwater Sampling and Purging Record – ANZ – ENV . For bailing, suction pump and foot valve/surge block methods, water quality readings should be collected at the same rates as for groundwater sampling using these methods (outlined in FQM Groundwater Sampling – Bailer – ANZ - ENV and FQM Groundwater Sampling - Hydrasleeve – ANZ - ENV [in preparation]). When using airlifting, water should be collected in a bucket and quality readings should be taken and recorded every half an hour.
6. During development using waterra or airlifting, the groundwater flow rate should be estimated. This can be undertaken by allowing water to flow into a bucket which has volumetric markings and recording the time taken to fill a pre-determined volume using a stopwatch. This reading can then be converted to L/sec or L/min flow rate measurements. Flow rates should be measured periodically throughout the development process and recorded on the development records.
7. In general, well development should continue until a minimum of 2 bore volumes have been removed from the well. After 2 bore volumes have been removed, development should continue until water quality readings have stabilised (see FQM Groundwater Quality Measurements – ANZ - ENV [in preparation] for discussion on collecting water quality readings) Under the following scenarios, it is necessary to remove additional volumes of groundwater:

© AECOM Restricted

- Where water has been used during drilling, an estimation of the water used should be made and this volume should be removed from the well as a minimum.
- Where bores are to be used for a production purposes, groundwater development should continue until less than 5 mg of sand sized particles are obtained for 1000L of groundwater or until no sand or silt is produced for an hour (NUDLC 2012).

8. Well development will begin after the monitoring well is completely installed and before water sampling. Development will be continued until representative water free of the drilling fluids, cuttings and other materials introduced during well construction is obtained. Representative water quality is assumed to be obtained when the pH, temp, and EC readings stabilise and the water is visually clear of suspended solids. The minimum duration of well development will vary with the method used to develop the well and with the nature of the aquifer material.
9. The method employed and results of the water quality parameters (pH, EC, DO, ORP and temperature) should be measured and observations of colour, turbidity and odour made periodically during the well development. This should be recorded on well development sheets (FQM Groundwater Sampling and Purging Record – ANZ – ENV). For bailing, suction pump and foot valve/surge block methods, water quality readings should be collected at the same rates as for groundwater sampling using these methods (outlined in FQM Groundwater Sampling – Bailer – ANZ - ENV and FQM Groundwater Sampling - Hydrasleeve – ANZ – ENV [in preparation]). When using airlifting, water should be collected in a bucket and quality readings should be taken and recorded every half an hour.
10. No time limit to development, although should be discussed with PM
11. Where mud has been used as a drilling fluid it is essential to break down the wall cake and remove the drilling mud used. Development of mudded holes should be continued until a significant reduction in groundwater turbidity is observed and groundwater parameters have stabilised.
12. Following development, the standing water level and total depth of the well should be measured and recorded for comparison to the original readings. Development may remove sediment from the base of the well so that it appears to be “deeper”.
13. Groundwater produced during development should be collected into drums or IBCs if it is considered to be potentially contaminated. The drums shall be appropriately labelled and stored in a secure location prior to collection and disposal by a licensed waste contractor.
14. If applicable, measure the concentration of vapours exiting the well using a PID by placing the intake nozzle above the well casing. Record the highest concentration measured by the PID in FQM Groundwater Sampling and Purging Record – ANZ - ENV.
15. Slowly lower the measurement probe down the well until the probe intersects groundwater.
16. Measure the depth to groundwater in metres (to two decimal places) from the measurement tape by holding the tape next to the top of casing. The top of casing may be the highest point on the well casing or a point that was previously marker on the casing for surveying.
17. Confirm the measured depth to groundwater by repeating Sections 5.2.11 to 5.2.12 until three consistent measurements are taken (i.e. ±0.01 m). Record the depth to groundwater in FQM Groundwater Sampling and Purging Record – ANZ - ENV.
18. Measure the total depth of the well by turning off the measurement probe and lowering the probe to the bottom of the well. This is usually determined by the point where there is no tension on the measurement tape.
19. -Measure the total depth of the well in metres (two decimal places may be sufficient) by holding the measurement tape next to top of casing. Record the total well depth in FQM Groundwater Sampling and Purging Record – ANZ - ENV.

7.0 Troubleshooting

I have purged 3 bore volumes from the bore but the groundwater parameters have not stabilised

Water quality parameters may not always stabilise within the realistic time frame of development. This may reflect aquifer heterogeneity.

Airlifting is only producing very small flow rates of groundwater to surface or is not being lifted out of the bore

© AECOM Restricted

This may reflect a short static water column and slow groundwater recharge. It is possible to place two pieces of poly pipe inside each other and inject air into the thinner diameter piece. The large piece acts to restrict the "diameter of the bore" and forces water to the surface. However, this will produce water at a low flow rate. While this method will allow removal of water, it will be very slow and may not develop the bore to maximum efficiency.

I have been developing a bore for hours but it is still generating sand sized particles.

This may require an assessment of the original geology and bore construction. This should be completed in consultation with the PM or PiC. Sand may be produced where a borehole has been left open (not screened and cased), due to damaged casing/screen, shifted filter pack, or if the screen/filter pack used was not of an appropriate aperture/size.

FQM - Groundwater Sampling - Low Flow Pump

1.0 Purpose and Scope

To instruct field staff on how to collect representative site-specific groundwater samples from the aquifer formation, with minimal disturbance to the water column.

This Field Instruction (FI) describes the methodology for the collection of groundwater samples using a bladder pump (low flow technique). This procedure should be read in conjunction with the following Australian/New Zealand Standards:

- AS NZS 5667.1.1998 – Water Quality Sampling – Part 1 Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples; and
- AS NZS 5667.11,1998 – Water quality - Sampling guidance on sampling of groundwaters.

3.0 Responsibilities

Role	Responsibility
Fieldwork Staff	To apply the methods detailed in this FI. To ensure equipment is in good working order prior to use, is maintained according to supplier's advice and is appropriately calibrated or verified, have a basic understanding of common faults and field based repairs. Any faults shall be reported to the Project Manager (PM) or the equipment supplier as soon as they are identified. To ensure Quality Assurance/Quality Control and Health and Safety Compliance.
Project Manager	Define the objectives and appropriate methodology to field staff prior to mobilisation into the field. The Project Manager should check (or designate another to check) the gauging data recorded by the fieldwork staff for anomalies such as measurements inconsistent with historical groundwater level fluctuations or well construction records. To ensure Quality Assurance/Quality Control and Health and Safety Compliance.
Regional SH&E Manager	The Regional Safety, Health and Environment (SH&E) Manager is one of the assigned person and is responsible for reviewing and approving the project specific risk assessment (e.g. Project Safety Plan/Safe Work Method Statement), monitoring the implementation of project specific risk assessment plans, interface with project managers in matters of safety, health and environment, and investigating reports of incidents or accidents.

4.0 Equipment and Materials

4.1 Equipment

Equipment required to complete this task includes:

- Low Flow (Bladder) Pump Casing;
- Wire hanger;
- Control Box;
- Compressor (Air or CO_2 Gas cylinder, Regulator and Hose);
- Water Quality Meter and Flow-through-cell; and
- Oil-water Interface Meter or Electronic Dip Meter drawdown meter.

Optional or supplemental equipment:

- Lower Explosive Limit (LEL) Detector; and
- Photo Ionisation Detector (PID).

For remote sites consideration should be given to providing a backup set of equipment, if the cost of remobilization is high, and there is no access to technical repair facilities.

4.1.1 Water Level Meter

A water level meter, also called electric dip meter, is used to measure the depth to standing water. Where Non Aqueous Phase Liquid (NAPL) is expected or suspected to be present in groundwater wells an oil/water interface meter should be used. A beeping sound is made when the electronic dip meter intersects the standing water level.

4.1.2 Drawdown Meter

A drawdown meter works differently to a water level meter: it makes a beeping sound when exposed to air and is silent in water. The probe should be locked in place in the water column above the pump inlet approximately 10 cm below the pre-pumping water level. As the water level drops during pumping the probe will beep when it is exposed to air. The probe can then be lowered until the beeping stops and the process repeated. The water levels will be recorded against time during the pumping on the field sheets.

4.1.3 Oil/Water Interface Meter

The oil/water interface probe should be used where Light Non Aqueous Phase Liquid (LNAPL) or Dense Non Aqueous Phase Liquid (DNAPL) are expected or suspected to be present in the wells. The probe emits two different sounds for distinguishing the depth to NAPL (continuous tone) and the standing water level (short beeping). Because LNAPL floats on top of water, the continuous tone will occur typically before the beeping tone;

© AECOM Restricted

with DNAPL, the continuous tone would occur towards the base of the well, after the beeping tone of the water column. As the water level drops during pumping the probe will stop beeping when it is exposed to air. The probe can then be lowered until the beeping starts to gauge water level and the process repeated. The water levels will be recorded against time during the pumping on the field sheets.

4.1.4 Water Quality Meter

A water quality meter will typically comprise instrument probes to measure electrical conductivity (EC), pH, temperature, oxidation reduction potential (ORP) and dissolved oxygen (DO). Common water quality meters include YSI and TPS FLMV. When renting a water quality meter, the rental company should supply a calibration certificate indicating that the equipment has been cleaned, calibrated and is ready for use. Ensure that a flow-through cell is included with the water quality meter.

4.1.5 Low Flow Pump Casing/Wire Hanger

Casing which is lowered down the well to pump groundwater. Holds the bladder that is used to pump water, one bladder is used per well and replaced during decontamination. The pump is connected to both the discharge line and airline. Both these lines must be securely in place with a tight seal for the pump to work properly. The pump contains o-rings that must be checked each time before the pump is used, for if one is missing or worn the pump will not operate properly.

A wire cable/hanger is connected to the pump from the surface, to hold the pump in place as a safe guard to stop it falling down the well. The D-bolt on the hanger should be checked between each well during the decontamination process to prevent it from loosening and dropping the pump down the well.

4.1.6 Low Flow Control Box

Used to control the rate at which water is pumped (Cycle per Minute) and the pressure that the water is pumped out of the well. The control box (shown in **Figure 1)** may contain a compressor or is connected to the gas cylinder through the hose and regulator, and also the pump through the air line. Low flow controller may be connected via 12v cables to a battery.

Figure 1 Low Flow Control Box

4.1.7 Compressor, Gas Cylinder, Regulator & Hose (if required)

CO_2 gas cylinder can be used to pump groundwater. This is connected to a regulator and regulator is connected to the hose.

Note the pressure on the gas bottle. A full gas bottle should read 5,000 kpa (1,900 psi), and will allow you to sample approximately 20 wells (varying with well depth). If the bottle reads 500 kpa or less it should be marked empty and replaced.

Compressors can be either battery powered or powered using a combustion engine, make sure the pressures are appropriately controlled and that a clear knowledge of operation and the HSEP reflects compressor use prior to mobilization.

