Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample Receipt Advice

Company name:	Aecom Austraila Pty Ltd Tasmania
Contact name:	Robert Crowe
Project name:	Macquarie Point
Project ID:	60693007 / 12
Turnaround time:	5 Day
Date/Time received	Jul 4, 2025 2:12 PM
Eurofins reference	1240646

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 5.4 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
NB	Necessary sampling information not provided, the Laboratory will not be responsible for compromised results should testing be performed outside recommended holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✓	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: Savini.Suduwelikondage@eurofinsanz.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Austraila Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	No
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
G01	The LORs have been raised due to matrix interference
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Hi Harry,

Thanks for providing all the soil and groundwater results provided to date from our Mac Point project in Hobart, Tasmania (Aecom job number 60693007). Could you please undertake the following actions as soon as you can, as indicated in the table below?

Batch	Medium	Sample Date	Requested Action
1234320	Water	17 June 2025	• Please analyse sample QC315 for PFAS Full Suite – 30 compounds, trace level
1236601	Water	23 June 2025	We note that additional samples QC107 And QC207 were received but not originally marked on the COC. These should both have a total of 13 bottles each as per the COC for samples marked for 'General Suite + Eco Suite' and 'PFAS' analysis, including 2 x VOC vials and 1 x 200mL amber labelled as 'filtered'. Please analyse additional sample QC107 for: • General Water Suite • Eco Risk Suite – conduct this on the 2 x VOC vials and 1 x 200mL amber labelled 'filtered' only • PFAS Full Suite – 30 compounds, trace level Please forward additional sample QC207 to ALS Springvale and request the same analysis as stated above for QC107
1234941	Soil	18-19 June 2025	• Results not yet received • Please update the sampled date of samples QC317 and QC417 to 18 June 2025. These were incorrectly dated 19 June 2025 on the original COC. • QC319 was requested for the 'General Suite + Gasworks Suite' analysis on the COC, and QC419 was requested for 'hold', however it is noted that these requests were around the opposite way on the Eurofins sample receipt summary, and we have therefore received results for QC419 instead of QC319 as originally requested. Can you please confirm if there was a typo on your end, and if the results received for QC419 are actually the results for QC319 as originally requested on the COC? If not, can you please urgently analyse QC319 as originally requested?
1231576	PASS	11 June 2025	• Results not yet received – can you please follow up

Note that the components of each analytical suite referred to in the table above is detailed in the original COC provided in each respective batch.

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
N/A	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✓	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Samples received by the laboratory after 5.30pm are deemed to have been received the following working day.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: Savini.Suduwelikondage@eurofinsanz.com

Results will be delivered electronically via email to Richard Bowers - richard.bowers@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Austraila Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Per- and Polyfluoroalkyl Substances (PFASs) - Trace			
PFASs Summations	Melbourne	Jul 10, 2025	
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS) - low level			
Perfluoroalkyl sulfonamido substances- Trace	Melbourne	Jul 10, 2025	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS) - low level

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank							
Perfluoroalkyl sulfonamido substances- Trace

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	N/A
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
A03	Exceeds instrument calibration range
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Melbourne, NATA accreditation no. 825, site no. 13778.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Sample ID	Sample Container Received	Preferred Sample Container for Analysis
Free CN by Segmented Flow Analyser : EK025SF		
QC208	- Clear Plastic Bottle - Natural	- Black Opaque Plastic Bottle - NaOH
QC209	- Clear Plastic Bottle - Natural	- Black Opaque Plastic Bottle - NaOH
Total Cyanide by Segmented Flow Analyser : EK026SF		
QC208	- Clear Plastic Bottle - Natural	- Black Opaque Plastic Bottle - NaOH
QC209	- Clear Plastic Bottle - Natural	- Black Opaque Plastic Bottle - NaOH
Weak Acid Dissociable Cyanide by Segmented Flow Analyser : EK028SF		
QC208	- Clear Plastic Bottle - Natural	- Black Opaque Plastic Bottle - NaOH
QC209	- Clear Plastic Bottle - Natural	- Black Opaque Plastic Bottle - NaOH

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

No. of samples analysed	: 2		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EP231X: Sample EM2511596_01 Poor matrix spike recovery due to matrix effects.
- EK028SF : EM2511596 #2 Poor matrix spike recovery for weak acid dissociable cyanide due to sample matrix. Confirmed by re-preparation and re-analysis.
- EP071,EPO75(SIM): ALS requires 100ml of sample to analyse water samples for standard, semi-volatile, organic parameters. Where larger volume bottles have been submitted 100ml of sample has been subsampled. Solvent rinsing of the sample bottle, which is part of ALS's normal procedure, cannot be conducted prior to extraction in these instances.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Analytical Results

Inter-Laboratory Testing

Analysis conducted by ALS Sydney, NATA accreditation no. 825, site no. 10911 (Chemistry / Biology).

(WATER) EP033: C1 - C4 Hydrocarbon Gases

QUALITY CONTROL REPORT

Work Order	: **EM2511596**	Page	: 1 of 13
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60321835_MacPoint	Date Samples Received	: 30-Jun-2025
Order number	: 60693007/12	Date Analysis Commenced	: 01-Jul-2025
C-O-C number	: ----	Issue Date	: 08-Jul-2025
Sampler	: RB		
Site	: ----		
Quote number	: EN/004/23		
No. of samples received	: 2		
No. of samples analysed	: 2		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Andrew Lu	VOC Section Supervisor	Melbourne Organics, Springvale, VIC
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

				Matrix Spike (MS) Report

Sampler	: RB	No. of samples received	: 2
Order number	: 60693007/12	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Free CN by Segmented Flow Analyser	EK025SF	WATER	In house: Referenced to ASTM D7237, APHA 4500-CN-C&O and ISO 14403: Using an automated segmented flow analyser, a sample at high pH (sodium hydroxide preserved) is buffered to pH 6.0. The hydrogen cyanide present passes across a gas dialysis membrane into an acceptor stream consisting of 0.01 M sodium hydroxide. The acceptor stream mixes with a buffer at pH 5.2 and reacts with chloramine-T to form cyanogen chloride. Cyanogen chloride reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour, measured at 600nm. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Total Cyanide by Segmented Flow Analyser	EK026SF	WATER	In house: Referenced to APHA 4500-CN C&O / ASTM D7511 / ISO 14403. Sodium hydroxide preserved samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Weak Acid Dissociable Cyanide by Segmented Flow Analyser	EK028SF	WATER	In house: Referenced to APHA 4500-CN C&O / ISO 14403. Samples preserved with sodium hydroxide are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN- The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4-pyridine carboxylic and 1,3-dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030E. This method is compliant with NEPM Schedule B(3)
C1 - C4 Gases	EP033	WATER	Technical Guidance for the Natural Attenuation Indicators: Methane, Ethane, and Ethene, US EPA - Region 1, EPA New England, July 2001. Automated static headspace, dual column GC/FID. A 12 mL sample is pipetted into a 20 mL headspace vial containing 3g of sodium chloride and sealed. Each sample is equilibrated with shaking at 40 degrees C for 10 minutes prior to analysis by GC/FID using a pair of PLOT columns of different polarity.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS	EP231X-LL	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

SAMPLE RECEIPT NOTIFICATION (SRN)

Work Order	: **EM2512123**		
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
E-mail	: robert.crowe@aecom.com	E-mail	: peter.ravlic@alsglobal.com
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Facsimile	: 03 9654 7117	Facsimile	: +61-3-8549 9626
Project	: 60321835_MacPoint	Page	: 1 of 3
Order number	:	Quote number	: EP2023AECOMAU0010 (EN/004/23)
C-O-C number	: ----	QC Level	: NEPM 2013 B3 & ALS QC Standard
Site	: ----		
Sampler	: RB		

Dates

Date Samples Received	: 07-Jul-2025 11:40	Issue Date	: 07-Jul-2025
Client Requested Due Date	: 16-Jul-2025	Scheduled Reporting Date	: **16-Jul-2025**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Not Available
No. of coolers/boxes	: 2	Temperature	: 7.1°C - Ice Bricks present
Receipt Detail	:	No. of samples received / analysed	: 1 / 1

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Melbourne, NATA accreditation no. 825, site no. 13778.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Sample ID	Sample Container Received	Preferred Sample Container for Analysis
Free CN by Segmented Flow Analyser : EK025SF		
QC210	- Clear Plastic Bottle - NaOH	- Black Opaque Plastic Bottle - NaOH
Total Cyanide by Segmented Flow Analyser : EK026SF		
QC210	- Clear Plastic Bottle - NaOH	- Black Opaque Plastic Bottle - NaOH
Weak Acid Dissociable Cyanide by Segmented Flow Analyser : EK028SF		
QC210	- Clear Plastic Bottle - NaOH	- Black Opaque Plastic Bottle - NaOH

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EP071,EP075(SIM): ALS requires 100ml of sample to analyse water samples for standard, semi-volatile, organic parameters. Where larger volume bottles have been submitted 100ml of sample has been subsampled. Solvent rinsing of the sample bottle, which is part of ALS's normal procedure, cannot be conducted prior to extraction in these instances.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Analytical Results

Sub-Matrix: WATER (Matrix: WATER)				Sample ID	QC210	----	----	----	----

Inter-Laboratory Testing

Analysis conducted by ALS Sydney, NATA accreditation no. 825, site no. 10911 (Chemistry / Biology).

(WATER) EP033: C1 - C4 Hydrocarbon Gases

QUALITY CONTROL REPORT

Work Order	: **EM2512123**	Page	: 1 of 8
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR ROBERT CROWE	Contact	: Peter Ravlic
Address	: COLLINS SQUARE LEVEL 10, TOWER TWO 727 COLLINS STREET MELBOURNE VIC, AUSTRALIA 3004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: 03 9653 1234	Telephone	: +6138549 9645
Project	: 60321835_MacPoint	Date Samples Received	: 07-Jul-2025
Order number	: 60321835_MacPoint	Date Analysis Commenced	: 08-Jul-2025
C-O-C number	: ----	Issue Date	: 11-Jul-2025
Sampler	: RB		
Site	: ----		
Quote number	: EN/004/23		
No. of samples received	: 1		
No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Free CN by Segmented Flow Analyser	EK025SF	WATER	In house: Referenced to ASTM D7237, APHA 4500-CN-C&O and ISO 14403: Using an automated segmented flow analyser, a sample at high pH (sodium hydroxide preserved) is buffered to pH 6.0. The hydrogen cyanide present passes across a gas dialysis membrane into an acceptor stream consisting of 0.01 M sodium hydroxide. The acceptor stream mixes with a buffer at pH 5.2 and reacts with chloramine-T to form cyanogen chloride. Cyanogen chloride reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour, measured at 600nm. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Total Cyanide by Segmented Flow Analyser	EK026SF	WATER	In house: Referenced to APHA 4500-CN C&O / ASTM D7511 / ISO 14403. Sodium hydroxide preserved samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Weak Acid Dissociable Cyanide by Segmented Flow Analyser	EK028SF	WATER	In house: Referenced to APHA 4500-CN C&O / ISO 14403. Samples preserved with sodium hydroxide are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN- The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4-pyridine carboxylic and 1,3-dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030E. This method is compliant with NEPM Schedule B(3)
C1 - C4 Gases	EP033	WATER	Technical Guidance for the Natural Attenuation Indicators: Methane, Ethane, and Ethene, US EPA - Region 1, EPA New England, July 2001. Automated static headspace, dual column GC/FID. A 12 mL sample is pipetted into a 20 mL headspace vial containing 3g of sodium chloride and sealed. Each sample is equilibrated with shaking at 40 degrees C for 10 minutes prior to analysis by GC/FID using a pair of PLOT columns of different polarity.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

Subject: Mac Point Lab Results - Batches 1234320, 1236601, 1234941 and 1231576

Unverified Sender: The sender of this email has not been verified. Review the content of the message carefully and verify the identity of th replying, opening attachments or clicking links.

Hi Harry,

Thanks for providing all the soil and groundwater results provided to date from our Mac Point project in Hobart, Tasmania (Aecom job number 60693007). Could you please undertake the following actions as soon as you can, as indicated in the table below?

Batch	Medium	Sample Date	Requested Action
1234320	Water	17 June 2025	• Please analyse sample QC315 for PFAS Full Suite – 30 compounds, trace level
1236601	Water	23 June 2025	We note that additional samples QC107 And QC207 were received but not originally marked on the COC. These should both have a total of 13 bottles each as per the COC for samples marked for 'General Suite + Eco Suite' and 'PFAS' analysis, including 2 x VOC vials and 1 x 200mL amber labelled as 'filtered'. Please analyse additional sample QC107 for: • General Water Suite • Eco Risk Suite – conduct this on the 2 x VOC vials and 1 x 200mL amber labelled 'filtered' only • PFAS Full Suite – 30 compounds, trace level Please forward additional sample QC207 to ALS Springvale and request the same analysis as stated above for QC107
1234941	Soil	18-19 June 2025	• Results not yet received • Please update the sampled date of samples QC317 and QC417 to 18 June 2025. These were incorrectly dated 19 June 2025 on the original COC. • QC319 was requested for the 'General Suite + Gasworks Suite' analysis on the COC, and QC419 was requested for 'hold', however it is noted that these requests were around the opposite way on the Eurofins sample receipt summary, and we have therefore received results for QC419 instead of QC319 as originally requested. Can you please confirm if there was a typo on your end, and if the results received for QC419 are actually the results for QC319 as originally requested on the COC? If not, can you please urgently analyse QC319 as originally requested?
1231576	PASS	11 June 2025	• Results not yet received – can you please follow up

Note that the components of each analytical suite referred to in the table above is detailed in the original COC provided in each respective batch.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Melbourne, NATA accreditation no. 825, site no. 13778.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EP071/EP071SG/EP075(SIM): ALS requires 100ml of sample to analyse water samples for standard, semi-volatile, organic parameters. Where larger volume bottles have been submitted 100ml of sample has been subsampled. Solvent rinsing of the sample bottle, which is part of ALS's normal procedure, cannot be conducted prior to extraction in these instances.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231X-INJ: The direct injection LCMSMS method may be used where the sample matrix is not suitable for Solid Phase Extraction (e.g. significant particulate load) or where only a single sample container is received.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Inter-Laboratory Testing

Analysis conducted by ALS Sydney, NATA accreditation no. 825, site no. 10911 (Chemistry / Biology).

(WATER) EP033: C1 - C4 Hydrocarbon Gases

QUALITY CONTROL REPORT

Work Order	: **EM2512174**	Page	: 1 of 12
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: MR RICHARD BOWERS	Contact	: Peter Ravlic
Address	: SUITE 6 13-17 CASTRAY ESPLANADE HOBART 7004	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: +61 03 9653 1234	Telephone	: +6138549 9645
Project	: 60693007/12_MacPoint	Date Samples Received	: 08-Jul-2025
Order number	: 60693007/12	Date Analysis Commenced	: 08-Jul-2025
C-O-C number	: ----	Issue Date	: 11-Jul-2025
Sampler	: RB/EM/TG/LL		
Site	: Hobart		
Quote number	: EN/004/23		
No. of samples received	: 2		
No. of samples analysed	: 2		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Dilani Fernando	Laboratory Coordinator	Melbourne Inorganics, Springvale, VIC
Jarwis Nheu	Non-Metals Team Leader	Melbourne Inorganics, Springvale, VIC
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: 60693007/12	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Matrix: **WATER**

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Free CN by Segmented Flow Analyser	EK025SF	WATER	In house: Referenced to ASTM D7237, APHA 4500-CN-C&O and ISO 14403: Using an automated segmented flow analyser, a sample at high pH (sodium hydroxide preserved) is buffered to pH 6.0. The hydrogen cyanide present passes across a gas dialysis membrane into an acceptor stream consisting of 0.01 M sodium hydroxide. The acceptor stream mixes with a buffer at pH 5.2 and reacts with chloramine-T to form cyanogen chloride. Cyanogen chloride reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour, measured at 600nm. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Total Cyanide by Segmented Flow Analyser	EK026SF	WATER	In house: Referenced to APHA 4500-CN C&O / ASTM D7511 / ISO 14403. Sodium hydroxide preserved samples are introduced into an automated segmented flow analyser. Complex bound cyanide is decomposed in a continuously flowing stream, at a pH of 3.8, by the effect of UV light. A UV-B lamp (312 nm) and a decomposition spiral of borosilicate glass are used to filter out UV light with a wavelength of less than 290 nm thus preventing the conversion of thiocyanate into cyanide. The hydrogen cyanide present at a pH of 3.8 is separated by gas dialysis. The hydrogen cyanide is then determined photometrically, based on the reaction of cyanide with chloramine-T to form cyanogen chloride. This then reacts with 4-pyridine carboxylic acid and 1,3-dimethylbarbituric acid to give a red colour which is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Weak Acid Dissociable Cyanide by Segmented Flow Analyser	EK028SF	WATER	In house: Referenced to APHA 4500-CN C&O / ISO 14403. Samples preserved with sodium hydroxide are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN- The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4-pyridine carboxylic and 1,3-dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030E. This method is compliant with NEPM Schedule B(3)
C1 - C4 Gases	EP033	WATER	Technical Guidance for the Natural Attenuation Indicators: Methane, Ethane, and Ethene, US EPA - Region 1, EPA New England, July 2001. Automated static headspace, dual column GC/FID. A 12 mL sample is pipetted into a 20 mL headspace vial containing 3g of sodium chloride and sealed. Each sample is equilibrated with shaking at 40 degrees C for 10 minutes prior to analysis by GC/FID using a pair of PLOT columns of different polarity.
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
TRH - Total Recoverable Hydrocarbons - Silica Gel Cleanup	EP071SG	WATER	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C36. This method is compliant with NEPM Schedule B(3).
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-INJ	WATER	In house: Direct injection analysis of fresh waters after dilution (1:1) with mobile phase solvent. Analysis by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Preparation Methods	Method	Matrix	Method Descriptions
Preparation for PFAS in water.	EP231-PR	WATER	Method presumes direct injection without workup. Preparation includes addition of internal standard and surrogate, and filtration prior to analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

QC SUMMARY

MB blank results are compared to the Limit of Reporting
LCS and MS spike recoveries are measured as the percentage of analyte recovered from the sample compared the the amount of analyte spiked into the sample.
DUP and MSD relative percent differences are measured against their original counterpart samples according to the formula：*the absolute difference of the two results divided by the average of the two results as a percentage.* Where the DUP RPD is 'NA' , the results are less than the LOR and thus the RPD is not applicable.

No QC samples were reported for this job.

METHOD SUMMARY

METHOD	METHODOLOGY SUMMARY
TO15-Cert	This method includes the preparation of the canisters and certification of cleanliness. This method is based on the USEPA TO-14 “Determination of Volatile Organic Compounds (VOCs) in Ambient Air using specially prepared canisters with subsequent analysis by Gas Chromatography” and USEPA TO-15 “Determination of Volatile Organic Compounds (VOCs) in Air collected in specially-prepared canisters and analysed by Gas Chromatography/ Mass Spectrometry (GC/MS).

FOOTNOTES

IS	Insufficient sample for analysis.	LOR	Limit of Reporting
LNR	Sample listed, but not received.	↑↓	Raised or Lowered Limit of Reporting
*	NATA accreditation does not cover the performance of this service.	QFH	QC result is above the upper tolerance
		QFL	QC result is below the lower tolerance
**	Indicative data, theoretical holding time exceeded.	-	The sample was not analysed for this analyte
		NVL	Not Validated

Samples analysed as received.
Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calcuated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the " Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.
Note that in terms of units of radioactivity:

a. 1 Bq is equivalent to 27 pCi
b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929.

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.sgs.com.au/~/media/Local/Australia/Documents/Technical%20Documents/MP-AU-ENV-QU-022%20QA%20QC%20Plan.pdf

METHOD	METHODOLOGY SUMMARY
MA-1105	This method is intended for the analysis of light hydrocarbons and permanent gases in low pressure gas, by micro gas chromatography (µGC) coupled with thermal conductivity detectors. Low pressure samples are analysed using an Agilent 490 Micro GC, (a 4-channel system). The sample is drawn through the inlet by the instrument's vacuum pump. The sample is then directed via separate paths through each of the four modules (containing different GC columns), the target analytes are separated and then passed through into the thermal conductivity detector. Based on ASTM D1945 Methodology.
TO-15	"This method is intended for the analysis of Volatile Organic Compounds (VOCs) for ambient air or soil gas, sampled onto canisters and analysed by gas chromatography mass spectrometry (GCMS) coupled with the Markes sample introduction units. This method is based on the USEPA Method TO-15.
TO-15	This method involves GC-MS analysis of the air sample collected in evacuated canisters. In the lab, a portion of sample is pre-screened if from an unknown source or is suspected to be high. Once the pre-screening is complete the sample is passed onto a sorbent trap, and is desorbed to the GC where the analytes are separated, and are then passed into the MS where fragmentation of the molecules occurs, to produce mass spectra of each analyte. The data is recorded on a Total Ion Chromatogram (TIC) from which each analyte detected can be individually identified (using the Mass Spectra) and quantitated against standards.
TO15-CWG	This method is intended for the analysis of total petroleum hydrocarbon (TPH) fractions for ambient air or soil gas, sampled onto canisters and analysed by gas chromatography mass spectrometry (GCMS) coupled with the Markes sample introduction units. This method is based on the USEPA Method TO-15.
TO15-CWG	This method involves GC-MS analysis of the air sample collected in evacuated canisters. In the lab, a portion of sample is pre-screened if from an unknown source or is suspected to be high. Once the pre-screening is complete the sample is passed onto a sorbent trap, and is desorbed to the GC where the analytes are separated, and are then passed into the MS where fragmentation of the molecules occurs, to produce mass spectra of each analyte. The data is recorded on a Total Ion Chromatogram (TIC) from which each analyte detected can be individually identified (using the Mass Spectra) and quantitated against standards.
TO15-TPH	This method is intended for the analysis of total petroleum hydrocarbon (TPH) fractions for ambient air or soil gas, sampled onto canisters and analysed by gas chromatography mass spectrometry (GCMS) coupled with the Markes sample introduction units. This method is based on the USEPA Method TO-15.
TO15-TPH	This method involves GC-MS analysis of the air sample collected in evacuated canisters. In the lab, a portion of sample is pre-screened if from an unknown source or is suspected to be high. Once the pre-screening is complete the sample is passed onto a sorbent trap, and is desorbed to the GC where the analytes are separated, and are then passed into the MS where fragmentation of the molecules occurs, to produce mass spectra of each analyte. The data is recorded on a Total Ion Chromatogram (TIC) from which each analyte detected can be individually identified (using the Mass Spectra) and quantitated against standards.
TO15-Vacuum	Canisters returned containing samples have the receipt pressure measured using Model 4600A Dynamic Diluter.

FOOTNOTES

*	NATA accreditation does not cover the performance of this service.	-	Not analysed.	UOM	Unit of Measure.
		NVL	Not validated.	LOR	Limit of Reporting.
**	Indicative data, theoretical holding time exceeded.	IS	Insufficient sample for analysis.	↑↓	Raised/lowered Limit of Reporting.
		LNR	Sample listed, but not received.		
***	Indicates that both * and ** apply.				

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received.
Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the " Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.
Note that in terms of units of radioactivity:

a. 1 Bq is equivalent to 27 pCi
b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: www.sgs.com.au/en-gb/environment-health-and-safety.

COMMENTS

All the laboratory data for each environmental matrix was compared to SGS' stated Data Quality Objectives (DQO). Comments arising from the comparison were made and are reported below.

The data relating to sampling was taken from the Chain of Custody document.
This QA/QC Statement must be read in conjunction with the referenced Analytical Report.
The Statement and the Analytical Report must not be reproduced except in full.

All Data Quality Objectives were met (within the SGS Melbourne EH&S laboratory).

SAMPLE SUMMARY

Sample counts by matrix	19 Canisters	Date documentation received	2/7/2025
Type of documentation received	COC	Turnaround time requested	Standard
Number of eskies/boxes received	2 Esky, 3 Orange ca	Sample temperature upon receipt	Ambient

HOLDING TIME SUMMARY

ME373630 R0

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1 : 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in **Green** when within suggested criteria or **Red** with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

HOLDING TIME SUMMARY

ME373630 R0

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1 : 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in **Green** when within suggested criteria or **Red** with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in **Green** when within suggested criteria or **Red** with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

No surrogates were required for this job.

Blank results are evaluated against the limit of reporting (LOR), for the chosen method and its associated instrumentation, typically 2.5 times the statistically determined method detection limit (MDL).

Result is shown in **Green** when within suggested criteria or **Red** with an appended dagger symbol (†) when outside suggested criteria.

Duplicates are calculated as Relative Percentage Difference (RPD) using the formula: RPD = | OriginalResult - ReplicateResult | x 100 / Mean
The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula: MAD = 100 x SDL / Mean + LR
Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in **Green** when within suggested criteria or **Red** with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

NOTE: The RPD reported is calculated from the unrounded data for the original and replicate result. Manual calculation of the RPD from the rounded data reported may give a different calculated RPD.

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA /QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in **Green** when within suggested criteria or **Red** with an appended dagger symbol (†) when outside suggested criteria.

General Gases MA-1105

Method: MA1105

Sample Number	Parameter	Units	LOR	Result	Expected	Criteria %	Recovery %

	Carbon Dioxide	%v/v	0.01	1.0	0.98	60 - 140	102

TO-15 in Air

Method: TO15

Sample Number	Parameter	Units	LOR	Result	Expected	Criteria %	Recovery %
LB091740.002	Benzene	µg/m³	-	38	32.4	60 - 140	118
LB091741.002	Benzene	µg/m³	-	38	32.4	60 - 140	118

Matrix Spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub -sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in **Green** when within suggested criteria or **Red** with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

No matrix spikes were required for this job.

MATRIX SPIKE DUPLICATES

ME373630 R0

Matrix spike duplicates are calculated as Relative Percent Difference (RPD) using the formula: RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The original result is the analyte concentration of the matrix spike. The Duplicate result is the analyte concentration of the matrix spike duplicate.

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula: MAD = 100 x SDL / Mean + LR

Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in **Green** when within suggested criteria or **Red** with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

No matrix spike duplicates were required for this job.

Samples analysed as received.

Solid samples expressed on a dry weight basis.

QC criteria are subject to internal review according to the SGS QA/QC plan and may be provided on request or alternatively can be found here: https://www.sgs.com.au/~/media/Local/Australia/Documents/Technical Documents/MP-AU-ENV-QU-022 QA QC Plan.pdf

*	NATA accreditation does not cover the performance of this service.
**	Indicative data, theoretical holding time exceeded.
***	Indicates that both * and ** apply.
-	Sample not analysed for this analyte.
IS	Insufficient sample for analysis.
LNR	Sample listed, but not received.
LOR	Limit of reporting.
QFH	QC result is above the upper tolerance.
QFL	QC result is below the lower tolerance.
①	Majority of surrogate recoveries are within acceptance criteria.
②	RPD failed acceptance criteria due to sample heterogeneity.
③	Results less than 5 times LOR preclude acceptance criteria for RPD.
④	Recovery failed acceptance criteria due to matrix interference.
⑤	Recovery failed acceptance criteria due to the presence of significant concentration of analyte (i.e. the concentration of analyte exceeds the spike level).
⑥	LOR was raised due to sample matrix interference.
⑦	LOR was raised due to dilution of significantly high concentration of analyte in sample.
⑧	Reanalysis of sample in duplicate confirmed sample heterogeneity and inconsistency of results.
⑨	Recovery failed acceptance criteria due to sample heterogeneity.
⑩	LOR was raised due to high conductivity of the sample (required dilution).
⑪	Majority of spike recoveries are within acceptance criteria.

Job Number	ME371965

[1] When a flow controller is attached to an evacuated canister, no change in pressure should be observed for at least 1 minute.

[2] Pressure on evacuation recorded on certification.

[3] Before canisters leave the Laboratory they must be tested for vacuum, this pressure to be recorded.

[4] Batch ID's can be found in soil gas train certification folder

Appendix F

Data Validation

Appendix E - Data Validation

1.0 Data Quality Objectives

The Data Quality Objectives (DQOs) presented in this appendix were developed at the time of preparation of the *Soil, Groundwater and Soil Vapour Investigation 2025 - Sampling and Analysis Quality Plan* (SAQP)*, Macquarie Point Development Project,* AECOM Australia Pty Ltd, 19 May 2025 (AECOM, 2025d) for the Soil, Groundwater and Soil Vapour Investigation 2025.

The DQO development process described herein was used to provide a systematic planning approach for collecting environmental data during the fieldwork program and to address the Quality Assurance/Quality Control (QA/QC) measures adopted for the purpose of this assessment.

Guidance regarding the development of DQOs has been referenced from the following primary documents:

- National Environment Protection Council, National Environment Protection (*Assessment of Site Contamination*) Measure 1999, *Schedule B2: Guideline on Site Characterisation* (as amended May 2013) [ASC NEPM].
- Australian Standard 4482.1-2005 *Guide to the investigation and sampling of sites with potentially contaminated soil, Part 1: Non-volatile and Semi volatile Compounds* (AS 4482.1).
- Australian Standard 4482.2-1999 *Guide to the sampling and investigation of potentially contaminated soil, Part 2: Volatile Substances* (AS 4482.2).
- New South Wales Environment Protection Authority (NSW EPA) *Contaminated Land Guidelines: Sampling Design Part 1 – Application* (NSW EPA, 2022).
- US EPA, 2006a *Guidance on Systematic Planning Using the Data Quality Objectives Process* (EPA QA/G-4).

The process of establishing appropriate DQOs is defined by the seven-step planning approach presented in the ASC NEPM and summarised in **Table 1** below.

Table 1 Data Quality Objectives

Step	Data Quality Objective Step Summary
1	***State the Problem*** – Summarise the problem that will require new environmental data and identify the resources available to resolve the problem based on a preliminary Conceptual Site Model (CSM) using available information prior to the commencement of the site investigation.
2	**Identify the Decision/Goal of the Study** – Identify the decisions that need to be made about the problem and the new environmental data required to make the decisions. Develop a decision statement linking the principal project objective(s) to the possible actions that will address the problem.
3	**Identify Information Inputs** – Identify the information needed to support any decision and whether new environmental data will be needed.
4	***Define the Boundaries of the Study*** – Specify the spatial and temporal aspects of the environmental media that the data must represent to support decision(s).
5	***Develop the Analytical Approach (or Decision Rule)*** – Define the parameter of interest, specify the action level, and integrate information from Steps 1–4 into a single statement that gives a logical basis for choosing between alternative actions.

Step	Data Quality Objective Step Summary
6	***Specify Performance or Acceptance Criteria*** – Specify the decision-maker's acceptable limits on decision errors, which are used to establish performance goals for limiting uncertainties in the data.
7	***Develop the Plan for Obtaining Data*** – Identify the most resource-effective sampling and analysis design for generating the data that is required to satisfy the DQOs.

The approach adopted relative to the seven steps presented above in **Table 1** is discussed in the sections below.

1.1 Step 1 – State the Problem

The primary problems to be addressed by the activities in the SAQP (AECOM, 2025) are addressing data gaps and refreshing knowledge of Site soil, groundwater and soil vapour, as discussed in **Section 1.2** of the main report text.

Data collected as part of this investigation will help identify future assessment, remediation and/or management requirements (if any). The outcomes of the investigation will inform future Site Suitability Statements, and any other work identified as a result.

1.2 Step 2 – Identify the Decision / Goal of the Study

As noted in **Section 1.1**, the investigation works are intended to address data gaps and refresh aged data from past investigations. The decision identification component of the DQO process represents the key issues that need to be reviewed and considered to resolve the problem identified in Step 1. These issues include:

- Have representative soil, groundwater and soil vapour data been collected to address the objectives (refer to **Section 1.2** of the main report text) and to inform the CSM and future decisions?
- Are the contaminants identified (if any) consistent with the understanding of the site history? Do the concentrations exceed the relevant Tier 1 relevant screening criteria (refer to **Section 3.0** of the report text)?
- Has the nature and extent of contamination (if any) and temporal trends been identified? Is further assessment required, or have data gaps been identified?
- Have potential contamination sources and/or risks been identified that may impact the future development of Regatta Point? Are there potential future remediation and/or management requirements?

If the investigation results suggest potential risk, or if there remains insufficient information, recommendations shall be made on further assessment, management, or remediation measures.

1.3 Step 3 – Identify Information Inputs

To allow assessment of the data against the issues and decisions listed in **Section 1.2**, various information inputs will be considered as follows:

- Field observations of aesthetic impacts (e.g. odours, sheen etc.) noted during sampling.
- Identification of the Contaminants of Potential Concern (CoPC) based on the historic records and previous assessments of the Site, and anecdotal information or other relevant information, where available.
- Assessment of data collected relative to relevant screening criteria and guidelines, and identified environmental values.

1.4 Step 4 – Define the Boundaries of the Study

The spatial boundaries (geographical limits) and lateral extent for data collection and decision making for the investigations are defined and illustrated by the Site boundaries on **Figure F1** (**Appendix A**), and adjacent soil, groundwater and soil vapour investigation locations shown on **Figure F2** (**Appendix A**).

The vertical extent works will be limited by the depth of the targeted upper aquifer beneath the Site.

1.5 Step 5 – Develop the Analytical Approach (or Decision Rule)

The decision for the investigation works is to obtain representative soil, groundwater and soil vapour data and compare data against relevant screening or acceptance criteria. The decision rules are as follows:

- If comparison of soil, groundwater or soil vapour chemical data to the relevant screening criteria (outlined in **Section 3.0** of the report text) identifies exceedances, or data gaps or discrepancies from the proposed investigation plan, the contamination impacts will be subject to further investigation, assessment, remediation, or management; otherwise, environmental conditions will be deemed suitable for the proposed future uses and environmental values associated with the Site based on the available data.
- If the investigation results suggest potential unacceptable risk, or if there remains insufficient information, recommendations shall be made on further assessment, management, or remediation measures.
- If the QA/QC data meets the Data Quality Indicators (DQIs) adopted (outlined in **Section 4.0** of the report text) to assess the precision and accuracy of the data, the data will be considered to be suitable for interpretive use. Data that fail to meet the DQIs will be managed using corrective actions (where possible) such as re-analysis of suspect samples, re-analysis of data and/or procedures, acceptance of data with acknowledged limitations/bias, or the data may be discarded.

Data collected as part of the investigations must be of sufficient representativeness to address the primary problem (refer to **Section 1.1**) and decisions (refer to **Section 1.2**) identified as part of the DQO process.

Primary and secondary laboratories selected for the analysis of soil and groundwater samples will be accredited by National Association of Testing Authorities (NATA) for the requested analyses, with the exception of pH-testing for ASS assessment. Where a test is not covered by NATA accreditation, this will be identified during reporting of results..

1.6 Step 6 – Specify Performance or Acceptance Criteria

A decision error in the context of the decision rules presented in Step 5 would lead to either underestimation or overestimation of the risk level associated with particular investigations/ samples/data. Decision errors may include:

- Limitations in the available site history information.
- Limitations based on inaccurate/inadequate data from previous investigations.
- Errors or limitations in this SAQP or proposed scope of works.
- Data not being adequately representative of site conditions.
- Breaches of recommended chemical extraction or analysis holding times for the proposed analytical suite
- Errors in the laboratory analytical reporting or procedures.
- Unnecessary implementation of remedial or management measures and controls.

Field and laboratory data will be reviewed and screened against relevant assessment criteria (outlined in **Section 3.0** of the report text) to make decisions regarding further assessment or management measures. A quality assurance/quality control (QA/QC) and data validation program has been

developed (refer to **Section 4.0** of the report text) to ensure that data collected are sufficiently accurate and reliable for the purpose of this investigation.

1.7 Step 7 – Develop the Plan for Obtaining Data

The methodology presented in this SAQP provides a sampling plan which has been designed to meet the objectives for the investigation (refer to **Section 1.2** of the report text), and also to achieve the nominated DQOs outlined in Steps 1 – 6.

The investigation will be carried out to a level of accuracy and confidence required in accordance with the ASC NEPM (2013). It is expected this SAQP may be updated in consultation with the Corporation and the Site Environmental Auditor.

2.0 Data Considered

The sampling events and relevant laboratory reports pertaining to the soil and groundwater data considered in this report are summarised in below **Table 2**.

Eurofins Environment Testing (Eurofins) was selected as the primary laboratory and ALS Laboratories (ALS) Melbourne was selected as the secondary laboratory for soil and groundwater samples. SGS Australia (SGS) was selected as the primary laboratory for soil vapour samples, noting all laboratories are accredited by NATA for the analyses selected.

Table 2 Soil/Groundwater Data Considered

Scope of Work	Sampling Event	Sample Media	Sampling Period	Lab Report Numbers
Soil assessment	Advancement of 43 soil bores	Soil	27 May – 19 June 2025	1225146 ^ 1227083 1227989 1228034 1229786 1231576 ^ 1231626 1232541 1234941 1237090 ^ EM2509944 * EM2512074 * EM2510162 * EM2510874 *
Groundwater assessment	Sampling of 54 groundwater wells	Groundwater	12 – 25 June 2025	1232587 1234320 1234988 1235189 1235243 1236601 1237216 1240646 1241421 EM2411596 * EM2512123 * EM2512174 *
Soil Vapour Assessment	Sampling of 18 Soil vapour bores	Soil Vapour	17 June to 27 June 2025	ME371965

*Note: ^ – Laboratory reports pertaining to acid sulfate soil analysis; * – Laboratory reports from the secondary laboratory.*

Development of DQIs for Data Comparability, and Precision and Accuracy, with reference to applicable standards, and QA and QC assessment of the sampling methodology and analytical data against DQIs has been undertaken and presented in this data validation appendix, and summarised in the SAQP (AECOM, 2025d).

Copies of the laboratory documentation including chain of custody (CoC) documentation, sample receipt notification (SRN) reports, QC reports and certificates of analysis are attached in **Appendix E**.

3.0 Assessment of Soil Data

3.1 Field Data Quality

3.1.1 Sample Collection

Collection of soil and associated QA/QC samples was undertaken by AECOM field personnel trained and experienced in environmental sampling, in accordance with the methodology described in the SAQP (AECOM, 2025d).

3.1.2 Trip Blanks

Sand trip blank samples were supplied by Eurofins, pre-prepared by the laboratory using high purity silicate sand free from VOCs and other organic and inorganic analytes. One sand trip blank was submitted for each esky transported to the laboratory. Trip blanks were analysed for select volatile compounds, consisting of volatile TPH C_6-C_{10} and BTEXN.

A total of 13 sand trip blank samples were collected and analysed as part of the soil assessment (27 May – 19 June 2025). Concentrations of target compounds were reported below the laboratory Limit of Reporting (LOR) in these samples, indicating that cross contamination of samples occurring in transit is unlikely to have occurred. Trip blank results are reported on **Table G1** attached.

3.1.3 Rinsate Blanks

Rinsate blanks were prepared by pouring laboratory supplied water over sampling equipment, following decontamination procedures to assess the potential for cross-contamination. A total of 14 rinsate blank samples were collected and analysed as part of the soil assessment (27 May – 19 June 2025), i.e. one for each day of sampling. The rinsate blanks were analysed for the same suite of CoPC analytes as the primary samples. Concentrations of analytes were below the laboratory LOR in these samples, with the exception of:

- QC313 for Ammonia (as N) (0.02 mg/L), collected on 13 June 2025.

The reported concentration of 0.02 mg/L was marginally above the laboratory LOR (0.01 mg/L). Concentrations of Ammonia (as N) in primary soil samples ranged from <5 mg/kg (LOR) to 870 mg/kg (refer to **Table T5a, Appendix B**), therefore the potential small positive bias in the results is unlikely to affect the interpretation of the results. Rinsate results are reported on **Table G1** attached.

3.1.4 Field Blanks

Field blank samples were prepared by pouring laboratory supplied de-ionised water into sampling containers during soil sampling to assess whether contamination may have occurred in the field sampling environment. However, in accordance with the SAQP, as the rinsate and trip blank results did not report detections of CoPC or marginal detections above the laboratory LORs, the field blank samples were not analysed and remained on-hold with the laboratory.

It is noted that the Ammonia (as N) detection noted above in rinsate sample QC313 (0.02 mg/L) did not trigger the analysis of field blank sample QC413 collected on the same day during soil sampling (13 June 2025), as it was not considered to adversely affect the interpretation of the results, as discussed above.

It is noted that field blank samples QC405 and QC419 were analysed by mistake, however concentrations of analytes reported below the laboratory LOR in each case.

3.1.5 Field Duplicate Samples

In accordance with the SAQP (AECOM, 2025d), field duplicate samples (intra-and inter-laboratory duplicates)were labelled so that they could not be linked to their respective primary samples. Field duplicate (inter and intra-laboratory) samples were collected at a rate of one each for every 20 primary samples, for each sample media, with the exception of:

- Field duplicates of PFAS samples were collected at a rate of one every 10 primary samples, in accordance with the PFAS NEMP (HEPA, 2025).

- No duplicate samples were collected for Potential Acid Sulphate Soil (PASS) samples, as pH Field Screening is qualitative. Data quality of Chromium Reducible Sulphur (CRS) analysis was assessed by Suspension Peroxide Oxidation Combined Acidity and Sulfur (SPOCAS) analysis at a rate of one per 10 CRS analyses conducted.

A total of four intra-laboratory duplicate and four inter-laboratory duplicate soil sample pairs were collected and analysed against 51 primary soil samples collected during the scope of work. This sample rate meets and exceeds the rate specified in the sample methodology, one each, per 20 primary samples (i.e. 5% rate) analysed for TRH, BTEXN, PAH, 8 metals, ammonia, cyanide, and one each per 10 primary samples (i.e. 10% rate) analysed for PFAS. This rate is equal to the recommended rate and considered sufficient to allow for assessment of precision of analytical results between laboratories. The samples were collected from fill material at MW184, MW194, SV42 and MW188 from 0.5 – 3 m bgl. Whilst QC requirements were met, additional QC samples were collected (QC104/QC204 and QC105/QC205) and were placed on hold. Intra-laboratory duplicate sample QC104 was analysed before hold request was sent to the laboratory.

Primary and duplicate sample results were compared, and Relative Percentage Differences (RPDs) were calculated. Results of duplicate samples and RPDs are presented in **Table G2**.

The following acceptance criteria have been applied for RPDs:

- RPD less than 30% for high level laboratory duplicates (i.e. concentrations >20 x LOR)
- RPD less than 50% for medium level laboratory duplicates (i.e. concentrations 10 – 20 x LOR)
- RPD less than 200% for low level laboratory duplicates (i.e. concentrations 1 – 10 x LOR)

Of a total of 441 RPD values calculated, 14 RPD values (~3%) were reported above the adopted acceptable RPD DQO limits. The RPD exceedances were associated with:

- TRH / TPH concentrations between:
  - Primary sample MW185_1.0 and intralab duplicate QC101 / interlab duplicate QC201 (TPH only)
  - Primary sample MW185_3.0 and intralab duplicate QC104 (TRH & TPH)
  - Primary sample SV42_2.0 and intralab duplicate QC106 (TPH only)
- Metals concentrations between:
  - Primary sample MW185_3.0 and intralab duplicate QC104 (mercury only)
  - Primary sample SV42_2.0 and interlab duplicate QC206 (chromium only)
- PAH concentrations between:
  - Primary sample SV42_2.0 and intralab duplicate QC106 (fluoranthene and pyrene only)

This is not unexpected considering the degree of heterogeneity known to be associated with fill material across the Site. For each primary / duplicate sample combination, the highest concentration has been adopted for interpretation. Noting this, and given that approximately 97% of the field duplicate RPD values were reported within the acceptable ranges, the precision of the soil sample dataset is considered to be sufficient for interpretive purposes.

3.2 Laboratory Data Quality

A summary of the assessment of laboratory data quality for soil and QA/QC samples relevant to the report is provided in the sections below.

Soil samples were analysed for a combination of analytes including metals, TRH (C_6-C_{40}), BTEXN, PAHs, metals (Arsenic, Cadmium, Chromium, Copper, Lead, Nickel, Zinc, Mercury), phenols, ammonia, cyanide.

In addition, 81 samples were also analysed for Acid Sulphate Soil (ASS) related analyses consisting of:

- 81 x pH field screen (pHf and pHfox)

- 20 x CRS suite
- 2 x SPOCAS suite

The soil analytical suite selected is considered appropriate for the purposes of this report as they are consistent with the analytes identified as CoPC (refer to **Section 2.2** of the main report) based on history and land use at Macquarie Point and surrounding areas.

3.2.1 Sample Receipt Temperature

Soil samples were kept chilled during storage and transportation with ice in portable coolers until received by the laboratory for analysis. Samples were reported to be received in good condition in appropriately preserved sample containers.

Samples were reported and received by the primary analytical laboratory (Eurofins) as chilled with ice present. Chilled PASS samples were immediately transported to the primary laboratory on the day of collection and frozen upon receipt. Samples from all laboratory reports were reported as being received within the acceptable temperature range of 0 – 6°C, with the exception of primary laboratory batches 1225146 (10.2°C) and 1229786 (10°C).

These temperatures were a result of insufficient cooling time, as these batches were delivered directly to the local primary laboratory (Eurofins) by AECOM field staff on the same day of collection, despite immediate placement of the samples on ice. Therefore, they are not considered to affect the interpretation of the results.

Samples were received within the acceptable temperature range of 0 - 6°C by the secondary laboratory (ALS) except batches EM2509944 (7.3°C) and EM2510162 (9.2°C). Ice was noted to be present in each batch by the secondary laboratory upon receipt.

Given that the interstate secondary laboratory (ALS) received the samples within the shortest available transit time (i.e. >24 hours) following collection, the potential exists that volatilisation or degradation of samples (i.e. VOCs/SVOCs/TPH) may have occurred from interlaboratory duplicate samples in these batches, resulting in under-reporting of concentrations. However, the following is noted for each batch:

- EM2510162 (interlaboratory duplicate QC203) – the receipt temperature of 9.2°C is not considered to affect the interpretation of the results on the following basis:
  - No volatiles were reported above LOR in corresponding primary sample MW194_3.0 (batch 1229786) and intra-laboratory duplicate sample QC103 (batch 1229786), which were both delivered to the primary laboratory on the same day of sampling (as noted above).
  - There were no RPD exceedances between primary sample MW194_3.0 and duplicates QC103 and QC203.
- EM2509944 (interlaboratory duplicate QC201) – the receipt temperature of 7.3°C is not considered to affect the interpretation of the results on the following basis:
  - No volatiles were reported above LOR in corresponding primary sample MW184_1.0 (batch 1227989) and intra-laboratory duplicate sample QC101 (batch 1227989), which were both delivered to the primary laboratory below the recommended temperature of 6°C.
  - RPD exceedances in the semi-volatile TPH range (TPH/TRH C10-C36) were detected between the primary sample MW184_1.0 and both duplicate samples (QC101 / QC201).
  - There were no volatile (TRH/TPH C6-C9, BTEXN) RPD exceedances between primary sample MW184_1.0 and duplicates QC101 and QC201 (as they were all reported below LOR).

In summary, it is considered unlikely that degradation of VOCs/SVOCs/TPHs occurred in transit, and the data is considered suitable for interpretation.

3.2.2 Sample Holding Times

All primary samples were received by laboratories within the recommended holding times for the requested analyses, noting that PASS samples were frozen by the analytical laboratory upon receipt within 24 hours of collection.

The results are considered suitable for interpretation. Proactive holding time assessments completed by the analytical laboratory are provided in the SRN reports in **Appendix E**.

3.2.3 Limits of Reporting

Laboratory LORs were either lower than or equal to the screening criteria applied to the samples analysed, with the exception of the analytes and criteria listed in **Table 3** below.

Table 3 Adequacy of Laboratory LORs – Soil

Chemical	Tier 1 Screening Criteria	Screening Value (mg/kg)*	LOR (mg/kg)*
Benzo(a)pyrene	Human Health (Direct Contact) • Low density residential • Medium/High Density residential • Recreation/Open space	0.11	0.5
Dibenz(a,h)anthracene		0.11	0.5
>C10-C16 (minus Naphthalene) (F2)	Human Health (Vapour Intrusion) • Residential	25	50

*Note: * Units for screening values and LOR values are expressed in 'mg/kg' unless specified otherwise.*

The following in noted regarding the exceedances and adequacy of LORs:

- Future planned development at the Site in the locations soil samples were collected comprises commercial buildings, mixed use areas, an underground carpark and recreational/open space areas. As no residential use is proposed for development at the Site in these areas, it is considered appropriate to apply commercial/industrial and recreational/open space use criteria for assessment of human health via direct contact and vapour exposure risks. Therefore, LOR discrepancies relating to residential land use are not considered to indicate any potential unidentified risk to future users of the Site.
- Based on reported concentrations of other CoPC above the adopted assessment criteria, future development across the site (including proposed future recreational/open space areas such as the Aboriginal Culturally Sensitive Area), will require an engineered break layer to mitigate direct contact with soil by human users of the land (other than intrusive maintenance workers).

On this basis, the reported LORs are considered adequate for assessment of the analytical results.

3.2.4 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix E**.

Matrix spike recoveries were noted to be within the DQO range of 70% - 130% or laboratory-derived limits for the methods used, with the exceptions of the outlier noted in **Table 4** below.

Table 4 Matrix Spike Outliers - Soil

Work Order	Sample ID	Analyte	Matrix Spike	Limits
Soil				
EM2510874	EM2510871--002	Chromium	63.6%	79.0%-121%[1]
EM2512074	EM2511831--008	Perfluorononane sulfonic acid (PFNS)	67.0%	69.0%-125%

Work Order	Sample ID	Analyte	Matrix Spike	Limits
Soil				
		Perfluorodecane sulfonic acid (PFDS)	35.7%	59.0%-134%
		10:2 Fluorotelomer sulfonic acid (10:2 FTS)	48.2%	70.0%-130%

Notes: ND – Not Determined; 1 – recovery less than lower data quality objective

Matrix spike recovery outliers, lower than the acceptable limits, are likely attributed to the heterogeneity of the soil samples submitted to the laboratory, or due to matrix interference with samples. The presence of varied fill material is well documented across the Site, including areas where these soil samples were generated.

Overall, these outliers are not considered to impact interpretation of the results.

3.2.5 Laboratory Method Blanks

All soil laboratory method blanks were reported within the acceptable range, i.e. below laboratory LORs and provided in the analytical QC reports provided in **Appendix E.**

3.2.6 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory QC reports provided in **Appendix E**. All surrogate spike recoveries for regular sample matrices were within the surrogate control limits adopted for the methods used.

3.2.7 Laboratory Control Spikes

Laboratory control spikes, presented in **Appendix E**, were within the laboratory-derived control limits for the methods used.

3.2.8 Frequency of Quality Control Spike

Frequency of QC spikes, presented in **Appendix E**, were at the rate expected by applicable QC specifications, with the exceptions of the outliers listed in **Table 5** below.

Table 5 Frequency of Quality Control Samples - Soil

Work Order	Type	Analyte	Rate (%)		QC Specification
			Actual	Expected	
Soil					
EM2510874	Matrix Spikes	Free Cyanide by Segmented Flow Analyser	0	5	NEPM 2013 B3 & ALS QC Standard
		WAD Cyanide by Segmented Flow Analyser	0	5	NEPM 2013 B3 & ALS QC Standard

Based on the above non-conformances the precision and accuracy assessment for this data is limited to field duplicates and laboratory control spikes for the compounds listed above.

3.2.9 Laboratory Duplicates and RPDs

The RPD between analytical results for primary samples and their corresponding laboratory duplicates, presented in **Appendix E**, were within acceptable limits, with the exception of the duplicate outliers listed below in **Table 6**.

Table 6 Laboratory Duplicate RPD Exceedances - Soil

Work Order	Sample ID	Analyte	RPD (%)	Limits (%)
Soil				
1227083	M25-Jn0002487	TRH C15-C28	35 %	0% - 30%[1]
1232541	M25-Jn0039077	Lead	40%	0% - 30%[1]

Notes: 1 – The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Laboratory duplicate RPD exceedances are attributed to the heterogeneity of the soil samples submitted to the laboratory. The presence of varied fill material is well documented across the Site, including areas where these soil samples were retrieved. These exceedances are not considered to impact interpretation of the results.

4.0 Assessment of Groundwater Data

4.1 Field Data Quality

4.1.1 Sample Collection

Collection of groundwater and associated QA/QC samples was undertaken by AECOM field personnel trained and experienced in environmental sampling, in accordance with the methodology described in the SAQP (AECOM, 2025d).

4.1.2 Trip Blanks

Aqueous trip blank samples were supplied by Eurofins, pre-prepared by the laboratory using ultrapure deionised water, free from VOCs and other organic and inorganic analytes. One aqueous trip blank was submitted for each esky transported to the laboratory. Trip blanks were analysed for select volatile compounds, consisting of volatile TPH C_6-C_{10} and BTEXN. A total of 17 aqueous trip blank samples were collected and analysed during the groundwater sampling works (12 – 25 June 2025). Concentrations of target compounds were reported below the LORs in these samples, indicating that cross contamination of samples occurring in transit is unlikely to have occurred. Trip blank results are reported on **Table G1** attached.

4.1.3 Rinsate Blanks

Rinsate blanks were prepared by pouring laboratory supplied water over sampling equipment, following decontamination procedures to assess the potential for cross-contamination. A total of 9 rinsate blank samples were collected and analysed during the groundwater sampling works (12 – 25 June 2025), i.e. one for each day of sampling. Concentrations of analytes were reported below the laboratory LOR in these samples, with the exception of:

- QC314 for Nitrate (as N) (0.02 mg/L), collected on 13 June 2025.

The reported concentration of 0.02 mg/L was marginally above the laboratory LOR (0.01 mg/L). Concentrations of Ammonia (as N) in primary soil samples ranged from <0.01 mg/L (LOR) to 46 mg/L (refer to **Table T6a, Appendix B**), therefore the potential small positive bias in the results is unlikely to affect the interpretation of the results. Rinsate results are reported on **Table G1** attached.

4.1.4 Field Blanks

Field blank samples were prepared by pouring laboratory supplied de-ionised water into sampling containers during groundwater sampling to assess whether contamination may have occurred in the field sampling environment. However, in accordance with the SAQP, as the rinsate and trip blank results did not report detections of CoPC or marginal detections above the laboratory LORs, the field blank samples were not analysed and remained on-hold with the laboratory.

It is noted that the Ammonia (as N) detection noted above in rinsate sample QC314 (0.02 mg/L) did not trigger the analysis of field blank sample QC414 collected on the same day during groundwater sampling (13 June 2025), as it was not considered to adversely affect the interpretation of the results, as discussed above.

4.1.5 Field Duplicate Samples

Field duplicate samples (intra-and inter-laboratory duplicates) were collected and labelled so that they could not be linked to their respective primary samples.

A total of four intra-laboratory and inter-laboratory duplicate water sample pairs were collected and analysed from a total of 55 primary water samples collected during the GME. This sample rate meets and exceeds the rate specified in the sample methodology, one each per 20 primary samples (i.e. 5% rate) analysed for TRH, BTEXN, PAH, phenols, metals (Arsenic, Cadmium, Chromium, Copper, Lead, Nickel, Zinc, Mercury), manganese, cyanide, ammonia, methane and one each per 10 primary samples (i.e. 10% rate) analysed for PFAS, which is equal to the recommended rate and considered sufficient to allow for assessment of precision of analytical results between laboratories. The samples were collected from groundwater at MW16, MW126A, MW193 and MW186.

Primary and duplicate sample results were compared and RPDs were calculated, noting the acceptance criteria described in **Section 3.1.5** were adopted. Results of duplicate samples and RPDs are presented in **Table G3**.

Of a total of 727 RPD values calculated and 25 RPD values (~3.5%) were reported above the adopted acceptable RPD DQO limits. The RPD exceedances were predominately associated with a range of volatile and non-volatile analytes including PAHs, PFAS, Methane and TRH, indicating that the exceedances are likely symptomatic of either sample heterogeneity, instability of volatile compounds and/or potential variability throughout the analytical process. PAHs and some TRH ranges have been previously demonstrated to sorb to clay particles in groundwater (AECOM, 2020a), and sediment/silt in water samples may have also led to discrepancies for these CoPC.

Given that approximately 96.5% of the field duplicate RPD values were reported within the acceptable range, the precision of the groundwater sample dataset is considered to be sufficient for interpretive purposes. The highest concentration of any inter- or intra-laboratory duplicate sample combination has been adopted for interpretive use.