© AECOM Restricted

4.1.8 Photo Ionisation Detector (PID)

Refer to FQM Operating a Photo-Ionisation Detector (PID) – ANZ – ENV , for applicability, operation and calibration of a PID.

4.1.9 Lower Explosive Limit (LEL) Detector

Refer to FQM Operating a Lower Explosive Limit (LEL) Monitoring – ANZ - ENV, for applicability, operation and calibration of a LEL.

4.2 Materials

Materials and consumables that may be required to complete this task include:

- Appropriate Buckets (based on COPC)
- Potable water
- Phosphate free detergent (e.g. Liquinox, **do not use Decon 90**)
- Deionised water
- Scrubbing brush
- Paper towel
- Alcohol Wipes
- Waste water container (e.g. jerry can)
- Laboratory supplied sampling containers
- Laboratory supplied rinstate water
- Garbage bags
- Field book
- Permanent markers
- Duct tape
- Nitrile gloves
- Hex keys
- Tools for opening well gatic (e.g. hammer, screw driver)
- Spare o-rings and hex bolts
- Scissors/Tube Cutters
- Funnel
- Tubing – Air & Discharge line (enough metres for all wells include spares)
- Esky/cool box
- Ice/ice blocks
- Low-flow bladders (1 per well with spares)
- Adjustable spanner
- Permanent markers and pens
- Stericup Filters or in-line filters (if required for COPCs)
- Hand pump (if Stericup filters are used);

5.0 Background

The objective of groundwater sampling is to obtain water samples that best represent natural undisturbed hydrogeological conditions. Low flow sampling is one of the techniques used to achieve this. It works by lowering the pump to a specified depth in the bore screen, thus pumping water coming into the bore from the aquifer, to achieve representative samples of the aquifer with minimal disturbance to the standing water in the well.

Before commencing low flow sampling, some important factors should be considered including, the method used historically on the site for sample collection. The groundwater characteristics may take some time to stabilise after installation and development of new wells. Refer to FQM Groundwater Monitoring Well Installation – ANZ - ENV and FQM Groundwater Well Development – ANZ - ENV for further information regarding the monitoring well installation and development.

Pumping should be done in a manner that minimises stress (drawdown) to the system to the extent practical.

© AECOM Restricted

6.0 Fieldwork Instruction

(PRINT THIS SECTION FOR USE IN THE FIELD)

Any variations to this Fieldwork Instruction required to meet project specific objectives should be identified by the Project Manager prior to fieldworks and an amended uncontrolled instruction provided to fieldwork staff. Variations made in the field by fieldwork staff should be documented in the site notes and communicated to the Project Manager.

Note that if samples are to be collected for the analysis of Per- and Polyfluoroalkyl Substances (PFAS) additional equipment and clothing restrictions must be provided by the Project Manager.

Olfactory assessment (smelling) of groundwater shall not be undertaken due to the potential for atmospheric hazards of unknown type and concentration to be present. Only ambient odours should be recorded.

6.1 Decontamination

The equipment (low flow pump/interface probe) shall be decontaminated prior to use and between sampling each surface sample location by the following procedure.

1. Wipe the probe and measuring tape (the length that comes into contact with groundwater) using disposable alcohol wipes. Dispose of the alcohol wipes into a contaminated waste bag.
2. Empty pump bladder and leftover groundwater in waste water container using a funnel.
3. Wash the low flow pump, suspension wire, probe and associated tape using a scrubbing brush in a bucket with a solution of potable water and detergent (phosphate free and biodegradable).
4. Rinse the low flow pump, probe, wire and tape with potable water in another bucket.
5. Final rinse of all apparatus using deionised water in a spray bottle/bucket or directly from the deionized water container.
6. The wash solution needs to be renewed when the decontamination process becomes ineffective, e.g. product on the probe after rinsing or sheen in the wash solution buckets.

6.2 Low Flow Groundwater Sampling

- YSI model WQMs should be turned on 30 minutes before sampling to allow sensors to stabilise. Ensure protective covers are removed from probe;
- Check the pressure on the gas cylinder – a full cylinder should read initially on the regulator 5000 kpa; and
- Check for leakage of CO_2 or air in the system, if identified immediately turn off CO_2/compressor and undertake repair/change equipment with apparatus isolated and de-energized.

1. The wells on the site least likely to be contaminated should be targeted first so as to reduce the risk of potential cross contamination between sample locations.
2. (If using CO_2) Connect gas cylinder/compressor to regulator, the regulator to hose and the hose to the control box.
3. Turn on the gas/start compressor, control box and Water Quality Meter (WQM).
4. Ensure pump casing and hanger cable have been decontaminated. Install new disposable bladder in pump, check o-rings are all in place correctly and undamaged. Connect hanger cable to pump casing, ensuring d-bolt is tightly secured.
5. Connect the tubing line to the pump casing, discharge line (larger diameter) and air line (thinner diameter). If using twin tubing (joined tubing), ensure the excess glue has been removed from tubing line using scissors or tube cutters before connecting to pump and controller to prevent damage to inlets and o-rings. Once connected pull on the tubing to test they are secure.
6. Open the monitoring well cover by (a) unlocking the flush mount well gatic with a hex key or (b) lifting the hinge lid on the monument/stick up well cover or (c) removing the lid on any other well cover as required (e.g. quarter turn well covers).

© AECOM Restricted

Monitoring well covers can cut / injure hands. Use cut resistant gloves to open well covers. Be careful for wells with positive pressure (such as landfill leachate bores that could pop off the loosened well cap. Keep body parts clear of well when opening).

Biological hazards (e.g. spiders, ants) may be present within gatic covers, exercise caution when opening wells. Wear gloves and remove cobwebs before placing hands into the well.

7. Remove the well cap (e.g. J-plug), PVC end cap, torque cap.

High concentrations of vapours can build up in the well and be released into the breathing zone when the well cap is removed. Implement appropriate work space monitoring (e.g. LEL, PID, colorimetric gas detection tubes) and HSE procedures (e.g. maintain appropriate fire extinguishers in work area) prior to removal of well cap.

8. Measure the SWL in the well with the interface probe. This depth will be taken as the original SWL on your purging sheet.

Wells should be gauged prior to the commencement of any sampling, where possible.

9. Lower pump into well slowly to avoid water column disturbance (pump should not be lowered to the bottom of well as this could cause resuspension of solids which will have collected at the bottom of the well). Lower tubing and wire carefully together to prevent tangling which can lead to the pump becoming lodged in the well. Review each well completion log to select the depth to which the pump inlet will be set. The pump should be positioned dependent on the contaminant of concern or to target high permeability zones. Where this is not known, the pump inlet should be located approximately in the middle of the screened interval so as not to disturb the bottom of the well and allow for sufficient water above the pump. Ensure the hanger cable is tight and that the cable reel has been locked in place. The depth of the pump inlet can be measured by using the interface probe / water meter to measure the depth to the top of the pump. Record depth to pump on purging sheet.

10. Attach the tubing airline to the control box (see **Figure 1**). Attach discharge line (larger diameter) to the flow cell in the bottom outlet to allow flow cell to fill with water before discharge. Place flow cell into a bucket to ensure overflow from discharge is contained.

11. Remeasure the SWL in the well, or use the drawdown meter to monitor any drawdown during pumping.

The difference in depth between the SWL recorded before the pump was lowered into the well and after will give a rough estimate of how quick the well will recharge if no historical data is available (the larger the difference in depths the slower the recharge as a general rule).

12. Measure depth to top of pump and record as purging depth on purge sheet. If this is not possible i.e. in wells with a diameter greater than 50 mm, an estimate can be made.

13. For CO_2 setup - Set the air pressure on the gas cylinder regulator and control box throttle to required pressure. Using the formula Purging Depth (1 metre = 1 psi) + 10 psi = Air Pressure e.g. 15m depth = (15x1) +10 = 25. The pressure should be slightly greater on the gas cylinder regulator compared to the control throttle. Watch the rate at which water is discharged and adjust pressure as necessary.

Review previous sampling sheets to obtain an idea of the appropriate pumping rate. Set the controller to the estimated flow rate or if unknown start on 100 ml/min (CPM 1). One cycle yields approximately 100 ml of water. Groundwater flow should be between 0.1-0.4 L/ min.

14. For O_2 setup – set the fill and discharge times. Discharge times are the time it takes to squeeze the bladder and fill time is the time allowed for the bladder to refill. Fill and discharge rates depend on hydrostatic pressure (i.e. water above the pump). The airline pressure gauge should not exceed the equivalent depth to water 1 PSI = 0.7 m of water.

Review previous sampling sheets to obtain an idea of the appropriate flow rate. If discharge falls off before the discharge cycle is complete, the discharge time can be lowered. If drawdown is significant, fill time can be increased.

15. Start the pump. Allow purged water to overflow (into a container) the flow-through cell before starting to take water quality parameter readings and standing water level readings, once this occurs take readings every three minutes (where sampling rate is 100ml/minute or more) or five minutes (if flow rate is less than 100ml/minute).

16. Fill in data on CPM or fill/discharge rate, SWL readings and water quality parameters on the field purging sheet.

© AECOM Restricted

The drawdown should not exceed 10 cm difference from the original SWL at any time. However it is more important that the groundwater quality parameters stabilise before sampling. If the drawdown is dropping continuously lower the flow rate to see if the SWL will stabilise. Once the SWL stabilises wait for three successive stable parameter readings before sampling (at 3 to 5 minute interval between each successive reading).

If you are still getting drawdown with the very low pump rates, contact PM for advice.

17. Once field parameters have stabilised samples can be collected (a minimum of 1 L of groundwater should be removed prior to sampling). The water quality parameters are considered stable when for three successive readings the parameters are within the following: ±10% Dissolved Oxygen; ±3% Electrical Conductivity; ±0.05 pH; ±10 mV Redox Potential; and ±0.2°C Temperature. Pay attention to water quality parameters and check that readings are as expected based on site knowledge and chemistry. Issues often occur with WQMs. Parameters can also be easily recorded incorrectly if the wrong units or parameter is referenced. Taking time to set-up WQM display screen with the required parameters and units may help as parameters that are not recorded (e.g. salinity) are not displayed. Contact PM and/or equipment supplier if unsure of readings or experiencing issues with WQM.

Record all purging and sampling details on the FQM Groundwater Sampling and Purging Record – ANZ - ENV.

If water quality parameters have changed significantly since last GME call the PM.

18. Maintain the same pumping rate for sampling. Disconnect the pump's tubing from the flow-through-cell so that the samples are collected from the pump's discharge tubing. Air pressure on the gas cylinder can be turned down so samples can be filled with minimal turbulence (if applicable).
19. Fill samples over a bucket/basin to minimise spillage.
20. Store samples in esky with sufficient ice or ice bricks. Ice should form a bed beneath samples and cover samples. Glass vials and bottles should be stored in bubble wrap and eskies should not be over-filled.
21. Turn the controller off. Remove the pump from the monitoring well. Decontaminate the pump and probe following steps decontamination steps in section **6.1** and dispose of the tubing, bladder and other waste. The flow-through cell doesn't need to be rinsed between wells (unless a sheen, strong hydrocarbon odour or sediment is noticed to keep it in good working condition). Water quality sensors should be rinsed with tap water.