4.2 Laboratory Data Quality

A summary of the assessment of laboratory data quality for groundwater and QA/QC samples relevant to the report is provided in the sections below.

Groundwater samples were analysed for a combination of analytes including metals, TRH, BTEXN, PAH, phenols, metals (Arsenic, Cadmium, Chromium, Copper, Lead, Nickel, Zinc, Mercury), manganese, cyanide, ammonia, methane.

The groundwater analytical suite selected is considered appropriate for the purposes of this report as they are consistent with the analytes identified as CoPC (refer **Section 2.2** of the main report) based on history and land use at Macquarie Point and surrounding areas.

4.2.1 Sample Receipt Temperature

Groundwater samples were kept chilled during storage and transportation with ice in portable coolers until received by the laboratory for analysis. Samples were reported to be received in good condition in appropriately preserved sample containers.

Samples were reported and received by the primary analytical laboratory (Eurofins) as chilled with ice present. Samples from all lab reports were reported as being received within the acceptable temperature range of 0 - 6°C.

Samples were received within the acceptable temperature range of 0 - 6°C by the secondary laboratory (ALS) except for batches EM2512123 (7.1°C) and EM2512174 (7.9°C), however, ice was noted to be present when samples were received by the secondary laboratory. It is considered unlikely that degradation of VOCs/SVOCs/TPHs occurred in transit, and the data is considered suitable for interpretation on the following basis:

- For batch EM2512174, there were no RPD exceedances between primary sample MW16 (batch 1236601) and secondary interlaboratory sample QC207 (batch EM2512174) except for VOCs TRH C6-C10 and methane. However, these RPD exceedances were also reflected at a similar range between primary sample MW16 and intra-laboratory duplicate sample QC107 (batch 1241421 – originally received as part of batch 1236601) which were received below 6°C, therefore the RPD exceedance cannot be directly attributed to receipt temperature differences.
- For batch EM2512123, there were no RPD exceedances (particularly between reported VOC concentrations) between primary sample MW186 (batch 1240646) and its respective inter-laboratory duplicate sample QC210 (EM2512123).

4.2.2 Sample Holding Times

All samples were reported as being received by the laboratories within the holding times for sample extraction and/or analysis, with the exception of:

- Primary sample batch 1240646 (primary samples MW120A, MW128A, MW186, MW196, MW197 & MW198, rinsate sample QC323, trip blanks QC528, QC529 and intra-laboratory duplicate QC110):

- 1 day outside holding time for TRH, PAH and Phenols.
- It is considered that the potential for low bias in the results (particularly VOCs) caused by a holding time exceedance of only 1 day is considered to be minimal given all other preservation benchmarks were met (appropriate preservatives were in the sample bottles, samples were immediately placed on ice and received at the laboratory below 6°C within the holding time), and therefore it is considered unlikely to affect the suitability of the samples in this batch for interpretive use.

- Interlaboratory sample batch EM2512123 (QC210):
  - 6 days outside holding time for TDS, TPH/TRH, PAH and phenols.
  - Although there is the potential for these analytes to have degraded over time and not be truly representative of field conditions and that this potential under reporting should be taken into consideration when interpreting data for these analytes, these holding time exceedances are not considered to adversely affect the suitability of this batch for interpretive use on the following basis:
    - There were no RPD exceedances between primary sample MW186 and interlaboratory duplicate QC210 (or between primary sample MW186 and intralaboratory duplicate QC110)
    - The highest reported concentration of any primary / intra- and interlaboratory duplicate sample combination has been adopted for interpretation.
- Interlaboratory batch EM2512174 (QC207):
  - 2 days outside holding time for TPH/TRH (volatile fraction) & BTEXN.
  - 3 days outside holding time for total/free/WAD cyanide & methane.
  - 8 days outside holding time for TDS.
  - 9 days outside holding time for TPH/TRH (semi-volatile fractions), PAH and phenols.
  - Although there is the potential for these analytes to have degraded over time and not be truly representative of field conditions and that this potential under reporting should be taken into consideration when interpreting data for these analytes, these holding time exceedances are not considered to adversely affect the suitability of this batch for interpretive use on the following basis:
    - There were few RPD exceedances between primary sample MW16 and interlaboratory duplicate QC207 except for TRH C6-C10 fraction, which was also reflected as an RPD exceedance between primary sample MW16 and intralaboratory duplicate QC107.
    - The highest reported concentration of any primary / intra- and interlaboratory duplicate sample combination has been adopted for interpretation.

Proactive holding time assessments completed by the analytical laboratory are provided in the SRN reports in **Appendix E**.

4.2.3 Limits of Reporting

Laboratory LORs were either lower than or equal to the screening criteria applied to the samples analysed, with the exception of the analytes and criteria listed in **Table 7** below.

Table 7 Adequacy of Laboratory LORs - Groundwater

Tier 1 Screening Criteria	Chemical	Screening Value (µg/L)*	LOR (µg/L)*
Drinking Water (Human Health)	Naphthalene	0.17	1
	Sum of PAHs & Benzo(a)pyrene	0.01	1
	Benz(a)anthracene	0.03	1
	Dibenz(a,h)anthracene	0.025	1

Tier 1 Screening Criteria	Chemical	Screening Value (µg/L)*	LOR (µg/L)*
	Indeno(1,2,3-cd)pyrene	0.25	1
	4,6-Dinitro-2-methylphenol	1.5	30
	2-Cyclohexyl-4,6-dinitrophenol	23	100
	Dinoseb	15	100
Drinking Water (Aesthetics)	2-chlorophenol	0.1	3
	2,4-dicholorophenol	0.3	3
	Sum of PAHs & Benzo(a)pyrene	0.1	1
Recreation (Primary / Secondary Contact)	Benz(a)anthracene	0.3	1
	Benzo(a)pyrene	0.1	1
	Dibenz(a,h)anthracene	0.25	1
	4,6-Dinitro-2-methylphenol	15	30

*Note: * Units for screening values and LOR values are expressed in 'µg/L' unless specified otherwise.*

Drinking of Site groundwater is prohibited by the SEMP (AECOM, 2024b), and is not considered a likely use at surrounding sites or in the inferred discharge water bodies (Sullivan's Cove and the River Derwent) due to the salinity of water bodies and the available supply of reticulated water in Hobart, and review of registered bores within 2 km of the Site conducted in 2024 did not identify any extractive groundwater use (refer to **Section 2.5.3** of the main report).

The CoPC with LORs in excess of the recreational criteria are all low mobility or immobile in groundwater, based on the logK_{OC} ranges provided in the ASC NEPM, and are not considered likely to have sufficient mobility in groundwater to reach the inferred point of discharge of groundwater (Sullivan's Cove / the River Derwent), where they could come into contact with potential receptors.

As such, the nominated LORs are considered acceptable for the objectives of the investigation.

4.2.4 Matrix Spike Recovery

The matrix spike recovery results are presented in the analytical laboratory QC reports provided in **Appendix E**. Matrix spike recoveries were noted to be within the DQO range of 70% - 130%, or laboratory-derived limits for the methods used, with the exceptions of the outliers noted in **Table 8** below.

Table 8 Matrix Spike Outliers - Groundwater

Work Order	Sample ID	Analyte	Matrix Spike	Limits
Groundwater				
12325787	M25-Jn0040583	Manganese (filtered)	61%	25%-125%[1]
EM2511596	QC209	Weak Acid Dissociable Cyanide	38.2%	70%-130%[2]
		Ammonia as N	ND[3]	
	QC208	Methane	ND[3]	
		Perfluoropropane sulfonic acid (PFPrS)	44.7%	70%-130%[2]
		N-Ethyl perfluorooctane	57.1%	61%-135%[2]

Work Order	Sample ID	Analyte	Matrix Spike	Limits
		sulfonamidoacetic acid (EtFOSAA)		
		10:2 Fluorotelomer sulfonic acid (10:2 FTS)	67.8%	70%-130%[2]
EM2512123	EM2512016--002	Sulfate as SO4 - Turbidimetric	ND[3]	
	EM2512117--001	Chloride	ND[3]	
	EM2512010--001	Total Cyanide	ND[3]	
	ES2520723--001	Methane	ND[3]	
EM2512174	EM2512080—002	Sulfate as SO4 – Turbidimetric	ND[3]	

Notes: ND – Not determined

1 – The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference.

2 - Recovery less than lower data quality objective

3 - MS recovery not determined, background level greater than or equal to 4x spike level.

Where matrix spike recoveries are not determined, the background analyte concentration was greater than or equal to four times the spike concentration, which does not affect the data quality as the spikes are used to assess matrix effects, and the concentrations are typically spiked at one to 10 times the expected sample concentration.

The laboratories have indicated that matrix spike non-conformances (where recoveries were determined) are due to sample matrix interferences.

Based on these non-conformances the reported concentrations for the samples listed above may bias slightly lower (matrix spike recovery below recovery range) depending on the analyte.

4.2.5 Laboratory Method Blanks

All groundwater laboratory method blanks were reported within the acceptable range, i.e. below the laboratory LORs and are presented in the analytical laboratory QC reports provided in **Appendix E**.

4.2.6 Surrogate Spike Recoveries

The surrogate spike recovery test results and laboratory-derived control limits are presented in the analytical laboratory QC reports provided in **Appendix E**. All surrogate spike recoveries for regular sample matrices were within the surrogate control limits adopted for the methods used.

4.2.7 Laboratory Control Spikes

Laboratory control spikes, presented in **Appendix E**, were within the laboratory-derived control limits for the methods used.

4.2.8 Frequency of Quality Control Spike

Frequency of QC spikes, presented in **Appendix E**, were at the rate expected by applicable QC specifications, with the exceptions of the outliers listed in **Table 9** below.

Table 9 Frequency of Quality Control Samples - Groundwater

Work Order	Type	Analyte	Rate (%)		QC Specification
			Actual	Expected	
Groundwater					

Work Order	Type	Analyte	Rate (%)		QC Specification
			Actual	Expected	
EM2511596	Laboratory duplicates	PAH/Phenols (GC/MS-SIM)	0	10	NEPM 2013 B3 & ALS QC Standard
	Matrix Spikes	PAH/Phenols (GC/MS-SIM)	0	5	NEPM 2013 B3 & ALS QC Standard
		TRH – Semivolatile Fraction	0	5	NEPM 2013 B3 & ALS QC Standard
EM2512123	Laboratory duplicates	PAH/Phenols (GC/MS - SIM)	0	10	NEPM 2013 B3 & ALS QC Standard
		TRH - Semivolatile Fraction	0	10	NEPM 2013 B3 & ALS QC Standard
	Matrix Spikes	PAH/Phenols (GC/MS - SIM)	0	5	NEPM 2013 B3 & ALS QC Standard
		TRH - Semivolatile Fraction	0	5	NEPM 2013 B3 & ALS QC Standard
EM2512174	Laboratory duplicates	PAH/Phenols (GC/MS - SIM)	0	10	NEPM 2013 B3 & ALS QC Standard
		TRH - Semivolatile Fraction	0	10	NEPM 2013 B3 & ALS QC Standard
		TRH - Total Recoverable Hydrocarbons - Silica Gel Cleanup	0	10	NEPM 2013 B3 & ALS QC Standard
	Matrix Spikes	Free CN by Segmented Flow Analyser	0	5	NEPM 2013 B3 & ALS QC Standard
		PAH/Phenols (GC/MS - SIM)	0	5	NEPM 2013 B3 & ALS QC Standard
		TRH - Semivolatile Fraction	0	5	NEPM 2013 B3 & ALS QC Standard
		TRH - Total Recoverable Hydrocarbons - Silica Gel Cleanup	0	5	NEPM 2013 B3 & ALS QC Standard
		Weak Acid Dissociable Cyanide by Segmented Flow Analyser	0	5	NEPM 2013 B3 & ALS QC Standard

Based on the above non-conformances the precision and accuracy assessment for this data is limited to field duplicates and laboratory control spikes for the compounds listed above.

4.2.9 Laboratory Duplicates and RPDs

Internal laboratory duplicates and RPD calculations were conducted on random samples outside the investigation dataset to assess the precision of testing equipment. The RPD between analytical results and their corresponding laboratory duplicates were within acceptable limits, with the exception of the duplicate outliers listed below in **Table 10**.

Table 10 Laboratory Duplicate RPD Exceedances - Groundwater

Work Order	Sample ID	Analyte	RPD (%)	Limits (%)
Groundwater				
1232587	M25-Jn0040583	Methane	34%	0% - 30%[1]

Work Order	Sample ID	Analyte	RPD (%)	Limits (%)
1234320	M25-Jn0051416	TRH C15-C28	31%	0% - 30%[1]
		TRH >C16-C34	34%	0% - 30%[1]
1234988 and 1235243	M25-Jn0056613	Chromium (filtered)	57%	0% - 30%[1]
1236601	M25-Jn0068788	Perfluoropentanoic acid (PFPeA)	59%	0% - 30%[1]
1237216	M25-Jn0072833	PAH - Acenaphthene	53%	0% - 30%[1]
		PAH - Fluoranthene	58%	0% - 30%[1]
		PAH - Fluorene	35%	0% - 30%[1]
		PAH - Phenanthrene	54%	0% - 30%[1]
		PAH - Pyrene	54%	0% - 30%[1]
1240646	M25-Jl0013171	Perfluorohexanoic acid (PFHxA)	33%	0% - 30%[1]
		Perfluorohexanesulfonic acid (PFHxS)	36%	0% - 30%[1]
		Perfluorooctanesulfonic acid (PFOS)	51%	0% - 30%[1]
1241421	M25-Jl0019440	Perfluorooctanoic acid (PFOA)	97%	0% - 30%[1]
	M25-Jl0024227	TRH >C10-C16	35%	0% - 30%[1]
		TRH >C16-C34	60%	0% - 30%[1]

Notes: 1 – The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Laboratory duplicate RPD exceedances should be taken into consideration when using the data qualitatively.

5.0 Assessment of Soil Vapour Data

5.1 Field Data Quality

5.1.1 Sample Collection

Collection of soil vapour and associated QA/QC samples was undertaken by AECOM field personnel trained and experienced in environmental sampling, in accordance with the methodology described in the SAQP (AECOM, 2025d).

5.1.2 Leak Testing

As discussed in **Section 6.3.1** of the investigation report, leak testing results can be summarised as follows:

- All samples passed the shut-in test.
- All initial canister pressures ranged from -26 to -30 mmHg, which was within the acceptable range as prescribed by the laboratory.
- Final sample pressures ranged from -4 to -6 mmHg, which is within the recommended range.
- The difference in pressure recorded at the completion of sampling and by the laboratory upon receipt ranged from -1.94 to +1.96 mmHg, which resulted in a calculated % difference of between -11% (an apparent increase in vacuum) and 8% (a decrease in vacuum). A decrease in vacuum can be indicative of leakage during transit, which may cause a low bias to the results, however none of the canisters exceeded the maximum relative vacuum loss % threshold of 10%. Given the low range of pressure difference, and that apparent increases in vacuum were also recorded at a similar scale and distribution to the decreases, they are likely within the range of error and imprecision between pressure gauges, and not considered to adversely impact the integrity of the results.
- Leak test indicator gas (isopropanol) was maintained at an average concentration of 1,394,920 µg/m^3 within a shroud covering both the canisters and soil vapour bore tubing/gatic throughout the sampling process. A canister sample of the shroud atmosphere was collected at SV42 (QC600) to quantify isopropanol concentrations, which reported a concentration of 2,600,000 µg/m^3. This was approximately twice the field-measured concentration measured while sampling SV42 (1,314,941 µg/m^3) using a PID with 4.6 isopropanol conversion factor, indicating that field measurements may have under-reported actual isopropanol concentrations by up to 50%. This is not considered to adversely impact the integrity of the leak test on the basis of the following point.
- The concentration of isopropanol leak test indicator gas within each sample ranged from <0.01 to 0.77% of the concentration within the shroud, which is well below the maximum threshold of 10%. This indicates that reported concentrations are considered to be representative of targeted sub-surface soil vapour conditions.

Leak test results are presented in **Table T3** (**Appendix B**).

5.1.3 Field Duplicate Samples

Field duplicate samples (intra-laboratory duplicates) were not collected during the soil vapour field sampling program due to the following:

- Three of the total number of canisters ordered arrived with an initial pressure of less than the laboratory-recommended minimum of -25 mmHg, indicating that a leak may have occurring during initial transit to site that may have compromised sample integrity if used. This meant that there were not enough canisters available within the minimum recommended initial pressure range to cover the duplicate sample.
- Additional canisters were expedited from the interstate laboratory to the site during the field sampling program, however they did not arrive in time due to delays with the courier company.

Based on no collection of field duplicate samples, laboratory data should be based on the precision and accuracy of laboratory statement of QA/QC performance, as presented in **Appendix E.** As a

conservative approach (requiring management of vapour infiltration in future buildings and structures) has been adopted, repeat sampling is not proposed.

5.2 Laboratory Data Quality

SGS Australia Pty Ltd, a NATA-accredited laboratory, were engaged to provide soil vapour suma canisters for sample collection, and to subsequently analyse soil vapour samples for CoPC.

A summary of the assessment of laboratory data quality for soil vapour and QA/QC samples relevant to the report is provided in the sections below.

Soil vapour samples were analysed for TO-15 method analytes including BTEXN, TPH (with aliphatic/aromatic speciation), O_2, CO_2, CH_4, and isopropanol (leak test indicator gas).

The soil vapour analytical suite selected is considered appropriate for the purposes of this report as they are consistent with the analytes identified as CoPC (refer **Section 2.2** of the main report) based on history and land use at Macquarie Point and surrounding areas.

5.2.1 Handling and Preservation

The laboratory-supplied certificate of cleanliness (**Appendix E**) did not report any concentrations of TO-15 analytes above the LOR.

Soil Vapour Suma Canisters were kept in laboratory provided containers during storage and transportation to and from the Site.

Initial pressures for the canisters used for sampling ranged from -26 to -30 mmHg. As discussed above, 3 of the 23 total canisters arrived with initial pressures below the laboratory-recommended minimum of -25 mmHg, which accounted for two spares and a duplicate sample (which was not able to be collected).

As discussed above in **Section 5.1.2**, the final field canister pressures following sampling ranged between -4 to -6 mmHg, and the final pressures recorded by the laboratory upon receipt ranged between 3.06 to 7.96 µg/m^3, which is within the recommended range. The difference in final pressure recorded at the completion of sampling and again by the laboratory upon receipt ranged from -1.94 to +1.96 mmHg, which is not considered to be indicative of significant leakage during return transit to the laboratory, and is likely within the range of pressure gauge variation.

5.2.2 Sample Holding Times

All samples were reported as being received by the laboratory within the holding times for the sample extraction and/or analysis. Proactive holding time assessments completed by the analytical laboratory are provided in the SRN reports in **Appendix E**.

5.2.3 5.2.3 Limits of Reporting

Laboratory LORs were either lower than or equal to the screening criteria applied to the samples analysed.

5.2.4 Matrix Spike Recovery

The matrix spike recovery test results were not required as presented in described in SGS analytical laboratory QC reports in **Appendix E**.

5.2.5 Laboratory Method Blanks

Soil vapour laboratory method blank concentrations were not detected above the laboratory LOR for all analytes tested and are presented in the analytical laboratory QC reports provided in **Appendix E.**

5.2.6 Surrogate Spike Recoveries

The surrogate spike recovery test results were not required as presented in described in SGS analytical laboratory QC reports in **Appendix E**.

5.2.7 Laboratory Control Spikes

Laboratory control spikes, presented in **Appendix E**, were within the laboratory-derived control limits for the methods used.

5.2.8 Laboratory Duplicates and RPDs

The RPD between analytical results for primary samples and their corresponding internal laboratory duplicates were within acceptable limits and are presented in the analytical laboratory QC reports provided in **Appendix E**.

6.0 Summary

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicate that the following should be considered when assessing the data provided in the report:

6.1 Soil

Laboratory QA/QC measures for soil were considered to be acceptable based on the heterogeneity expected in fill material and soil composition.

- Rinsate Blank QC313 reported an exceedance at 0.02 mg/L for Ammonia (as N). This is marginally above the laboratory LOR (0.01 mg/L) and a potential small positive bias in the results is unlikely to affect the interpretation of results.
- Field duplicate RPDs in soils for TRH/TPH, BTEXN and PAHs/phenols indicate potential variations associated with fill material, however, as approximately 97% of the RPDs were within acceptable limits, precision was considered to be adequate for interpretive use. The highest concentration of any inter- or intra-laboratory duplicate sample combination has been adopted for interpretive use.
- Soil samples received by laboratories were noted to be chilled with ice, although some samples were received above the acceptable temperature range of 0 – 6°C, at temperatures between 7.3 – 10.2°C (batches 1225146, 1229786, EM2510162 and EM2509944), however this was not considered to affect the interpretation of the results due to the following:
    - For batches 1225146, 1229786 and EM2510162, there was insufficient cooling time between sample collection and laboratory drop-off on the same day.
    - For batches EM2510162 and EM2509944 (interlaboratory duplicate samples QC203 and QC204), RPD exceedances were within acceptable limits and volatile CoPC concentrations were below LOR between primary / intra laboratory duplicate pairs (MW194_3.0 / QC103 and MW184_1.0 / QC101) that were received below 6°C.
- LORs were greater than adopted criteria for:
    - PAHs (benzo(a)pyrene and dibenz(a,h)anthracene) for human health (direct contact) for low/medium/high residential and recreational/open space uses. As residential use is not proposed in the areas soil samples were collected, and the future development of the Site includes a barrier between soil and direct contact with Site users, these LORs are not considered to affect the overall outcomes of assessment.
    - TRH (>C10-C16 (minus naphthalene) for human health (vapour intrusion) for residential users. As residential use is not proposed in any of the areas where soil samples were collected, the LOR is not considered to affect the overall outcomes of assessment.

6.2 Groundwater

- Rinsate Blank QC314 reported an exceedance at 0.02 mg/L for Ammonia (as N). This is marginally above the laboratory LOR (<0.02 mg/L) and a potential small positive bias in the results is unlikely to affect the interpretation of results.
- Field duplicate RPDs in groundwater for PAHs, PFAS, Methane and TRH indicate potential variations associated with sample heterogeneity, VOC instability and/or laboratory methods, however, as approximately 96.5% of the RPDs were within acceptable limits, precision was considered to be adequate for interpretive use. The highest concentration of any inter- or intra-laboratory duplicate sample combination has been adopted for interpretive use.
- Groundwater samples received by laboratories were noted to be chilled with ice, although two batches of secondary interlaboratory duplicate samples were received above the acceptable temperature range of 0 – 6°C, at temperatures between 7.1 – 7.9°C (batches EM2512174 and EM2512123). This was not considered to affect suitability for interpretive use on the following basis:
    - For batch EM2512174, there were no RPD exceedances between primary sample MW16 (batch 1236601) and secondary interlaboratory sample QC207 (batch EM2512174) except

for VOCs TRH C6-C10 and methane. However, these RPD exceedances were also reflected at a similar range between primary sample MW16 and intra-laboratory duplicate sample QC107 (batch 1241421 – originally received as part of batch 1236601) which were received below 6°C, therefore the RPD exceedance cannot be directly attributed to receipt temperature differences.

  - For batch EM2512123, there were no RPD exceedances (particularly between reported VOC concentrations) between primary sample MW186 (batch 1240646) and its respective inter-laboratory duplicate sample QC210 (EM2512123).

- Holding times were exceeded by 1 day for primary sample batch 1240646. It is considered that the potential for analyte degradation (particularly VOCs) caused by a holding time exceedance of only 1 day is likely to be minimal given all other preservation benchmarks were met (appropriate preservatives were in the sample bottles, samples were immediately placed on ice and received at the laboratory below 6°C within the holding time), and therefore it is considered unlikely to affect the suitability of the samples in this batch for interpretive use.
- Holding times were exceeded by 2 – 9 days in secondary interlaboratory duplicate sample batches EM2512123 and EM2512174 (depending on the analyte). Although there is the potential for these analytes to have degraded over time and not be truly representative of field conditions and that this potential under reporting should be taken into consideration when interpreting data for these analytes, these holding time exceedances are not considered to adversely affect the suitability of this batch for interpretive use on the following basis:
  - There were few RPD exceedances between associated primary and intra- and interlaboratory duplicate sample pairs, and any exceedances were reflected in both primary / intralaboratory and primary / interlaboratory sample combinations.
  - The highest reported concentration of any primary / intra- and interlaboratory duplicate sample combination has been adopted for interpretation.
- LORs were greater than adopted criteria for:
  - PAHs (naphthalene, benzo(a)pyrene, benz(a)anthracene, dibenz(a,h)anthracene, indeno(1,2,3-c,d)pyrene, sum of PAHs) and phenolic compounds (4,6-dintro-2-methylphenol [dinitro-o-cresol]), 2-cyclohexyl-4,6-dinitrophenol, dinoseb, 2-chlorophenol, 2,4-dichlorophenol) for drinking water (health and/or aesthetics). No extractive groundwater bores have been identified within 2 km of the Site, and extraction of groundwater for drinking purposes is not considered likely to occur now or in the future based on the urban setting and available reticulated water supply, and these LORs are not considered to present a data gap or any risk to human receptors.
  - PAHs (benz(a)anthracene, benzo(a)pyrene, dibenz(a,h)anthracene) and phenol (4,6-dintro-2-methylphenol [dinitro-o-cresol]) for recreational (primary/secondary contact) users. All these CoPC are low mobility or immobile in groundwater, based on the organic carbon-water partitioning ranges presented in the ASC NEPM, and are not considered to have sufficient mobility to migrate to the inferred points of groundwater discharge (Sullivan's Cove / the River Derwent) where they may come into contact with potential receptors, and these LORs are not considered to present a data gap or any risk to human receptors.

6.3 Soil vapour

Soil vapour Intra-laboratory duplicate sample was not collected during the field program due to three of the 23 supplied canisters (including 2 spares and 1 duplicate canister) delivered with an initial pressure below the minimum laboratory-recommended threshold of -25 mmHg, indicating a potential leak during transit. Replacement suma canisters were immediately dispatched by the interstate laboratory but did not arrive prior to the completion of the field program. Laboratory data should be based on the precision and accuracy of laboratory statement of QA/QC performance. As a conservative approach (requiring management of vapour infiltration in future buildings and structures) has been adopted, repeat sampling is not proposed.

These are not considered to impact the overall reliability and usability of the analytical data for the purpose of this report.

Based on the known contamination status of the Site, the procedures adopted during the field program, and the analytical data validation procedures employed, the data are considered to be suitable for interpretative use.

*RPDs have only been considered between individual analytes, where a concentration is greater than 1 times the EQL. Summed concentrations and TEQ calculations have been excluded from RPD calculations.

**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 200 (1 - 10 x EQL); 50 (10 - 20 x EQL); 30 (> 20 x EQL))

***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

*RPDs have only been considered between individual analytes, where a concentration is greater than 1 times the EQL. Summed concentrations and TEQ calculations have been excluded from RPD calculations.
**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 200 (1 - 10 x EQL); 50 (10 - 20 x EQL); 30 (> 20 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

RKI GX-6000

Enqip #: 24675

Company: AECOM Australia Pty Ltd

Consultant: Richard Bowers

PO #: TBC

Certificate #: 36573

INSTRUMENT IDENTIFICATION

Model Number: GX-6000

Serial Number: 52J0193501-5RN

INSPECTION RECORD

Flow Rate: PASS

Buzzer: PASS

Date & Time: PASS

CALIBRATION DETAILS

Sensor	Span Gas	Value	Reading	
O_2	Air	20.9 %	20.9	%
	O_2	18.0 %	18.0	%
H_2S	Hydrogen Sulphide	25ppm	N/A	ppm
LEL	Methane 2.5%	50%	50	%
CO	Carbon Monoxide	100ppm	N/A	ppm
CO2 PPM	Carbon Dioxide	5000 ppm	N/A	ppm
VOC	Isobutylene	100ppm	100	ppm

Correction Factor: 1

Calibration Successful: YES

Calibrated By: Phuong Tran **Test Date:** 21/05/2025

Executive Summary

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) to undertake assessment and identification of Acid Sulfate Soil (ASS) in areas of the Macquarie Point and Regatta Point sites (referred to collectively as "the Site") which may be disturbed by proposed future development of the Site.

Acid Sulfate Soils (ASS) are soils containing sulfides, most commonly iron sulfides, which have been generated by natural bacterial activity in anerobic, sulfate rich water (e.g. coastal swamp or wetland) and remain buried generally beneath the water table. If ASS is oxidised, sulfuric acid may be produced, in potentially high quantities which may represent a risk to surrounding land and aquatic humans and ecosystems. Unoxidised ASS, for example ASS below the water table, is referred to as Potential Acid Sulfate Soil (PASS), while ASS which has oxidised is referred to as Actual Acid Sulfate Soil (AASS).

The assessment methodology and framework was derived from the *Tasmanian Acid Sulfate Soil Management Guidelines* (TASSMG) (Department of Primary Industries, Parks, Water and Environment [DPIPWE], 2009), and consisted of:

- A preliminary desktop review of the Site location and elevation, including review of existing ASS mapping information, and the level of disturbance which may be required by future construction activities.
- Review of soil profile mapping.
- Collection of soil samples for laboratory assessment and analysis in two field events:
  - 339 soil samples were collected from 30 soil bores on Macquarie Point during a geotechnical investigation conducted by WSP Pty Ltd (WSP) between 16 April 2024 and 11 June 2025.
  - 15 soil samples were collected from four soil bores on Regatta Point as part of an environmental investigation conducted by AECOM on 20 September 2024.
- Laboratory analysis of soil samples for:
  - pH field screening
  - Chromium Reducible Sulfur (CRS) and Suspension Peroxide Oxidation Combined Acidity and Sulfur (SPOCAS).
  - Incubation assessment / chip tray analysis.
- Review of results and preparation of this report.

The preliminary desktop review and soil profile mapping identified that there was potential for ASS to be present, and disturbed in a volume greater than 100 m^3 by development, on both Macquarie Point and Regatta Point, primarily by:

- Lowering or reworking of the Site surface elevation to preserve sight lines and level areas for development.
- Installation of piling and lift wells.
- Excavation of soil to install underground carparking in the north-east portion of Macquarie Point.

Based on observations recorded during bore advancement and the results of laboratory analysis for pH field screening, CRS, SPOCAS, and chip tray analysis, the following is concluded about the presence, extent and characteristics of ASS at the Site:

- No AASS has been detected at Macquarie Point, and no ASS (either AASS or PASS) has been detected at Regatta Point.
- Oxidisable sulfides have been detected at Macquarie Point, consisting generally of sands and clays consistent with estuarine materials, and it is considered likely that river- and lake-bed materials (either originally present on Site, or used as part of historic land reclamation) is the ultimate source of this material.

Soil with a high potential to acidify due to the presence of reduced inorganic sulphur, which is considered PASS, has been identified in:

- Saturated soil, and soil which may have been intermittently wet at the water table.
- Pockets of unoxidised estuarine sands in fill, characterised as black sand and gravel, which has not oxidised prior or during land reclamation, or while *in situ* on the Site.

Management will be required for any work which may disturb or dewater PASS.

- Review of historic data identified indicators that Site groundwater may have been affected by the oxidation of sulfides, but that acidification has not occurred. Site groundwater is assessed as reasonably adequate to maintain a neutral pH in future, noting that this does not constitute protection against environmental impact if widespread or uncontrolled acidification occurs due to Site activities.
- PASS management is not considered required for the remaining unsaturated soil at the Site based on the existing ANC of soil, which is an order of magnitude or greater than the potential acidity. While the reported ANC may be inflated by sample preparation, it is considered suitable for use in interpretation with the safety margin of 10x as it has been corroborated by chip tray analysis.
- Indicative dosage rates of to treat and neutralise PASS of between 28 and 73 kg/tonne with a generic agricultural lime (aglime) if disturbed have been calculated, based on the location and treatment scenario (*in situ* vs stockpiled PASS).

  The estimated rates are based on a generic assumed aglime with an SNV ≥ 85%$CaCO_3$, and in which ≥80% of aglime particles are < 0.3mm. These parameters have been assumed based on typical aglime available in eastern Australia.

  Any neutralisation agent proposed for use on the Site should be compared to these properties. While alternatives may be suitable for PASS treatment, the suitability and dosage rate of any alternative should be reviewed and verified by a suitability qualified and experienced environmental practitioner with consideration of:

  - SNV and particle size distribution
  - Solubility and longevity
  - Potential for other environmental effects.

  Any neutralisation of PASS must be verified by post-treatment laboratory analytical results.

Based on the outcomes of this assessment, it is recommended that:

- Future activities at Macquarie Point should identify all activities which have the potential to disturb or expose (i.e., dewater) PASS at the Site, and:
  - The Site Environment Management Plan (SEMP) and Construction Environment Management Plans (CEMPs) should include overarching management obligations for disturbance of ASS and/or water table drawdown via dewatering.
  - A scope specific Acid Sulfate Soil Management Plan (ASSMP) and Dewatering Management Plan (DWMP) should be developed for each discrete works package involving civil and general earthworks activities, water table drawdown via dewatering, and any other significant soil disturbance activities or changes to natural groundwater and surface water systems.

    These documents should be prepared by those undertaking works which may disturb PASS, and must include:

    - Estimated volumes and action criteria for PASS which may be disturbed by the proposed works.
    - Procedures for the handling of disturbed PASS, including verification of neutralisation, groundwater generated by dewatering, and monitoring of Site environmental conditions in the vicinity of PASS disturbances.

    - Contingency measures which are specific, measurable, and attainable, and can be implemented in a timely manner in the event that action criteria or trigger values are exceeded.

- Future structures and infrastructure at the Site should consider the potential effects of sulfides and possible acidification in design and selection of materials, and adopt appropriate mitigation measures to prevent degradation of materials overtime.
- Any groundwater, or run-off which may have come into contact with PASS, should be considered as potentially contaminated. pH and the potential to acidify should be considered in assessment any such water prior to disposal

The above recommendations should be documented in the Site Environment Management Plan (SEMP; AECOM, 2025a).

1.0 Introduction

The Macquarie Point Development Corporation (the Corporation) has engaged the services of AECOM Australia Pty Ltd (AECOM) in the role of Project Remediation Consultant to assist with the development, implementation, and ongoing oversight of a remediation strategy for the Macquarie Point site, and adjacent Regatta Point site in Hobart, Tasmania. These areas are collectively referred to as "the Site" in this report. The Site location is shown on **Figure F1**, and layout and proposed future development on **Figure F2**.

Acid Sulfate Soils (ASS) are soils containing sulfides, most commonly iron sulfides, which have been generated by natural bacterial activity in anerobic, sulfate rich water (e.g. coastal swamp or wetland) and remain buried generally beneath the water table. If ASS is oxidised, sulfuric acid may be produced, in potentially high quantities which may represent a risk to surrounding land and aquatic humans and ecosystems. Unoxidised ASS, for example ASS below the water table, is referred to as Potential Acid Sulfate Soil (PASS), while ASS which has oxidised is referred to as Actual Acid Sulfate Soil (AASS).

The Site is mapped as having a low probability (6-70%) of Potential Acid Sulfate Soils (PASS), as indicated on LISTMap's Coastal Acid Sulfate Soils (0 – 20m AHD) layer, however the site is located close to the surface water bodies of the River Derwent and Sullivans Cove and alluvial/estuarine sands have been observed during previous intrusive investigations (AECOM, 2024). These sediments, which are covered by historic land reclamation events (1827 and 1970), may be disturbed, for example during pile installation, as part of the planned future development of the Site described in the *Mac Point Precinct Plan* (the Precinct Plan) (MPDC, 2024).

At the request of the Corporation, AECOM has prepared this report detailing assessment and identification of potential on-Site ASS based on field investigations conducted between April 2024 and June 2025.

1.1 Objectives and Scope of Work

The objectives of this report are to:

- Assess if ASS is present in the areas of the Site which may be disturbed by future development.
- Evaluate the potential impacts to human health or the surrounding environment if ASS is present and disturbed by the proposed development of the Site.
- Identify suitable mitigation measures to avoid or minimise any identified ASS, or manage any ASS which may be unavoidably disturbed by future development of the Site.

In order to fulfil these objectives, the following scope of work has been completed:

- Collection of representative Site soil samples and ASS field screening during three field events:
    - 258 soil samples from 20 soil bore locations on Macquarie Point, where soil was considered likely to be disturbed by future stadium development, were collected by WSP Australia Pty Ltd (WSP) between 16 April and 21 May 2024, in tandem with a broader geotechnical assessment of Site soil in this area.
    - 15 soil samples from 4 soil bore locations in Regatta Point were collected by AECOM on 20 September 2024, as part of a broader environmental investigation of this area.
    - 81 soil samples from 10 soil bores in shallow, unsaturated soil surrounding boreholes BH-004 and ABH-004 by AECOM between 27 April and 4 June 2025, to further assess the potential for acidification in these locations.
- Assessment of field screen results and selection of samples for Chromium Reducible Sulfur (CRS), Suspension Peroxide Oxidation Combined Acidity and Sulfur (SPOCAS), and chip tray analysis.
- Assessment of results of additional testing in context of the Site setting and proposed future development.

This report has been prepared to document the work conducted, the outcomes of assessments, and any requirements or recommendations for future work.

1.2 Regulatory Framework and Guidelines

The Corporation was formed under the *Macquarie Point Development Corporation Act 2012* (the MPDCA), last amended 1 July 2023. Under the MPDCA, the Corporation has the following principal objectives:

a) to plan, facilitate and manage the remediation of the Macquarie Point land in accordance with the Intergovernmental Agreement; and

b) to plan, facilitate and manage the redevelopment of the site so as to ensure that the site –

i) is redeveloped as a vibrant and active area, with a mix of uses, that connects with and complements adjacent areas within Hobart; and

ii) encourages inner-city living; and

iia) encourages pedestrian and bicycle traffic; and

iib) allows for public transport; and

iic) provides for public open space; and

iii) is redeveloped so as to deliver sustainable social and economic benefits to Hobart; and

iv) is redeveloped in accordance with sound planning, urban design and environmental principles; and

ba) to plan, facilitate and manage temporary and longer-term use of the site; and

(c) to the extent practicable, to make a profit from carrying out its functions

Remediation and assessment of the Site has been conducted in order to assist in meeting these objectives. Assessment for ASS has been conducted as part of the Corporations mandate to plan, facilitate and manage the redevelopment of the Site.

1.2.1 Acid Sulfate Soil

While there is no Tasmanian legislation which directly considers ASS, identification and management of ASS and potential environmental issues which may arise from it is considered to fall under the General Environmental Duty contained in the *Environmental Management and Pollution Control Act 1994* (the EMPCA), which states:

A person must take such steps as are practicable or reasonable to prevent or minimise environmental harm or environmental nuisance caused, or likely to be caused, by an activity conducted by that person.

The *Tasmanian Acid Sulfate Soil Management Guidelines* (the TASSMG) (DPIPWE, 2009), provide a seven step framework for identification, assessment, and management of ASS, summarised on **Table 1** in **Section 1.3**. This assessment has been conducted in accordance with the approach in the Guidelines, with additional information to inform the approach and interpretation taken from the following state or national framework documents or guidelines:

- *Australian Standard 4482.1-2005 Guide to the investigation and sampling of sites with potentially contaminated soil. Non-volatile and semi volatile compounds* (AS4482.1) (Standards Australia, 2005)
- *National Environment Protection (Assessment of Site Contamination) Measure 1999* as amended in 2013 (the ASC NEPM)
- *National Acid Sulfate Soils Guidance: National Acid Sulfate Soils Identification and Laboratory Methods Manual 2018*
- *Victorian Best Practice Guidelines for Assessing and Managing Coastal Acid Sulfate Soil* (CASS BPMG, 2010)
- *Queensland Acid Sulfate Soil Technical Manual, Soil Management Guidelines* (Dear et al, 2024)
- *Treatment and Management of Soils and Water in Acid Sulfate Soil Landscapes* (DER, 2015a)
- *Identification and Investigation of Acid Sulfate Soils and Acidic Landscapes* (DER, 2025b)

1.2.2 Development of the Site

The Tasmanian Government Department of State Growth announced in September 2022 that the Site is the preferred location for a mixed-use precinct, including a multipurpose stadium. Details of the proposed development of the Site were released in the Precinct Plan (MPDC, 2024).

The proposed development of a multipurpose stadium at the Site was classified as a Project of State Significance (PoSS) by the Governor of Tasmania on 16 October 2024, and was subject to an integrated assessment process by the Tasmanian Planning Commission (TPC) under the *State Policies and Projects Act 1993*.

TPC issued the *Integrated Assessment Report – Macquarie Point Multipurpose Stadium Project of State Significance* (TPC, 2025) in September 2025. With consideration of the TPC report, *State Policies and Projects (Macquarie Point Precinct) Order 2025*,was introduced to the Tasmanian House of Assembly for review in October 2025, and is currently undergoing parliamentary review. If this order is accepted by both houses of Tasmanian State Parliament, it will approve and provide the conditions under which the development of the Site shall proceed.

Clause 14 of Schedule 5 of the order requires a Construction Environment Management Plan (CEMP) to be prepared for the work, and Clause 14 (2) (b) of Schedule 5 notes that the CEMP must include "*a management plan for contaminated sites that provides for the prevention, minimisation and control of potential human health and environmental risks associated with subsurface contamination and acid sulphate soils…"*

1.2.3 Site Environmental Audit

The MPDCA was amended in 2015 to enable the accreditation of a Contaminated Land Auditor, which for the first time in Tasmania allowed for a statutory audit of contaminated land to be undertaken (the Audit). The Corporation has engaged an independent Contaminated Land Auditor (the Auditor), Mr David Lam of Tetra Tech Coffey Pty Ltd (Coffey) to provide confidence to key stakeholders that environmental investigations, remediation, and validation activities have been completed to a level compliant with required standards

Mr Lam is included on the Director of the Tasmanian EPA Register of Interstate Contaminated Land Auditors and is considered suitably qualified by EPA to undertake an Environmental Audit to review the progress of environmental assessment, remedial planning and execution works at the Site.

The role of the Auditor is to ensure that the works are carried out in compliance with local Tasmanian legislation and guidelines with consideration given to the requirements of the Victorian EPA Environmental Audit framework in the absence of an Audit scheme in Tasmania. It is noted that Victoria legislation which defines the Audit process was updated and superseded by the *Environment Protection Act 2017* (the EP Act), which came into effect on 1 July 2021, and contains significant changes to Audit methodology and terminology under the Victorian framework. Under Section 478 of the EP Act, existing Audits where an Auditor has been engaged prior to 1 July 2021, and the Audit has not been completed by 1 July 2021, can be conducted under either the EP Act or the previous framework. To maintain continuity with the portions of the Audit already completed, the Site Audit has continued under the previous framework and terminology at this time, noting that this approach may be changed in future.

The overarching outcome required for the Environmental Audit is an Environmental Audit Statement and Environmental Audit Report (i.e., sign off) prepared by the Contaminated Land Auditor confirming that Clean Up to the Extent Practicable (CUTEP) (also referred to as Clean Up So Far As Reasonably Practicable [CUSFARP] in more recent regulation) has been achieved and that the Site is suitable for the intended future uses.

Transfer of the land comprising Regatta Point to the Corporation's control is currently underway, however this area has not yet been formally added to the Site Environmental Audit. However, the Corporation has begun investigations of Regatta Point and provided details of actions and assessments undertaken to the Environmental Auditor under the expectation that Regatta Point will be included in the Site Environmental Audit scope in the near future.

1.3 Assessment Methodology

The TASSMG (DPIPWE, 2009) provides a seven step framework for identification, assessment, and management of ASS, summarised on **Table 1** below, with reference to where in the report text each step in the assessment process has been conducted.

Table 1 Assessment of Projects Which May Affect Acid Sulfate Soils

Step	Summary	Results
1	**Assess Location** If the proposed project is: • within the coastal zone, and is located, or will disturb soil or nearby groundwater hydrology, at or below 20 m AHD; or • in an inland area, but within or adjacent to a deflation basin, wetland area, area of known acid mine discharge, or if indicators of acid conditions are identified Proceed to **Step 2** if any of these conditions are met.	**Section 4.1**
2	**Consider Level of Disturbance** If the proposed project will: • excavate >100 m^3 of soil or sediment; or • will involve the dumping or filling of land with more than 500 m^3 of soil to a depth greater than 0.5 m Proceed to **Step 3** if any of these conditions are met.	
3	**Review Existing Mapping Information** If the proposed project area: • Is mapped as a potential ASS risk area on existing map resources which predict the distribution of coastal areas affected or potentially affected by ASS. LISTMap (https://www.thelist.tas.gov.au/app/content/home) or the Australian Soil Resource Information System (ASRIS) (https://data.csiro.au/collection/csiro:62790) are referenced in the Guidelines. • Has local indicators or topography which indicates ASS risk. Proceed to **Step 4** and beyond if any of these conditions are met.	
4	**Desktop Risk Assessment** Potential disturbances in groundwater hydrogeology or surface drainage patterns should be investigated, designed and managed to avoid potential adverse effects on the natural and built environment and human health.	
5	**Develop a Soil Profile** Develop a profile of project soils, including soil types and depths, and assess the likelihood of soil types to contain ASS, and volumes of any such soils identified to be disturbed by the proposed project.	**Section 4.2**
6	**Conduct Field Tests and Laboratory Analysis** Collect field data to assess ASS presence. Sampling and testing of soil should be undertaken by a qualified and experience soil professional. Results of field trials and laboratory analysis should be interpreted to present the locations, depths, and concentrations of any ASS detected.	**Section 5.0**
7	**Develop an Acid Sulfate Soil Management Plan** Develop an ASS Management Plan to minimise environmental harm from the project.	To be conducted prior to each phase of work. Considerations are included as **Section 6.0**

2.0 Site Setting and Background

2.1 Description and Features

Prior to European settlement, Hobart and the surrounding areas, including the Site, were occupied and inhabited by the Muwinina people.

Since first European settlement circa 1804, the Site has been subject to land reclamation events[1], farming, quarrying and various construction and industrial activities, including but not limited to progressive land reclamation events, rail and freight operations, gasworks, and bulk fuel storage.

Macquarie Point is currently occupied by the Corporation, who are undertaking remediation of the Site and preparing it for development. Temporary uses, including events, carparking, storage of construction equipment, markets, and rent-out of office and commercial spaces, also have or do occur on Macquarie Point.

For the purpose of assessment and completion of the Environmental Audit, the Macquarie Point has been divided into seven sub-areas for assessment based on the nature of identified contamination, historic activity, and the intended future uses of each area. The location and boundaries of sub-areas of Macquarie Point are shown on **Figure 1** below, which also includes two additional areas which are noted in the Precinct Plan:

- Regatta Point, a stretch of land along the River Derwent to the north of Macquarie Point. The Corporation is currently in the process of negotiating land transfer of this land to their control and for inclusion in the Environmental Audit. It is noted that the proposed boundary of Regatta Point to be transferred to the Corporation presented on **Figure 1** is not final and may have minor changes.
- The Royal Engineers Building and Land to the west of Macquarie Point is included in the overall planned development of the area, however no changes in use are planned and it is not intended to be included in the Audit at this time.

Figure 1 Site Assessment Areas

[1] Historic land reclamation and the covering of former river- and sea-beds is considered a potential source of ASS, and additional detail is provided in **Section 2.1.1**.

Details of the Site, including Regatta Point, are provided in **Table 2** below.

Table 2 Overall Site Details

Item	Description
Macquarie Point Site	
Site Address	10 Evans Street, Hobart, Tasmania (refer to the Site Location plan provided as **Figure F1** in the **Figures** section)
Site Area	Approximately 9.3 ha
Current Site Owners	State of Tasmania (Crown Land)
Title Details	Macquarie Point contains the following land title references: • The majority of Macquarie Point is within land title 113521/1 (formerly CT 114462/1) • A portion of the southwest area (within the Gateway area) is within land title 129483/1
Current Zoning (1)	In accordance with the Hobart City Council (HCC, 2021), the *Sullivans Cove Planning Scheme 1997* notes that the Macquarie Point site falls within the *Macquarie Point Mixed Use Zone* and is subject to the following use areas: • Commercial and Institutional • Mixed Use • Open Space.
Current Uses	• The majority of Macquarie Point is currently vacant. Portions of the north and west of Macquarie Point are currently in use for remediation activities, including stockpiling of excavated materials. • The Corporation office building is located in the Goods Shed on the southern boundary of Macquarie Point. The Goods Shed has also been subject to intermittent uses including public events. • An occupied office building (8A Evans Street) is located on the western boundary of Macquarie Point. • The “Red Shed”, located in the south eastern portion of Macquarie Point, is currently used by a microbrewer and includes a public bar. • A warehouse (the SeaRoad Shed) was located in the south-east corner of Macquarie Point but was demolished in 2023. A large slab (the SeaRoad Slab) remains in place and has been used for intermittent storage of construction equipment. • Small retail outlets are located in the area adjacent to the Red Shed (Red Square) which is also used regularly for markets, music and other outdoor events with food vans. • A public car park is present in the south eastern and eastern portion of Macquarie Point. • A roadway (the Northern Vehicular Access) is present on the northern portion of Macquarie Point.
Closest Surface Water Body	• Sullivans Cove, approximately 150 m to the south. • River Derwent, approximately 280 m south-east (inferred direction of groundwater flow) and 25 m to the north-east.
Site Layout	**Figure F2** in the **Figures** section

Item	Description
Regatta Point	
Address	Located adjacent to McVilly Drive, Queens Domain (refer to the Site Location plan provided as **Figure F1** in the **Figures** section). A street address is not allocated for this area.
Area	Approximately 0.7 ha
Current Land Owners	The land comprised within Regatta Point is under the authority of: • Department of Natural Resources and Environment Tasmania (DNRET) Property Services (Potential Property ID 2513934), under Crown lease Regatta Point is currently being transferred to the control of the Corporation.
Title Details	Title details are not available for the public reserve (Potential Property ID 2513934).
Current Zoning	In accordance with the Hobart City Council (HCC, 2021), the *Sullivans Cove Planning Scheme 1997* notes that the Regatta Point site falls within the *Macquarie Point Wharf & River Zone B* and is subject to the following use areas: • Commercial • Mixed Use • Open Space.
Current Uses	The following is noted with regard to current Regatta Point use and features: • A public reserve in the southern portion of Regatta point is used for public open space and recreation. Carparking and access to the River Derwent (via two marine jetties and two boat ramps) are present in this area, and accessible via McVilly Drive. • A pumphouse (under Crown Licence) is present in this area. It is not known if this pumphouse is operational, what use is authorised under its licence, or what historical uses it may have had. • A small two-storey building of unknown use is in this area. • A disused rail line and corridor passes to the west of Regatta Point.
Closest Surface Water Bodies	• The River Derwent is located to the east, immediately adjacent to Regatta Point. • Sullivans Cove is located approximately 560 m to the south at the closest point. Recreational fishing restrictions apply in the waters adjacent to Regatta Point.
Site Layout	**Figure F2** in the **Figures** section

2.1.1 Historic Land Reclamation

Historic land reclamation was conducted in successive waves at the Site between 1827 and 1970, with the areas of each land reclamation event shown on **Plate 1** below.

Previous Site investigations have identified that the existing river- and sea-bed was left *in situ* and covered by land reclamation and, while the source of the material used for extension of the shoreline has not been identified, it is considered likely based on recorded observations of the soil profile that dredged material, either from the nearby Sullivans Cove and the River Derwent or from other water bodies, was a source of some material.

Material within, or sourced from, aquatic environments can be a source of ASS due to the deposition of sulfides in anoxic underwater environments.

Plate 1 Historic Shorelines and Progressive Land Reclamation (MPDC, 2024)

2.1.1.1 Geology

2.1.1.1.1 Regional

The *Engineering Geology Greater Hobart Area, Map 1* (Hofto, 1990), describes the Site as being underlain by a combination of reclaimed land, Quaternary aged sediments and Dolerite of Jurassic age. Micaceous quartz sandstone and white felspathic sandstone and micaceous mudstone of Triassic age are located to the north and west of the Site.

2.1.1.1.2 Local (Site-wide)

The Site has been subject to significant filling from the early 1800s to the 1900s (Austral, 2013) with up to 600 m of land reclaimed from the original 1800s' shoreline (Department of the Environment, *Australian Heritage Database*, 2007). Fill material has been encountered across the Site to depths of up to approximately 12.0 m below ground level (bgl).

Fill material has been described as generally containing a combination of clays, sands, gravels, cobbles and bricks. The thickness of fill is variable across the Site (0.2 – 12.0 m bgl), and generally increases from north to south across the Site consistent with historical land reclamation activities.

Deeper fill material generally consists of silty sands, similar to the underlying natural estuarine/ marine estuarine deposits, indicating that the deeper fill material may be associated with reworked natural material or dredged material.

Two main natural soil types have been encountered at the Site including estuarine/ marine deposits (silty sands) and weathered dolerite including clays, gravels and cobbles.

Estuarine/ marine deposits have generally been encountered in the south-eastern portion of the Site, ranging in depth from 3.7 – 15.6 m bgl. Weathered dolerite generally underlay the estuarine/ marine deposits (with the exception of the northern portion of the Site where the estuarine/ marine deposits are absent). Weathered dolerite has been encountered at near surface to 1.4 m bgl in the northern portion of the Site, and from 11.2 to 19.0 m bgl in the southeastern portion of the Site.

Fresh dolerite bedrock underlies the fill and natural soils at the Site. Dolerite has been encountered at near surface in the northern portion of the Site, and slopes down in a southerly and south easterly direction and has been encountered at depths up to 25.0 m bgl. The dolerite has been described as high strength and slightly to highly fractured (Douglas Partners, 2015).

Hunter Island, a bedrock high, is located to the south of the Site and is inferred to influence groundwater flow direction.

2.1.1.2 Hydrogeology

2.1.1.2.1 Regional

Groundwater flow is inferred to be in a general easterly direction toward the River Derwent and is encountered in coastal deposits, alluvial sediment, sandstone and in fractured Dolerite (DIER, 2006).

Groundwater yield generally ranges from 0.77 to 1.24 litres per second (L/s) in the varying aquifer types, and salinity ranges from 70 – 11,200 milligrams per litre (mg/L) (DIER, 2006).

2.1.1.2.2 Local (Site-Wide)

The Site is underlain by a single aquifer unit (within multiple lithological units) extending to depths greater than 25.0 m bgl (the maximum depth assessed). Groundwater has generally been encountered in fill material in the central, southern and eastern portions of the Site, extending into underlying natural material including estuarine/ marine deposits, weathered Dolerite and fractured Dolerite. No surface water bodies are present on the Site, however Sullivan's Cove is located approximately 150 m south of the Site, and the River Derwent is directly adjacent to Regatta Point.

Groundwater elevation at the Site in June 2025 was between 4.684 mAHD at BG1 located at the base of the sharp topographic rise to the north of the Site, to 0.423 mAHD at off-Site well MW152, located in the University of Tasmania carpark to the south-east of the Site (AECOM, 2025b). Groundwater was between 0.761 m bgl (MW180 in Regatta Point) and 7.988 m bgl (MW120A in the north-east of the Site), and was typically ~4 m bgl in the north-west of the Site and ~2 m bgl in the southern, eastern and central areas.

Overall, at the Site, the inferred groundwater flow direction in the shallow portion of the aquifer is in a general southeast direction, towards River Derwent and/or Sullivans Cove, noting the following:

- Flow in the northern and western portions of the Site is inferred to be in a general south easterly direction and is likely to be influenced by the shallow bedrock.
- Flow in the far northern portion of the Site has a slight north easterly component of, which may be due to influence from the Hobart Rivulet which traverses the northern Site boundary and discharges to the River Derwent to the northeast.
- Flow in the central, southern and eastern portions of the Site is inferred to be in a general southerly direction, towards Sullivan's Cove.
- The groundwater hydraulic gradient in the central and eastern portions of the Site is relatively flat, when compared to the northern portion of the Site. The difference in groundwater hydraulic gradient is likely a result of:
    - Increasing depth to the low permeability bedrock towards the east of the Site, resulting in an increase in potential saturated thickness.
    - The Sewer (Main Hobart Pipeline) which is aligned approximately north to south through the centre of the Site.

The inferred shallow Site-wide groundwater flow contours generated during the most recent groundwater monitoring event (GME), conducted in June 2025 (AECOM, 2025b), are shown on **Figure F5**.