- If SWL varied during purging, measure the SWL after sampling to ensure that levels did not exceed 10 cm difference from the original SWL.
- If this is the last well for the day, or before a break, the gas line should be turned off and de-pressurised before leaving by turning the gas off at the cylinder and running the controller through one or two cycles. All caps should be replaced on the WQM.

22. Replace cap on well, lock gatic. Check area for anything left behind before leaving.

7.0 Troubleshooting

a. **Water isn't discharging from the pump:**

1. Check gas bottle is not empty/compressor is operating.
2. Check air pressure gauges on the gas bottle and controller are at appropriate levels (if applicable).
3. Re-connect air hose to compressor to ensure there isn't a leak.
4. Remove pump from well.
5. Check water and air lines connecting pump to ensure there isn't a leak.
6. Check o-rings are in place in pump; replace any worn o-rings.
7. Check bladder hasn't broken and is in good condition.
8. Decontaminate or clean pump and inlet to remove sediment.

b. **There are air bubbles (observed audibly from the well head) in the water discharge tube:**

1. O-rings are missing or worn, check and replace if needed.

© AECOM Restricted

2. Air line connecting to pump is leaking causing water bubble in discharge line, re-connect both air and water tubes connecting to pump.
3. Bladder is missing or not sealed.

c. **The water level keeps fluctuating up and down rapidly:**

1. O-rings are missing or worn, check and replace if needed.
2. Air line connecting to pump is leaking causing water to bubble in well, re-connect both air and water tubes connecting to pump.
3. Bladder is missing or not sealed.

FQM - NAPL and Groundwater Level Gauging

Q4AN(EV)-414-PR1

1.0 Purpose and Scope

To obtain accurate and representative measurements of non-aqueous phase liquid (NAPL) levels and groundwater levels in groundwater monitoring wells.

This Fieldwork Instruction describes the methodology for gauging light (floating on groundwater) non-aqueous phase liquid (LNAPL) levels, dense (sinking in groundwater) non-aqueous phase liquid (DNAPL) levels and groundwater levels in monitoring wells.

This document is applicable to the measurement of groundwater levels only using an oil/water interface probe and should be used in preference to FQM Groundwater Level Gauging – ANZ - ENV for investigations at sites that may have NAPLs present in the subsurface.

3.0 Responsibilities

Role	Responsibility
Fieldwork Staff	To apply the methodology detailed in this Fieldwork Instruction. To ensure equipment is in good working order prior to use and is maintained according to supplier's advice. Report all anomalies to the Project Manager or the equipment supplier as soon as they are identified. Maintain accurate fieldwork data and observation records and provide to the Project Manager for review and filing in the project central file.
Project Manager	Define the task objectives and provide all relevant information to field staff prior to mobilisation into the field. The Project Manager should check (or designate another to check) the gauging data recorded by the fieldwork staff for anomalies such as measurements inconsistent with historical level fluctuations or well construction records.
Regional SH&E Manager	The Regional Safety, Health and Environment (SH&E) Manager is is responsible for reviewing and approving the project specific risk assessment (e.g. Project Safety Plan/Safe Work Method Statement), monitoring the implementation of project specific risk assessment plans, interface with

© AECOM Restricted

Role	Responsibility
	project managers in matters of safety, health and environment, and investigating reports of incidents or accidents.

4.0 Equipment and Materials

4.1 Equipment

Equipment required to complete this task include:

- Oil/water interface probe;
- Photo Ionisation Detector (PID); and
- Lower Explosive Limit (LEL) Detector.

Optional or supplemental equipment:

- Non-electrical water level meter such as “plopper” or “Fox Whistle”;
- AB(E) fire extinguishers; and
- Oil/fuel spill kit.

4.1.1 Oil/Water Interface Probe

The oil/water interface meter is suitable for LNAPL, DNAPL and groundwater level measurements. Check the equipment user guide for specific operating principles.

4.1.2 Photo Ionisation Detector (PID)

Refer to FQM Photo-Ionisation Detector (PID) – ANZ - ENV , for applicability, operation and calibration of a PID.

4.1.3 Lower Explosive Limit (LEL) Detector

Refer to FQM Lower Explosive Limit (LEL) Monitoring – ANZ - ENV , for applicability, operation and calibration of a LEL Detector.

4.2 Materials

Materials and consumables required to complete this task include:

- Buckets;
- Potable water;
- Phosphate free detergent (e.g. Liquinox, **do not use Decon 90**, especially if sampling for per and poly-fluoroalkyl substances [PFAS] is to be conducted);
- Scrubbing brush;
- Paper towel;
- Alcohol wipes;
- Liquid contaminated waste container;
- Steel rod for electrical grounding (e.g. screwdriver);
- Allen key set;
- Tools for opening well covers, e.g. magnet or pair of pliers;
- Spare o- rings and hex bolts;
- Bailers for confirming presence of NAPL;
- Steel measuring tape;
- Bailer twine;
- Solid contaminated waste bags; and
- Spare batteries.

© AECOM Restricted

5.0 Background

Accurate and reliable groundwater level measurements are essential in determining the hydraulic head, hydraulic gradients (vertical or along the water table), and the likely directions for groundwater flow and contaminant transport at a site. Before commencing a groundwater gauging round, some important factors should be considered, including:

- The groundwater level may take some time to stabilise after development of new wells.
- Groundwater levels fluctuate naturally (e.g. rainfall infiltration and tidal influences) and anthropogenically (e.g. pumping and irrigation), therefore groundwater gauging of a site should be completed in one day or less if possible. If a site is influenced by tidal variations, gauging should ideally be completed within a single tidal stage and water level data loggers may be needed to determine groundwater elevation.
- Effervescent groundwater such as in mineral spring areas or at landfills may cause difficulty gauging.
- Highly saline groundwater can cause the alarm of a dip meter or oil-water interface probe to sound even when the probe is lifted out of the water in the well. This usually occurs if the probe initially was lowered below the water level in the well. The probe may need to be washed, dried and the water level re-measured.
- Highly turbid wells can cause the continuous tone of an oil-water interface meter to sound even when NAPL is absent. If the occurrence of NAPL is unlikely or new, its occurrence should be checked using a new bailer or by looking for evidence of oils on the tape of the meter.
- Electronic dip meters and oil/water interface probes have co-axial conductive wires within a graduated plastic tape. A damaged tape may result in stretching of the graduations and inaccurate measurements. The tape should be calibrated for length against a steel tape prior to use and markings should be checked for legibility.

© AECOM Restricted

6.0 Fieldwork Instruction

(PRINT SECTION 6 AND 7 FOR USE IN THE FIELD)

This section details the step by step processes for completing the task and should accompany AECOM field personnel in the field. Any variations to this Fieldwork Instruction required to meet project specific objectives should be identified by the Project Manager prior to fieldworks and an amended uncontrolled instruction provided to fieldwork staff. Variations made in the field by fieldwork staff should be documented in the site notes and communicated to the Project Manager.

Caution: An explosive atmosphere may be present in the vicinity of an open monitoring well due to vapours emanating from a well with LNAPL floating on groundwater. Refer to the project Health, Safety and Environment Plan (HSEP) for specific controls to manage the potential acute safety hazard.

6.1 Decontamination

The measurement equipment (oil/water interface probe) shall be decontaminated prior to use and between measuring each monitoring well by the following procedure.

1. Wipe the probe and measuring tape (the length that comes into contact with groundwater) using disposable alcohol wipes. Dispose of the alcohol wipes into a contaminated waste bag.
2. Wash the probe and measuring tape (the length that comes into contact with groundwater) using a scrubbing brush in a bucket with a solution of potable water and detergent (phosphate free and biodegradable, NOTE: do not use Decon 90, especially if sampling for PFAS is to be conducted).
3. Rinse the probe and washed section of the measuring tape with potable water over another bucket and collect the rinse water for later disposal as contaminated waste.
4. The wash solution needs to be renewed when the decontamination process becomes ineffective, e.g. product remains on the probe after rinsing or sheen is present in the wash solution buckets.

6.2 NAPL and Groundwater Level Gauging

This section provides the methodology for the relative measurement of LNAPL (if present), groundwater and DNAPL (if present) levels in that order. Water and NAPL levels should be measured in a sequence from clean to contaminated wells to avoid cross-contamination of wells. A gauging round should be conducted of all monitoring wells at the site as quickly as possible before any samples are collected.

1. Open the monitoring well cover by (a) unlocking the flush mount well gatic with an Allen key (typically 7 mm) or (b) lifting the hinge lid on the monument/stick up well cover or (c) removing the lid on any other well cover as required (e.g. quarter turn well covers).

Monitoring well covers can cut / injure hands. Use cut resistant gloves to open well covers. Be careful for wells with positive pressure (such as landfill leachate bores that could pop off the loosened well cap. Keep body parts clear of well when opening).

Biological hazards (e.g. spiders, ants) may be present within gatic covers, exercise caution when opening wells. Wear gloves and remove cobwebs before placing hands into the well.

2. Remove the well cap (e.g. J-plug), PVC end cap, torque cap. Stand upwind from the well and allow hydrocarbon vapours to dissipate.

High concentrations of vapours can build up in the well and be released into the breathing zone when the well cap is removed. Implement appropriate work space monitoring (e.g. LEL, PID, colorimetric gas detection tubes) and HSE procedures (e.g. maintain appropriate fire extinguishers in work area) prior to removal of well cap.

3. Check the breathing zone above the well using a PID. Only proceed with gauging when the safety requirements stipulated in the project HSEP have been attained, i.e. vapour concentrations are below action levels or appropriate PPE is in use where action levels are exceeded.
4. Measure the concentration of vapours exiting the well using a PID by placing the intake nozzle immediately above the well casing.

Record the highest concentration measured by the PID and also the general condition of the monitoring well (e.g. missing or broken cover or well cap, well head filled with surface water) in FQM NAPL and Groundwater Level Gauging – ANZ - ENV.

© AECOM Restricted

5. Electrically ground the interface probe by attaching the grounding clip to the well casing or to a steel rod (e.g. screwdriver) inserted into the ground.

Caution: Static electricity may cause a spark and ignite vapours if the interface probe is not suitably grounded.

6. Slowly lower the interface probe down the well until the probe intersects LNAPL (if present) as indicated by the noise made by the equipment (typically a continuous tone - refer to equipment user guide for details). Measure the depth to LNAPL in metres (to three decimal places) from the measurement tape by holding the tape next to the top of casing.

The top of casing may be the highest point on the well casing or a point that was previously marked on the casing for surveying.