Groundwater modelling completed by GHD (2016) indicates groundwater flow to the south of the Site is in an easterly direction between the southern boundary and the location of Hunter Island. The easterly groundwater flow direction is likely to be influenced by Hunter Island, which is likely to be relatively low permeability when compared to the surrounding sediment, and the higher permeability sediment located in the former Hobart Rivulet (i.e. beneath Evans Street). The former Hobart Rivulet is likely to be a preferential pathway for groundwater flow.

There are a number of former sea walls located beneath and surrounding the Site. The sea walls were used in progressive stages of land reclamation and are likely to influence localised groundwater flow direction, but have not been observed to affect the overall observed groundwater flow and are not considered to affect the final discharge points of groundwater.

Evidence of tidal influence on groundwater levels has been identified to the south of the Site within the inferred groundwater flow path at MW151, where tidal variation of approximately 0.1 m has been noted. Tidal influence (i.e. increasing standing water level [SWL] variations) has been noted to increase toward Sullivans Cove.

Total Dissolved Solids (TDS) concentrations for shallow groundwater for the Site are generally low (< 1,110mg/L in June 2025), indicating there is likely limited estuarine/ marine water intrusion on-Site within shallow groundwater (<10.0 m bgl). Higher TDS (22,000 mg/L) was reported in MW153, off-Site within a carpark approximately 60 m south of the Site where higher interaction with estuarine/ marine water is inferred to occur.

Hydraulic conductivity testing undertaken on the southern portion of the Site (AECOM, 2016a) has estimated the hydraulic conductivity of the different lithological units as follows:

- Fill Material – 0.52 m/day
- Alluvial/ Marine Deposits – 0.59 m/day
- Slope Deposits – 0.26 m/day
- Bedrock – 5.3 x 10^{-3} m/day.

2.2 Future Development

The Precinct Plan outlines the concept for the Site which comprises mixed use precincts including, but not limited to those summarised in **Table 3** below.

Table 3 Precinct Plan - Proposed Development Precincts

Precinct	Likely Land Use
Aboriginal culturally informed zone	Open space and commercial
Multipurpose stadium and associated concourse zone	Open space and commercial
Royal Engineers building and land	Open space and commercial
Complementary integrated mixed use zone, including restraints, cafes, hotels, medical facilities and commercial office space	Open space and commercial
Antarctic facilities zone including commercial spaces and connections with the complementary integrated mixed use zone	Commercial and underground car parking
Residential development and public foreshore zone accommodating a variety of tenures and housing opportunities, along with a new public promenade and food and beverage offerings	Medium to high density residential, commercial and open space
A transport corridor and roadway linking Regatta Point to the main areas of the Site	Open space / vehicle traffic / foot traffic
A vegetated area along the northern boundary of the Site, where the escarpment below the Hobart Cenotaph would prevent development or construction	Open space

Subsurface utilities and maintenance activities are anticipated to occur in all Site areas. In addition, large scale excavation is anticipated as part of development within:

- The Multipurpose Stadium and Associated Concourse, in order to lower the profile of the future stadium to level with Evans Street to the south, and preserve sight lines across the Site.
- The Antarctic Facilities Zone, for development of a potential future underground carpark.

The concept layout of the Site in the Precinct Plan is shown on **Figure F2**.

3.0 Field Methodology

3.1 Soil Sampling

Soil samples included in this assessment were collected during:

- Geotechnical investigation conducted on the main Site area by WSP between 16 April and 21 May 2024 (WSP, 2024a).
- Environmental investigation on Regatta Point conducted by AECOM in September 2024. All samples considered as part of the ASS investigation were collected on 20 September 2024.

  The final Detailed Site Investigation (DSI) report detailing this investigation of Regatta Point has not yet been issued.
- Environmental sampling around BH-004 and ABH-004, conducted by AECOM in June 2025.

Table 4 below summarises the sample methodology and record keeping undertaken during both sampling programs.

Table 4 Soil Sampling Program Requirements

Aspect	Description
Use of Experienced Personnel	Field work was undertaken by trained personnel with previous experience in contaminated site assessment and ASS sampling. Field personnel were familiar with field soil sampling techniques.
Equipment Calibration	Where applicable, field equipment was calibrated daily prior to use in the field.
Record Keeping	Date, field personnel details, observations and findings of field activities including (but not limited to) sample description, collection details, sample volumes, amendment quantities and monitoring results were recorded. Bore logs, including noting soil description, lithology, and any indicators of ASS, were recorded during borehole advancement. Coordinates of bores were either recorded on bore logs, or on mud maps recording any change in proposed location. All collected samples were recorded on appropriate Chain of Custody (CoC) documentation, which were provided with samples when delivered to analytical laboratories. A copy of any CoC was made prior to delivery and retained in the project records.
Sample Collection	Soil samples were collected via fresh nitrile glove, directly from the bore materials collected from cores collected from bores advanced by sonic drill rig. Samples were collected at 0.5 meters below ground level (m bgl), and every 0.5 m until either dolerite bedrock is encountered, or the bore hole terminates (whichever is shallower). No duplicate samples were required as part of these works. Samples were prepared in the field in clean, laboratory provided containers (zip lock bags) with air excluded. Approximately 0.5 kg of soil were collected per sample, with any shell fragments removed prior to packing so far as practicable. Samples were immediately placed in chilled eskies for storage at the drill site, then either transferred at the end of the day to: • The on-Site sample freezer. Samples were repacked in chilled eskies for transfer to the analytical laboratory at a later time (less than a week after sampling). • Directly to the analytical laboratory.

Aspect	Description
Sample Labelling	A unique name was used for each soil sample, and consisted of the bore ID, the depths the sample was collected between, and the date of sampling. For example, the sample collected from bore BH-003 between 0.5 and 0.6 m bgl on 16 April 2024 had the following ID: • BH003_0.5-0.6_160424 Samples collected from seven bores (ABH-002, ABH-003, ABH-004, BH-004, BH-012, BH-013, and BH-015) did not have the date included in the sample ID. However, sample dates were recorded on sample containers, field notes, and CoC documentation.
Chain of Custody	Standard CoC procedures were adopted for sample transfers. CoC documentation included sample numbers; date of sampling/ collection; analyses required; and release and receipt of parties accepting sample custody. A copy of the CoC was included with samples sent to the analytical laboratory, and a separate copy was retained by field staff. All samples collected were initially submitted for the **pH – Field Screen (pH_F and pH_{FOX})** analytical suite on the CoC.

3.2 Adopted Assessment Criteria

3.2.1 pH Field Screening

pH field screening was undertaken as a preliminary detection method for ASS and PASS to allow selection of appropriate locations for quantitative laboratory analysis, and reported the following outputs:

- Field pH (pH_F)
- Oxidised field pH (pH_{FOX})
- Reaction rate, a qualitative rating of how vigorously samples react to peroxide. The *National acid sulfate soils sampling and identification methods manual* (Sullivan et al, 2018b) NASSG fizz rating uses between values between 1 (no reaction) and 4 (vigorous reaction).
- The difference between pH_F and pH_{FOX} (ΔpH) is also an important indicator of possible levels of unoxidized materials present in samples.

Appendix B of TASSMG identifies a combination of three factors which are considered to result in a positive field sulfide identification:

- A reaction with hydrogen peroxide
- A high ΔpH
- The actual value of pH_{FOX}

TASSMG also noted that pH field screening is considered indicative only and not quantitative or suitable to rely upon for definitive identification of the potential to acidify or on the presence or absence of ASS. Field screen results should not be used for determination of management requirements, and must be confirmed with quantitative laboratory analysis.

Results of pH field screening have been assessed and interpreted in four possible categories, with the indicators and interpretation used presented on **Table 5** below.

- Existing acidity
- Strongly indicates potential to acidify
- May indicate potential to acidify
- Low probability of acidification

Table 5 Field pH Screening Criteria

pH Field Screen Result	Interpretation and Considerations
pH_F < 4	Indicates existing acidity
Strength of reaction with peroxide	Indicator of potential to acidify, but cannot be relied upon along. Other soil constituents, such as organic matter or manganese oxides, can also induce a vigorous reaction with peroxide.
ΔpH > 1	May indicate potential to acidify. A larger ΔpH, combined with a lower final pH_{FOX} value, is considered to more strongly indicate potential acidity.
pH_{FOX} < 3	Strongly indicates potential to acidify
pH_{FOX} 3-4	Moderately indicates potential to acidity
pH_{FOX} 4-5	Neither positive nor negative indicator
pH_{FOX} >5	Low probability of potential to acidify Low net acidifying ability present (especially if low ΔpH recorded).

3.2.2 CRS and SPOCAS

Appendix B of the TASSMG provides the following action levels for ASS in soil, based on texture categories.

Table 6 ASS Action Criteria (TASSMG)

Type of Material		Action Criteria (100-1000 tonnes disturbed)		Action Criteria (>1000 tonnes disturbed)	
Texture range	Approx. clay content (%<0.002 mm)	Sulfur trail (%S oxidisable)	Acid trail (mol H+/tonne)	Sulfur trail (%S oxidisable)	Acid trail (mol H+/tonne)
Coarse Texture Sands to loamy sands	≤5	0.03	18	0.03	18
Medium Texture Sandy loam to light clays	5-40	0.06	36	0.03	18
Fine Texture Medium to heavy clays and silty clays	≥40	0.1	62	0.03	18

Notes: Action criteria are presented on an over-dry basis

The criteria for >1,000 tonnes of coarse soil disturbed have been adopted for this assessment as:

- Initial assessment of soil excavation for Site development are approximately 220,000 tonnes; and
- Historic investigations of the Site have observed a mixture of soils, consisting primarily of sands or clays with silt/sand/gravel inclusions.

The adopted ASS action criteria are:

- Sulfur trail ≥ 0.03 %S oxidisable
- Acid trail ≥ 18 mol H+/tonne

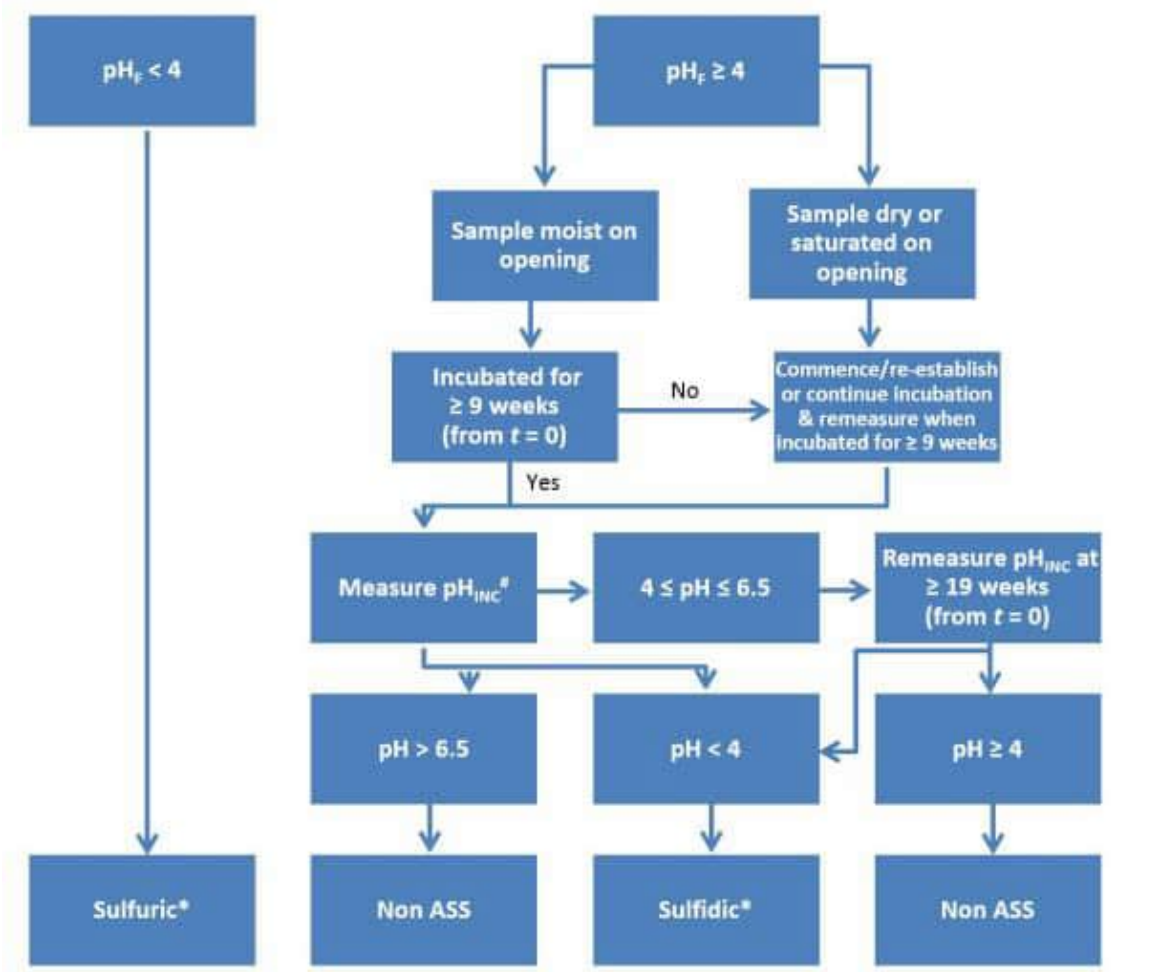
These action level criteria have been applied to the net acidity (both including and excluding ANC) reported by each analytical method, and to the Titratable Peroxide Acidity (TPA) and Titratable Sulfidic Acidity (TSA) reported by SPOCAS analysis.

3.2.3 Laboratory Incubation – Chip Tray Analysis

Appendix C of the *National Acid Sulfate Soils Guidance: National Acid Sulfate Soils Identification and Laboratory Methods Manual* (Sullivan et al, 2018a) identifies two preferred methodologies for laboratory

incubation to simulate natural oxidation behaviour, and semi-quantitatively assess the acidification potential, of ASS materials.

Chip tray analysis, adopted for this assessment, includes measures of soil pH from samples after 9 and 19 weeks of incubation (pH_{INC}). Results of chip tray analysis have been considered following the flow chart shown on **Plate 2** below.



If pH during incubation is less than 6.5, ANC cannot be included in Net Acidity determination.
* (Isbell 1996) - the low pH must be demonstrated to be due to ASS processes for the soil material to be classified as an ASS material.
Source: Creeper et al. 2012.

Plate 2 Flow chart of the chip tray incubation method (Sullivan *et al*, 2018a)

3.3 Selection of Sample Analysis

Collected soil samples were assessed by four methodologies as part of this assessment, with selection of sample analysis was conducted in a step-wise manner:

- **Stage 1** - pH Field Screening
- **Stage 2** - Chromium Reducible Sulfur (CRS) and/or Suspension Peroxide Oxidation Combined Acidity and Sulfur (SPOCAS)
- **Stage 3** - Chip Tray Analysis

Table 7 below summarises the assessment criteria used to select samples for analysis at each stage of investigation and assessment.

Table 7 Selection Criteria for Sample Analysis

Analytical Method	Criteria
Stage 1	
pH Field Screening	All samples collected
Stage 2	
CRS	CRS sample analysis was selected based on the individual pH_F, pH_{FOX}, ΔpH and observed lithologies in the field, with locations for further analysis selected in order to obtain ASS analytical data for: • A lateral and vertical distribution of samples • Each lithology or distinct soil type observed in each bore. If multiple samples were collected from a single soil profile, samples with lower pH_F or pH_{FOX}, or greater ΔpH, were preferentially selected for CRS analysis, based on a higher assessed potential to contain ASS. For example, in BH-004, two samples were collected from gravelly sand between 2.5 and 3 m bgl for pH field screening. Sample BH004_2.9-3.0m (pH_{FOX} = 4.3 and ΔpH = 4.6) was selected for further CRS analysis, when compared to sample BH004_2.5-2.6m (pH_{FOX} = 4.3 and ΔpH = 4.6)
SPOCAS	SPOCAS sample analysis was selected as an alternative analysis method to validate results of CRS. SPOCAS analysis was requested for samples selected for CRS assessment at a ratio of one SPOCAS per ten CRS, with similar consideration to indicators of ASS provided by pH field screening as noted above.
Stage 3	
Chip Tray Analysis	Chip tray analysis was conducted on samples which had been interpreted to contain PASS based CRS/SPOCAS analysis, in order to assess Acid Neutralisation Capacity (ANC) and inform any future management or mitigation requirements. In some cases, the analytical laboratory reported that insufficient sample mass remained for chip tray analysis.

3.4 Assessment of Data Quality

The Data Quality Indicators (DQIs) adopted are based upon data validation guidance documents published by Standards Australia (SA) and National Environment Protection Council (NEPC). These include *Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soil* (AS 4482.1-2005), Schedule B2 *Site Characterisation* (NEPC 1999, amended 2013) and Schedule B3 *Laboratory Analysis of Potentially Contaminated Soils* (NEPC 1999, amended 2013).

Specific elements that have been checked and assessed for this Project include:

- Preservation and storage of samples upon collection and during transport to the laboratory.
- Sample holding times.
- Use of appropriate analytical and field sampling procedures.
- Required limits of reporting (LOR)
- Frequency of conducting quality control measurements.
- Field duplicate and triplicate results.
- Laboratory control measures, including laboratory duplicates, matrix spikes, and surrogate spikes.
- The occurrence of apparently unusual or anomalous results (e.g. laboratory results that appear to be inconsistent with field observations or measurements).

4.0 Desktop Acid Sulfate Soil Assessment

4.1 Preliminary Desktop Review

Prior to any field activity, a preliminary review of conditions of the Site and the likelihood of future development potentially disturbing ASS was conducted using previous investigations and assessments, available information on the proposed development plans for the Site, and publicly available ASS mapping tools were reviewed and the potential for ASS presence at the Site considered in early 2024.

Outcomes and key information considered as part of this assessment are summarised on **Table 8** below.

Table 8 Summary of Desktop Assessment Actions

Data Sources	Key Information Considered	Conclusions and Actions
Step 1 – Assess Location		
Previous assessments of the Site summarised in the *Site Remediation Strategy Update 2024* (AECOM, 2024)	The Site elevation is less than 20 m AHD, and Site groundwater elevation is between 0.5 to 3 m AHD. The Site is in close proximity to surface water bodies, and has been subject to historic land reclamation. Previous investigations have identified apparent estuarine materials (sands), both natural and reworked in fill material, which have the potential to be PASS (see **Section 2.1.1.1**). These materials are typically located below the water tables. No acidic (pH<5) groundwater has been detected in previous assessments. However, review of existing data identified indicators that Site groundwater has possibly been affected by the oxidation of sulfides (see **Section 4.1.1.1**	The Site has the potential for ASS to be present. Proceed to **Step 2**.
Step 2 – Consider Level of Disturbance		
The Precinct Plan (MPDC, 2024) and discussion with the Corporation	Although not quantified at the time of assessment, significant soil disturbance of an estimated 220,000 tonne (130,000 m^3) will be required for the proposed Site development, including potential: • Lowering or reworking of the Site surface elevation to preserve sight lines and level areas for development. • Installation of piling and lift wells. • Consideration of underground carparking. Based on the scale of proposed development, redesign of the project to avoid or reduce soil disturbance below 100 m^3 is not considered practicable. Regatta Point is currently proposed for development as medium density residential structures, with ground floor commercial or carparking. Excavation of a portion of the hillside in the western portion of Regatta Point may be required as part of building design and construction.	130,000 m^3 (>100 m^3) of soil disturbance is likely to occur as part of development. Proceed to **Step 3**.

Data Sources	Key Information Considered	Conclusions and Actions
Step 3 – Review Existing Mapping Information		
LISTMap – Coastal Acid Sulfate Soils (0-20 m AHD) layer	The Site is mapped as a Low (6-70%) probability of PASS.	PASS is potentially present. Proceed to **Step 4** and beyond.

Based on preliminary desktop review of the data considered, it was concluded that:

- Based on observed conditions, in particular observed estuarine sands (both natural and in reworked fill) beneath the water table at Macquarie Point, and available ASS mapping, PASS has the potential to be present in soils beneath the Site.
- Disturbance of 130,000 m^3 of soil has been estimated to occur during Site development activities. The structures included in proposed development, including the multipurpose stadium, are unlikely to be able to be constructed without the following soil-disturbance activities:
  - Lowering of the Site, to preserve sight lines to surrounding features (i.e., the Hobart Cenotaph to the north) and provide a level surface for development and the future stadium playing field.
  - Installation of piles anchored on dolerite bedrock to support building and stadium weights.
  - Construction of a potential underground carpark in the north-east portion of the Site, or of lift wells within proposed buildings.
  - Excavation of a portion of the hillside in the west of Regatta Point to allow basement carpark/commercial development.
- A hydrological assessment, based on available groundwater data collected in previous Groundwater Monitoring Events (GMEs), is provided in **Section 4.1.1**. This assessment concluded that there is some indicators that groundwater at the Site has been impacted by the oxidation of sulfides, but that it has a high alkalinity and is generally adequate to maintain an acceptable pH level in the future.

Due to the lack of analytical data on the presence/absence of ASS, the existing data on Site lithology and setting which identified that PASS may be present, and the level of soil disturbance identified for Site development, it was considered that the proposed development had a potential risk of disturbance of ASS. As a result, development of a soil profile and collection and analysis of field samples was commenced.

4.1.1 Hydrological Assessment

Understanding of the condition of groundwater should be undertaken prior to any activities which may disturb ASS or PASS, in order to determine:

- The vulnerability of groundwater to acidification;
- Groundwater levels, groundwater flow patterns, and the hydrogeological regime of the local area; and
- Baseline groundwater quality

The current groundwater well network at and adjacent to the Site consists of 76 groundwater wells on-Site (including Regatta Point), and 12 wells off-Site, with these wells, and other wells which have been lost or destroyed by Site remediation and development activities, sampled in 14 GMEs between 2015 and 2025. The location of existing and historic groundwater assessment locations is shown on **Figure F4**.

Based on the outcomes of previous assessments, the following is known about the Site's geology and hydrogeology.

4.1.1.1 Groundwater Use

No groundwater is currently in use on Site, or planned for use in future. Use of groundwater at the Site is restricted by the Site Environmental Management Plan (SEMP) (AECOM, 2024b), and is not anticipated to occur for any purpose other than environmental monitoring.

Site groundwater is inferred to discharge to Sullivan's Cove, located approximately 150 m south of the Site, and the River Derwent, directly adjacent to Regatta Point.

A search of the Tasmanian Groundwater Information Access Portal (https://wrt.tas.gov.au/groundwater-info/) conducted in November 2024 in a 2 km radius surrounding the Site, identified one bore (Feature ID 2864) located approximately 2 km north-north-west of the Site (AECOM, 2025d). This bore, of depth 54 m, was drilled in 1983 by Tasmania Department of Mines, and reported groundwater at 40 m bgl. Based on the age, depth to groundwater, and originator of this bore, distance and direction from the Site, and the presence of reticulated water supply in the Hobart area, it is not considered likely that extractive use of groundwater occurs from this bore, or that groundwater would be affected by Site conditions if extraction is occurring. No other bores were detected within 2 km of the Site.

4.1.1.2 Baseline Groundwater Conditions and Indications of Oxidation of Sulfides

Treatment and Management of Soils and Water in Acid Sulfate Soil Landscapes (DER, 2015a) and *Identification and Investigation of Acid Sulfate Soils and Acidic Landscapes* (DER, 2015b) (the WA Guidelines) recommends baseline groundwater conditions be collected for:

- pH
- Total acidity and alkalinity
- Major ions – sulfate, chloride, sodium,
- Nutrients – ammonia (as N), total nitrogen, total phosphorus
- Physio-chemical parameters – Total Dissolved Solids (TDS) and Electrical Conductivity (EC)
- Metals[2] – aluminium (dissolved and total), arsenic, chromium, cadmium, iron (total and dissolved), manganese, nickel, selenium and zinc.
- Field readings – pH, redox potential (eH), dissolved oxygen (DO), total titratable acidity, total titratable alkalinity and conductivity.

The WA Guidelines also recommend using low-flow collection methods, which is the method which has been used in previous GMEs at the Site.

Available field parameters and laboratory analytical data collected at or adjacent to the Site between 2015 and 2025 are attached as **Table T5a** and **Table T5b** respectively. It is noted that previous investigations have not collected field parameters for total titratable acidity or alkalinity, or conducted laboratory analysis for total acidity.

From historic available data, however:

- Recorded laboratory analytical pH is above 6.5 in all samples, and above 6 in all field readings. Total alkalinity (as $CaCO_3$) was reported between 70 and 2,170 mg/L in 301 of 303 samples assessed for this analyte suite, with locations where total alkalinity below 70 mg/L (MW128B and MW164) both having at least two later samples collected where alkalinity was above 70 mg/L.

  On this basis, the groundwater at and around the Site is considered to have a high alkalinity and to be generally adequate to maintain an acceptable pH level in the future (DER, 2015).

- Assessment of historic groundwater data for indicators that groundwater **may** be being affected by, or has already been affected by, the oxidation of sulfides (DER, 2015) noted:
  - The calculated ratio of alkalinity (as $CaCO_3$) to sulfate (as SO_4) ranged between from historic groundwater data ranged between 0.11 and 1,000. The WA Guidelines note that a ratio of less than 5 may indicate groundwater has been affected by oxidation of sulfides.

[2] The WA Guidelines recommend dissolved metal unless otherwise noted here.

- The calculated ratio of chloride to sulfate (as SO_4) between 0.04 and 351, a ratio of less than 2 considered an indicator that groundwater has been affected by oxidation of sulfides.

  While seawater would generally have a ratio of ~7.2, this ratio is less predictive in freshwater or areas of interface between brackish and seawater. TDS, chloride and sodium concentrations in Site water generally indicate limited salinity and this ratio is considered less applicable to Site groundwater. However, this ratio is considered a secondary indicator of impact to Site groundwater by oxidation of sulfides.

- No pH of less than 5 has been recorded for groundwater. pH of less than 5 would indicate groundwater has been affected by oxidation of sulfides. However, as assessed above, the groundwater is considered to have a high alkalinity and be generally adequate to maintain an acceptable pH, which may have prevented decrease in pH.

- Reported soluble aluminium concentrations are generally less than 1 mg/L, with the exception of one sample collected from MW120 in August 2015, which reported a dissolved aluminium concentration of 1.38 mg/L.

  Some metals, including aluminium, may also have higher solubility and mobility under alkaline conditions, and 2015 sample from MW120 also reported a pH of 11.1. MW120 was located on the north-east corner of the Site near the former location of a cement plant, and it is considered likely that cement manufacturing may have elevated the pH in this area and mobilised aluminium, rather than any oxidation of sulfides.

Based on the above indicators, it is considered that, based on the ratios of alkalinity and chloride to sulfate, groundwater may have already been affected from the oxidation of sulfides. However, no indications that groundwater has been acidified or that mobilisation of aluminium has occurred were identified, and it is considered that the high alkalinity and relatively adequate buffering capacity of groundwater has prevented acidification.

4.2 Soil Profile Mapping and Planned Soil Disturbance

4.2.1 Macquarie Point

During previous soil investigations at the Site (AECOM, 2024), fill material, attributed to historic land reclamation and described as containing a combination of clays, sands, gravels, cobbles and bricks, has been recorded at a variable thickness from the surface to 0.2 to 12 m bgl, generally increasing in depth and volume from north to south across the Site, consistent with historical land reclamation activities.

Deeper fill material generally consists of silty sands, similar to the underlying natural estuarine/ marine estuarine deposits, indicating that the deeper fill material may be associated with reworked natural material or dredged material.

Two main natural soil types have been encountered at the Site including estuarine/ marine deposits (silty sands) and weathered Dolerite including clays, gravels and cobbles.

Estuarine / marine deposits have generally been encountered in the south eastern portion of the Site, ranging in depth from 3.7 -15.0 m bgl. Weathered Dolerite typically underlay the estuarine/ marine deposits (with the exception of the northern portion of the Site where the estuarine/ marine deposits are absent). The weathered Dolerite is encountered at near surface to 1.4 m bgl in the northern portion of the Site, and from 11.2 to 19.0 m bgl in the south eastern portion of the Site.

Dolerite bedrock underlies the fill and natural soils at the Site. Dolerite has been encountered at near surface in the northern portion of the Site and slopes down in a southerly and south-easterly direction to depths of up to 25.0 m bgl. The Dolerite has been described as of high strength and slightly to highly fractured (DP, 2015).

The results of geotechnical assessment of Macquarie Point, conducted by WSP in 2024, including mapping of the soil profile, were reported in *Macquarie Point Stadium Development – Geotechnical Factual Report* (WSP, 2024a). As part of this investigation, 20 soil bores, names ABH-001 to ABH-004 and BH-001 to BH-016, were advanced across the Site. The location of soil bores is shown on **Figure F2**.

Bore logs (attached in **Appendix D**) were primarily recorded by field staff from WSP field staff on-Site with the drill rig. Six bore logs (ABH-001, ABH-003, BH-004, BH-012, BH-013, and BH-015) were recorded by field staff from William C. Cromer Pty Ltd (Cromer), a Hobart-based environmental and geotechnical consultancy subcontracted by WSP.

Based on this program of work, and previous soil bore and groundwater well logs provided by AECOM, WSP prepared a three dimensional geological model of Macquarie Point using the *Leapfrog Works* software package. An extract of this model was prepared by WSP for the Corporation (WSP, 2024b), with estimates of soil volumes to be excavated and disturbed as part of Stadium development. The model extract is attached as **Appendix F**. The following features regarded in the area proposed for excavation are noted from the soil profile:

- The proposed bulk excavation will primarily remove fill and dolerite. Bulk excavation of estuarine/alluvial material is likely to occur only for construction of a proposed basement carpark in the north-east portion of Macquarie Point.
- The model output does not consider installation of support piles, which are considered likely to be anchored on fresh dolerite bedrock and will pass through/disturb intervening material. Piles will typically pass through fill material and weathered dolerite in the northern and western portions of Macquarie Point, and through fill material, estuarine/alluvial material, and weathered dolerite in the eastern, southern, and central portions of Macquarie Point. It is noted that the method of pile installation has not been determined, and that methodologies which minimise disturbance of soil (i.e., driven piles) may be considered.
- Piles will also pass through and disturb soil beneath groundwater in the eastern and southern portions of Macquarie Point.
- No jarosite, a yellowish mineral commonly found in acidic environments such as acid mine drainage or ACC, was noted on bore logs, or on review of soil core photos attached in **Appendix D**.

Additional soil bores advanced between 27 May and 11 June 2025 for ASS investigation are also included in **Appendix D**. These bores have not been incorporated into the soil profile model produced by WSP, but the observed lithologies and depths area consistent with the model.

4.2.2 Regatta Point

As part of previous environmental investigations undertaken by AECOM, 39 soil bores have been advanced within or adjacent to Regatta Point, including soil bores advanced as part of groundwater well installation.

Soil bore logs recorded by AECOM field staff are attached in **Appendix D**. The locations of soil bores in Regatta Point, with cross-sections of the observed geology, are shown on **Figure F3**.

Review of soil data indicates that the geology at Regatta Point consists of two areas:

- A flat area in the east of Regatta Point and extending to the south-east along the shoreline. Lithology observed in this area consisted of loose cobbles, up to 12 cm in diameter, present at depth of up to 2.2 m bgl, with underlying dolerite bedrock.

  This area is bitumen covered and currently in use as a public carpark in the northern portion of Regatta Point, while sandy soil/gravel, up to 0.2 m thick, was recorded at the flat portion surface in the south-east portion of Regatta Point.
- The tiered hillside on the western portion of the Site, which consists primarily of soil/fill material, typically clay or sand, of between 0.4-1.55 m thickness, underlain by a natural dolerite surface. The dolerite slopes from the west in rough alignment with the surface elevation and contours.

  Minor volumes of natural material (up to 0.3 m thick), described as clay with some shell fragments, were recorded on the fill/dolerite interface.
- No jarosite was observed in the soil cores from Regatta Point.

While the details of proposed development at Regatta Point are not yet finalised, the Corporation has indicated that:

- The flat, bitumen sealed area in the eastern portion of Regatta Point is likely to be raised by ~ 1 m, be used as public open space.
- Buildings are likely to be built on or into the hillside in the western portion of the Site. Removal of dolerite bedrock on the western side of Regatta Point may be required.

Based on the recorded soil profile and proposed disturbance:

- Future development will disturb fill material (clay and sand) above the water table, and dolerite both above and below the water table.
- Dolerite bedrock is shallow and deeper excavation (i.e., installation of piles) is unlikely to be required for future structures.

5.0 Detailed Acid Sulfate Soil Assessment

A total of 354 ASS samples were collected and have been considered for ASS assessment from 34 locations.

Sampling was undertaken using the methodology described in **Section 3.1**. The information collected in field investigations or laboratory analysis and provided in this report includes analytical laboratory documentation (**Appendix C**) and bore logs (**Appendix D**).

The locations where ASS samples were collected are shown on **Figure F2**. Summary tables of recorded lithology and analytical results are presented in **Appendix B** by methodology on **Table T1** to **Table T3**.

Assessment of results is presented below.

5.1 Sample Locations and Density

Appendix B of the TASSMG provides guidance on sampling density for ASS investigation, adapted for Tasmanian conditions from the Queensland *Guidelines for Sampling and Analysis of Lowland Acid Sulfate Soils (ASS) in Queensland 1998* (Ahern, 1998).

Table 9 presents the typical density of sampling holes required for ASS assessment, depending on the total surface area to be assessed, noting that the guidance also states:

- More detailed transect sampling (50 m intervals) may be required along proposed excavations (i.e., canals, lakes, drainage channels and borrow pits).
- Additional sampling (50-75 m grid) may need to be taken in areas of more intense disturbance or in potential hot spots.
- Material to be dredged should be sampled in accordance with the detailed transect sampling guidance noted in the first bullet point.

Table 9 Number of Sampling Holes (TASSMG, Appendix B)

Area of Site	Number of bore holes
Up to 1 ha.	4 holes
1-2 ha	6 holes
2-3 ha	8 holes
3-4 ha	10 holes
>4 ha	2 holes/ha

Macquarie Point is approximately 9.3 ha in total. However, the assessment area considered in this report is confined to a smaller area of approximately 8.7 ha, selected based where future soil disturbance and excavation is planned (i.e., the area within the proposed footprint of the multi-purpose stadium and structures along the eastern boundary of Macquarie Point). The following future use zones, shown on **Figure F2**, are excluded from assessment:

- The vegetated areas on the northern edge of the Escarpment.
- The portion of the Transport Corridor in Audit Area 4 East which is not within the footprint of the proposed underground carpark. It is noted that this land may be transferred to the control of the Tasmanian Department of State Growth in the future.

Based on **Table 9**, approximately 18 bore holes would be the typical sample point density required for the assessment area (shown on **Figure F2)**.

ASS assessment samples were initially collected from 20 locations in 2024, greater than the typical sample point density requirement, in the assessment area, with sample locations being generally well distributed, although locations are not aligned on a strict grid layout as they were also influenced by the requirements of the geotechnical investigation. The targeted locations surrounding ABH-004 and BH-

004 advanced in 2025 are not considered in this assessment of sample density and are discussed below.

The area of Regatta Point to be added to the Site and assessed for ASS is approximately 0.7 ha, and four locations, equal to the typical sample point requirement, were sampled for ASS assessment. Due to the relatively long and narrow boundaries of the area, ASS assessment locations were selected based on areas of proposed future building construction, as shown on **Figure F2**.

No channels, material to be dredged or potential hot spots have been identified within the assessment areas on Macquarie Point or Regatta Point, based on the current proposed development plans for the Site, with the potential exception of the area proposed for construction of an underground carpark in the north-east portion of Macquarie Point, where potential excavation of alluvial/estuarine soil from beneath the water tables has been identified.

The distribution of samples by depth, recorded lithology, and whether samples were saturated/ unsaturated (i.e., below the water table) is presented on **Table 10** below.

Table 10 Summary of pH Field Screen Sample Locations

Parameter		Macquarie Point		Regatta Point	
		Number	%	Number	%
Total number of samples analysed		330		15	
Lithology	Fill	251	71%	15	100%
	Estuarine / Alluvial / Colluvial	86	29%	0	0%
	Dolerite	2	<1%	0	0%
Depth	<2 m bgl(1)	95	28%	15	100%
	≥2 – <4 m bgl	99	29%	0	0%
	≥4 m bgl	145	43%	0	0%
Saturated (above or below water table)(2)	Unsaturated	171	50%	15	100%
	Saturated	168	50%	0	0%

Notes: 1. As surface (0 m bgl) samples were not collected on Macquarie Point, total samples <2 m bgl are slightly less than samples collected ≥2 to <4 m bgl; 2. Presence or absence of groundwater was not explicitly recorded by field staff for bole holes ABH-004, BH-004, BH-015, BH-004N, BH-004S and BH-004E. Saturated / unsaturated sample numbers for the 56 samples collected from these locations has been estimated based on recorded water depth in soil bores in the vicinity, reported moisture/wetness of sample cores, and review of core photos attached to the bore logs provided by WSP.

At each location, samples were collected at 0.5 m bgl, and every 0.5 m following this until solid dolerite bedrock, which is not considered as having any potential to be classified as ASS, was reached, with the exception of additional bores to assess possible PASS in unsaturated fill near BH-004 (BH-004A, N, S, E &W) and ABH-004 (ABH-004A, N, S, E & W) in June 2025. These bores were advanced to the water table. Samples were also collected at the surface (0-0.1 m bgl) on Regatta Point.

The following exceptions to the sampling density or depth methodology are listed on **Table 11** below.

Table 11 Identified Gaps in Sample Collection

Soil Bore	Depth (m bgl)	Reason for Discrepancy
ABH-001	1 – 2.7	Cores between 1 m bgl and 2.7 m bgl (where dolerite was encountered) consisted primarily of (>75%) dolerite cobbles up to 100 mm in length. Cromer field staff did not sample this material, based on their field assessment that it was unlikely to be ASS.
ABH-003	5.5 – 8.9	Soil above dolerite bedrock was logged as colluvial sediments by Cromer field staff and not sampled, based on their field assessment that it was unlikely to be ASS.

Soil Bore	Depth (m bgl)	Reason for Discrepancy
BH-004	9.1 – 10.5	Core loss in estuarine sediments / sands
	11.6 – 17.3	Soil above dolerite bedrock was logged as colluvial sediments by Cromer field staff and not sampled, based on their field assessment that it was unlikely to be ASS.
BH-012	5 - 6	Core loss in estuarine sediments / sands
	6.5 – 9.5	Soil above dolerite bedrock was logged as colluvial sediments by Cromer field staff and not sampled, based on their field assessment that it was unlikely to be ASS.
BH-013	13 – 14.3	Soil above dolerite bedrock was logged as colluvial sediments by Cromer field staff and not sampled, based on their field assessment that it was unlikely to be ASS.
BH-015	6 – 9	Soil above dolerite bedrock was logged as colluvial sediments by Cromer field staff and not sampled, based on their field assessment that it was unlikely to be ASS.
BH-016	9 – 12	Core loss in estuarine sediments / sands
BH-004A, N, S, E & W	>5	These five bores were advanced surrounding BH-004 in June 2025 to assess possible PASS in unsaturated soil, and were terminated at the water table. However, due to field error, samples were only collected 1 m below 1 m bgl, rather at every half meter.

All locations where discrepancies in sample depths were identified were within Macquarie Point, and no discrepancies were identified at Regatta Point.

The noted discrepancies are not considered to affect the overall interpretation of results as:

- While ASS samples were not collected from the surface and sampling commenced at 0.5 m bgl in all locations on Macquarie Point in 2024, which is recommended in Appendix B of the TASSMG, in the majority of locations where samples were advanced, the Site surface is sealed and consisted of bitumen, concrete, or other man-made materials which are not considered as having the potential to acidify by field staff, who did not collect samples.
- Core loss when drilling through estuarine sediments. Further sampling in these depths may encounter the same issue (core loss), and further or repeat sampling is not considered required as estuarine sediment samples were able to be collected and analysed from all soil bores where core loss occurred, in most cases both above and below core loss, and from other bores across Macquarie Point, and suitable density and spread is considered to have been achieved for assessment of this lithology.
- Miscommunication between WSP and Cromer field staff, and field decisions by Cromer staff to alter the scope and not sample soil which was logged as colluvial, which were not communicated to office staff until completion of field works.

  While this does constitute a potential gap in the understanding of ASS at Macquarie Point, further assessment is not considered required as:

  - The sampling discrepancy at ABH-001 was in shallow (1 – 2.7 m bgl) soil above the water table, with a recorded lithology consisting primarily (>75%) of solid dolerite cobbles.

    This soil is considered likely to have had decent exposure to atmosphere and unlikely to be oxidised and consisted primarily of large cobbles which limit the volume of soil with the potential to be ASS present, and it is not considered likely to be .
  - The other discrepancies in sampling which occurred during Cromer drilling supervision were all located beneath the water table and had overlaying estuarine materials, considered to be a higher risk of ASS, which were sampled. Mitigations for ASS in estuarine soil should also be applied to deeper materials.

- Samples were collected every 1 m below 1 m bgl in the five bores advanced adjacent to or BH-004 advanced in June, rather than every 0.5 m, due to field error. While this density is lower than recommended in the TASSMG, the high spatial density of the boreholes, within the same geological unit (fill material) is considered to offset this and the number of data points are considered sufficient for interpretation.

Based on the proposed development of the Site, the number and distribution of sampling points, and the depths in each location where samples were collected, the sampling program is considered to meet the requirements of the TASSMG and be suitable for assessment purposes.

5.2 pH Field Screening

pH field screening tests involve shaking the soil samples first with deionised water (pH_F) and then with peroxide (pH_{FOX}) and noting the resultant pH of each sample, as well as how vigorous the reaction between peroxide and the soil sample which occurs is. The pH_{FOX} test simulates extreme conditions and the formation of acid commonly simulates the oxidation of pyrite present in the soil sample, however, the oxidation of additional materials such as organic material may also affect the sample pH. As such, the pH_{FOX} result may not be entirely attributable to pyrite oxidation.

Field screening was conducted on samples frozen within 24 hours of collection at an analytical laboratory (Eurofins MGT), with sample locations and results presented on **Table T1**, which also includes with additional data about the recorded lithology and the recorded presence/absence of groundwater in each bore hole samples were collected, and interpretation of results. Analytical certificates from laboratories including the results of pH field screening are attached as **Appendix C**.

5.2.1 Results

Table 12 below summarises results of field pH screening.

Table 12 Summary of pH Field Screening Results

Parameter		Macquarie Point		Regatta Point	
		Number	%	Number	%
Total number of samples analysed		330		15	
pH_F	Minimum	5.8		6.9	
	Maximum	12		8.7	
	Number of results ≤4.0(1)	0	0%	0	0%
	Number of results >4.0	339	100%	15	100%
pH_{FOX}	Minimum	2		4.5	
	Maximum	12		7.9	
	Number of results ≤3.0(2)	31	9%	0	0%
	Number of results >3.0 and <4.0(3)	22	6%	0	0%
	Number of results >4.0	286	84%	15	100%
ΔpH	Minimum	-1		0.4	
	Maximum	7.5		3.2	
	Number of results ≥1.0(4)	221	65%	14	93%
	Number of results <1.0	118	35%	1	7%

Parameter		Macquarie Point		Regatta Point	
		Number	%	Number	%
Reaction Rate(5)	Results reported as 1	2	<1%	0	0%
	Results reported as 2	0	0%	0	0%
	Results reported as 3	2	<1%	0	0%
	Results reported as 4	335	99%	6	40%
	Results reported as 5	N/A		9	60%

Note: 1. pH_F ≤4.0 indicates AASS likely present; 2. pH_{FOX} ≤3.0 strongly indicates PASS; 3. pH_{FOX} >3.0 and ≤4.0 may indicate PASS; 4. ΔpH ≥1.0 is an indicator of PASS; 5. The analytical laboratory used a scale of 1 to 4 for reaction rate when reporting results for samples collected from Macquarie Point, and a scale of 1 to 5 when reporting results from samples collected from Regatta Point. For both scales, a higher rating indicates a more vigorous reaction.

5.2.2 Interpretation

Table 13 below summarises the results of pH field screen results against the interpretation factors presented in **Table** 5 in **Section 3.2.1**.

Table 13 Summary of pH Field Screening Interpretation

Parameter	Macquarie Point		Regatta Point	
	Number	%	Number	%
Total number of samples analysed	339		15	
Existing acidity	0	0%	0	0%
Strongly indicates potential to acidify	42	12%	0	0%
May indicate potential to acidify	184	54%	14	93%
Low probability of acidification	113	33%	1	7%

The following was noted from review of sample locations and interpretation of pH field screen results:

- No samples with existing acidity (i.e., pH_F below 4) were identified within the assessment area at Macquarie Point. Previous assessments of groundwater and soil on Macquarie Point have not detected low pHs which indicate acidic conditions or AASS present, and the results of pH field screens are consistent with the previous investigations of the Site.
- No samples with existing acidity (i.e., pH_F below 4), or strong indicators of potential to acidify, were detected at Regatta Point. This is consistent with the recorded lithology, where limited to no soil which is considered likely to be ASS was observed and where groundwater is predominantly within the dolerite aquifer.
- Samples from Macquarie Point which strongly indicated potential to acidify may be present were collected predominantly from estuarine sands at least 2 m below the water surface and generally deeper than 5 m bgl.

  Strong indicators of potential to acidify were only reported in unsaturated fill samples in:

  - ABH-004 at 1.5 m bgl, and in adjacent bores ABH-004A at 2.0 m bgl, and ABH-004W between 1.5 and 2.6 m bgl.
  - BH-004 at 3 m bgl, noting that depth to groundwater was not recorded on field records for this location, and a depth of 3.5 m bgl to groundwater has been estimated based on surrounding bore logs.
- While TASSMG considered ΔpH greater than 1 to indicate PASS may be present, this is considered a stronger indicator the greater the value ΔpH, and where pH_{FOX} is low. For the 235 pH field screening results from Regatta Point and Macquarie Point with ΔpH greater than 1:

- 160 (68%) reported a pH_{FOX} greater than or equal to 5, indicating samples were still close to neutral and of low likeliness to acidify following dosing with peroxide during field screening.
- 155 (66%) reported a ΔpH less than 3, indicating a relatively low level of change in pH following dosing with peroxide during field screening.

While a relatively high proportion of pH field samples were identified as potentially indicating potential to acidify based on ΔpH, this would not be considered a strong indicator for many locations, based on the magnitude of change or the final pH_{FOX} value recorded.

- All samples reported at least a strong reaction with peroxide, with the majority reporting a reaction described by the analytical laboratory as extreme. The rate of reaction with peroxide is not controlled solely by sulfides, and other constituents of soil, such as the manganese which is known to be present in dolerite and fill at the Site, are considered likely to contribute to the recorded reaction rates.

As pH field screening is considered indicative only and not quantitative or suitable to rely upon for definitive identification of potential to acidify or determination of management requirements, additional laboratory analysis was required to confirm results and is discussed in **Section 5.3** below.

5.3 CRS and SPOCAS Analysis

In order to assess the results of pH field screening, CRS was selected as the primary analytical measure for analytical assessment of ASS. CRS analysis was conducted on 100 samples collected from Macquarie Point and for 5 samples from Regatta Point.

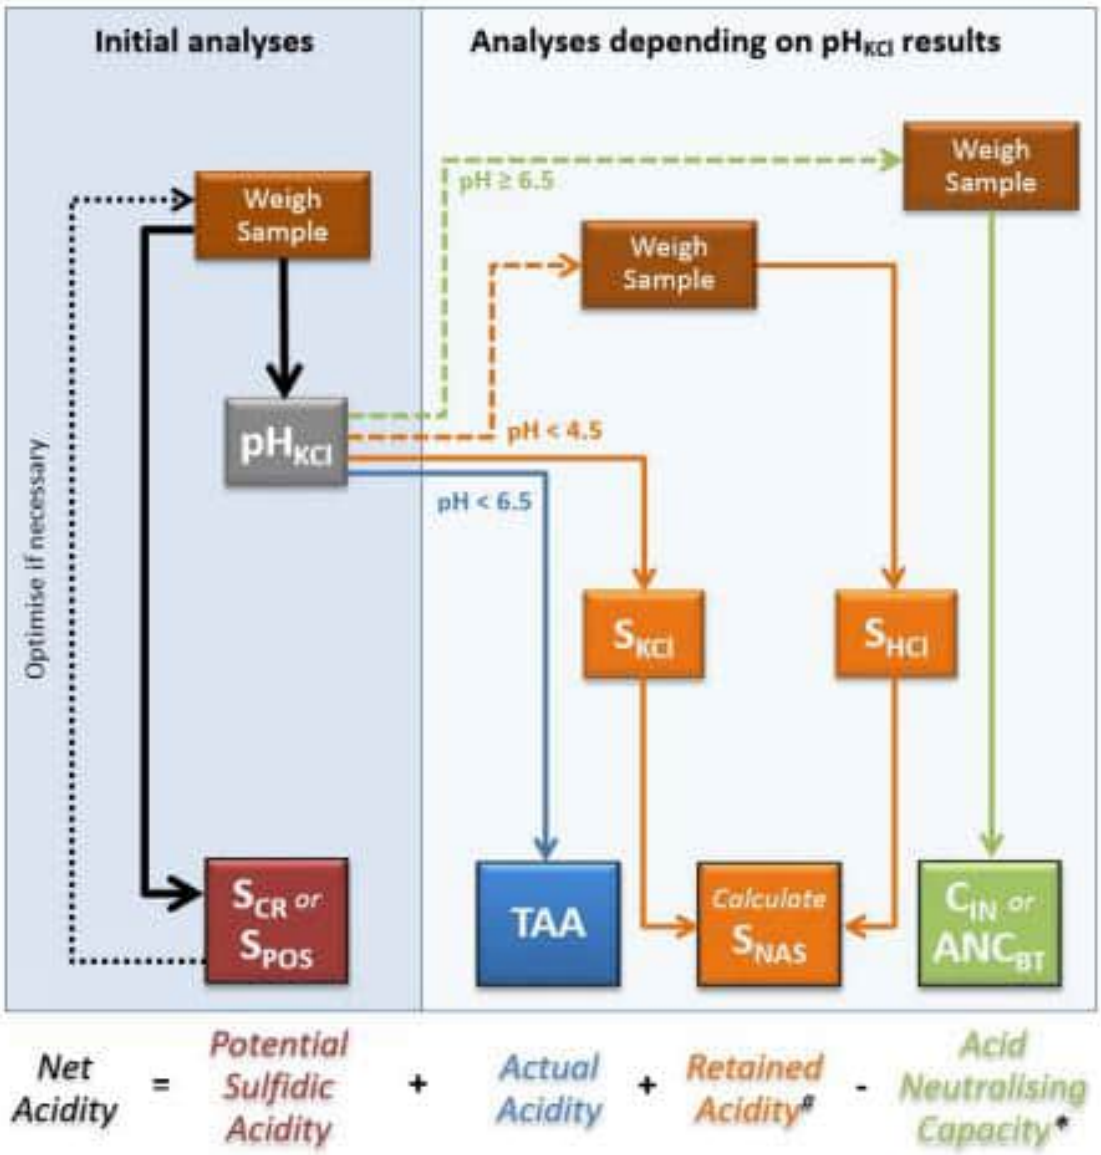
SPOCAS was conducted on 8 samples from Macquarie Point and 1 sample from Regatta Point as an alternative analytical method to assess the validity of CRS results, as discussed in **Section 5.5.3**.

Samples were selected for further CRS and/or SPOCAS analysis using the decision criteria presented on **Table 7** in **Section 3.3**.

Both CRS and SPOCAS analysis was conducted on unused portions of the soil samples collected for pH field screening and stored frozen at the analytical laboratory. CRS and SPOCAS sample results are presented screened against the adopted criteria on **Table T2**, with analytical certificates from laboratories attached as **Appendix C**.

The *National Acid Sulfate Soils Guidance: National Acid Sulfate Soils Identification and Laboratory Methods Manual* (Sullivan et al, 2018) presents required ASS analyses for the acid-base accounting used to assess potential acidity, summarised on the flow chart presented as **Plate 3** below.

Figure 3.1 Flow chart showing ASS analyses required.



* Retained Acidity must be determined when the pH_{KCl} less than 4.5 or where jarosite has been visually observed in the soil material.

* ANC can only be included in Net Acidity calculation if its effectiveness has been corroborated by other data (for example incubation data) that demonstrate acidification is not experienced by the soil material during complete oxidation under field conditions. If corroboration of a measured ANC is not available, then the ANC must not be used for the determination of Net Acidity of that soil material (that is Equation 3.2 must be used). Regardless of whether ANC measurements are allowed for the calculation of Net Acidity, ANC measurements will be required on soil materials for verification purposes should lime be used for management (Equation 3.3).

Plate 3 Figure 3.1 Flow chart showing ASS analyses required for (Sullivan et al, 2018)

5.3.1 Results

Results of CRS and SPOCAS analysis are summarised below in **Table 14** and **Table 15** respectively.

Table 14 Summary of CRS Results

Parameter		Macquarie Point		Regatta Point	
		Number	%	Number	%
Total number of samples analysed		100		5	
Actual Acidity (%S)	Number of results >LOR	0	0%	0	0%
	Minimum	<0.003		<0.003	
	Maximum	<0.003		<0.003	
	Number of results >0.03%S(1)	0	0%	0	0%
	Number of results <0.03%S	100	100%	5	100%
Potential Acidity (%S)	Number of results >LOR	96	96%	1	20%
	Minimum	<0.005		<0.005

Notes: 1. 0.03%S is the adopted criteria for identification of ASS. 2. ANC was not reported by the analytical laboratory for some samples, and has been calculated as discussed below.

5.3.2 Interpretation

Results of CRS and SPOCAS analysis have been assessed and interpreted on **Table T2** into four possible categories, based on the results of TAA and net acidity (both excluding and including ANC). Interpretation is based on the considerations below:

- If the TAA is greater than the adopted criteria (0.03 %S), the sample has already acidified and would be considered AASS.
- If the net acidity (excluding ANC) is greater than criteria, sulfidic compounds are present and may have the potential to acidify if disturbed and exposed to oxidising conditions.
- However, if the ANC of material is greater than the Potential Acidity, while sulfides may be present, natural components of the soil may prevent acidification. ANC cannot be relied upon for assessing natural buffering effects unless corroborated by alternative measures (Sullivan et al, 2018a), and the applicability of ANC in assessment of samples is assessed in **Section 5.5.3**.

The categorisation undertaken is presented on **Plate 4** below.

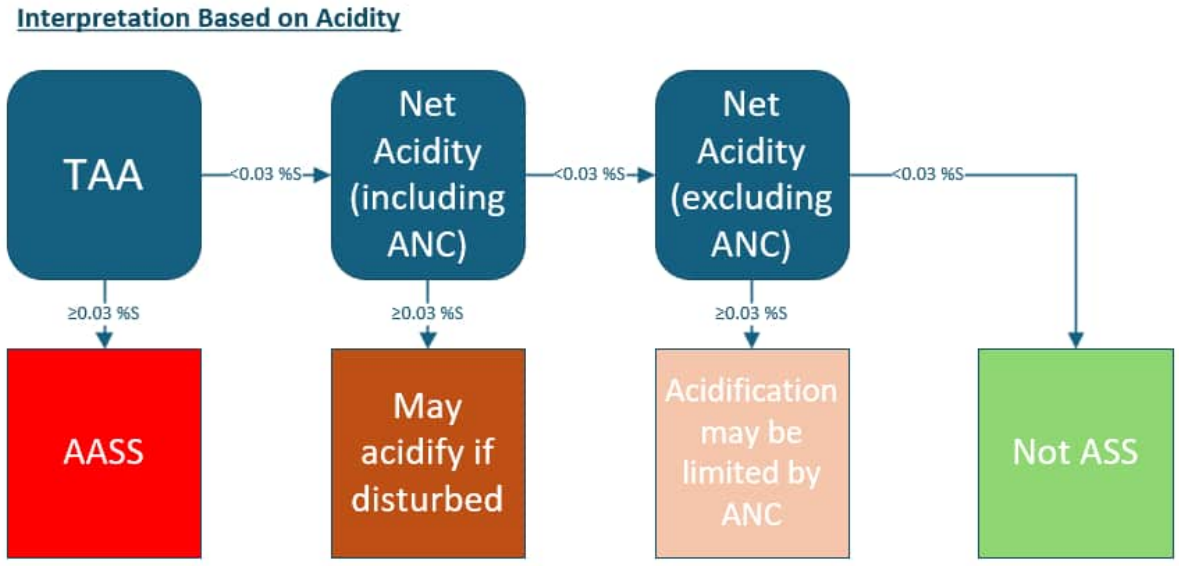

Plate 4 CRS / SPOCAS Interpretation Flow Chart

Outcomes of interpretation, using the decision tree on **Plate 4** and consideration of ANC vs net acidity (excluding ANC) on **Plate 4** are summarised in **Table 16** below.