Record the depth to LNAPL in metres below top of casing (mBTOC) in FQM NAPL and Groundwater Level Gauging – ANZ - ENV .

7. Slowly continue to lower the probe down the well until groundwater has been intersected (typically beeping tone – refer to equipment user guide for details). Measure the depth to groundwater in metres (to three decimal places) from the measurement tape by holding the tape next to the marked measuring point of the top of casing.

Record the depth to groundwater in metres below top of casing (mBTOC) in FQM NAPL and Groundwater Level Gauging – ANZ - ENV .

8. Confirm the measured depth to LNAPL and groundwater by repeating Step 6 and 7 until three consistent measurements are taken (i.e. ± 0.002 m).

9. To check for and measure DNAPL (if applicable), continue to lower the probe down the well through groundwater until the probe intersects DNAPL (typically a continuous tone - refer to equipment user guide for details). Measure the depth to DNAPL in metres (to three decimal places) from the measurement tape by holding the tape next to the marked measuring point of the top of casing.

10. Confirm the measured depth to DNAPL and groundwater by repeating Step 9 until three consistent measurements are taken (i.e. ± 0.002 m).

Record the depth to DNAPL in metres below top of casing (mBTOC) in FQM NAPL and Groundwater Level Gauging – ANZ - ENV .

If historical NAPL and groundwater levels are available for the monitoring well, compare the water level measurements with previous results for a reality check. That is, if groundwater levels have decreased in most wells since the previous gauging event but increased in one or two, then the anomalous measurements should be re-measured to confirm.

11. Measure the total depth of the well by turning off the interface probe and lowering the probe to the bottom of the well. This is usually determined by the point where there is no tension on the measurement tape. Measure the total depth of the well in metres (to two decimal places) by holding the measurement tape next to the marked measuring point at the top of casing.

Record the total well depth in FQM NAPL and Groundwater Level Gauging – ANZ - ENV .

TIP: It may be required to measure the height of the riser pipe in stick up wells. Check with your PM.

12. Where confirmation of NAPL is required by collecting a sample of LNAPL or DNAPL from the well refer to Fieldwork Instruction FQM NAPL Sampling – ENV – ANZ.

Record observations of NAPL (i.e. colour, odour, viscosity) on the interface probe or from a bailer used to collect a NAPL sample in FQM NAPL and Groundwater Level Gauging – ANZ - ENV .

13. Lock the well cap after gauging is complete.

7.0 Troubleshooting

a. I can't find the monitoring well I am supposed to sample

i. Use the figure to identify nearby features and attempt to triangulate its location.

ii. Ask field staff involved in previous monitoring events.

iii. Use a metal detector to sweep the general area.

© AECOM Restricted

iv. Request GPS co-ordinates from the GIS team and use a GPS to locate the well. If possible have a surveyor locate well position.

v. Check the project folder (and historical project folders) for any photographs of the well location.

b. The stickup well has a padlock

i. Check with the PM to ensure AECOM does not hold a key for the well.

ii. Check with client / land owner that a key is not available for the well.

iii. Cut the lock off.

iv. Re-secure the stickup using a cable tie unless client/PM indicates a lock should be replaced on the stickup.

c. The well is dry

i. Confirm that the measured depth to bottom matches the information in the well log / historical gauging logs.

ii. Check to see if the well is seasonally dry

iii. If blocked, unblock the well using appropriate means.

d. I can't get the well cover open or the well cap off

i. Check that the tool is right for the job i.e. the right size Allen key is being used. A welder's magnet may be useful in opening flush mounted well covers.

ii. Gently tap the well cover with a hammer to loosen.

iii. Replace O-rings and cover plate bolts as necessary to avoid the same problem next gauging round.

iv. Do not overexert and risk an injury or damage to the well head. Make a note on the gauging record and contact the Project Manager.

e. I can't get three stable measurements

Atmospheric pressure has the potential to affect the SWL. Wait a few minutes after opening the well cap for the SWL to stabilise and confirm again after an hour.

i. Inspect the measurement tape (whole length) for damage.

ii. Check the tip of the probe for damage, dirt or NAPL.

iii. Try the probe in a bucket of water.

iv. Check the battery.

Refer to the dip meter / interface probe user manual.

DRAFT

Appendix G

Site Specific Remediation Criteria

Site Specific Remediation Criteria

In order to assess risks and inform potential remediation works required to allow development of the Macquarie Point Site (the Site) in accordance with the Site *Masterplan* (Macquarie Point *Strategic Framework and Masterplan 2015 – 2030*), AECOM prepared *Derivation of Remediation Criteria* (AECOM, 2016) to develop Site specific Remediation Criteria (RC) for soil and groundwater which are protective of human health under the proposed future land uses at the Site.

The RC were reviewed and updated in 2025 (AECOM, 2025e) for the changes in proposed Site development to the current plan, described in **Section 2.3** of the main report text. A summary of the initial formulation, and updates from the review, are provided below.

The RC consider the following scenarios and land uses based on the initial and current proposed development of the Site:

- High density residential development (slab-on-grade buildings and buildings with a communal basement car park).
- Recreation / open space
- Multi-storey car park
- Commercial/light industrial (slab-on-grade buildings and working within a basement car park).

It is noted that residential development is now only proposed in Regatta Point, which is not one of the assessment areas with existing Site Suitability Statements considered in this report. However, high density residential land use is known to occur off-Site and hydraulically down-gradient along Evans Street to the south of the Site, and the potential exists for groundwater migration from the Site to reach this area. As such, the RC protective of residential use have been applied to groundwater data from the Site.

Information about proposed Site layout, uses and building design can be used to refine the RC to be more Site-specific and reduce conservatism where appropriate based on any changes to the Masterplan or Site uses in future. Any changes to RC should be prepared by a qualified environmental professional, and if changes allow higher concentrations of Chemicals of Potential Concern (CoPC) to remain on Site, be reviewed and endorsed by a Contaminated Land Auditor.

Assumptions

The following key assumptions have been made when deriving the RC and should be noted as limitations when applying the RC:

- NAPL impacts at the Site will be remediated to the extent practicable and therefore risks associated with exposure to NAPL, and volatile contaminants derived from NAPL were not considered in the derivation of the RC.
- Intrusive maintenance work at up to 1 m bgl may be undertaken in all land uses.
- An engineered break layer will be present at the ground surface to mitigate the potential for future Site users (with the exception of maintenance workers) to have direct contact with soils.
- A reticulated water supply will be available, based on the urban setting of the Site, and abstraction of groundwater for any purposes other than remediation or monitoring, or temporary extraction during construction, will not be required. Potential exposure to contaminants in groundwater during any construction, remediation, or monitoring will be managed by task specific safety documentation informed by the SEMP.
- A SEMP will be prepared and put in place to maintain/manage surface cover.
- With regard to basements:
    - Use of any future basements is assumed to be limited to car parking. If basements are constructed for other purposes, a risk assessment specific to the intended use should be conducted.

  - Where basements are associated with future residential or commercial buildings, it is assumed that these will be communal areas for multiple properties, for example, as part of a strata scheme that is managed by a body corporate. Private basements will therefore not be associated with individual residences.
  - Where there is access to a basement car park, it is assumed that any groundwater seepage collects in floor drains and a physical barrier is present, and therefore, groundwater will not be directly contacted by basement users, with the exception of maintenance workers. It is assumed that individual tenants will not be involved in the maintenance of any associated services, including drainage pumps or sumps.

- For potential future multi-storey car park users, the most sensitive receptor in this scenario would be considered to be a parking attendant present at the Site for a typical eight hour working day. It is considered that RC derived for potential future commercial/light industrial workers (working within a basement) would be protective of all other basement users. This includes multi-storey car park users and residential tenants who access basement car parks and are likely to have lower frequency and duration of exposure, therefore the multi-storey car park users scenario is not evaluated separately in this assessment.
- Adjacent off-Site land uses include open space, commercial/industrial, and residential areas. As these potential land uses have been considered on-Site, the derived RC are considered to also be protective of potential exposures to off-Site receptors (e.g. via groundwater migration beyond the Site boundary), as:
  - Extractive groundwater use is not known to occur within 2 km of the Site, based on review of registered groundwater bores undertaken in 2024 (AECOM, 2025), and the urban setting and reticulated water supply indicate that groundwater extraction and use is unlikely to occur
  - No basements are known to be present in the surrounding buildings, and are considered unlikely due to the additional costs which would be required for basement construction, based on shallow groundwater elevation, hydraulically downgradient of the Site.
- It is considered that potential exposure to workers undertaking remediation and/or development activities can effectively be mitigated through the implementation of an appropriate Construction Environmental Management Plan (CEMP). The CEMP should be prepared during the planning stage for any future remediation and/or development activities.
- A separate assessment of the potential risks to on-Site visitors was not undertaken as it was considered that the chronic exposure duration assessment of commercial/light industrial workers or residents is sufficiently protective of the shorter exposure duration visitor scenario.

Soil

Table 1 below provides the adopted Site specific RC (reported to two significant figures) for soil concentrations which are considered to be protective of human health for proposed future uses.

Unexpected Discovery Plan - Aboriginal Artifacts and Relics

Unanticipated Discovery Plan

Procedure for the management of unanticipated discoveries of Aboriginal relics in Tasmania

For the management of unanticipated discoveries of Aboriginal relics in accordance with the *Aboriginal Heritage Act 1975* and the *Coroners Act 1995*. The Unanticipated Discovery Plan is in two sections and is issued alongside advice from Aboriginal Heritage Tasmania (AHT) and should not be relied upon in isolation without accompanying advice.

If in doubt, please contact AHT for advice: call **1300 487 045** or email **aboriginal@heritage.tas.gov.au**

Discovery of Aboriginal Relics other than Skeletal Material

Step 1:

Any person who believes they have uncovered Aboriginal relics should notify all employees or contractors working in the immediate area that all earth disturbance works must cease immediately.

Step 2:

A temporary 'no-go' or buffer zone of at least 10m should be established around all visible Aboriginal relics to protect the suspected Aboriginal site, where practicable. No unauthorised entry or works should be allowed within this 'no-go' zone until the suspected Aboriginal relics have been assessed by a consulting archaeologist, Aboriginal Heritage Officer or AHT staff member.

Step 3:

Contact AHT on **1300 487 045** as soon as possible but no later than 48hrs from the discovery of the relic and inform them of the discovery. Documentation of the find should be emailed to **aboriginal@heritage.tas.gov.au** as soon as possible. AHT will then provide further advice in accordance with the *Aboriginal Heritage Act 1975*.

Discovery of Skeletal Material

Step 1:

Call the Police (or if practical, a coroner) immediately. Under no circumstances should the suspected skeletal material be touched or disturbed. It is advisable to immediately treat the area as a potential crime scene, and remove all personnel and equipment that may contaminate the area.

Step 2:

Any person who believes they have uncovered skeletal material should notify all employees or contractors working in the immediate area that all earth disturbance works cease immediately.