Table 16 Summary of CRS and SPOCAS Interpretation

Parameter	Macquarie Point		Regatta Point	
	Number	%	Number	%
CRS				
Total number of samples analysed	100		5	
AASS	0	0%	0	0%
May acidify if disturbed	17	17%	0	0%
Acidification may be limited by ANC	45	45%	0	0%
Not ASS	38	38%	5	100%
SPOCAS				
Total number of samples analysed	10		1	
AASS	0	0%	0	0%
May acidify if disturbed	4	40%	0	0%
Acidification may be limited by ANC	6	60%	0	0%
Not ASS	0	0%	1[1]	100%

Notes: 1. Detected S_{POS} > 0.03%S in sample BH253_0.5_A_240920 from Regatta Point is attributed to organic interference from grass rootlets in the shallow sample, and is not considered to indicate PASS as discussed below.

The CRS and SPOCAS results and interpretation indicate that:

- No AASS was detected on either Macquarie Point or Regatta Point.
- Net acidity (excluding ANC) exceeding the action criteria was identified by CRS in 62 of the 100 samples collected Macquarie Point.

  Samples with net acidity (excluding ANC) were reported soil identified as both fill and as natural estuarine soils, and in both saturated and unsaturated soil. Sand, clay, or both were noted on bore logs at locations of each of these samples, and it is considered likely that detected sulfides ultimately source from river- and sea-beds, which was either used as fill material or covered *in situ* during historic land reclamation at the Site.

  Of these samples, 17 also reported the net acidity (including ANC) was above the action criteria. While ANC reported by CRS may be inflated due to sample preparation methods for laboratory analysis and cannot be used in assessment without corroboration (which has been assessed in **Section 5.5.3**) the results indicate that there may some capacity for natural neutralisation of acidification.
- Regatta Point did not report any actual acidity or potential acidity (excluding ANC) above the action criteria in CRS results.

  One sample, BH253_0.5_A_240920, reported potential acidity (excluding ANC) above the action levels following SPOCAS analysis. However, this result is considered likely to be organic sulfate present in organic materials (rootlets from surface grass cover) noted in the sample, and is not considered at risk of acidification.

  On this basis, soil at Regatta Point is not considered to have the potential to acidify and future management is not considered to be required.

5.4 Other Considerations

5.4.1 Use of CRS for Assessment (Inorganic vs Organic Sulfur)

CRS, the primary laboratory analytical methodology used for this assessment, uses a set of independent analytical methods, each of which determine a particular component of the acid-base accounting present on **Plate 3**. CRS can underestimate potential for acidification as it measures and

assesses inorganic sulfur components only, and can neglect organic sulphur. While organic sulphur is generally slower to oxidise and acidification can more readily be prevented by neutralising agents (either natural or added to soil), it's presence still forms a potential risk if soil is disturbed.

SPOCAS analysis includes organic sulfur, and was undertaken in order to assess the potential for organic sources of acidification. Relative percentage difference (RPD) between SPOCAS and CRS results are presented on **Table T4**.

RPDs for nine of the eleven CRS/SPOCAS analytical duplicates collected were less than the 30%, which has been adopted based on the ASC NEPM (2013) guidelines for assessing the reproducibility and comparability of separate analytical methods. RPD values in excess of the adopted acceptance criteria were reported for:

- 44 - 46% in sample BH014_3.5-3.6_240424
- 149 - 152% in sample BH253_0.5_240920

A slight variance in RPD is a result of the precision of results when reported in %S versus mole H+/tonne.

BH-253_0.5_250920 was collected from shallow soil with noted rootlets from the grass present at the surface in this area. The SPOCAS result at this location is considered likely to be due to grass and plant matter, which can induce acidification of soil in order to increase nutrient update, and this result is not considered to indicate a source of acidification which could induce risks to future soil management. The RPD exceedance in BH014_3.5-3.6_240424 is minor, and may be attributable to either some heterogeneity of the sample material, or to the presence of anthropogenic materials noted in the fill, which would also not be considered likely to induce acidification if disturbed.

The use of CRS for interpretation and assessment of ASS is considered suitable.

5.4.2 Other Sources of Acidification

CRS and SPOCAS considered potential sulfidic acidity. However, the potential exists for other sources of acidification, such as organic acidity or oxidation of iron or manganese containing compounds. While these sources are not as quick to oxidise and acidify as sulfides, they may be released over a longer timeframe and can potentially lead to environmental impact if not addressed.

As part of the SPOCAS analysis, Titratable Peroxide Acidity (TPA), a measure of the net acidity of a sample, including ANC, and Titratable Sulfidic Acidity (TSA), which is the TPA minus the Total Actual Acidity, were measured. If other sources of acidification are present, the TPA would be expected to be greater than the net acidity (including ANC) reported by SPOCAS assessment.

Table 17 SPOCAS - TPA vs Net Acidity (including ANC)

Location	Depth (m bgl)	Net Acidity (including ANC) (%S)	TPA (%pyrite S)
Macquarie Point			
ABH-002	4.0 – 4.1	<0.02	<0.02
ABH-004A	2.0 – 2.1	0.23	<0.02
BH-004	6.0 – 6.1	<0.02	<0.02
BH-004W	4.0 – 4.1	0.87	0.79
BH-005	8.5 – 8.6	<0.02	<0.02
BH-010	4.5 – 4.6	<0.02	0.06
BH-011	3.0 – 3.1	<0.02	<0.02
BH-013	3.5 – 3.6	<0.02	<0.02
BH-014	3.5 – 3.6	<0.02	<0.02
BH-016	3.5 – 3.6	0.76	0.69
Regatta Point			
BH-253	0.5 – 0.6	<0.02	<0.02

TPA was equal to or less than net acidity (excluding ANC) for all samples analysed by SPOCAS with the exception of BH-010 at 4.5 to 4.6 m bgl, where a TPA of 0.06 %pyrite S was detected. Net acidity (including ANC) was reported as <0.02 %S by CRS analysis.

Site dolerite contains appreciable concentrations of manganese, which can oxidise and acidify under peroxide titration. The soil in this sample was collected at the interface between natural estuarine sands and the underlaying dolerite bedrock, and was noted to contain fragments of dolerite on the bore log, and it is considered that this is a probable source of the discrepancy between the TPA and net acidity results.

While manganese-containing compounds can potentially generate acidification over long periods, the rate of oxidation and release is comparatively slow, when compared to sulfides, and the high alkalinity of groundwater in the area is likely to buffer and prevent acidification, as the Site and surrounding area contain large quantities of natural dolerite, including exposed natural dolerite, and have not had detectable acidification of groundwater. It is not considered that the natural dolerite is a potential source of environmental impact.

5.5 Chip Tray Analysis

During CRS and SPOCAS analysis, as part of sample preparation, soil and other materials (e.g. shells) are ground up and particle size reduced. As a result, results may report elevated ANC (either measured or calculated), as materials within the sample which may act to neutralise acidification will have a greater exposed surface area and consequently react with acidifying materials at a faster rate. As such, additional assessment to corroborate ANC is required in order to use this parameter in assessment of results.

Chip tray analysis, which simulates the natural oxidation behaviour of ASS by laboratory incubation of moist soil samples and is undertaken as a semi-quantitative technique to assess the acidification potential of samples, was selected as the alternative method to corroborate ANC results from CRS. Chip tray analysis is one of the two methodologies for soil incubation identified in Appendix C of the *National Acid Sulfate Soils Guidance: National Acid Sulfate Soils Identification and Laboratory Methods Manual* (Sullivan et al, 2018a).

Samples were selected for chip tray analysis using the decision criteria presented on **Table 7** in **Section 3.3**. Samples were collected from frozen portions of the soil samples collected for pH field screening, and not used for pH field screening or CRS/SPOCAS analysis.

Chip tray analysis was conducted on 41 of 51 samples which were collected from Macquarie Point in 2024 and identified as containing net acidity (excluding ANC) above the action levels based on CRS analysis. Chip tray analysis was requested for the remaining 10 samples which met this criteria, but was not able to be undertaken as analytical laboratory reported insufficient sample volumes remaining. However, all such locations are below the water table, and have conservatively been considered PASS in assessment.

Chip tray analysis was not considered required for samples from Regatta Point, as no net acidity (excluding ANC) has been identified in soil samples collected based on CRS analysis, or an samples collected on Macquarie in 2025, as the results of the 2024 chip tray tests discussed below are considered suitable for consideration of ANC in these samples.

Chip tray analysis results are presented screened against the adopted criteria (see **Plate 2** in **Section 3.2.3**) on **Table T2**, with analytical certificates from laboratories attached as **Appendix C**. The results of chip tray analysis are summarised on **Table 18** below.

Table 18 Summary of Chip Tray Analysis

Parameter		Macquarie Point	
		Number	%
Total number of samples analysed		41	
AASS		0	0%
Sulfidic		10	24%
Not ASS	ANC should not be used for interpretation (pH ≤ 6.5 reported during incubation)	9	22%
	ANC can be used for interpretation (pH ≤ 6.5 not reported at any time during incubation)	22	54%

No samples reported an initial pH (prior to incubation) of less than or equal to 4, and no AASS is considered to have been present in samples.

5.5.1 Sulfidic Samples

The NASSG flowchart on **Plate 2** classifies samples as sulfidic if a pH of less than or equal to 4 is detected during incubation. NASSG notes that the low pH must be confirmed to be due to ASS processes for the soil to be classified as ASS material.

Chip tray analysis reported ten samples as sulfidic, and, in light of the consideration of potential other sources of acidification in **Section 5.4.2**, which did not identify any alternative sources of acidification, should be considered PASS. As all samples submitted for analysis had net acidity (excluding ANC) greater than the action criteria, and would be expected to acidify in the absence of ANC, the relatively low percentage of chip tray samples which did acidify supports the presence of ANC within the soil.

Eight of the ten samples which chip tray analysis indicated were sulfidic were collected from saturated estuarine sand collected at greater than 5.5 m bgl, and support the assessment that PASS is present in saturated material beneath Macquarie Point.

It is noted that for six of these locations, pH_{INC} increased to greater than 4 (non-ASS) after 19 weeks. While this may indicate some acidification of soils may return to neutral over medium to long term time periods, these materials are still considered ASS in accordance with NASSG, and have the potential to cause environmental harm in the short to medium term. Management of ASS during excavation is considered required based on these outcomes.

5.5.2 Chip Tray - Not ASS

Chip tray results reported that 31 were not ASS, and that ANC could be used for interpretation (i.e., $pH_{INC} \leq 6.5$ was not observed during analysis) in 22 of these samples.

The nine samples identified as not ASS, but in which ANC should not be used for interpretation, where $pH_{INC} \leq 6.5$ was observed, but $pH_{INC} < 4$, was not, were all collected from fill materials noted as combinations of silt, sand, clay and gravels. Six of the nine samples collected from saturated materials, and seven of the samples were collected from 2 m bgl or deeper.

Considering the location of the Site, the depths of samples, and the description of the lithology, it is considered likely that the soil these samples were collected from may be dredged materials used as fill during historic land reclamation at Macquarie Point.

While the results from these samples indicates that ANC should not be used in assessment of net acidity, these samples did not acidify sufficiently to be considered ASS as part of the 19 week period of chip tray assessment.

5.5.3 Use of ANC in Assessment of Potential to Acidify

ANC represents the natural capacity for soil to neutralise acidification, and if ANC exceeds the sum of the potential, actual, and residual acidity of soil then acidification is unlikely to occur.

However, ANC reported by CRS and SPCOAS can be overstated as the sample preparation process includes grinding of samples, which can break up and increase the surface area of natural neutralising

constituents of the sample, such as shell fragments, which leads to a faster rate of reaction and greater ANC than is likely to occur in nature. While sample preparation includes sieving and removal of materials >2 mm in size, the ANC of remaining materials in the 0.3 to 2 mm range would not be 100% available under real field conditions. Use of ANC is only permissible where it has been confirmed by other analytical methodologies (Sullivan et al, 2018a).

Chip tray analysis was undertaken as a method to assess if the ANC values derived from CRS and SPOCAS assessment could be used in interpretation and assessment of results. The results of CRS and SPOCAS results were in agreement with or more conservative than chip tray results in 37 of the 41 samples analysed, and indicate that there is ANC in the soil which can prevent

22 of the 31 (71%) samples which chip tray analysis indicated were not ASS did not report a pH_{INC} of less than or equal to 6.5 during any measure taking during incubation, which would support use of ANC. For the remaining 9 samples, where the flowchart (**Plate 2**) indicates that ANC may not be reliable:

- Four samples (ABH004_3.0-3.1, BH004_4.5-4.6M, BH012_4.5-4.6 and BH014_1-1.1_290424) reported a pH_{INC} of less than or equal to 6.5 after 9 weeks of incubation, but were above this criteria after 19 weeks, indicating that neutralising activity was occurring within samples. Sample BH008_5.5-5.6_070524 also reported a $pH_{INC(19\ weeks)}$ of 6.4, only marginally below the NASSG guideline value.
- Six samples were collected from saturated material, which has been assessed as PASS regardless of if ANC is included in assessment.
- Only one sample from unsaturated material (BH016_2-2.1_010524) did not report a $pH_{INC(19\ weeks)}$ > 6.5.

The majority of chip tray samples agreed with the outcomes of CRS/SPOCAS analysis. However, in four samples, listed on **Table 19** below, chip tray samples acidified (pH < 4) for locations where CRS/SPOCAS indicated that ANC may prevent acidification.

Table 19 Samples where chip tray was more conservative than CRS

Location	Depth (m bgl)	Material	Interpretation	
			CRS	Chip Tray
BH004	2.9-3.0	Unsaturated fill	Acidification may be limited by ANC	Sulfuric
	8.5-8.6	Saturated estuarine	Acidification may be limited by ANC	Sulfuric
BH005	5.5-5.6	Saturated estuarine	Acidification may be limited by ANC	Sulfuric
BH007	6.0-6.1	Saturated estuarine	Acidification may be limited by ANC	Sulfuric

Based on comparison of chip tray to CRS/SPOCAS results, it is considered that:

- While all 41 samples submitted for chip tray analysis had sufficient net acidity (excluding ANC) to acidify, 31 (75%) of them did not report a pH less than 4 and are not considered to have acidified. Some ANC is present in Site soils on this basis.
- The level of ANC may be over-estimated by CRS. In particular, 9 samples (22%) did not acidify but reported pH of less than 6.5, and four of the samples (10%) which did acidify reported sufficient ANC from CRS/SPOCAS to prevent this.

Based on these results, while the quantified ANC may be overstated by CRS/SPOCAS, it is still present. In order to assess the net acidity and determine if soil is considered probably to generate acid if disturbed, ANC will only be included if the measured ANC value is an order of magnitude greater than measured net acidity (excluding ANC).

5.6 Data Validation

An assessment of data quality and validation has been undertaken and is attached as **Appendix E**. This assessment noted:

- Sample receipt temperatures were greater than 0°C or not recorded for sample batches 1094321,1141778, 1225146, 1231576, and 1237090. However:
  - 1094321, 1225146, 1231576 were reported between 2.9 and 10.2°C upon receipt to the laboratory. 1141778 did not have a sample receipt temperature reported by the analytical laboratory.

    However, all batches were delivered to the analytical laboratory, when they were frozen, less than 24 hours after collection, and had efforts to chill noted, and it is not considered that these receipt temperatures indicate a breach in sample preservation.
  - 1237090 had a reported sample receipt temperature of 5.6°C. This batch consisted of additional analysis of samples delivered in batches 1225146 and 1231576, and the reported receipt temperature was derived from these early batches. The laboratory confirmed all samples in 1237090 had been maintained at <0°C since receipt, and it is not considered that these receipt temperatures indicate a breach in sample preservation.

Overall, on the basis of the data validation, the overall quality of the analytical results is considered to be acceptable and suitable for assessment of the soil conditions of the study area.

6.0 Preliminary ASS Management Considerations

6.1 Potential to Acidify

No AASS has been detected in soil at either Macquarie Point or Regatta Point.

Net acidity reported by CRS and SPOCAS analysis have been assessed to identify locations where soil is considered at high risk of acid generation, using the action levels in **Section 3.2.2**. Based on the outcomes of chip tray analysis (**Section 5.5.3**), it is considered suitable to include ANC in assessment where it is an order of magnitude (10x) greater than the net acidity (excluding ANC).

Results of this assessment are presented on **Table T2**. Locations where the net acidity exceeds the adopted action levels, and soil is considered of high probability of acidification, are summarised on **Table 20** below and shown on **Figure F6**.

Table 20 Locations with High Probability of Acid Generation

Borehole	Average Depth (m bgl)	Generalised lithology	Saturated?	pH_{ox} (pH units)	CRS Net Acidity (%S)
ABH-002	4.05	FILL - Sandy gravelly CLAY	Yes	6.8	0.11

	8.55	FILL - SAND. Shell fragments	Yes	4.8	0.12
	13.55	FILL - SAND. Shell fragments	Yes	2.6	0.44

Notes: * ANC has been used in determination of net acidity.

Based on this assessment, while no soil with a high potential to acidify has been identified at Regatta Point and soil in this area is not considered at risk of acidification, samples collected from 23 soil bores at Macquarie Point have been identified as having soil with a high risk of acidification if disturbed. The locations where soil with high potential to acidify are shown on **Figure F6**.

Soil with high potential to acidify is relatively widely distributed across the Site, but was not detected in the northern and western portions of the proposed excavation area, closer to the historic shoreline (prior to historic land reclamation; refer to **Section 2.1.1**). The soil profile of samples with high potential to acidify generally included sand and/or clay, and it is considered most probable that the source of high potential to acidify the presence of river- and sea-bed which was either covered *in situ*, or used as a fill source following dredging, during historic land reclamation in the area.

41 of the 49 samples with high potential to acidify were collected from saturated soils (i.e., below the water table), and it is considered that soil with the potential to acidify if disturbed is likely to be widespread below the water table and will require management to prevent acidification if disturbed by excavation, or by any activities which may introduce dewatering.

The majority (48 of 56 samples) of unsaturated soil samples were assessed as low potential to acidify, and had between 10 and 2,000 times ANC in excess of the potential acidity (noting that ANC values may be inflated due to sample preparation procedures prior to analysis). Unsaturated soil with high potential to acidify was identified in two areas:

- In one sample collected at 3 m bgl from BH-004 in the southern portion of the proposed excavation area.

As the depth to water was not recorded on the bore log for BH-004, it has been assumed that the sample collected at 3.0 m bgl was unsaturated, based on historic gauging recording groundwater depths of between 3.060 and 3.360 m bgl in groundwater well MW128, and of 2.948 to 3.293 m bgl in RS6, both approximately 10 m from BH-004. However:

- Minor variations or unevenness may mean the surface at BH-004 is lower than at MW128 or RS6.
- Minor fluctuations in groundwater level have been recorded seasonable and in response to broader climatic changes (i.e., drought or heavy rain periods), and such minor fluctuations may have led to groundwater covering the depth at which this sample was collected for periods of time.
- Core loss occurred in BH-004 between 3.0 and 3.7 m bgl, which may indicate saturated material. On the photographic record of this bore, a distinct colour change and some apparently wetness can be seen in the soil profile at 3 m bgl, which may also indicate a transition to saturated soil (see **Plate 5** below and **Appendix D**).

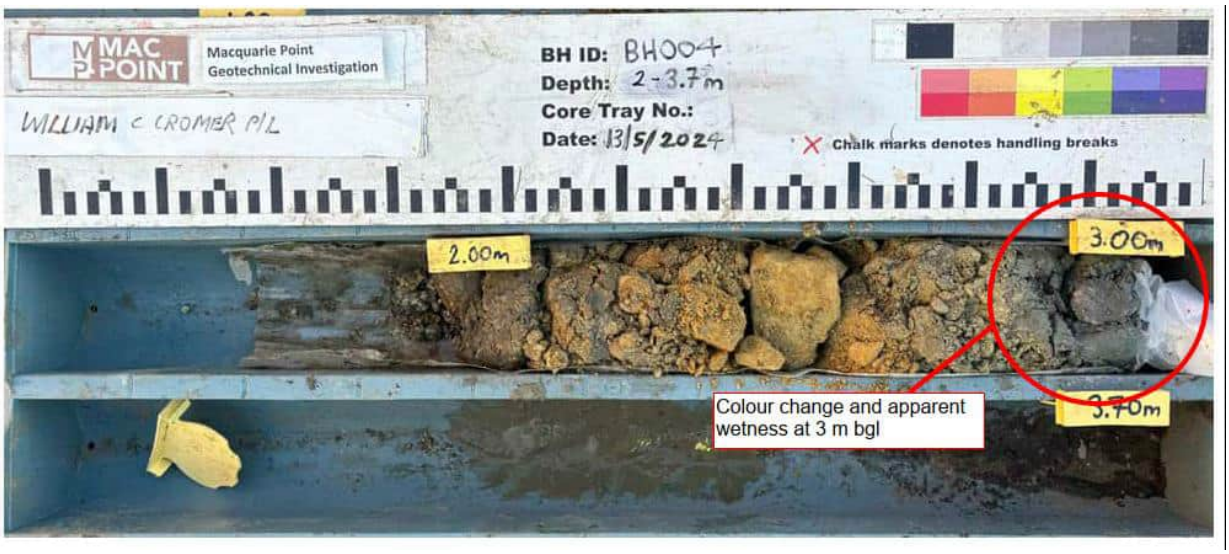

Plate 5 BH-004 - Core Log at 2 to 3.7 m bgl

As such, the sample collected at 3 m bgl from BH-004 is considered likely to have been representative of soil which may have been saturated, or is saturated on an intermittent basis, and is not considered indicative of PASS in unsaturated soil.

However, this sample does indicate that soil close to groundwater, even if not saturated at the time of excavation, may have been intermittently saturated and contain unoxidized sulfides, and it is considered that management of potential acidification should also be required for wet or damp soil near the water table which demonstrates colour change such as visible on the BH-004 bore log.

- In seven samples collected in the central eastern area of the proposed excavation, from between 1.5 and 2.5 m bgl in ABH-004 and surrounding satellite bores ABH-004A, ABH-004S, ABH-004S, and ABH-004E.

  The soil in these bores which was assessed as high potential for acidification is described on bore logs as mixtures of sand, gravel and clay. Photographs of the material with high potential to acidify show black sand and gravels which appear to be estuarine soil in the fill (see **Plate 6** below and **Appendix D**).

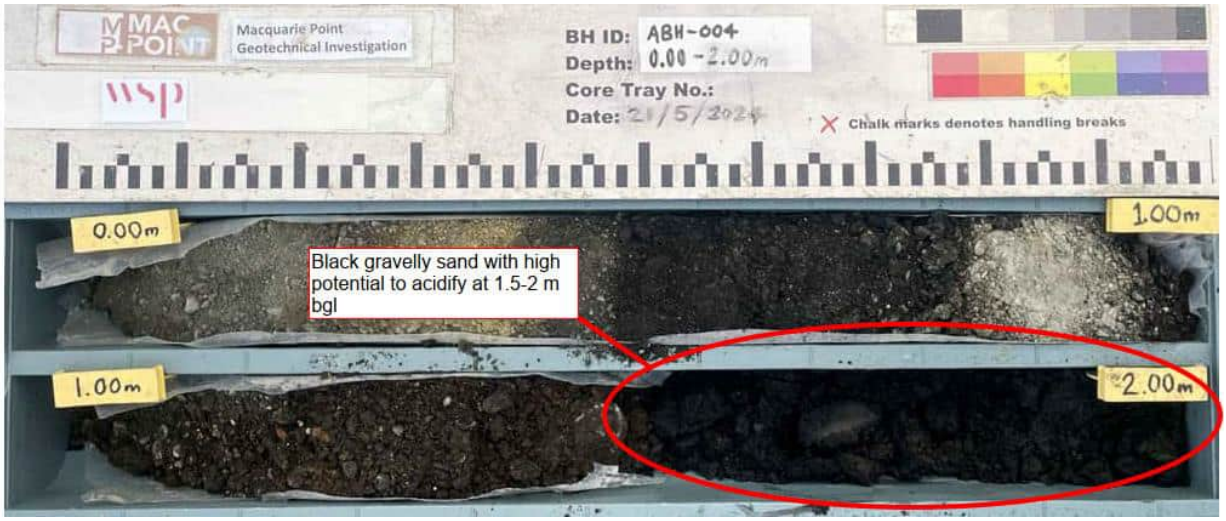

Plate 6 ABH-004 – Core Log at 0 to 2 m bgl

Unsaturated soil is considered of lower potential to acidify, as it would generally be expected to have been exposed to oxygen during dredging, storage and handing as part of land reclamation, as well as in the >85 years since the most recent phase of land reclamation in this area in 1937.

However, the potential exists for pockets within the unsaturated fill where oxidation has not occurred. Historic soil sample in the vicinity of ABH-004 has detected low soil oxygen, which has been attributed to anaerobic digestion of either organic material in estuarine sands or historic fuel hydrocarbon impacts.

The material in ABH-004 and surrounding bores, and any other similar material encountered in the unsaturated fill, much be segregated and managed as PASS

Overall, on the basis of assessment of potential acidity:

- Soil at Regatta Point is not considered to have potential to acidify and no management measures are considered required for this area.
- PASS is present in soil at Macquarie Point and will require future management in:
  - Saturated soil, and soil which may have been intermittently wet at the water table.
  - Pockets of unoxidized estuarine sands in fill, characterised as black sand and gravel, which has not oxidised prior or during land reclamation, or while *in situ* on the Site.
- Management is not considered required for the remaining unsaturated soil at the Site based on the existing ANC of soil, which is an order of magnitude or greater than the potential acidity. While the reported ANC may be inflated by sample preparation, it is considered suitable for use in interpretation with the safety margin of 10x as it has been corroborated by chip tray analysis.

6.2 Indicative Treatment and Neutralisation Requirements

Neutralisation (or liming) of ASS is undertaken by the addition of agents which can increase the ANC of soil and prevent or reverse acidification. The dosage rate of neutralisation agents is based on the net acidity of the soil to be treated.

No neutralisation of soil at Regatta Point is considered required based on the net acidity of samples from this area. For the purpose of calculating an indicative neutralisation rate, the identified PASS at Macquarie Point has been split into three domains:

- Type 1 – Estuarine material within the unsaturated fill across the Site. The material detected in ABH-004 and surrounding bores is considered Type 1.
- Type 2 – Saturated soil within 3 m of the top of the water table, or soil at the water table which may be intermittently wetted, which is considered more likely to be disturbed by direct excavation and construction activities, or by dewatering for construction.

- Type 3 – Saturated soil at greater than 3 m below the water table, which may be disturbed by piling activities, or other activities which disturb deeper soil.

The expected net acidity for each domain has been calculated using the mean of the net acidity for assessment (**Table T2**) plus one standard deviation, and is presented on **Table 21** below.

Table 21 Net Acidity for Soil Neutralisation

PASS Type	Number of CRS Samples	Net Acidity (%S)			
		Range	Mean	Standard Deviation	Adopted Treatment Value
Type 1	15	<0.02 – 1.7	0.37	0.52	0.89
Type 2	33	<0.02 – 0.97	0.22	0.26	0.48
Type 3	17	0.025 – 1.3	0.54	0.36	0.91

Appendix C of the TASSMG provides a table for estimation of the amount of pure, finely ground calcium carbonate ($CaCO_3$) required to neutralise potential acidification based on %S. However, real world products used for treatment of potential acidification are unlikely to be as effective and greater dosage rates are likely.

Agricultural lime (aglime) is a commonly used liming agent for the treatment of AASS and PASS as it is typically readily available and relatively low cost. Estimated liming rates have been calculated for each PASS type for a generic agricultural lime (aglime) using the methodology provided in DER (2015a) has been used, with the calculation parameters present on **Table 22**.