Step 3:

A temporary 'no-go' or buffer zone of at least 50m should be established to protect the suspected skeletal material, where practicable. No unauthorised entry or works will be allowed within this 'no-go' zone until the suspected skeletal remains have been dealt with under the *Coroners Act 1995* or the *Criminal Code Act 1924*.

Step 4:

Should the skeletal material be determined to be Aboriginal, the Coroner will contact the Aboriginal organisation approved by the Attorney-General, as per the *Coroners Act 1995* and Aboriginal Heritage Tasmania as per the *Aboriginal Heritage Act 1975*.

Guide to Aboriginal site types

Stone Artefact Scatters

A stone artefact is any stone or rock fractured or modified by Aboriginal people to produce cutting, scraping or grinding implements. Stone artefacts are indicative of past Aboriginal living spaces, trade and movement throughout Tasmania. Aboriginal people used hornfels, chalcedony, spongelite, quartzite, chert and silcrete depending on stone quality and availability. Stone artefacts are typically recorded as being 'isolated' (single stone artefact) or as an 'artefact scatter' (multiple stone artefacts).

Shell Middens

Middens are distinct concentrations of discarded shell that have accumulated as a result of past Aboriginal camping and food processing activities. These sites are usually found near waterways and coastal areas, and range in size from large mounds to small scatters. Tasmanian Aboriginal middens commonly contain fragments of mature edible shellfish such as abalone, oyster, mussel, warrener and limpet, however they can also contain stone tools, animal bone and charcoal.

Rockshelters

An occupied rockshelter is a cave or overhang that contains evidence of past Aboriginal use and occupation, such as stone tools, middens and hearths, and in some cases, rock markings. Rockshelters are usually found in geological formations that are naturally prone to weathering, such as limestone, dolerite and sandstone.

Quarries

An Aboriginal quarry is a place where stone or ochre has been extracted from a natural source by Aboriginal people. Quarries can be recognised by evidence of human manipulation such as battering of an outcrop, stone fracturing debris or ochre pits left behind from processing the raw material. Stone and ochre quarries can vary in terms of size, quality and the frequency of use.

Rock Marking

Rock marking is the term used in Tasmania to define markings on rocks which are the result of Aboriginal practices. Rock markings come in two forms; engraving and painting. Engravings are made by removing the surface of a rock through pecking, abrading or grinding, whilst paintings are made by adding pigment or ochre to the surface of a rock.

Burials

Aboriginal burial sites are highly sensitive and may be found in a variety of places, including sand dunes, shell middens and rock shelters. Despite few records of pre-contact practices, cremation appears to have been more common than burial. Family members carried bones or ashes of recently deceased relatives. The Aboriginal community has fought long campaigns for the return of the remains of ancestral Aboriginal people.

Limitations and Disclaimer:

This Asbestos Management Plan (AMP), including all findings, conclusions, and recommendations, has been prepared by Injury Prevention Services Pty Ltd solely for the use of Macquarie Point Development Corporation (MPDC) and in accordance with the scope of work agreed between the parties. The information, data, and documents referenced in this AMP were supplied by MPDC and other sources identified herein. Injury Prevention Services Pty Ltd has not physically inspected the site and has relied on information provided regarding the location and condition of asbestos-containing materials (ACM). No independent verification beyond the agreed scope has been undertaken. Injury Prevention Services Pty Ltd assumes no responsibility for any inaccuracies, errors, or omissions in the information supplied, and makes no representation that such information is complete or accurate beyond the agreed scope.

This AMP is subject to change if new information becomes available or if circumstances change after the date of preparation. Injury Prevention Services Pty Ltd disclaims liability for changes in conditions or actions taken on the basis of this AMP after the date of its preparation. This document should be considered valid only as at the date of issuance unless explicitly stated otherwise. This AMP must be read and interpreted in its entirety, including all referenced documents and appendices. No liability is accepted by Injury Prevention Services Pty Ltd for the use of this AMP, in whole or in part, for any other purpose, in any other context, or by any third party. Any use or reliance by third parties is at their own risk, and Injury Prevention Services Pty Ltd expressly disclaims liability in such circumstances. Where intrusive works are planned, a site inspection and verification sampling should be undertaken prior to disturbance.

All concepts, methodologies, and intellectual property contained in this document are the property of Injury Prevention Services Pty Ltd. Unauthorised use, reproduction, or dissemination of this document, in whole or in part, for any purpose without prior written consent from Injury Prevention Services Pty Ltd is strictly prohibited and constitutes an infringement of copyright.

EXECUTIVE OVERVIEW

This Asbestos Management Plan (AMP) sets out Macquarie Point Development Corporation's (herein 'MPDC') strategic approach to managing asbestos-containing materials (ACM) in the workplace.

The AMP includes a policy, procedures, and guidelines to assist MPDC staff, contractors, and stakeholders in safely managing ACM, minimising the potential for persons to be exposed to asbestos, and managing unexpected discoveries.

The AMP centres upon open communication regarding asbestos-related issues between MPDC, contractors, and stakeholders. MPDC aims to raise the level of asbestos awareness and improve management practices through education and sound policies and procedures.

At all times, MPDC will ensure that personal asbestos exposures are kept as low as possible and less than the asbestos National Exposure Standard. Where air monitoring or visual inspections identify degradation of ACM, removal, targeted repair, replacement, or relocation will occur. This work will be conducted on the basis of risk, within legislative requirements, and by competent personnel.

Note that this AMP must be read in conjunction with the site Asbestos Register.

1. INTRODUCTION AND SCOPE

Macquarie Point Development Corporation (MPDC) is committed to maintaining the health and safety of its workers, contractors, and visitors. Asbestos Containing Materials (ACM) are known to be present within buildings and in soil at the site, under the organisation's control (refer Figure 1). MPDC aims to eliminate exposure to asbestos by identifying and removing ACM where safe to do so, or by minimising exposure so far as is reasonably practicable where elimination is not possible.

This Asbestos Management Plan (AMP) has been developed in accordance with the *Tasmanian Work Health and Safety Regulations 2022* and the *Safe Work Australia Codes of Practice for managing and controlling asbestos in the workplace, and safely removing asbestos*. It establishes the framework and legal requirements for the management of ACM during construction and related activities within the site footprint.

Figure 1. Site Footprint and Areas Under MPDC Control

1.1. Scope of the Plan

The AMP applies to all workers, contractors, sub-contractors, and stakeholders who may come into contact with, or disturb, ACM during The Project. It covers the management and maintenance of ACM encountered during all relevant activities, including routine works, excavation within former landfill/Gasworks sites, maintenance, removal, and emergency responses to unexpected ACM finds.

The plan ensures:

- ACM is identified, recorded, and managed to minimise the risk of exposure to airborne fibres.
- Activities comply with the hierarchy of controls outlined in Tasmanian WHS Regulations.
- Only competent and licensed personnel undertake removal, monitoring, and risk assessment.

- Emergency response procedures address unexpected ACM finds or incidents.
- Compliance with all relevant legislative requirements and standards, including:
  - Safe Work Australia's Codes of Practice: *How to Manage and Control Asbestos in the Workplace* and *How to Safely Remove Asbestos* (current editions)
  - Environmental Management and Pollution Control Act 1994 (Controlled Waste Regulations)
  - Safe Work Australia National Exposure Standard for airborne asbestos fibres (0.1 fibres/mL)

The AMP covers the area outlined in Figure 1 and aims to protect all personnel and members of the public in proximity to the site and/or project works through proactive management and stringent risk controls.

2. POLICY STATEMENT

2.1. Policy Principles and Outcomes for Asbestos Management:

- To eliminate exposure to airborne respirable asbestos fibres.
- To facilitate the removal or repair of ACM that have been assessed as potentially exposing workers, contractors, or the public to a moderate or greater risk of airborne respirable asbestos fibres.
- To effectively manage the risks of asbestos exposure by conducting regular inspections of ACM.
- To conduct regular reviews of the AMP and develop asbestos management action and removal plans.

2.2. Policy Commitments:

MPDC will meet these principles by:

- Identifying ACM and creating a site asbestos register, ensuring all ACM and/or known or suspected locations of ACM are labelled as far as is reasonably practicable.
- Ensuring that the site asbestos registers is in place, kept up to date, and regularly reviewed in accordance with assessed risks by competent personnel.
- Making the site asbestos register available to contractors, workers, and stakeholders who may come into contact with ACM.
- Undertaking risk assessments on all identified ACM.
- Implementing the hierarchy of controls to effectively minimise risks.
- Ensuring that only suitably competent or licensed persons remove and handle ACM.
- Ensuring any work on ACM is carried out in accordance with the *Tasmanian Work Health and Safety Act 2012*, the *Tasmanian Health and Safety Regulations 2022* and the *Safe Work Australia Codes of Practice - How to Safely Remove Asbestos, and How to Manage and Control Asbestos in the Workplace (current editions)*.
- Providing information, instruction, and training to all workers who may be required to conduct tasks involving ACM.

3. ROLES AND RESPONSIBILITIES

To ensure the effective management and implementation of this AMP, roles and responsibilities are outlined in **Table 1**.

This procedure defines responsibilities for specific activities; however, the listed positions or roles may not apply to all projects or operations. In such cases, any variations must be clearly identified in the relevant management plans (e.g., Project, Safety, Environmental Plans).

Table 1. Summary of Responsibilities.

Role	**Responsibility**
Work Health and Safety Officer	Site-wide management of WHS
Senior Project Officer	Site Operations

4. IDENTIFICATION AND LABELLING OF ACM

All areas of a workplace containing ACM, including plant, equipment, or components, must be signposted with appropriate warning signs or labels. This ensures personnel are not unknowingly exposed to asbestos during operational activities. In addition, where soil contamination with asbestos is known or suspected, affected areas must be clearly delineated both on site plans and using aerial or satellite imagery. These locations should be ground-truthed and physically marked prior to the commencement of any excavation or ground disturbance works. This approach ensures that any personnel involved in site works are fully informed of potential asbestos risks and can implement appropriate controls to prevent exposure.

When removal work is being undertaken, the work area must be barricaded to prevent unauthorised personnel from entering the hazardous area.

The location, type, and positioning of signs and labels must be determined or authorised by a competent person. Asbestos warning signs must comply with the requirements of AS 1319-1994 REC:2018 for size, illumination, location, and maintenance. Examples of warning signs may include variations suitable for the site conditions.

MPDC will ensure that the current asbestos register provided as Attachment A is maintained and updated as per Section 12.

Where practicable, affected areas will display Asbestos Warning Signs prominently. Workers required to excavate in areas known or suspected of containing buried ACM will be fully briefed before commencing any work activities. Figure 2 provides an example of asbestos warning labels that may be encountered onsite.