Table 22 Aglime Dosage Rate Assumptions

Parameter		Value
Aglime Properties[3]		
Particle Sizing Distribution (PSD)	>0.850 mm	5% $^{w}/_{w}$
	0.300 – 0.850 mm	15% $^{w}/_{w}$
	<0.300 mm	80% $^{w}/_{w}$
Stated Neutralisation Value (SNV)		85%$CaCO_3$
Site Specific Characteristics		
Estimated Average Soil Density (*in situ*)		1.4 tonnes/m^3
Safety Factor[4]		
In situ soil		2
Stockpiles (*ex situ* soil)		1.5

The estimated liming rate for each PASS type is presented on **Table 23** below.

Table 23 Estimated Liming Rates - Generic Aglime

PASS Type	Assumed %S	Liming Rate (Generic Aglime)			
		Stockpiles		*In situ* soil	
Type 1	0.89	55 kg/t	77 kg/m^3	73 kg/t	102 kg/m^3
Type 2	0.48	28 kg/t	41 kg/m^3	39 kg/t	55 kg/m^3
Type 3	0.91	55 kg/t	77 kg/m^3	73 kg/t	102 kg/m^3

[3] These parameters should be available from aglime suppliers. The adopted values are based on those generally available on the eastern coast of Australia.
[4] Homogeneous and uniform mixing of liming agents is more difficult to achieve in *in situ* soil, and a higher safety factor has been adopted as a result.

The following is noted for assessment and selection of future dosage produces and the treatment of PASS:

- Areas with higher %S that the adopted treatment value may be present in PASS. Any neutralisation undertaken should be verified by post-treatment testing, and may require re-treatment if the potential for acidification has not been sufficient reduced.
- Granulated products should not be considered. Granulation reduces the surface area available for neutralisation and, while such products may have longevity in treated soil, they are unable to neutralise acidification at the rate which may occur in PASS.
- Alternative products may be considered for use in neutralisation of PASS. The properties of any such alternative must be assessed, and the dosage rate reevaluated by a suitably qualified and experienced environmental practitioner, prior to any treatment.
- The longevity and potential additional environmental impacts of alternatives should be considered. For example, products such as sodium hydroxide (NaOH) typically have little residual alkalinity and buffering capacity over time, and can lead to elevated sodium levels in soil or groundwater with knock-on effects and impacts.

7.0 Conclusions and Recommendations

7.1 Conclusions

Based on observations recorded during bore advancement and the results of laboratory analysis for pH field screening, CRS, SPOCAS, and chip tray analysis, the following is concluded about the presence, extent and characteristics of ASS at the Site:

- No AASS has been detected at Macquarie Point, and no ASS (either AASS or PASS) has been detected at Regatta Point.
- Oxidisable sulfides have been detected at Macquarie Point, consisting generally of sands and clays consistent with estuarine materials, and it is considered likely that river- and lake-bed materials (either originally present on Site, or used as part of historic land reclamation) is the ultimate source of this material.

  Soil with a high potential to acidify due to the presence of reduced inorganic sulphur, which is considered PASS, has been identified in:

  - Saturated soil, and soil which may have been intermittently wet at the water table.
  - Pockets of unoxidised estuarine sands in fill, characterised as black sand and gravel, which has not oxidised prior or during land reclamation, or while *in situ* on the Site.

  Management will be required for any work which may disturb or dewater PASS.
- Review of historic data identified indicators that Site groundwater has been affected by the oxidation of sulfides, but that acidification has not occurred and has likely been prevented by the alkalinity of groundwater. Site groundwater should also have a reasonable capacity to buffer against acidification from ongoing natural oxidation of sulfides in soil.
- PASS management is not considered required for the remaining unsaturated soil at the Site based on the existing ANC of soil, which is an order of magnitude or greater than the potential acidity. While the reported ANC may be inflated by sample preparation, it is considered suitable for use in interpretation with the safety margin of 10x as it has been corroborated by chip tray analysis.
- Indicative dosage rates to treat and neutralise PASS with aglime if disturbed have been calculated for three categories, presented on **Table 24** below.

Table 24 PASS Liming Rates (Generic Aglime)

PASS Type	Assumed %S	Liming Rate (Generic Aglime)			
		Stockpiles		*In situ* soil	
Type 1 Estuarine material in unsaturated fill, which may be encountered during excavation or development. Black sand/gravel matrix with some clay potentially present.	0.89	55 kg/t	77 kg/m^3	73 kg/t	102 kg/m^3
Type 2 Saturated soil at or ≤3 m below the water table, which may be encountered during excavation or development, or affected by dewatering	0.48	28 kg/t	40 kg/m^3	39 kg/t	55 kg/m^3
Type 3 Saturated soil at >3 m below the water table, which may be affected by piling.	0.91	55 kg/t	77 kg/m^3	73 kg/t	102 kg/m^3

The rates on **Table 24** are based on a generic assumed aglime with an SNV ≥ 85%$CaCO_3$, and in which ≥80% of aglime particles are < 0.3mm. These parameters have been assumed based on typical aglime available in eastern Australia.

Any neutralisation agent proposed for use on the Site should be compared to these properties. While alternatives may be suitable for PASS treatment, the suitability and an dosage rate of any alternative should be reviewed and verified by a suitability qualified and experienced environmental practitioner with consideration of:

- SNV and particle size distribution
- Solubility and longevity
- Potential for other environmental effects

Any neutralisation of PASS must be verified by post-treatment laboratory analytical results.

7.2 Recommendations

Based on the outcomes of this assessment, it is recommended that:

- Future activities at Macquarie Point should identify all activities which have the potential to disturb or expose (i.e., dewater) PASS at the Site, and:
  - The SEMP and CEMPs should include overarching management obligations for disturbance of ASS and/or water table drawdown via dewatering.
  - A scope specific Acid Sulfate Soil Management Plan (ASSMP) and Dewatering Management Plan (DWMP) should be developed for each discrete works package involving civil and general earthworks activities, water table drawdown via dewatering, and any other significant soil disturbance activities or changes to natural groundwater and surface water systems.

    These documents should be prepared by those undertaking works which may disturb PASS, and must include:
    - Estimated volumes and action criteria for PASS which may be disturbed by the proposed works.
    - Procedures for the handling of disturbed PASS, including verification of neutralisation, groundwater generated by dewatering, and monitoring of Site environmental conditions in the vicinity of PASS disturbances.
    - Contingency measures which are specific, measurable, and attainable, and can be implemented in a timely manner in the event that action criteria or trigger values are exceeded.
- Future structures and infrastructure at the Site should consider the potential effects of sulfides and possible acidification in design and selection of materials, and adopt appropriate mitigation measures to prevent degradation of materials overtime.
- Any groundwater, or run-off which may have come into contact with PASS, should be considered as potentially contaminated. pH and the potential to acidify should be considered in assessment any such water prior to disposal

The above recommendations should be documented in the SEMP (AECOM, 2025a).

Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of the Macquarie Point Development Corporation, and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the contract *Macquarie Point - Proposal for Acid Sulfate Soil Assessment, Technical Support, and Reporting* dated 9 April 2024, and the contract *Macquarie Point - Proposal for Additional Acid Sulfate Soil Analysis* dated 9 July 2024.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between 8-Jan-2025 and 04-Dec-2025 and is based on the information available and reviewed at the time of preparation, as referenced in the Report text. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

Notes
#1. Macquarie Point reactions rates were reported on the following scale: 1 - None to slight; 2 - Moderate; 3 - Strong reaction with persistent froth; 4 - Extreme reaction
Regatta Point sample reaction rates were reported on the following scale: 1 - no visible or audible effervescence; 2 - slight audible but no visible effervescence; 3 - audible and slightly visible effervescence; 4 - moderate visible effervescence; 5 - strong visible effervescence
#2. Groundwater presence/absence not noted on borelog. Depth of water table estimated from nearby locations and apparent saturation on core photographs

Notes
#1. Groundwater presence/absence not noted on borelog. Depth of water table estimated from nearby locations and apparent saturation on core photographs
#2. While pH_{INC} (19 weeks) was greater than 4, this sample is still considered ASS due to pH_{INC} (9 weeks) of less than 4.

Notes:

EC - Electrical Conductivity (milliSiemens per centimetre)

TDS calculated by multiplying electrical conductivity by 0.65

ORP - Oxidation Reduction Potential (milliVolts)

Redox potential converted from Ag/AgCl electrode to Standard Hydrogen Electrode (SHE) electrode by adding +200 mV

[1] The Easting and Northing coordinates presented are the MGA94 Coordinates

PROJECT NUMBER / TASK CODE: 60693007/1	P.O. NO.: 60693007 / 1	EMAIL REPORT TO: supriya.lath@aecom.com; robert.crowe@aecom.com	282A Argyle St, North Hobart TAS 7000
RESULTS REQUIRED (Date):	QUOTE NO.:	ANALYSIS REQUIRED including SUITES (note - suite codes must be listed to attract suite prices)	

FOR LABORATORY USE ONLY
COOLER SEAL (circle appropriate)
Intact: Yes No N/A
SAMPLE TEMPERATURE
CHILLED: Yes No

COMMENTS / SPECIAL HANDLING / STORAGE OR DISPOSAL:
Unused sample volume should be retained following assessment as additional sample analysis (CRS or SPOCAS) will be requested based on results of pH field screen analysis

Notes: e.g. Highly contaminated samples e.g. "High PAHs expected". Extra volume for QC or trace LORs etc.

Date/Time received	Apr 23, 2024 10:20 AM
Eurofins reference	1091401

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 3.4 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acid Sulfate Soils Field pH Test	Brisbane	Apr 30, 2024	7 Days

- Method: LTM-GEN-7060 Determination of field pH (pHF) and field pH peroxide (pHFOX) tests

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Lab Sample ID	QA Source	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Duplicate									
Acid Sulfate Soils Field pH Test				Result 1	Result 2	RPD			
pH-F (Field pH test)*	B24-Ap0069101	CP	pH Units	8.9	8.9	pass	20%	Pass	
Duplicate									
Acid Sulfate Soils Field pH Test				Result 1	Result 2	RPD			
pH-F (Field pH test)*	B24-Ap0069113	CP	pH Units	9.0	9.1	pass	20%	Pass	

Comments

V3: Report amended to correct the sample IDs to match the COC.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S05	Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

Company name:	Aecom Aust Pty Ltd Tasmania
Contact name:	Supriya Lath
Project name:	Not provided
Project ID:	60693007/1
Turnaround time:	5 Day
Date/Time received	Apr 30, 2024 10:00 AM
Eurofins reference	1093109

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Supriya Lath - supriya.lath@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acid Sulfate Soils Field pH Test	Brisbane	May 03, 2024	7 Days

- Method: LTM-GEN-7060 Determination of field pH (pHF) and field pH peroxide (pHFOX) tests

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Lab Sample ID	QA Source	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Duplicate									
Acid Sulfate Soils Field pH Test				Result 1	Result 2	RPD			
pH-F (Field pH test)*	B24-My0005717	CP	pH Units	8.1	8.3	pass	20%	Pass

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S05	Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

Authorised by:

Catherine Wilson	Analytical Services Manager

Project name:	MACQUARIE POINT 41 EVANS ST HOBART
Project ID:	60693007/1
Turnaround time:	5 Day
Date/Time received	May 7, 2024 10:40 AM
Eurofins reference	1094321

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 2.6 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to - ALL INVOICES - AP_CustomerService.ANZ@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acid Sulfate Soils Field pH Test	Brisbane	May 14, 2024	7 Days

- Method: LTM-GEN-7060 Determination of field pH (pHF) and field pH peroxide (pHFOX) tests

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Lab Sample ID	QA Source	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S05	Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

Good afternoon Onur, Sheridan,

I've got two additional requests for this sample batch:

- Each sample has been given a rating of "4.0 – Extreme Reaction" for the field screen of the fizz rating. There is limited change between pHf and pHf_{ox} values for each sample, and it seems unlikely that there would be an extreme reaction. Would you be able to confirm with Brisbane that this field has been completed correctly and using the scale provided as qualified code S05?
- Can the following samples be analysed for the Chromium Reducible Sulfur (CRS) suite (National Acid Sulfate Soils Guidance) (excluding Acid Neutralising Capacity):
  - BH-002-0.5-0.6-180424
  - BH-002-2.0-2.1-180424
  - BH-002-3.5-3.6-180424
  - BH-003-0.5-0.6-160424
  - BH-003-1.5-1.6-160424
  - BH-003-3.0-3.1-160424

Thanks, and please let me know if you need any additional information or details,

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✗	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
LCS - % Recovery

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	No
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S01	Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3'
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5
S03	Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5
S04	Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period

Morning Onur, Savini,

Could additional analysis please be organised on the following samples:

Batch	Field ID	Chromium Reducible Sulfur (CRS) suite (National Acid Sulfate Soils Guidance) (excluding Acid Neutralising Capacity):	Suspension Peroxide Combination Acidity (SPOCAS) (NASSG) (excluding ANC)
1091401	BH-003-1.0-1.1-160424	X	
1093109	BH001-1.0-1.1_190424	X	
	BH010_0.5-0.6_240424	X	
	BH010_1.5-1.6_240424	X	
	BH010_4.0-4.1_240424	X	
	BH010_4.5-4.6_240424	X	X
	BH011_1.0-1.1_220424	X	
	BH011_2.0-2.1_220424	X	
	BH011_3.0-3.1_220424	X	X
	BH011_4.5-4.6_220424	X	
	BH011_5.5-5.6_220424	X	

Thanks, and please let me know if you need any additional information, or if there's any alternative email to include on further assessment requests.

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
N/A	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to - ALL INVOICES - AP_CustomerService.ANZ@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

V3: Report reissued to include reporting of all net acidity calculations.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	N/A
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S01	Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3'
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5
S03	Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5
S04	Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period

PROJECT MANAGER (PM): R.Crowe	SITE: Macquarie Point, 41 Evans St, Hobart	MOBILE: 0413884779 PHONE:	Eurofins Hobart
PROJECT NUMBER / TASK CODE: 60693007/1	P.O. NO.: 60693007 / 1	EMAIL REPORT TO: supriya.lath@aecom.com; robert.crowe@aecom.com	282A Argyle St, North Hobart TAS 7000
RESULTS REQUIRED (Date): Standard	QUOTE NO.:	ANALYSIS REQUIRED including SUITES (note - suite codes must be listed to attract suite prices)	

FOR LABORATORY USE ONLY
COOLER SEAL (circle appropriate)
Intact: Yes No N/A
SAMPLE TEMPERATURE
CHILLED: Yes No

COMMENTS / SPECIAL HANDLING / STORAGE OR DISPOSAL:
Unused sample volume should be retained following assessment as additional sample analysis (CRS or SPOCAS) will be requested based on results of pH field screen analysis.

Notes: e.g. Highly contaminated samples e.g. "High PAHs expected". Extra volume for QC or trace LORs etc.

Eurofins reference	1097381

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : -1.2 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acid Sulfate Soils Field pH Test	Brisbane	May 22, 2024	7 Days

- Method: LTM-GEN-7060 Determination of field pH (pHF) and field pH peroxide (pHFOX) tests

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Lab Sample ID	QA Source	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Duplicate									
Acid Sulfate Soils Field pH Test				Result 1	Result 2	RPD

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S05	Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

PROJECT MANAGER (PM): R.Crowe	SITE: Macquarie Point, 41 Evans St, Hobart	MOBILE: 0418 616 659 PHONE:	Eurofins Hobart
PROJECT NUMBER / TASK CODI 60693007/1	P.O. NO.: 60693007 / 1	EMAIL REPORT TO: supriya.lath@aecom.com; robert.crowe@aecom.com	282A Argyle St, North Hobart TAS 7000
RESULTS REQUIRED (Date): standard	QUOTE NO.:	**ANALYSIS REQUIRED including SUITES** (note - suite codes must be listed to attract suite prices)	

FOR LABORATORY USE ONLY
COOLER SEAL (circle appropriate)
Intact: Yes No N/A
SAMPLE TEMPERATURE
CHILLED: Yes No

COMMENTS / SPECIAL HANDLING / STORAGE OR DISPOSAL:
Unused sample volume should be retained following assessment as additional sample analysis (CRS or SPOCAS) will be requested based on results of pH field screen analysis

Notes: e.g. Highly contaminated samples e.g. "High PAHs expected". Extra volume for QC or trace LORs etc.

SAMPLE INFORMATION (note: S = Soil, W=Water)					CONTAINER INFORMATION		pH – Field Screen (pHf and pHfox) – NASSG												HOLD

Company name:	Aecom Aust Pty Ltd Tasmania
Contact name:	Robert Crowe
Project name:	PS212776 MACQUARIE POINT DEVELOPMENT CORPORATION
Project ID:	60693007/1
Turnaround time:	5 Day
Date/Time received	May 21, 2024 10:10 AM
Eurofins reference	1099835

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : -.8 degrees Celsius.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- ✓ Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acid Sulfate Soils Field pH Test	Brisbane	May 28, 2024	7 Days

- Method: LTM-GEN-7060 Determination of field pH (pHF) and field pH peroxide (pHFOX) tests

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Lab Sample ID	QA Source	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Duplicate

Comments

Sample Integrity

Custody Seals Intact (if used)	Yes
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S05	Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

Company name:	Aecom Aust Pty Ltd Tasmania
Contact name:	Robert Crowe
Project name:	Not provided
Project ID:	PS212776
Turnaround time:	5 Day
Date/Time received	May 23, 2024 10:00 AM
Eurofins reference	1100380

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 3.4 degrees Celsius.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- ✓ Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acid Sulfate Soils Field pH Test	Brisbane	May 30, 2024	7 Days

- Method: LTM-GEN-7060 Determination of field pH (pHF) and field pH peroxide (pHFOX) tests

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Lab Sample ID	QA Source	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Duplicate									
Acid Sulfate Soils Field pH Test				Result 1	Result 2	RPD			
pH-F (Field pH test)*	B24-My0065441	CP	pH Units	8.1	8.3	pass	20%	Pass

Comments

Sample Integrity

Custody Seals Intact (if used)	Yes
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S05	Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

Subject: Macquarie Point - Acid Sulfate Soil Assessment Questions and Additional Analysis Request

CAUTION: EXTERNAL EMAIL - Sent from an email domain that is not formally trusted by Eurofins.

Do not click on links or open attachments unless you recognise the sender and are certain that the content is safe.

Afternoon Savini,

Hope the week is finishing well. I'm just sending this email to request some additional assessment on some samples received by Eurofins, and to ask a few questions on some previous samples received (apologies for it being a Friday afternoon request).

My questions are:

- On the Eurofins-AECOM price guide from 1 October 2023, there is costs for slab tray and chip tray incubation. Would you have sufficient sample volume left from samples submitted for CRS/SPOCAS to undertake either or both of these assessments?
- In terms of sample storage, how long will Eurofins store samples after analysis (i.e., if we want to undertake incubation assessment)? I would expect to have some idea of if and how many samples we want to undertake this on by mid-June (depending on turnaround of some samples currently with Eurofins) – will all samples for this assessment (dating back to 18 April) still be frozen, or can I request a longer storage period? I am happy to provide a list of batches/samples which may be further assessed.
- In batch 1097156 last week, a number of CRS results (such as pH_{KCl}, net acidity, liming rate etc) were reported as "N/A" for samples BH-011_2.0-2.1_220424 and BH-010_4.5-4.6_240424 – could you let me know why these results were not reported or not applicable, or if they will be?

For additional analysis, can the samples from batches 1094321 and 1097381 listed below be analysed for the following suites (as indicated on the table). Costs for this assessment should reference AECOM project/PO 60693007.1.
Analytical suites are:

- Chromium Reducible Sulfur (CRS) suite (National Acid Sulfate Soils Guidance)
- Suspension Peroxide Combination Acidity (SPOCAS) (NASSG)

Thanks, and please let me know if you need any further information or detail.

Hope you have a good weekend ahead,

Company name:	Aecom Aust Pty Ltd Tasmania
Contact name:	Robert Crowe
Project name:	MACQUARIE POINT 41 EVANS ST HOBART
Project ID:	60693007/1
Turnaround time:	5 Day
Date/Time received	May 24, 2024 2:23 PM
Eurofins reference	1103208

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 2.6 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

V2: Report amended to reflect the follows:

-Reporting updated for My0088876 to reflect Net Acidity calculations, all other reporting data correct and accurate.

-Net Acidity calculations reported.

-pH-KCl triggered ANC analysis, also reported

-Retained Acidity (inc Net Acid Soluble Sulfur) and Extractable Sulfur pathway not reported as this is triggered with pH-KCl<4.5.

V3: Report amended to update net acidity values.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S01	Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3'
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5
S03	Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5
S04	Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period

Subject: RE: Macquarie Point - Acid Sulfate Soil Assessment Questions and Additional Analysis Request

CAUTION: EXTERNAL EMAIL - Sent from an email domain that is not formally trusted by Eurofins.

Do not click on links or open attachments unless you recognise the sender and are certain that the content is safe.

Hi Savini,

Hope you've had a good long weekend and are not looking at this email till Tuesday at the very earliest. Just sending through three requests relating to the Mac Point acid sulfate soil assessment.

1. Could the samples in the following lab batches be kept on hold beyond 2 months for potential further assessment:
   - 1091401, 1093109, 1094321, 1097381, 1100380 and 1099835 (initial sample batches).
   - 109715, 1097156, 1103208 (batches taken from the above 6 on which further analysis was conducted).

I should be able to provide details for additional assessment once the results for the additional sampling request in Point 3 below are received.

2. Just following up again on my question around reporting of some characteristics (i.e., Net Acidity et all), and noting the same approach/results not report has been taken for the following samples from batch 1103208:
   - BH005_8.5-8.6_270424
   - BH014_3.5-3.6_290424
   - BH016_5.5-5.6_010524

These three samples all also had a pH_{KCl} of greater than 6.5 reported.

3. Can you organise additional CRS (NASSG) and SPOCAS (NASSG) assessment on the following samples from batches 1100680 and 1099385:

Field ID	Sample Date	Lab Report	Additional Analysis	
BH004_2.0-2.1m	13/05/2024	1099835	CRS	
BH004_2.9-3.0m	13/05/2024		CRS

Eurofins reference 1108737

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : -.8 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Comments

V2: Report amended to reflect the following:

-Reporting updated for samples requested for Chromium and SPOCAS suites to reflect Net Acidity calculations.

-Net Acidity calculations.

-pH-KCl triggered ANC analysis.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S01	Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3'
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5
S03	Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5
S04	Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period

Subject: Macquarie Point Acid Sulfate Soil - Additional Slab Tray NLM8.2 (Standard) Analysis Request

CAUTION: EXTERNAL EMAIL - Sent from an email domain that is not formally trusted by Eurofins.

Do not click on links or open attachments unless you recognise the sender and are certain that the content is safe.

Morning Savini,

Hope the day is going well. Would you be able to request some additional analysis (Slab Tray NLM8.2 (Standard)) for the acid sulfate soil samples below which are stored at Eurofins Brisbane (or please let me know the email to send further assessment requests to if needed)?

Please let me know if there is insufficient sample mass left in any of the samples, and I can provide alternatives. It'd be good if the remaining samples from the batches could remain in storage for the time being as well – we may need some further assessment (TBD).

Invoicing for this assessment should reference AECOM PO/Job Number 60693007.1

Thanks, and please let me know if you need any additional information or details,

Sample Information

- ✓ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ✓ Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : -.8 degrees Celsius.
- ✓ All samples have been received as described on the above COC.
- ✓ COC has been completed correctly.
- ✓ Attempt to chill was evident.
- ✓ Appropriately preserved sample containers have been used.
- ✓ All samples were received in good condition.
- ✓ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ✓ Appropriate sample containers have been used.
- ✓ Sample containers for volatile analysis received with zero headspace.
- ✗ Split sample sent to requested external lab.
- ✗ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Chip Tray Incubation NLM 8.2 (Standard)	Brisbane	Jul 17, 2024	N/A
- Method: in-house pH analysis			
% Moisture	Brisbane	Jul 16, 2024	14 Days
- Method: LTM-GEN-7080 Moisture

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Turnaround time: 1 Day
Date/Time received Sep 20, 2024 4:31 PM
Eurofins reference 1141778

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 10 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Sample "BH236_0.5_240920" recieved as jar, logged in standard TAT report, please advise if PHFOX is required on sample.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
NASSG ASS Field Screen	Brisbane	Sep 24, 2024	7 Day

- Method: LTM-GEN-7060 Determination of field pH (pHF) and field pH peroxide (pHFOX) tests

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Lab Sample ID	QA Source	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Hi Catherine,

In addition to the question below, can the following additional assessment be conducted on samples in this batch on standard TAT?

Field ID	Chromium Reducible Sulfur (CRS) suite	SPOCAS Suite
BH236_0.5_A_240920	X	
BH243_0.2_A_240920	X	
BH243_1.5_A_240920	X	
BH252_1.5_A_240920	X	
BH253_1.25_A_240920	X	X

Thanks,

Robert Crowe

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 10 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
N/A	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: SaviniSuduweli@eurofins.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Aust Pty Ltd Tasmania email address.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)

CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
LCS - % Recovery							
Actual Acidity (NLM-3.2)							
pH-KCL (NLM-3.1)	%	100			80-120	Pass

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	N/A
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
S01	Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3'
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5
S03	Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5
S04	Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period

ANALYSIS SUITES

General Soil Suite:
TRH, BTEXN, PAH, 8 Metals (As, Cd, Cr, Cu, Pb, Ni, Zn, Hg)

Gasworks Soil Suite:
Cyanide (Total, Free & WAD), Ammonia as N, Phenols (Speciated)

General Water Suite:
TRH/BTEXN/PAH/Phenols/8 metals (As, Cd, Cr, Cu, Ni, Pb, Zn, Hg) plus Manganese, Cations/Anions #3 (incl TDS), Cyanide (Total, Free & WAD), Ammonia as N, Methane

Eco Risk Organics Suite:
TRH Aliphatic / Aromatic Speciation
TRH (C6-C40 (silica gel cleanup)
TRH (C6-C40) - on 5 µm field filtered sample
PAH - on 5 µm field filtered sample

PFAS:
Full suite - 30 compounds, trace level

Trip Blank Suite:
TRH C6-C9, BTEXN

Additional Information	Comments on likely contamination, dilutions samples for QC analysis, specific preparation etc

Hi Sheridan,

Can you please update the following sample ID from this batch (1225146):

- Please update QC01 to QC501

Kind regards,

Richard Bowers

Subject: Eurofins Sample Receipt Advice - Report 1225146 : Site Macquarie Point (60693007 / 12)

Dear Valued Client,

Please find attached a Sample Receipt Advice (SRA), a Summary Sheet and a scanned copy of your Chain-of-Custody (COC). It is important that you check this documentation to ensure that the details are correct such as the Client Job Number, Turn Around Time, any comments in the Notes section and sample numbers as well as the requested analysis. If there are any irregularities then please contact your Eurofins Analytical Services Manager as soon as possible to make certain that they get changed.

Kind Regards,

Sheridan Barrett
Assistant Analytical Services Manager (TAS)

Sample Receipt Advice

Company name:	Aecom Austraila Pty Ltd Tasmania
Contact name:	Robert Crowe
Project name:	Macquarie Point
Project ID:	60693007 / 12
Turnaround time:	5 Day
Date/Time received	May 27, 2025 9:18 PM
Eurofins reference	1225146

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 10.2 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Please note the temperature reading listed is the temperature recorded on arrival to Eurofins Hobart Office.
Samples received by the laboratory after 5.30pm are deemed to have been received the following working day.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Savini Suduweli on phone : +61 3 8564 5051 or by email: Savini.Suduwelikondage@eurofinsanz.com

Results will be delivered electronically via email to Robert Crowe - Robert.Crowe@aecom.com.

Note: A copy of these results will also be delivered to the general Aecom Austraila Pty Ltd Tasmania email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Acid Sulfate Soils Field pH Test	Brisbane	Jun 03, 2025	7 Days
- Method: LTM-GEN-7060			
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	May 29, 2025	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	May 29, 2025	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Total Recoverable Hydrocarbons	Melbourne	May 29, 2025	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
BTEX	Melbourne	May 29, 2025	14 Days
- Method: LTM-ORG-2010 BTEX and Volatile TRH			
Eurofins Suite B7			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	May 29, 2025	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Polycyclic Aromatic Hydrocarbons	Melbourne	May 29, 2025	14 Days
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Metals M8	Melbourne	May 29, 2025	28 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS			
% Moisture	Melbourne	May 28, 2025	14 Days
- Method: LTM-GEN-7080 Moisture

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