Figure 2. Examples of asbestos warning labels and signs

5. ASBESTOS REGISTER

MPDC will maintain an Asbestos Register covering the footprint of their site. The Asbestos Register will enable MPDC to:

1. Facilitate regular ACM condition inspections as determined by a risk assessment, with a frequency of no greater than five years.
2. Effectively program work activities for excavation, ground improvement, and other operations where ACM may be present.
3. Prioritise and program the removal of damaged ACM or areas with significant risk potential.
4. Provide timely advice to affected persons, including workers, contractors, and other stakeholders, on the presence of ACM prior to ground disturbance or construction activities.

The Asbestos Register will be maintained by MPDC's site safety advisor (or equivalent) and made readily accessible at designated locations, such as site sign-in areas, for all personnel who may encounter or disturb ACM.

The Asbestos Register will contain the following information:

- The date the inspection/identification was made and details of the competent person(s) who carried out the inspection/identification.
- Type of asbestos-containing material (e.g., fragments in soil).
- The location of the ACM or presumed ACM.
- The type of asbestos, where identifiable.
- The ACM's condition and potential for disturbance.
- A risk assessment of the ACM, including potential exposure scenarios.
- Details of any air monitoring conducted, including results.
- Recommended actions for handling, removal, or mitigation of risks.
- Documentation of removal, maintenance, or other works on ACM, including details of contractors involved, scope of work, asbestos removal control plans, WorkSafe Tasmania notifications, and clearance and disposal certificates.

The register will be updated following any re-inspection, removal, or maintenance activities involving ACM. Further details regarding review frequency are outlined in Section 12.

6. ACM RISK MANAGEMENT AND CONTROLS

6.1. Risk Assessment Process

A risk assessment involves evaluating what could happen if someone is exposed to a hazard, such as asbestos, and the likelihood of that exposure occurring. For persons conducting a business or undertaking (PCBU), risk assessments assist in determining the severity of a risk, whether existing control measures are effective, what actions are necessary to control the risk, and how urgently those actions should be taken. Risk assessments can be conducted with varying levels of detail depending on the hazard, available information, data, and resources. They may be as straightforward as a discussion with workers or may involve the use of specific risk analysis tools and techniques, particularly for more complex situations. In some cases, expert or specialist advice may be needed.

Risk management is a proactive and systematic process that supports continuous improvement and enables effective response to change. It should be carefully planned, cover all reasonably foreseeable hazards and associated risks, and be revisited regularly to ensure ongoing effectiveness of control measures. A visual representation of the risk management process is provided in Figure 3.

Figure 3. Risk Management Process for Workplace Health and Safety (Source: Safe Work Australia Code of Practice: How to Manage Work Health and Safety Risks)

With respect to ACM identified onsite, risk assessments will be undertaken by an experienced, licensed Asbestos Assessor or Competent Person on all identified or suspected ACM. The assessments will consider:

- The type of ACM.
- The nature of the ACM (e.g., friable or non-friable).
- The ACM's condition.
- The disturbance potential during ground improvement works or excavation where ACM may be present with the soil, or through day-to-day activities withing buildings containing ACM.
- The potential for personal exposure.

Where appropriate, risk assessments will be validated by airborne fibre monitoring to ensure compliance with the Safe Work Australia action level of 0.01 fibres/mL (refer Section 6.2.1). This action level is set at one-tenth of the workplace exposure standard (0.1 fibres/mL) and is used to trigger immediate review and implementation of additional controls if exceeded. Adhering to this lower threshold ensures that workers, contractors, and stakeholders are not exposed to airborne asbestos fibres, so far as is reasonably practicable.

Monitoring and site inspection programs will identify ACM at an early stage, preventing its degradation to a condition that could pose occupational health risks. Early detection and management will allow MPDC to manage ACM before risks escalate.

6.2. Risk Controls

ACM will be managed in accordance with the hierarchy of control. This is a systematic approach to managing health and safety risks, such as those associated with asbestos, that prioritises the most effective risk control measures. The hierarchy requires that, wherever practicable, hazards are eliminated entirely. Where elimination is not feasible, the next most effective controls are applied in descending order of reliability: substitution, isolation, engineering controls, administrative controls, and, as a last resort, personal protective equipment (PPE). This framework ensures that all reasonably practicable steps are taken to minimise the risk of exposure to airborne asbestos fibres.

The hierarchy of control, as illustrated in Figure 4 (adapted from the *Safe Work Australia Code of Practice: How to Manage Work Health and Safety Risks*), provides a visual summary of this approach.

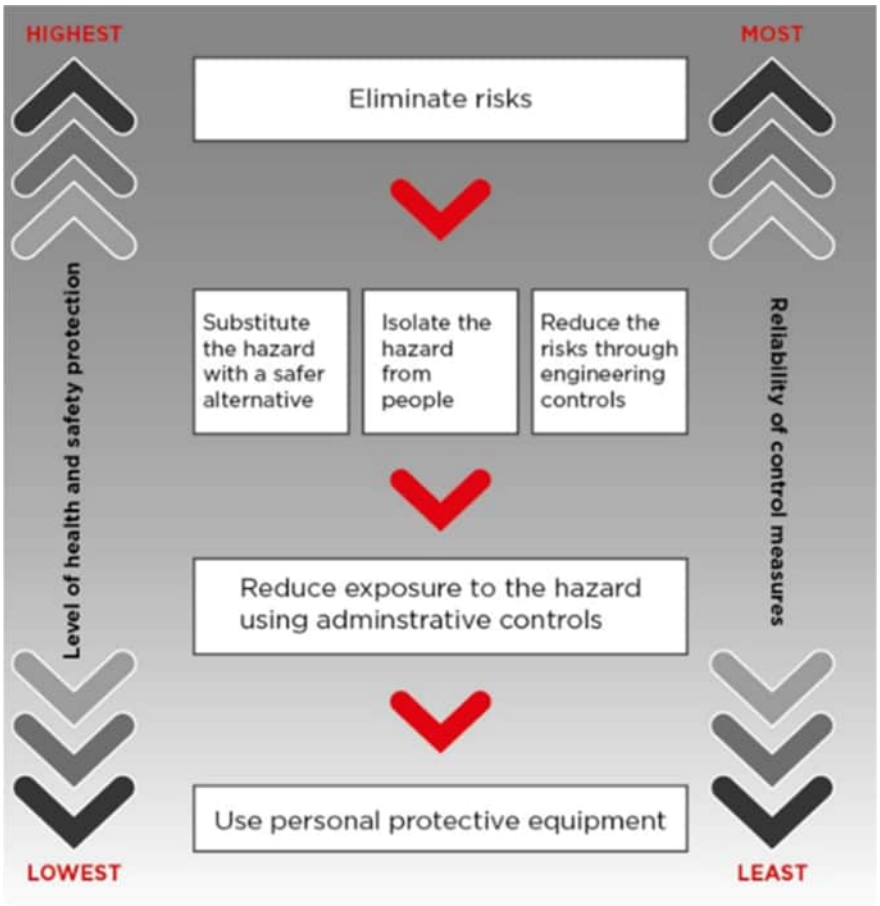

Figure 4. Hierarchy of Control for Asbestos Risk Management
(Source: Safe Work Australia Code of Practice: Code of Practice: How to Manage Work Health and Safety Risks)

Examples of how to use the hierarchy of control to manage ACM are provided as follows:

1. **Elimination**
    - *Example:* All identified ACM in a building scheduled for renovation are removed by a licensed contractor before any demolition or refurbishment work begins.
    - *Outcome:* This completely removes the risk of asbestos exposure for workers and occupants in that area.
2. **Substitution**
    - *Example:* When repairing building cladding, asbestos-cement sheets are replaced with new, asbestos-free fibre cement products certified to Australian safety standards.
    - *Outcome:* Prevents reintroduction of asbestos into the workplace or future maintenance risks.

3. **Isolation**

    - *Example:* Areas known to contain ACM are physically isolated using barriers, locked doors, or sealed enclosures. Clear warning signage is installed to restrict access to authorised personnel only.
    - *Outcome:* Reduces the likelihood of accidental disturbance or exposure by limiting access.

4. **Engineering Controls**

    - *Example:* During asbestos removal, negative pressure enclosures, local exhaust ventilation with H-Class HEPA filtration, or water misting techniques are used to suppress and capture airborne fibres.
    - *Outcome:* Minimises the spread of airborne asbestos during works that disturb ACM.

5. **Administrative Controls**

    - *Example:* Site-specific Safe Work Method Statements (SWMS) and work permits are developed and enforced for all ACM-related activities. Workers receive training in asbestos awareness, and regular toolbox meetings reinforce safe work procedures.
    - *Outcome:* Reduces risk through safe systems of work, clear procedures, and ongoing communication.

6. **Personal Protective Equipment (PPE)**

    - *Example:* Workers performing asbestos removal or disturbance wear P2 disposable respirators, full-body coveralls, gloves, and eye protection. All PPE is disposed of as contaminated waste after use.
    - *Outcome:* Provides a final barrier of protection when other controls alone cannot eliminate the risk.

6.2.1. Airborne Respirable Fibre Monitoring

Airborne Respirable Fibre Monitoring is a recognised process for quantifying the concentration of respirable fibres (including asbestos) within the air. The following types of monitoring may be undertaken depending on the nature of the works and associated risk:

- Background monitoring is conducted before asbestos work begins to establish baseline airborne fibre levels and detect any pre-existing contamination. It may also be used to inform a risk assessment where ACM is present but is not being disturbed.
- Control (or exposure) monitoring is undertaken during asbestos work to verify that control measures (such as enclosures, negative pressure units or wet methods) are effectively minimising airborne fibre release.
- Clearance monitoring is performed after asbestos removal to ensure airborne fibre concentrations are below the relevant limit and that the area is safe for reoccupation.

Air monitoring will be conducted by an independent, competent person in accordance with the *Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Fibres [NOHSC:*

3003(2005)]. This method is the recognised standard for quantifying airborne asbestos fibre concentrations during asbestos-related works and can also be used as a technique to determine risk, as part of a larger risk assessment process.

All monitoring results, including clearance certificates, will be documented and retained within the site's asbestos register to ensure compliance, facilitate ongoing risk management, and provide evidence of safe reoccupation where required.

Air monitoring is required when:

- Friable (Class A) asbestos removal is carried out (mandatory by law).
- Exposure risk is uncertain and the PCBU cannot demonstrate airborne fibres are below the limit.
- An HSR requests it due to a reasonable concern about exposure.
- The site AMP or risk control plan requires it for specific work or conditions.

6.2.2. Maintenance and Service Work

Tasks involving ACM disturbance will be conducted only after an appropriate risk assessment and the implementation of necessary controls. The following details will be recorded in the asbestos register:

- The name of the competent person(s) performing the work.
- The date and scope of the work undertaken.
- Safe work methods or job safety analyses applied.
- Clearance and disposal certificates.

During maintenance or construction activities, ACM risks will be assessed, and control strategies implemented to ensure compliance with legislative requirements.

6.3. Management of Identified Asbestos Containing Materials

This section outlines the risk controls and management measures to be applied to each ACM identified in the site's Asbestos Register (refer Appendix A). These controls are based on assessed condition, likelihood of disturbance, and relevant regulatory requirements.

The risk evaluation uses the Appendix E ACM Risk Assessment Tool from the National Guide for Asbestos Surveys (2025) published by the Asbestos and Silica Safety and Eradication Agency (ASSEA). The Guide provides a nationally recommended, standardised methodology for conducting asbestos surveys and assessing the risk of in-situ ACM based on material type, condition, disturbance potential and building use.

The risk assessment matrix, including risk factors, weighting, and scoring criteria etc., is provided in Table 1. The final risk score is the sum of the four risk factors, with a minimum possible score of 21.33 and a maximum of 100. Risk categories and recommended control actions are provided in Table 2. Table 3 summarises the identified ACM (reproduced from the Asbestos Register) together with the required management controls derived from the assessed risk category.

Table 1: Risk Assessment Matrix

Risk Factor	Weighting	Scoring Range/Criteria	Examples/Notes
Product Risk Level	Up to 35%	Level 1 = 3.5% (lowest) to Level 10 = 35% (highest)	Resins/plastics (Level 1, low risk); adhesives/vinyl; bitumen; cement products; cement debris; cloth/rope; insulation board; lagging; sprayed coatings; loose-fill Insulation (Level 10, high risk).
ACM Condition	Up to 15%	Stable = 3.75% to Poor = 15%	Condition considers bonding, sealing, visible damage, debris, and weathering.
Disturbance Potential	Up to 25%	Level 1 = 6.25% (low) to Level 4 = 25% (high)	Based on accessibility, likelihood of deterioration, and maintenance activities.
Building Rating	Up to 25%	Five sub-factors: a) Public access (Yes/No), b) Frequency of use, c) Daily duration, d) Level of activity, e) Mobile plant.	Each sub-factor scored to 20% then averaged to yield the building rating: Building rating = (a + b + c + d + e) ÷ 4.

Table 2: Risk Score Actions

Risk Score	Recommended Control Actions
High: ≥ 69	Restrict access and arrange removal as soon as reasonably practicable; the higher the score, the higher the priority.
Medium: > 50 and < 69	Encapsulate damaged areas; monitor; schedule removal or review; remove if impacted by refurbishment or demolition.
Low: ≤ 50	Manage in place; avoid damage; schedule review; remove if impacted by refurbishment or demolition.

Table 3: Identified ACM and Required Management Controls

ACM Description	Location	Product Type	Condition	Disturbance Potential	Risk Score	Risk Category	Management Controls
Electrical Backing Board	Main switchboard in Shed A office area	Bituminous Panel	Stable	Moderate	37.4	Low	Manage in situ; avoid mechanical disturbance; keep labelled; routinely review condition.
Arc Shields and Wiring	Main switchboard in Shed A office area	Millboard / Woven Rope	Unknown	Low	51.8	Medium	Manage in situ; avoid mechanical disturbance; keep labelled; assess if access becomes available; remove if identified.
Telstra Pit	Adjacent Shed E; Evans Street side	Moulded Cement	Unknown	Low	41.3	Low	Manage in situ; do not disturb decking or subsurface without prior assessment; reassess if decking is removed or ground works are planned.
Soil and Fill	Historical Roundhouse Hardstand / Buried ACM in north-east portion of the site	Unknown*	Unknown	Low	60.3	Medium	Manage in situ; avoid disturbance; maintain hardstand capping; restrict excavation unless approved by a competent person; engage licensed removalist if soil is to be disturbed.

* Asbestos containing cement sheet has been historically identified within soil underlying the site.

7. UNEXPECTED FINDS PROCEDURE

The discovery of unexpected ACM during excavation, construction, or maintenance activities will be managed in accordance with this procedure. This includes materials not identified in the Asbestos Register (Appendix A) or presumed ACM encountered in soil or other areas.

1. Initial Assessment and Immediate Controls

Identify the material and immediately stop work in the affected area. Prevent access to the area until a preliminary assessment is completed.

2. Determine Competency for Identification

If a competent person (per WHS Regulations and Codes of Practice) is not available within the workplace, arrange for the material to be assessed and sampled by a licensed asbestos assessor, licensed asbestos removalist, or suitably qualified occupational hygienist.

3. Sampling Requirements

If material cannot be reliably identified as non-asbestos:

- A competent person must collect representative samples in accordance with the *Safe Work Australia Code of Practice: How to Safely Remove Asbestos*.
- Samples must be submitted to a NATA-accredited laboratory for analysis.
- Sampling should be avoided if disturbing the material would create a higher risk than managing it as asbestos in situ; in these cases apply conservative controls until competent advice is obtained.

4. Risk Assessment

Once material is identified (or presumed) to contain asbestos, undertake a formal risk assessment considering:

- Friability (friable versus non-friable)
- Condition of the material (damaged, weathered, water-affected, intact)
- Likelihood of disturbance
- Occupancy and exposure potential in the area
- Requirements under WHS Regulations and relevant Codes
- Document the risk level and required controls.

5. Decision Point: When Air Monitoring Is Required

Air monitoring should be conducted when:

- There is any potential for airborne fibre release, based on the risk assessment.
- The material is friable or significantly damaged.
- Unplanned disturbance has occurred (e.g., drilling, breakage, impact).
- The area remains occupied or partially occupied during assessment or clean-up.
- Visual inspection alone cannot confirm that airborne fibre risk is negligible.

Air monitoring is not required when:

- Material is confirmed non-asbestos by a NATA lab.
- Material is intact, non-friable, undisturbed, and isolated effectively, and the risk assessment documents negligible airborne fibre potential.

6. Control Measures

Based on the risk assessment, implement appropriate controls such as:

- Isolation of the area (barriers, signage, access restriction)
- Encapsulation or sealing of the material (if suitable for non-friable ACM)
- Wet wiping or HEPA vacuuming of settled dust
- Clean-up by licensed asbestos removalist where required
- Removal of the ACM if it presents an ongoing risk and cannot be safely managed in situ

7. Reassessment and Clearance

After controls or clean-up activities, perform a final risk review. If air monitoring was undertaken, ensure results are below the limit of detection (0.01 f/mL) prior to reoccupation. Obtain clearance documentation where required.

8. ACM REMOVAL AND DISPOSAL

8.1. Asbestos Removal Work

An Asbestos Removal Control Plan will be developed for all work involving the removal of ACM. Competent personnel may undertake exempt ACM work following the approval of an Asbestos Removal Control Plan by a competent person (e.g., WHS Advisor or Occupational Hygienist).

All ACM removal work shall be carried out in accordance with the requirements of the *Work Health & Safety Regulations* and the *Code of Practice: How to Safely Remove Asbestos*. A licensed asbestos removalist will be engaged to undertake any non-exempt ACM work. Non-exempt ACM removal shall not commence unless written acknowledgment of the Asbestos Removal Start Work Notification and ACM Control and Removal Plan has been received by WorkSafe Tasmania.

An independent licensed Asbestos Assessor shall conduct a Visual Clearance Inspection of the Asbestos Work Area following the ACM removal but prior to the removal of access restrictions. A Visual Clearance Certificate must be issued by a competent person prior to the re-occupation of the area for normal use.

For all ACM removal projects, appropriate project documentation must be retained and recorded in the Master Asbestos Register (Appendix A).

8.2. Air Clearance Monitoring

Airborne respirable fibre monitoring (also see Section 6.2.1) will be conducted where the Asbestos Removal Control Plan requires air clearance monitoring to be conducted. All air monitoring shall be conducted by an independent competent person in accordance with the *Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Fibres* [NOHSC: 3003 (2005)].

Where air clearance monitoring is required, the independent competent person must issue an Air Clearance Certificate, which shall be retained and recorded in the appropriate Asbestos Register. Air Clearance Certificates must be issued prior to the removal of enclosures, access restrictions, and signage, and re-occupation.

8.3. Clean-Up and Disposal

Where ACM must be removed from the site, MPDC workers and contractors will ensure that clean-up is properly completed and that there is no asbestos contamination left.

ACM must be disposed of in a manner that satisfies the requirements detailed in the *Environmental Management and Pollution Control Act 1994 (Controlled Waste Regulations)* including:

- Risk prioritisation for ACM handling.
- Scheduled dates for risk reassessment and updates to the asbestos register.
- Identify triggers for emergency or interim reviews, such as ACM disturbance or removal.

9. INDUCTION PROGRAM

MPDC's worker and contractor induction program will include:

- Information on this AMP and ACM locations listed in the Asbestos Register (Appendix A).
- Procedures for accessing this AMP and how to update the site asbestos register, including the information and testing that needs to be collected and documented.
- Key responsibilities and actions to take when suspect ACM is discovered.
- Documentation and record-keeping of induction completion.

10. TRAINING PROGRAM

Where MPDC workers are required to either assist or be involved in asbestos removal work or working in areas where there is a risk of exposure to airborne asbestos or hazardous fibres, they must receive appropriate training for the work which they are to undertake. The degree of training must be appropriate to the nature and scale of work being undertaken and as a minimum include the following:

- The nature of the hazards and risks
- All requirements of the SWMS
- Safe work practices and proper use of equipment
- Selection and use of all PPE and RPE
- Decontamination procedures
- Waste disposal procedures
- Emergency procedures
- Exposure and health risks from hazardous fibres

NOTE: All certification and training records for licensed removal work must be retained within the vicinity of the immediate work area and must remain accessible for inspection as per the *Tasmanian WHS Act 2012*.

11. COMMUNICATION STRATEGY

MPDC is committed to open communication regarding the management of ACM.

This includes:

- Sharing outcomes of AMP reviews and monitoring with project stakeholders.
- Informing workers and contractors of ACM removal projects and relevant safety controls.
- Ensuring registers and plans are readily accessible to workers and contractors.

The Project or Operations Manager will ensure all workers and contractors at the site, facility, or operation are aware of the Asbestos Management Plan and can access it. Asbestos-related hazards and locations of ACM must be communicated during site inductions, where applicable.

If asbestos removal work is planned, the appropriately licensed asbestos removalist, is responsible for notifying the regulator, management, workers, and any other potentially affected persons (e.g., neighbouring property owners or occupants) of the work details and start date before commencing.

12. MONITORING AND REVIEW

12.1. Review the Asbestos Management Plan and Asbestos Register

The AMP and Asbestos Register must be reviewed at least once every five (5) years, in accordance with the WHS Regulations and the Safe Work Australia *How to Manage and Control Asbestos in the Workplace* Code of Practice.

It is recommended that the 5-yearly review be undertaken by a licensed asbestos assessor. A review must also be completed when:

- Asbestos or ACM is removed, disturbed, sealed or enclosed on-site.
- Additional asbestos or ACM is identified on-site.
- Refurbishment or demolition work is planned.
- Asbestos control measures are reviewed.
- The AMP or Register is no longer adequate for managing asbestos or ACM.
- A health and safety representative, PCBU or worker reasonably requests a review.

To ensure conditions have not changed between the five yearly reviews, industry best practice is to complete an internal visual inspection of all identified asbestos/ACM every 12 months to verify their condition and the effectiveness of existing controls.

Persons conducting the internal annual inspection must:

- Have read and understood the AMP and associated Asbestos Register.
- Have received asbestos awareness training (internal or external).
- Be able to demonstrate competence in the inspection process (for example, through experience, supervision or additional training).

Any changes in asbestos/ACM condition identified during these inspections must be recorded in the Asbestos Register, reflected in the AMP and referred to a competent person (such as a licensed asbestos assessor) to determine whether remediation or additional controls are required.

12.2. Air Monitoring (also refer Section 6.2.1.)

Where personnel are required to undertake Class A asbestos removal work, an air monitoring program is mandatory and must be implemented.

Where personnel are required to undertake Class B removal work, the air monitoring program must be established and conducted by a licensed asbestos assessor.

Results of all air monitoring shall be made available to personnel undertaking removal work with all copies of air monitoring results to be kept for a minimum of 30 years.

NOTE: Air monitoring requirements must be detailed on the job specific SWMS or applicable risk assessment.

13. HEALTH SURVEILLANCE

A PCBU must ensure health monitoring is provided to a worker if they are at risk of exposure to asbestos when carrying out:

- Licensed asbestos removal work.
- Other ongoing (unlicensed) asbestos removal work.
- Asbestos-related work.

Examples of ongoing (unlicensed) asbestos removal work or asbestos-related work can include undertaking maintenance work on ACM regularly as part of another job (for instance electricians or building maintenance staff in older buildings).

Where an employee has been (or suspected to having been) exposed to airborne asbestos the employee should notify the Site Work Health and Safety Officer as per MPDC incident reporting requirements.

For comprehensive information on health monitoring requirements, refer to Safe Work Australia's *Health Monitoring for Exposure to Hazardous Chemicals: Guide for Persons Conducting a Business or Undertaking*.

14. EMERGENCY PROCEDURES

In emergency situations involving ACM:

- Notify the MPDC Work Health and Safety Officer.
- Notify the regulator (WorkSafe Tasmania) immediately - by telephone - and in writing within 24 hours.
- Evacuate and secure the area to prevent access.
- Engage an Occupational Hygienist for remediation advice.
- Suppress airborne fibres using appropriate measures (e.g., water mist or PVA sealant).
- Conduct an ACM Risk Assessment and implement controls as necessary.
- Engage a licensed asbestos removalist for non-exempt ACM removal.
- Document all actions and update the asbestos register accordingly.

16. GLOSSARY

ACM (Asbestos-Containing Materials) - Any material or product that contains asbestos as defined in relevant workplace regulations.

AMP (Asbestos Management Plan) - A documented plan detailing procedures and responsibilities for managing asbestos-containing materials.

Air Monitoring - The process of measuring airborne asbestos fibres to assess occupational exposure levels and ensure compliance with safety standards.

AS 1319-1994 - The Australian Standard for safety signs used in workplaces to warn or inform personnel of potential hazards.

Asbestos Register - A document that records the presence, type, condition, and location of ACM in a workplace.

Clearance Certificate - A document issued by a competent person certifying that an area is safe to reoccupy following asbestos removal work.

Competent Person - An individual with the required training, qualification, and experience to perform a specific task safely and effectively.

Hierarchy of Controls - A system for managing risks by prioritising elimination, substitution, isolation, engineering controls, administrative actions, and personal protective equipment.

HSE Professional - Health, Safety, and Environmental professional responsible for implementing and overseeing workplace safety programs.

Licensed Asbestos Assessor - An individual licensed to assess asbestos-related risks and supervise removal or remediation activities.

Membrane Filter Method - A technique for estimating airborne asbestos fibres, referenced as NOHSC: 3003 (2005).

National Exposure Standard - The maximum allowable concentration of airborne asbestos fibres, set at 0.01 fibres/mL by Safe Work Australia.

PPE (Personal Protective Equipment) - Equipment such as respirators, gloves, and coveralls used to protect workers from exposure to hazardous materials.

RPE (Respiratory Protective Equipment) - Specific equipment designed to protect the wearer from inhaling hazardous airborne particles, including asbestos fibres.

Safe Work Method Statement (SWMS) - A document outlining high-risk construction work, associated hazards, and control measures.

Visual Clearance Inspection - A thorough visual assessment conducted after ACM removal to ensure no residual asbestos contamination remains.

SECTION 1

1 INTRODUCTION

Elgin Associates Pty Ltd (Elgin) was engaged by Macquarie Point Development Corporation (MPDC) to update the structure of the MPDC Asbestos Register for the property identified as Macquarie Point, Hobart ("the Site"). **Please note: This is not an 'Asbestos Management Plan'.**

This document details records of asbestos containing material (ACM) previously identified at the site and should be read in conjunction with the previous register and Asbestos Management Plan prepared for the Site. Elgin did not visually observe or confirm the existing ACM for this register update and relied entirely on information provided by the MPDC.

In accordance with the Tasmanian Work Health and Safety Regulations 2022, this Asbestos Register must be kept up to date. Industry best practice is to conduct annual re-inspections to ensure that the risk is regularly re-assessed and known to all stakeholders.

1.1 Purpose of an Asbestos Register

An Asbestos Register details the type, condition and location of accessible asbestos materials to assist with the adoption of appropriate & regulatory asbestos management practices & procedures. An Asbestos Register is created following a non-destructive audit that identifies visually evident ACM, or sampling results from laboratory testing of material suspected of containing ACM.

The purpose of an Asbestos Register is to ensure that persons conducting a business or undertaking, works (contractors, clients and other stakeholders) are aware of the location, type, condition, and risk, in order to avoid inadvertent disturbance of the ACM.

It is a requirement of Work Health and Safety regulations that regular inspections of known asbestos are conducted by a competent person with appropriate licences and training, firstly to identify the type, condition and location of asbestos and secondly to assess any changes in the state of the asbestos.

All personnel undertaking works on the site that may result in the disturbance of any building materials on the site should read the **Macquarie Point Asbestos Management Plan** and sign the Asbestos Register Control Form provided in **Appendix A.** If suspected ACM material is observed during site works, then the Suspected Asbestos Reporting Form provided in **Appendix B** should be completed, or the registry updated directly by the relevant MPDC officer**.**

SECTION 2

2 ASBESTOS REGISTER

2.1 Locations of Identified Asbestos Containing Material

The locations and extent of currently existing ACM materials on the site are detailed in the following tables with locations shown in **Figure 1**.

Table 1: **ACM ID 001**

Description	Electrical backing board
Location	Main switchboard in Shed A office area
Type	Unknown
Friable or non-friable	Non-friable but with potential for friable inside the enclosed portion.
Size	<2 m^2
Condition	Good
Signage	Yes (sticker)
Recommendation/Action	Monitor and maintain/avoid disturbance
Comment	-
Photographs	

SECTION 2

Table 2: ACM ID 006

Description	Telstra Pit
Location	Adjacent Shed E; Evans Street side
Type	Moulded Cement
Friable or non-friable	Likely non-friable
Size	<1 m^2
Condition	Unknown
Signage	No - None required
Recommendation/Action	Monitor and maintain, remove if access available
Comment	Likely covered by decking – potentially removed.
Photographs	
	

Table 3: ACM ID 020

Description	ACM sheet debris
Location	Site soils within historical roundhouse hardstand
Type	Unknown
Friable or non-friable	Unknown
Size	Unknown
Condition	Sealed
Signage	N/A
Recommendation/Action	Monitor – Do not disturb
Comment	Any excavation or disturbance of soils at MPDC have the potential for uncovering ACM. Consult the MPDC
Photographs	

Table 4: ACM ID 014/015/016

Description	ACM sheet debris
Location	Site soils in the north-east portion of the site
Type	Chrysotile
Friable or non-friable	Non-friable
Size	Unknown
Condition	Covered
Signage	N/A
Recommendation/Action	Monitor – Do not disturb
Comment	Any excavation or disturbance of soils at MPDC have the potential for uncovering ACM. Consult the MPDC.
Photographs	
	

2.2 Historical Register

Details of ACMs and related materials that have been historically removed from the site are documented in **Appendix C**, including relevant removal dates, locations, and associated works. The information is included to support ongoing asbestos management and to ensure that accurate historical data is maintained for reference in future inspections and assessments.

SECTION 3

3 CONCLUSIONS

Asbestos Containing Materials have historically been identified at the site as identified in **Section 2**. Existing ACM management measures for the MPDC Site have been updated in November 2025 by IPM Consultants, as detailed in the **Asbestos Management Plan** that includes this **Asbestos Registry**.

It is important to note that if asbestos products are disturbed, asbestos fibres may be released, thereby resulting in a health risk. Care must be exercised in the immediate and ongoing management of any products found to contain asbestos. Any persons planning to carry out works on the MPDC site are made aware of the **Asbestos Management Plan** and **Asbestos Register** before commencing any work.

4 LIMITATIONS

The work herein involved updating the MPDC Asbestos Register which details known asbestos detections reported for the Site. Elgin did not verify the authenticity or risk of any current or historical detections.
Elgin prepared the registry for the sole use of Macquarie Point Development Corporation in accordance with the usual care and thoroughness of the consulting profession. No other warranty, expressed or implied, is made as to the professional advice included in this report.

The methodology adopted and sources of information used by Elgin Associates are outlined in this report. Elgin Associates has made no independent verification of this information beyond the agreed scope of works and Elgin Associates assumes no responsibility for any inaccuracies or omissions. No indications were found during our investigations that information contained in this report as provided to Elgin Associates was false.

DRAFT

Appendix K

Change Register

Appendix K Change Register

Any change or modification to the SEMP, or activities or designs which do not conform to the SEMP, but include suitable management of any environmental risks which has been reviewed and accepted by a suitably qualified and experienced Contaminated Land Auditor, should be recorded on **Table K1** below, and evidence of review and Contaminated Land Auditor acceptance should be added to this Appendix.

The change register should be reviewed as part of the regular SEMP review and update process (**Section 5.4**) and incorporated as appropriate into any updates of the SEMP.

Table K1 Change Register

#	Change	Person who conducted update or change		Record of Contaminated Land Auditor Review and Acceptance	
		Who	Date	Who	Date
1	Issue of SEMP Revision 5 with initial change register attached. Changes from Revision 4 made to: • Incorporate outcomes of *Review of Site Suitability Statements* (AECOM, 2026a). • Inclusion of Change Register • Changes to body text for design variances (**Section 1.2**).	Robert Crowe Associate Director – Environment, AECOM Australia Pty Ltd	16 February 2026	David Lam TetraTech Coffey Pty Ltd	16 February 2026
